ABBREVIATIONS

The titles of subjects, which are printed first in bold type, have been abbreviated within each article to the initial letter or letters.

ac., acre(s).
 agric., agricultural.
 ambas., ambassador(s).
 Amer., American.
 anct., ancient.
 ann., annual.
 arron., arrondissement.
 A.-S., Anglo-Saxon.
 A.V., Authorised Version.
 b., born.
 Biog. Dic., Biographical Dictionary.
 bor., borough.
 bp., birthplace.
 Brit., British.
 C., Centigrade.
 c., about.
 cap., capital.
 cf., compare.
 co., county.
 com., commune.
 cub. ft., cubic feet.
 d., died.
 Dan., Danish.
 dept., department.
 dist., district.
 div., division.
 E., east; eastern.
 eccles., ecclesiastical.
 ed., edition; edited.
 e.g., for example.
 Ency. Brit., Encyclopædia Britannica.
 Eng., English.
 estab., established; establishment.
 F., Fahrenheit.
 fl., flourished.
 fort. tn., fortified town.
 Fr., French.
 ft., feet.
 Ger., German.
 Gk., Greek.
 gov., government.
 Heb., Hebrew.
 hist., history.
 horticult., horticultural.
 h.p., horse-power.
 hr., hour.
 i.e., that is.
 in., inch(es).
 inhab., inhabitant(s).

is., island(s).
 It., Italian.
 Jap., Japanese.
 jour., journal.
 Lat., Latin.
 lat., latitude.
 lb., pound(s).
 l. b., left bank.
 long., longitude.
 m., mile(s).
 manuf., manufacture.
 min., minute(s).
 mrkt. tn., market town.
 MS., manuscript.
 mt., mount; mountain.
 N., north; northern.
 N.T., New Testament.
 O.E., Old English.
 O.F., Old French.
 O.T., Old Testament.
 oz., ounce(s).
 par., parish.
 parl., parliamentary.
 pop., population.
 prin., principal.
 prof., professor.
 prov., province; provincial.
 pub., published; publication.
 r., which see.
 R., riv., river.
 r. b., right bank.
 Rom., Roman.
 R.V., Revised Version.
 S., south; southern.
 sec., second(s).
 sev., several.
 Sp., Spanish.
 sp. gr., specific gravity.
 sq. m., square mile(s).
 temp., temperature.
 ter., territory.
 tn., town.
 trans., translated; translation.
 trib., tributary.
 univ., university.
 urb., urban.
 vil., village.
 vol., volume.
 W., west; western.
 Wm., William.
 yd., yard.

The article ABBREVIATIONS contains a list of those in general use. See also ABBREVIATION (music) and ELEMENTS (chemical symbols).

M

Maps are representations on a plane, and on a reduced scale, of part or the whole of the earth's surface. They are either topographical, cadastral, general, or atlas. Topographical M. are based on accurate survey, and show the natural features of the country, hills and rivers, forests and swamps; also such artificial features as towns and villages, buildings, roads, railways, canals, bridges, and telegraphs. They serve as guides for travel on business or pleasure, or for the operations of war. The 'one-inch' map (scale 1 in. to 1 m.) is the standard topographical map of the British Isles. Cadastral M. are on a larger scale, as required for local administration, taxation, management of estates, legal documents, etc. These M. in other countries are often in MS. and deposited with the local authority. The Brit. map of the scale (q.v.) of 25 in. to 1 m., commonly called the 25-in. plan, shows hedges and fences, etc., but is not strictly a cadastral map, though commonly called so, because the real boundary of properties may frequently be some feet beyond the hedge. Moreover a cadastral map proper records the co-ordinates of boundary stones, corners, etc., referred to in the general framework of the survey. This registration of co-ordinates is more important in a country like Egypt, which has no permanent hedges or boundary walls and where the annual inundation of the Nile may obliterate the very vague boundaries of cultivated lands. General or atlas M. are on a small scale, in which the topographical details are necessarily suppressed, for these M. aim at the representation of a large tract of country, a continent, or even the world. (An international world map, to a uniform scale of 1:1,000,000, is described later.)

M. of the sea-coast, and to some extent of the sea bottom, are generally known as charts (q.v.). They give information of buoys, lights, soundings, etc., all referred to low water as datum, instead of to mean sea level, with information on tides or currents. It is to be noted that charts which were good enough in the old days of sail and low-powered steamships are not now satisfactory for the requirements of the fast, deep-draught vessels of to-day. The hydrographic dept. of the Brit. Admiralty, since the Second World War, is engaged in the great task of recharting the oceans of the world. Particular attention is given to the location of wrecks, which is effected by means of an echo-sounder, which records electric impulses 'bounced' off the sea bed. In shallow coastal waters dual cameras on aircraft, using panchromatic film, will locate wrecks to within 3 ft. of their depth. (See H.M.S.O., *Charting the Seas in Peace and War*, 1949.)

The oldest extant Ms. are said to be the

Babylonian clay tablets in the Brit. Museum (c. 2300 B.C.). The anc. Egyptians were skilled mathematicians, and were producing scientifically constructed cadastral Ms. as early as Ramesses II. (1330-1300 B.C.). From such M. Eratosthenes (276-196 B.C.) measured the distance from Syene to Alexandria, from which he estimated the size of the earth. The accuracy of the M. is shown by the fact that the estimate of Eratosthenes was not improved upon till the determinations of Picard in 1871. The *Mapa Mundi* at Hereford Cathedral was made about 1290.

PROJECTIONS.—A spherical surface, unlike a cylindrical, cannot be unrolled into a plane surface. Hence it follows that it is impossible to give an absolutely true representation of the earth on a plane map, but only on a globe. To represent it at all the sphere must be *projected* on to the plane. It is usual to define position by reference to lat. and long. lines, and any representation of these lines upon a plane is called a 'map projection.' Though projections in actual use are not strictly projections in the geometrical sense, they approximate to them. The perfect map would show uniform and correct shape, and correct angles (bearings). In settling the particular kind of projection to be adopted in showing parts of the earth's surface on a plane map surface, consideration must be given to the area of the survey, the purpose for which it is required, and the degree of accuracy desired. Some of the qualities desirable in a theoretically correct map must therefore be sacrificed, and the main purpose of the map will be the deciding factor. The system of meridians and parallels forming, as it were, the general framework construction of any map is known as the graticule, and every 'hole' in it is known as a mesh. It is only possible here to give a brief account of the more important projections.

Rectangular Projection.—In this the meridians are all straight vertical parallel lines and the parallels of lat. are horizontal parallel lines perpendicular to the meridians. The map is started by drawing a central meridian and marking off degrees of lat. thereon, as given in geodetic tables, through which parallels of lat. are drawn as straight lines at right angles to the central meridian. Degrees of long. are marked off in a similar way on the middle parallel and meridians drawn through these points parallel to the central meridian. This method should not be used for sheets containing a larger area than 100 sq. m. The detailed plotting of topographical details may be done by polar or rectangular co-ordinates.

Trapezoidal Projection.—This may be used for M. containing an area of not more

than 25 m. square, i.e. 625 sq. m., in which the meridians and parallels are all straight lines, but the meridians are drawn to converge. It is started by drawing a central vertical meridian and dividing it for lats. all as before. Two parallels of lat. are then plotted, one about quarter the height of the sheet up from the bottom and the other about quarter the height down from the top. These are then divided into degrees and minutes at their respective lats., as given in geodetic tables. The meridians are then drawn as straight converging lines through the points of div. on these two parallels. The longs. indicated on the map will be correct, and the lats. nearly so.

Cylindrical.—Let us imagine a plane surface wrapped round the globe in the form of a cylinder of the same height, touching the equator. Further let us suppose the plane of each meridian and parallel produced to touch the cylinder, so that, on unfolding, the former would be represented by vertical straight lines, and the latter by horizontal. Such a projection would be much distorted in the region of the poles, though approximately true in equatorial regions. Its merit is that, in spite of distortion in shape, equal areas on the globe are represented by equal areas on the map. Hence it is called an equal area cylindrical projection. Another cylindrical projection, almost universally used for navigation, is Mercator's. Its approximate form can be visualised by supposing a light at the centre of the globe to cast a shadow of the meridians and parallels on a cylinder of infinite length enclosing it. Here, as the polar shadows are at infinity, there is obviously tremendous distortion in size at extreme lats., but within 30° N. or S. lat. of the equator the representation is good. This projection retains the characteristic property of orthomorphic or stereographic projection, viz. similarity of representation of small parts of the surface (see next paragraph). Its importance is due to the fact that the loxodromic curve, i.e. a line on the sphere cutting all the meridians at the same angle, becomes a straight line on the map. In effect this means that bearings read from the map are true bearings.

Stereographic.—Here the point of vision is supposed to be on the sphere's surface, and the plane of projection is the tangent plane at the other end of the diameter through the point of vision. In this projection the scale varies, but is orthomorphic, i.e. a small area of any particular shape on the globe is represented on the map by an area of the same shape.

Central or Gnomonic Projection.—Here the point of vision is supposed to be at the centre of the sphere, and all great circles are accordingly represented by straight lines. The plane of projection may be either parallel to the plane of the equator, or parallel to the plane of some meridian, or inclined to the axis of the sphere at any angle. These three variations are known as polar, meridional, or horizontal.

Conical.—Many modifications of the conical projections are in use. They are

(1) the simple conic with one selected parallel; (2) De L'Isle's projection with two standard parallels and with rectified meridians; and (3) Bonne's projection, in which all the parallels are properly divided. This was largely used by the Fr. but abandoned in 1917. It was used for the 1-in. Ordnance Survey (O.S.) map of Scotland. The most important is that with two standard parallels. A mental picture approximating to it can be formed by supposing the plane of the map to be folded into a cone cutting the sphere's surface at any two selected parallels. When the map is unfolded again these two parallels will be represented by concentric arcs of correct length; other parallels will be concentric arcs not quite true to length; and the meridians will be radii, also untrue to length. Provided the portion of the sphere represented on the map is not too great, no very significant distortion of any kind is produced.

Sinusoidal Equal-area Projection.—This is a particular case of Bonne's projection, the selected parallel being the equator. It is a projection very suitable for the map of Africa.

Polyconic Projection.—In the foregoing simple conic projections only one tangent or intersecting cone is used, but for very large areas it is better to make each parallel of lat. the development of the base of a cone tangent to the sphere at that lat. This polyconic projection is employed for the M. of the U.S. Coast and Geodetic Survey.

Some Special Purpose Projections.—(1) Globular; (2) Elliptical (equal area); (3) Zenithal, in which some point on the earth is selected for a central point of the map, great circles radiating from this point being represented by straight lines; (4) the Two-point Equidistant; having chosen two points on the sphere, the distances on the map from these two points to all other points are true to scale; (5) a map, based on a modified oblique Mercator projection, was prepared by A. R. Hinks, C.B.E., F.R.S., in connection with the preparatory International Conference on Trade and Employment, in London in Feb. 1946 (pub. in *World Affairs*, June 1947).

A comprehensive disquisition on sphere and map projections, with finely drawn steel engravings, will be found in P. Nicholson's *Popular Course of Pure and Mixed Mathematics* (1825).

THE GREAT INTERNATIONAL MAP OF THE WORLD.—This was first proposed by Prof. Penck at the International Geographical Congress at Bern in 1891. It is to the scale of one-millionth (1/1,000,000 or 1/M), and a kilometre of distance is therefore represented on the map by 1 millimetre. It is officially known as the *Carte du monde au millionième*. Since this original proposal a series of conferences has been held at various times from 1891 to 1928 at London, Geneva, Rome, Paris, and London, and a comprehensive convention on points of detail was gradually and unanimously built up. Greenwich was adopted for the prime meridian, a colour scheme (*gumme*) for the

representation of altitudes was agreed, and, after much discussion a metric system for units, contours, and for the 'grid' was accepted. A central office for the world map was estab. at the headquarters of the Brit. Ordnance Survey Dept. at Southampton (since removed to Cheshington, Surrey—see below), and a branch office at the headquarters of the Royal Geographical Society; but no definite arrangements were made for a centralised publishing and selling agency. The projection of this international world map is a slightly modified form of the simple polyconic projection proposed by one of the Fr. delegates, M. Lallemand. It has all the properties necessary for such a map—that neighbouring sheets shall fit along their edges; that the representation of distances and bearings within the sheet shall be sensibly perfect; and that it shall be constructed with ease. Each sheet comprises 4° of lat. by 6° of long., each being plotted independently. The upper and lower parallels have the radius $V \cot. \text{lat.}$, where V in each case is the normal terminated by the minor axis. Instead of the central meridian (which is a straight line) being exactly to scale the meridians 2° to the E. and W. of it are true to scale, the object of this device being to reduce the maximum error. The meridians themselves are divided equally and the inner parallels join the appropriate points on the meridian. The normal vertical interval of contours is 100 metres. The international world map is generally referred to by the symbol 1/M—but the system of numbering and lettering the sheets is complicated. On this map Great Britain falls on no less than seven sheets. To avoid this inconvenience the Brit. Ordnance Survey decided to produce a special ed. in two sheets, each 26½ in. by 26½ in., and in this form one is better able to appreciate the real merit of the international map. The system of layer colouring brings out the relief with great clearness. Communications are very well delineated, prin. roads being shown by strong red lines and secondary roads by fine red lines. Railways are shown in black, double and single lines and narrow gauge and light railways being distinguished. The international co-operative effort involved in the preparation of the 1/M international world map was interrupted by the two world wars—and its progress from 1919 to 1942 has been disappointing. The thirty or forty publishing estab. concerned have not always been consistent in conforming strictly to the conventions agreed; but the map is beginning to be very useful as it becomes more complete and its merits better recognised, especially in relation to peace conferences, to UNESCO, and to the new European movement launched at Strasbourg in 1949. The former offices of the central bureau, with their contents, including the whole of the collection of the international 1/M. map series, were destroyed during the Second World War. The central bureau is now situated at the Ordnance Survey Office, Cheshington, Surrey, England. The president requested

(1949) the receipt of a copy of every international 1/M map sheet pub. to date in order to reconstitute the map library of the central bureau, also a list of the sheets, so far unpublished, of the international 1/M series upon which work was in hand, or was to be put in hand, with the approximate date for their pub.

REPRESENTATION OF HILL FEATURES.—A difficulty in cartography is to show hill features on a flat surface. The earlier M. either did not attempt to do so, or represented them by 'mole-hills' drawn on the map. These showed approximate positions, but little else. The use of contours (*q.v.*) was introduced by M. S. Cruquius in 1728. They may be considered as successive coastlines at equal vertical intervals, if the landscape were to sink into the sea. It is possible to obtain an accurate mental picture from a contour map, as well as to deduce mathematically exact information; but it may involve detailed study and requires previous education in map-reading. To render hill features visible at a glance and without special training 'hachures' were devised by L. C. Müller in 1788. They are lines crossing the contours at right angles, their thickness varying with the slope. The disadvantage in the older M. was that, in hilly country, the black hachures concealed other features and names. Hachures belonged to the days of delicate and expensive engraving upon copper and are rapidly becoming obsolete. Excellent examples of the system, however, are to be seen in the old engraved sheets of the 1-in. O.S. M. of the United Kingdom, and it survives on a few modern colour-printed M., as, for example, the new 1-in. O.S. map of England. J. G. Bartholomew (of the celebrated firm of cartographers, Messrs. John Bartholomew & Son) was responsible for the now universally recognised way of portraying the relief of the earth's surface: the introduction of hypsometric (or contour) colouring.

LAYER MAPS.—Layer M., in which the spaces between different contours are tinted in different colours, were first constructed by Carl Ritter in 1806. Contour M. immediately became easy to visualise. Improvements in the mechanical processes of colour printing, and the use of transparent colours, have led to a great development of layer M. The system of using colours in the order of the spectrum, now almost universal, was introduced by E. G. Ravenstein in his map of Ben Nevis. In some of the finest examples of modern cartography the layer system is supplemented by hill shading in transparent colours, giving the effect of a relief map. The main drawback to such M. is the cost of printing. The specimen plate attached to the report of the International Map Conference of 1913 was printed at the Brit. War Office. It is a masterpiece of layer printing.

MAPS OF THE ORDNANCE SURVEY.—For the hist. and functions of this institution in Great Britain see the article **ORDNANCE SURVEY**. For convenience in production the M. pub. by the Ordnance Survey are classified as (1) small scale—up to 1 in. to

Maps

1 m.; (2) medium scale—2½ in. and 6 in. to 1 m.; and (3) large scale, about 25 in. and 50 in. to 1 m. Normally the line between 'maps' and 'plans' is drawn just below the 6-in., everything smaller in scale being known as a map. The ½-in. map has been for many years the standard map for motoring. The usefulness of these has been greatly increased by a rearrangement of the sheet lines, by showing the Ministry of Transport road numbers and classification, and adding the national grid (q.v.). Among ½-in. M. an entirely new series is in preparation, incorporating the national grid. Sheets will be larger than in the pre-war ed., and are of standard sizes, but the map of Greater London will be issued in a particularly large sheet. Separate administrative M. for each co. are pub. for England and Wales. One-in. M. are the original standard M. of the Ordnance Survey, and are valuable not only to the student of geography, but also are well suited for the needs of walkers, cyclists, and motorists, and those who wish to understand and appreciate the details of the countryside. Footpaths, roads, rivs., streams, woods, high- and low-water marks are all delineated, and altitudes above mean sea level are shown along main roads, etc., while contours are drawn at 50-ft. intervals, and the grid lines are 1 kilometre apart. Among the new features shown on the sixth (new popular) ed. are National Trust areas, youth hostels, wireless masts, and electricity transmission lines, and telephone call-boxes in open country.

The new O.S. map, to a scale of 1/25,000, or about 2½ in. to 1 m., was produced as a result of the recommendations of the departmental committee set up in 1935, it having been considered that there was too wide a gap between the 1-in. and the 6-in. series. Some 500 sheets have been pub. (1949). The new map has been produced on National Grid sheet lines and is based on the old 6-in. map to which certain revision material, collected for A.R.P. wartime purposes, has been added. It is obtainable in three styles, the fully coloured, the outline, and the administrative areas, which latter, by means of a red overprint, defines all classes of boundaries down to pars. and wards. It should be studied in relation to the report of the Boundary Commission, pub. 1949, which recommended revision of the areas of some of the smaller authorities.

Special Ordnance Survey Maps.—In former days the main function of a map was to provide a guide for travellers, showing them where different places were, and how to get there by road, rail, or by ship. To-day these functions have been enormously extended, and M. are now produced (in the Brit. Isles at least) to provide special visual information on a variety of matters: other than communications, e.g. historic, political and economic, and administrative, of special interest to

Maps

'planners' of all kinds. First may be mentioned two 'period' M.: (1) Rom. Britain and (2) Britain in the Dark Ages (A.D. 410–871). These are on the 1/M scale, or 15·782 m. to 1 in., and with the map can be obtained an explanatory pamphlet giving a list of reliable books on the period, a chronological table of important events, and an index of names.

Among the remaining M., constituting this special 'Planning' Series, but to a scale of 1/625,000 or about 10 m. to the inch, on the transverse Mercator projection and carrying the new National Grid lines at 10-kilometre intervals, are the following, sponsored by many gov. depts. and by independent research organisations for planning purposes: base maps, administrative areas, land classification, land utilisation, types of farming, grasslands, pop. density, pop. of urb. areas, geological, topographical, coal-fields, iron-mines and quarries, iron and steel works, roads, railways (including underground), electrical statutory supply areas (both power companies and joint boards, etc.). M. in course of preparation include such subjects as gas supply, electricity supply lines, pop. changes and migrations, economic minerals, posts, and a new geological map of Scotland and the N. of England incorporating results of much research work. Other special M. to varying scales, include the Channel Is., the Scilly Isles, the Royal Botanic Gardens at Kew, and the 1½ Million of Great Britain (on one sheet).

Relief Maps.—These are models produced by sev. methods, from contoured M. In the peg method, heights above sea level are represented by pegs of appropriate length set up along the contours: a suitable medium is packed between them so as to create a smooth surface. In the layer method contours are drawn on separate cardboard sheets and cut out; these are placed above each other and clay or plasticine used to make an even surface. In the section method vertical, parallel sections are drawn on cardboard, profiles cut out, thickened with plasticine, and arranged in order. The surface is smoothed, streambeds marked in, etc. From originals made by these methods moulds may be constructed from which cement or plaster casts can be taken. Geological features, strata, etc., may be shown by colour. Some vertical exaggeration as compared with the horizontal scale is usually necessary. The project for a 6 in. to 1 m. relief map of England and Wales, proposed in 1949 by Sir Clive Morrison Bell, envisaged a model 1100 yds. long, showing all natural features, roads, etc., and divided by gangways for inspection.

AIR SURVEY MAPS.—Among the recommendations contained in the final report (dated Feb. 3, 1938) of the departmental committee on the Ordnance Survey (commonly known as the Davidson Committee) was one to the effect that

short-term contracts to civil firms, for aerial photographs, should not be continued as a permanent policy but that the gov. should consider the formation, as soon as possible, of a special air-survey unit capable of satisfying the requirements of the Ordnance Survey. This recommendation was accepted, and during 1947 and 1948 the R.A.F. air-surveyed 589,000 sq. m. of terr., of which 295,000 sq. m. were in E. Africa and 165,000 sq. m. were in the United Kingdom. Considerable work has been done in the aerial photography of central London streets and blitzed buildings, and in air-photo mosaics and obliques by commercial air photographers.

Maquis, see under GUERRILLAS.

Mar, Earl of, see COCHRANE, ROBERT.

Mar, John, eleventh Earl of (1675-1752), famed as the leader of the 1715 rebellion. He continually changed sides politically, being in turn Whig and Tory as it was advantageous to him, this practice earning him the name of 'Bobbing John.' As a Whig he assisted in the union of Scotland and England. After the union and on the overthrow of the Whig Gov. he again became a Tory, and was made secretary of state for Scotland. Later, on the accession of George I., he again endeavoured to keep his position by changing sides, but failing on this occasion to obtain favour, he lost his office. This so angered and disgraced him that he returned to Scotland and started the rebellion at Braemar, and soon had a large and enthusiastic following. His fickle character, however, again showed itself in his hesitancy, and his long delay in the Highlands enabled the duke of Argyll to check him when he finally advanced at the battle of Stirling. He then gradually retreated and escaped with the Pretender to France. He was a favourite of the Pretender, and when arrested in Geneva he purchased freedom and the possession of his estates by betraying James.

Mar, name of an old Scottish dist. and forest in the S. of the co. of Aberdeen. It lies between the Rr. Don and Dee, and is divided into Cromar, Braemar, and Midmar. W. of Braemar vil. at the head of the Dee valley stretches the forest of M., originally a royal hunting ground in the twelfth century. The demands of war have

denuded much of the area of its trees, but Glen Tilt and Glen Dee still afford scenery of great beauty and grandeur.

Marabou, large W. African stork. Its feathers are used chiefly for trimming feminine headgear.

Marabouts, class of religious saints or sorcerers among the Borbers of N. Africa, held in high esteem. They held Spain and Morocco for a considerable period. The Almohads put an end to their temporal dominion, but they continued to exercise spiritual superiority over the Muslim Negroes of Barbary.

Marabrun, Gascon poet and troubadour of the twelfth century. According to tradition he was a founding discoverer and brought up by Audric del Villar, and was assassinated by an enemy. His famous poems are in praise of the crusades: *Auats de Chan* (1135) and *Pax in nomine Domini* (1137).

Maracaibo, fortified city of Venezuela, S. America, situated on a sandy plain on the W. shore of the strait which connects the lake of M. with the gulf of the same name. It is the chief tn. of a prov. of the same name in the state of Zulia. It is a handsome tn. with a hot but healthy climate. There is trade in sugar, coffee, cocoa, and rubber, and the oil industry centres here. The harbour is spoilt by a bar, which renders transhipment to smaller draught ships at Curaçao necessary. A new pier and gov. buildings have been erected. M. has an air station and a regular service to Maracay. M. is notable historically as the scene of one of the most daring of the exploits of the famous buccaneer, Sir Henry Morgan (q.v.). In 1918 M. was a small primitive tn. of 15,000 inhab., mostly Indian and Negro; its aspect having altered but little since the sixteenth century; it was without pavements or sewers, or any of the conveniences of a modern city. Yet, through the foreign exploitation of oil in the M. region in the short space of ten years M. became the second city of Venezuela, a little metropolis with paved streets, modern public services, tall office buildings, golf clubs, and substantial dwellings. Pop. 112,500 (white foreigners 30,000).

Maracaibo, Lake and Gulf. The lake of M., in the N. of Venezuela, is about 100 m. in length and 70 m. in breadth. A bar at its mouth prohibits the entrance of large vessels. It is connected with the gulf of the same name by a strait 20 m. in length and from 5 to 10 m. in breadth. The gulf is a wide inlet of the Caribbean Sea, 150 m. from E. to W., and about 75 m. from N. to S. The longest single producing oil-field in all Lat. America is on the E. shore of Lake M., near the vil. of Lagunillas.

Maracay, chief tn. of the state of Aragua, Venezuela. Has cotton mills and a wireless station. Pop. 30,000.

Maragha, city of Azerbaijan, Persia, 50 m. S. of Tabriz, enclosed by walls. The tomb of Genghis Khan is here, and an observatory was founded on an adjacent mt. by his grandson, Hulagu Khan. M. is noted for its fine marble. Pop. 45,400.

Maragopipe, tn. of Brazil in Bahia state, at the head of All Saints Bay, 25 m. S.W.

of Cachoeira. A variety of coffee is named after it. Pop. about 15,000.

Maraka, see NEW DONGOLA.

Maramuresh, div. of Rumania, lying between the Hungarian border and Moldavia. Pop. (with Crisana) 1,460,000.

Maranhão, maritime state of N.E. Brazil, largely covered by forests, but the riv. valleys and coastal dists. are very fertile, producing maize, cotton, sugar, rice, coffee, tobacco, etc. Cattle breeding and agriculture have declined in importance. Gold is mined, and rubber and hides exported. The cap., São Luiz de Maranhão, is a prosperous, well-built city on an is. of the same name. Area 177,569 sq. m. Pop. 1,381,300.

Marano di Napoli, com. in the prov. of Naples, Italy, 5 m. N.W. of Naples. Pop. 11,000.

Marañon, see AMAZON.

Marans, chief tn. and seaport of Charente-Maritime, France, 18 m. from La Rochelle, on the Sèvre Niortaise. It is in the midst of marshy land intersected by canals. Pop. 4600.

Maranta, genus of perennials (order Scitamineae), with tuberous or creeping rhizomes, from which arrowroot is obtained, and ornamental leaves, green above and grey, purple, or rose below.

Maraschino, fermented juice of the marasca cherry, *Prunus avium*, the gean (marasca ~ amarasca, bitter), which was originally distilled in Dalmatia as a cordial, and is now produced elsewhere. It is flavoured with the kernels.

Marash, or Maras, tn. of Anatolia, Turkey, the chief tn. of the vilayet of M. E. of the Jihun R., at the foot of Mt. Taurus. There is a large trade in Kurd carpets and embroideries. The name Marash is found in Assyrian inscriptions, and the tn., under the name of Germanicia-Marasion, played an important part in Byzantine hist. Pop. (vilayet) 265,000. (tn.) 30,600.

Marat, Jean Paul (1743-93), Fr. revolutionary leader, son of Jean Paul M., a native of Cagliari. In 1759 M. went to Bordeaux for two years to study medicine. From Bordeaux he went to Paris, from there to Holland, and finally to London, where he practised his profession as a physician, his special study being diseases of the eyes. His other chief interest was the study of electricity. In 1773 he wrote his *Philosophical Essay on Man*, and in 1774 he pub. *The Chains of Slavery*. In 1775 he was made an M.D. of St. Andrews. He was now famous as a skilled physician, and the year 1777 saw him as the brevet physician to the comte d'Artois's guards. In 1789 he pub. his first journal, *L'Ami du Peuple*, and gradually abandoned his scientific life and studies for a political career. In 1789 he was arrested and suffered a month's imprisonment. In Jan. 1790 he fled to London, but returned to Paris and hid in foul cellars, where he contracted a loathsome and painful skin disease. He took a leading part in the struggle between the Jacobins and the Girondists. He called himself the 'martyr of liberty,' and after being tried and acquitted by the Girondist gov., he became more popular than ever with the Paris

mob. After the republic was declared he began to edit *Le Journal de la République française*. He was one of those who were implacable towards the king, and demanded his death for the good of the people. The skin disease from which he suffered was so painful that only by lying in warm baths could he obtain relief. While sitting in his bath writing his journal, a young woman, Charlotte Corday (q.v.), demanded admittance. The girl was a Girondist and an enthusiast and, believing him to be a monster of bloodthirstiness, she stabbed him through the heart, convinced she had rid France of a terrible enemy. His works were ed. by A. Vermorel in 1869; and *Correspondance* by C. Villay in 1908. See E. DeFrance, *Charlotte Corday et la mort de Marat*, 2nd ed.

MARAT ASSASSINATED

After the painting by J. L. David.

1909; also lives by A. Bourgeart, 1865; A. Vermorel, 1880; F. Chèvremont, 1880; E. B. Hax, 1900; and P. Compton, 1935.

Maratea, tn. of the Neapolitan prov. of Basilicata, situated on the slope of a mt., in the midst of a lovely and salubrious country. Pop. 9500.

Marathas, see MAHRATTAS.

Marathi Language, see under INDO-EUROPEAN LANGUAGES.

Marathon, tn. of anc. Greece, in Attica, on a plain between the mts. and the sea coast, about 20 m. N.E. of Athens. It is famous in mythology for the overthrow of the monstrous bull by Theseus, and in hist. for the victory of the Athenian, Miltiades, over the Persians. The date generally given is 490 B.C.; but the *Cambridge Ancient History* (iv, 245) has 'probably the 21st September, 491 B.C.'

Marathon Race, name given to the crowning event in the revival of the Olympic games held in normal times every four years at the cap. of the country chosen to

hold them. The name is also used for similar races held elsewhere, at the stadium, etc. The race—classic exemplar was the journey of Pheidippides to Athens bearing the tidings of the victory of Marathon. The race is usually over a course of 26 m. The race of 25 or 26 m. had no place in the Olympic games of ancient Greece. When the games were revived at Athens in 1896, a race from Marathon to Athens was included. The games were next held in Paris in 1900 and a race of similar length was run round the walls of the city. The games of 1904, in St. Louis, also included a 25-m. race. Then came the extra games of 1906, in Athens, and, naturally enough, another race from Marathon. London, in 1908, followed suit by organising a race from Windsor to the White City stadium, where the games were being held, and the event had by that time become fully established and the distance stabilised so that times and performances could be compared. The exact distance covered in the 1908 race was found to be 26 m. 385 yds. and that has been the official distance of a M. R. ever since. The 1908 race in London was memorable for the disqualification of the It. Dorando Pietri (whose Christian name and surname were erroneously reversed on the programme), who was first into the stadium, but was in a state of collapse and helped over the line by officials. He received a gold cup from Queen Alexandra for his great effort.

Maratta, or Maratti, Carlo (1625-1713), It. painter and engraver, b. at Camerano. A pupil of Raphael. His Madonnas were particularly numerous and admired. He was entrusted by Clement XI. with the charge and restoration of the frescoes of Raphael in the Vatican, and was commissioned by Louis XIV. to paint his celebrated picture of 'Daphne.'

Maravedi, old Sp. coin in use until the end of the eighteenth century. Originally the name was used for Moerish coins, both silver and gold, but after 1494 it was only used for a small copper coin, in value about 7 centimes (1d.), and a silver coin (1½d.).

Marazion, or Market Jew, fishing vil. in the St. Ives, parli. div. of Cornwall, England; on Mount's Bay, 3 m. N. of Penzance. At low tide it is united to St. Michael's Mt. by a causeway of boulders. It was burnt by the Fr. in 1513 and again in 1549 during the Arundell rebellion in the reign of Henry VIII. Pop. about 1500.

Marbeck, or Merbeck, John (d. 1585), Eng. organist and musical composer. He took a leading part in a society formed at Windsor to promote the spread of Reform doctrines, and narrowly escaped the stake. He composed the first book of chants for use in the Anglican Church, *Book of Common Prayer Noted* (1550). He also compiled the first concordance of the Eng. Bible (1550).

Marbella, tn. in the prov. of Malaga, Spain, on the Mediterranean, 30 m. S.W. of Malaga. It has iron mines and foundries in the neighbourhood, and exports salt fish, figs and wine. Pop. 10,000.

Marble, crystalline form of limestone.

The term is usually applied to those forms of limestone or dolomite which are sufficiently compact to take a high polish. A characteristic M. consists of granules of uniform size closely packed together. When broken the fracture presents a multitude of glistening facets, owing to the granules breaking along their rhombohedral cleavage planes. The colour is usually white, but markings of many hues and patterns are produced by the presence of metallic salts, either as constituents of the original limestone, or as later intrusions. All Ms. are probably metamorphosed limestones. The metamorphosis has been brought about by great heat and pressure, the former produced by the near neighbourhood of igneous intrusions, and the latter the result of overlying masses. Much crushing, folding, and twisting have often taken place, so that streaks or bands of impurities in the original limestone frequently take on peculiar shapes. The economic importance of Ms. is derived from the adaptability of the finer forms to uses in statuary, and of the other forms to more or less ornamental architecture. Many fine Ms. were known to the ancients, of which Pentelic and Parian Ms. are the most famous. The former was obtained from Mt. Pentelcus in Attica, and served as the material for the Elgin Ms., now lodged in the Brit. Museum. Parian M. was quarried in the Isle of Paros; the Venus de Medici was carved in stone from this source. The M. used by medieval and modern sculptors is that found in the neighbourhood of Carrara in Italy. Architectural Ms. are quarried from the Devonian system in Devon. In the U.S.A., M. is quarried in Tennessee, New York, Massachusetts, and California; onyx in Arizona, Colorado, and California.

Marble Arch, London landmark erected by George IV. and made by George Nash, as a gateway to Buckingham Palace, and, in 1850, removed to its present position by the N.E. corner of Hyde Park, London.

Marblehead, seaport and township of Essex co., Massachusetts, U.S.A., 16 m. N.E. of Boston, on Massachusetts Bay, settled by Eng. immigrants in 1629. It has a good harbour and some shipbuilding industry, and is a seaside resort and yachting centre. Pop. 10,800.

Marburg: 1. Or Maribor, tn. in Slovenia, Yugoslavia, 41 m. S. of Graz by rail. It has a large trade in leather, boots and shoes, iron and tin goods, liqueurs and sparkling wines, and is a summer resort. Pop. 33,100. **2.** Tn. in Hesse, Germany, on the R. Lahn, 60 m. N. of Frankfurt by rail. The chief buildings are the Elisabethenkirche, built in 1235-83, to contain the tomb of St. Elizabeth of Hungary, and the univ., founded in 1527. In the Second World War M. was taken by the 7th Corps of the Amer. Third Army on March 29, 1945. Pop. 33,000.

Marcantonio, or Marcantonio Raimondi, It. engraver of the fifteenth and sixteenth centuries, b. at Bologna. Until 1510 he worked as a goldsmith and engraver at Bologna, under Francia. From 1510 until the taking of Rome by the Spaniards

(1527) he lived there, engraving many of the best pictures of Raphael and his pupils.

Marcaria, com. in the prov. of Mantua, Italy, 13 m. S.W. of Mantua. Pop. 9000.

Marcasite, mineral consisting of iron disulphide (FeS_2). It is chemically identical with iron pyrites, and was formerly looked upon as a variety of pyrites. M. is yellowish-brown and has a brilliant lustre. It is mined at Littnitz near Carlsbad, and is used for the preparation of sulphur and ferrous sulphite.

Marceau, François Séverin Desgravières (1769-96), Fr. general, b. at Chartres. He took part in the attack on the Bastille (1791), in the defence of Verdun (1792), and in the wars of the Vendée, and commanded at Fleurus (1794). He was in command of the 1st Div. of the Army of the Rhine, and fought at Lahn and at Altenkirchen where he was mortally wounded.

Marcel, Gabriel (b. 1887), Fr. dramatist and idealist philosopher. His philosophy, which has been described as the Christian expression of existentialism (*q.v.*), owes much to Bergson, Nietzsche, and Dostoevsky. He is concerned mainly with the problems of the theory of the method and grounds of knowledge and the importance of faith and intuition. His plays have given him a high place in Fr. drama but are not markedly popular. Consistently with his philosophy they explore the value of faith in the lives of their characters and the necessity for love of God and of one's neighbour to achieve a satisfactory relationship with God or man. M. denies having a philosophy that belongs exclusively to him, or one which can be mathematically formulated; he avers that he is still seeking such a philosophy. The *Journal métaphysique* in which, since 1914, he has recorded his day-to-day reflections on the cardinal problems of metaphysics, was begun with the object of preparing the book in which he was to have expounded his system: but, after 'twenty years of meditations' he has reached the 'melancholy conviction' that he will never write it (*Homo viator*). But unlike Kierkegaard, with whose Christian existentialism that of M. has some affinities, M. at least aspires to a systematic unity of thought. Much more than the Dan. essayist M. provides a type of Christian existentialist more philosopher than man of letters. M.'s method is comparable to that of Husserl, but aims at attaining to being itself; he is truly existentialist in that he practises a concrete philosophy; and he differs on this point from other existentialists by the capital importance he gives to the consideration of the body. Partaking both of a subjective and an objective nature, the body constitutes the intermediary which Descartes failed to find, in order to link the thinking mind with the external world. M. differs from Sartre and other atheist existentialists in that despair and anguish at the absurdity of life are no part of his attitude. For him as for other Catholic existentialists despair is no more than a transient temptation; hope is the texture of his life, and is its essential

condition. 'I am not far from believing that hope is to the soul what breathing is to the living being; where hope is lacking the soul wilts and exhausts itself' (*Homo viator*). In technique his plays are admittedly influenced by the sensualist Georges de Porto-Riche—who regarded love as a fever rather than an inspiration, as exemplified in *L'Amoureuse*—François de Curel, and, to a less extent, by Ibsen. Among them are *La Grâce* (1911); *Un Homme de Dieu* (1925); *La Chapelle ardente* (1925); and *Le Dard* (1938). His philosophical works include *Être et avoir* (1935) and *Du refus à l'invocation* (1940).

Marcello, Benedetto (1686-1739), It. musical composer and author, b. at Venice. While holding various official positions he devoted himself to music and poetry. His masterpiece is the *Estro poetico-armonico* (1724), a musical setting of the first fifty psalms as paraphrased into It. by G. Giustiniani. He also wrote cantatas and an opera. His pamphlet, *Il Teatro alla moda* (1722), was a brilliant satire on contemporary opera. See monographs by L. Busi, 1884, and A. d'Angeli, 1940; also E. Fondi, *La vita e l'opera letteraria del musicista Benedetto Marcello*, 1909.

Marcellus, the name of two popes:

Marcellus I., succeeded Marcellinus probably in May 308. He imposed such severe penances upon all Christians who had recanted under the recent persecutions that he was banished by popular demand in 309.

Marcellus II., succeeded Julius III. in 1555, but d. the same year. As Cardinal Corvini he presided over the Council of Trent. Palestrina dedicated a famous Mass to him.

MARCELLUS (1): FROM AN OLD COIN

The inscribed name is that of P. Cornelius Lentulus Marcellinus, who struck the coin.

Marcellus, Marcus Claudius: 1. Rom. general (c. 264-208 B.C.) during the second Punic war. In 222 B.C. during his consulship, he distinguished himself in battle by killing with his own hands Viridomarus, the king of the Insubrian

Gauls, whose spoils he afterwards dedicated as *spolia opima* in the temple of Jupiter Feretrius. This was the third and last time in Rom. hist. that this offering was made. In 214 he began a famous siege of Syracuse, which he finally took in 212. On the capture of the city Archimedes, who directed the engines which defended the tn., was put to death by the Rom. soldiers. In 208 M. was killed in a skirmish with Hannibal near Venusia. 2. Another Rom. of the same name (c. 43-23 B.C.), was the son of C. M. and Octavia, sister of Augustus. In 25 B.C. he was adopted by the emperor and married the latter's daughter, Julia. In 23 B.C. M. d. suddenly at Baia, supposedly poisoned by Livia, to the grief of Augustus. He is the subject of a famous passage in Virgil, *Æneid*, vi. 861-87.

March, Agnes. Countess of, see BLACK AGNES.

March, Ausias (1397-1459), Catalan poet, b. in Valencia. His poems, which show the influence of Petrarch, were written in the dialect of Catalonia, and testify to the vivid imagination of the writer. His chief works are *Cants d'Amor* and *Cants de mort*, and others may be found in various eds., among them that of F. P. Jiriz (Barcelona), 1864. See monograph by A. Pagès, 1912, and his *Commentaire sur les poésies d'Ausias March*, 1929.

March, Earl of, see MORTIMER, ROGER. March, tn. in the isle of Ely, Cambridgeshire, with a market on Friday. It is situated on the Nen, 81 m. N. of London. It manufs. a considerable variety of farm tools and has engineering works. There are extensive marshalling yards, and the tn. is an important railway junction. Pop. 14,000.

March, first month of the Rom. year, and the third according to our present calendar, consists of thirty-one days. It was considered as the first month of the year in England until the change of style in 1752, and the legal year was reckoned from M. 25th, as the fiscal year still is. The A.-S. called it *Hlud monath*, stormy month, and *Hred monath*, rugged month. There is a proverb which represents M. as borrowing three days from April.

March, boundary, used more particularly of the Welsh Ms., and Scottish Ms., the border countries between England and Wales and Scotland respectively. The earl of March took his title from the Welsh Ms., and in the Middle Ages the governors of the border dists. were known as wardens of the Ms. The name is allied to the Ger. *Mark* (q.v.). See also BOUNDS, BEATING THE.

March, in music is, as its name indicates, a musical composition intended to regulate the step of marching troops. Written in common time and not too slow, it should have the rhythm sufficiently clear and well marked to make the march of the soldier natural.

Marchand, Jean Baptiste (1863-1934), Fr. soldier; b. at Thoissey, Ain. Enlisting as private in 4th Marines, 1883, he was commissioned in 1886, and saw active service in Senegal, 1888-91, being twice

wounded. In the course of numerous explorations in the African interior, he estab. (when major) the post of Fashoda on the White Nile, 1898. His refusal to withdraw on a demand made by the Brit. led to an international crisis. He was called home to report, and Fashoda was evacuated in his absence. A colonel in 1902. He commanded colonial troops in the First World War, becoming a general of div. in 1917. See also FASHODA.

Marchant, Sir Stanley Robert (1883-1949), Brit. organist and composer, b. in London. He was trained at the Royal Academy of Music, and was appointed sub-organist at St. Paul's Cathedral, 1916; organist, 1927; organist emeritus, 1936. Regarded as one of the most brilliant masters of the organ of his period. From 1930 to 1932 he was president of the Royal College of Organists. As organist at St. Paul's he directed the music at King George V's silver jubilee thanksgiving service in 1935. In 1936 he succeeded Sir John McEwen as principal of the Royal Academy of Music. He was King Edward professor of music at London Univ. from 1937. His compositions included some songs and many pieces of church music, one of which, a Te Deum, was sung at the jubilee service.

Marchena, tn. in the prov. of Seville, Spain, 30 m. E. of Seville. It is an old Moorish tn., some of the fortifications still remaining. It also has sulphur springs. Pop. 14,000.

Marches, Riding the, see BOUNDS BEATING THE.

Marches, The (It. *Le Marche*), region of Italy, comprising the provs. of Pesaro e Urbino, Macerata, Ascoli-Piceno, and Ancona. The region produces limestone, sulphur, wine, silk, and cereals. Before 1860 these states were included in the papal terrs. Area 3750 sq. m. Pop. 1,352,000.

Marchfeld, plain in Austria, stretching in a northerly direction from Vienna, and in a westerly one from the March. It was the scene of the defeat of Ottakar of Bavaria by Rudolph of Hapsburg in 1278, and also of Napoleon's battles of Aspern and Wagram.

Marchienne-au-Pont, tn. of Hainaut, Belgium, 2 m. W. of Charleroi, on the R. Sambre. It has coal mines, blast furnaces, copper foundries, wire-drawing mills. It is one of the most important iron and steel producing tns. of Belgium. Pop. 21,300.

Marchin, tn. of Belgium, prov. of Liège, 16 m. E. of Namur. Pop. (comm.) 6000.

Marcianise, tn. in the prov. of Caserta, Italy, 13 m. N.E. of Naples, with which it is connected by rail. Pop. 15,000.

Marcianus, or Marcellian (A.D. 450-57), emperor of the E., b. about 391. He entered the army at an early age, and served under Aspar, whom he accompanied in his campaign against Genseric, king of the Vandals, in Africa in 431, and under Ardaburius. He seems to have acquired great distinction, for on the death of the Emperor Theodosius the Younger (450), his widow, Pulcheria, offered him her hand in marriage, and he was crowned the same

year. During his reign he repelled attacks upon Syria and Egypt (452), and quelled disturbances on the Armenian frontier (456); he also refused payment of tribute to Attila, reformed the finances, and repopled the devastated districts.

Marcianus, Aelius, Rom. jurist, who wrote after the death of Septimius Severus. His chief works are sixteen books of *Institutiones*; two books on *Publica Indicta*; two books on *Appellationes*; and five books entitled *Regularia*.

Marcinelle, tn. in the prov. of Hainaut, Belgium, just S. of Charleroi. It has coal mines, blast furnaces, and quarries of marble and moulding clay. It manufs. steel goods and fireproof stone. Pop. 23,000.

Marion, founder of the Marcionites, an ascetic Gnostic sect, was the son of a bishop of Sinope on Pontus. The gospel of Christ, according to him, consisted in free love of the Good; the Mosaic system, with its motives of rewards and punishments, was mere legality (*see* Gnostics). M. entirely rejected the O.T.; and of the N.T., all but a few epistles and part of the gospel of St. Luke. He is mentioned by Irenæus in *Adversus Hæreses* (c. 180), but our chief source of knowledge of his opinions, etc., comes from Tertullian's *Adversus Marcionem* (207). *See* E. Walder, *Marcion and the Roman Church*, 1929.

Marcmanni, powerful league of borderers belonging to a Suevic tribe, who dwelt between the Danube and the Rhine after Cæsar's death. Under their king, Marobodus, they made themselves masters of the country of the Boii, the present Bohemia. They subsequently made incursions into Rom. ter. during the reign of Marcus Aurelius, until A.D. 180, when peace was purchased by Commodus.

Marconi, Guglielmo, Marchese (1874-1937), lt. inventor of the wireless-telegraphy system, b. at Bologna, son of Giuseppe M. and of his wife Annie Jameson, an Irish woman. He was educated first at Leghorn, under Prof. Rosa, and then at Bologna Univ. After a series of experiments in wireless telegraphy at Bologna, in regard to which he received no encouragement from the It. Gov., he migrated to England, where he was well received by Sir Wm. Preece, engineer-in-chief of the post-office telegraph system, and himself an experimenter in wireless. In 1899 he estab. wireless communications between France and England. In 1901 signals were received across the Atlantic from Poldhu (Cornwall) to St. John's (Newfoundland), a distance of 2100 m. Following on this, wireless telegraphy communications were estab. and formally inaugurated between Canada (Cape Breton) and England, when the governor-general of Canada and M. transmitted messages to King Edward VII. Communications were next estab. between Cape Cod, Massachusetts, and Cornwall. His system came to be used by Lloyd's and the prin. shipping companies in England and abroad, as well as by the Brit. and It. admiralities: the prin. warships of these navies were fully equipped as well as ships of the mercantile marine. M. instituted

a public wireless service between Bari (Italy) and Antivari (Montenegro). He made certain improvements in his system about 1910—a new valve receiver and a new electrolytic detector—and developed a duplex system. The rapid spread of wireless telegraphy had made Marconi Wireless Telegraph Company, Limited (estab. 1900), a very important concern with subsidiary companies in other lands. This company was originally founded in England as the Wireless Telegraph and Signal Company.

In 1902 he was created by the king of Italy commander of the order of St. Maurice and St. Lazarus, and received the grand cross of the order of the Crown of Italy. He received the freedom of the city of Rome in 1903, and was decorated with the order of St. Anne by the tsar of Russia. In 1909 he was awarded half the Nobel prize for physics, Stockholm. On Italy's entry into the First World War in June 1915 M. took charge of the lt. wireless-telegraphy system. He was lt. plenipotentiary at the Peace Conference, and signed the peace treaties with Austria and Bulgaria. In 1929 he was made marchese and an lt. senator. In 1930 he became president of the lt. royal academy, and a member of the council of the Fascist party. At his own wish he was buried at his native tn. of Bologna, and a state funeral was accorded him by the lt. Gov. *See* J. de Boineid, *Marconi, Master of Space*, 1936; and life by B. L. Jacob and D. M. Collier, 1937.

Marco Polo, see POLO, MARCO.

Marocq-en-Barcel, tn. in the dept. of Nord, France, 3 m. N. of Lille. Pop. 22,200.

Marcus Aurelius, see AURELIUS ANTONINUS, MARCUS.

Marcy, William Learned (1786-1857), Amer. politician, b. at Sturbridge, Massachusetts, U.S.A. Educated at Brown Univ., he practised law at Troy, New York state. He came to the front as a Democratic politician and became one of the 'Albany regency' which was reputed to decide the policy of the party in New York state. He was a U.S. senator in 1831-32 and during his term incidentally uttered the phrase afterwards so often heard: 'To the victor belong the spoils of the enemy' (*see* Parton's *Life of Jackson* (1860), vol. iii.). He was governor of New York from 1833 to 1839; secretary of war under Polk, 1845-49, and secretary of state under Pierce, 1853-57. In the last named capacity he successfully conducted the Koszta case (1854), which involved a dispute with Austria on the legal right of expatriation. All his political leanings were towards that branch of the Democratic party in New York which afterwards became the backbone of the new Republican party in 1856, and he might have been its natural leader had he followed his own convictions over the Kansas-Nebraska Bill.

Marcy, Mount, see under ADIRONDACK MOUNTAINS.

Marczaly, c. 1. of Hungary, 98 m. S.W. of Budapest, near the E. shore of Lake Balaton. Pop. 4000.

Mar del Plata, tn. and holiday resort in

the prov. of Buenos Aires, Argentine Republic, on the coast near Cape Corrientes. Pop. 60,000.

Mardi Gras, Fr. name for Shrove Tuesday, the eve of Lent, and concluding day of the carnival, marked by a procession through the streets of a prize ox, a burlesque of an old Rom. sacrificial custom, together with mock priests, a band, and other merry-makers.

Mardin, tn. in the vilayet of M., Anatolia, 54 m. S.E. of Diarbekir. It has a picturesque position on the side of a hill, and is the headquarters of an Amer. mission. Pop. (vilayet) 235,500, (tn.) 21,000.

Mardonius (Gk. *Μαρδωνιος*), Persian general, the son of Gobryas. He was sent by Darius in 492 B.C. to complete the settlement of Ionia, and to punish Eretria and Athens for their share in the war, but lost his fleet off Mt. Athos and suffered defeat at the hands of the Bryges. On the succession of Xerxes in 485, however, he was again in favour, and was one of the chief instigators of the expedition against Greece. After the defeat of Salamis he persuaded Xerxes to return home, and being left in command of 300,000 men, sent a proposal to the Athenians to withdraw from the Gk. confederacy, and on their refusal occupied the city and reduced it to ruins. He next marched against the Gk. force, which was collected at the isthmus of Corinth, and following it to Platea, was defeated and slain in 479 B.C.

Marduk (*Merodach*), mighty lord of Babylon, the Bél of the O.T. and Apocrypha. He rose into prominence under the conqueror Hammurabi (c. 2300 B.C.), who brought the upper and lower states of the Euphrates valley under one dominion, and set up Babylon as his cap. Bél of Babylon was invested with all the divine attributes of En-ili, the old Bel of Nippur. He was lord and light of heaven and earth, in whose hands were the decrees of fate and from early times had been a god of the morning light and of the spring sun. The Babylonian new-year's feast commemorated his victory over the primeval being and rebel Tiamat and the monsters of her creation, and his marriage with Sarpanitum, the Succoth-Benoth of 2 Kings, xvii. 30. M. was worshipped as a god of battle by the Babylonian kings, and some scholars identify him with Nimrod; others, however, identify the latter with Gilgamesh (*q.v.*). He was the son of Ea, the third of the great Babylonian triad of the gods, the others being Anu and En-ili, and he partook of his father's powers: he acted as intermediary between mankind and the latter, and like Ea was a god of the exorcist cult. He himself was the father of Nabo, or Nebo of the O.T., and was identified with the planet Jupiter. The creation legend ends with a hymn of praise to this god, on whom innumerable titles of honour are bestowed. See E. G. King, *Babylonian Religion and Myth*, 1899, and *Seven Tablets of Creation*, 1902.

Mare, see under LOYALTY ISLANDS.

Mare Caspium, or Hyrcanium, see CASPIAN SEA.

Mare Loch, Ross-shire, Scotland, 2½ large and beautiful lake, 2½ m. long by ½

to 2m. broad. It is surrounded by gorgeous mt. scenery, and studded with is. It is drained by the R. Ewe into Loch Ewe.

Mare Internum, see MEDITERRANEAN SEA.

Maremma, marshy region of central Italy, in the S. part of Tuscany, extending along the coast of the Tyrrhenian Sea. It was practically all desert land, and virtually uninhabitable, but since the beginning of the nineteenth century, and especially under the regime of Mussolini, it has been widely drained and settled.

Marengo: 1. Vil. of Piedmont, Italy, situated about 2 m. S.E. of Alessandria. It was the scene of Napoleon's victory over the Austrians in 1800. 2. Tn. of Algeria, 38 m. W.S.W. of Algiers. Pop. (com.) 8000.

Marennas, seaport in the dept. of Charente-Maritime, France, 25 m. S. of La Rochelle. It has oyster fisheries and salt-works. Pop. (com.) 4000.

Marenzio, Luca (c. 1555-99), It. composer. b. at Coccaglio, close to Brescia. He occupied for a time the position of maestro to Cardinal d'Este, after which he went to Poland and was employed by Sigismund III. About the year 1595, however, he returned to Rome and became organist at the pontifical chapel. His most important works are his madrigals, of which there are nine vols.

Mareotis, Lake, see BIRKET-EL-MARUIT. **Mare's-tail**, or *Hippuris*, genus of glabrous aquatic herbs (order Haloragaceae). The only Brit. species, *H. vulgaris*, occurs in ditches and stagnant water. Ms. are sometimes planted beside ornamental waters.

Mareuil, Arnaud de, see ARNAUD DE MAREUIL.

Margam, dist. of the bor. of Port Talbot, Glamorganshire, Wales, 4 m. S.E. of Aberavon. It is a coal-mining centro. Its chief building is the restored M. church, dedicated to the Virgin Mary, formerly a Cistercian abbey, of which the chapter-house and other twelfth-century ruins have survived. Some 3 m. N.W. of M. is M. Abbey, long the seat of the Talbot and Mansel families. In 1921 M. was amalgamated with Aberavon to form the bor. of Port Talbot. Near by are the new M. and Abbey works of the Steel Company of Wales, which are being built on a strip of marshland and dunes, ½ m. wide and 3 sq. m. in area, between the sea and the railway from Cardiff to Swansea. These 260,000,000 works are said to be the biggest single new industrial project under construction in Britain to-day. It is expected that by 1951 its 1300-yd.-long rolling mill will produce 1,000,000 tons a year of steel plate and 'hot strip.'

Margaret, St. (d. 1093), sister of Edgar Atheling. On the accession of William the Conqueror to the Eng. throne Edgar Atheling, his mother, and his sisters M. and Christina, went to Scotland, and M. became the wife of Malcolm III. of Scotland. Malcolm, enraged at the seizure of Carlisle by the Eng., laid siege to Alnwick (1093), and was defeated and slain. M. d. when she heard the news of her husband's death. See Lucy Menzies *St. Margaret, Queen of Scotland*, 1925.

Margaret, the 'Maid of Norway,' see FAIR MAID OF NORWAY.

Margaret (1353-1412), queen of Denmark, Norway, and Sweden, and daughter of Waldemar IV. of Denmark. At the age of ten she was married to King Haakon VI. of Norway, and on his death in 1380 the whole of Norway was placed in her hands. Her son, Olaf, whose election as king of Denmark she had procured, *d.* seven years later, thus enabling her to secure the throne to herself. Shortly afterwards she defeated Albert, the Swedish king, and obtained possession of the throne of Sweden. She combined Denmark, Sweden, and Norway into one kingdom, and was called the Semiramis of the N. See M. IIII, *Margaret of Denmark*, 1898.

Margaret of Anjou (1430-82), daughter of René the Good of Anjou, titular king of Naples, married to Henry VI. of England in 1445. She became regent for her husband because of his imbecility, and represented the Lancastrian cause in the wars of the Roses. Although successful at some of the battles, she was in the end defeated at Tewkesbury and taken prisoner with her son, who was killed, M. herself being imprisoned for four years. See Mary Hookham, *The Life and Times of Margaret of Anjou*, 1872; and J. J. Bagley, *Margaret of Anjou, Queen of England*, 1949.

Margaret of Carinthia, called Margaret Maultasch (1318-69), elder daughter of Count Henry of Tyrol and duke of Carinthia (1310-35), son of Meinhard II., count of Tyrol. She is known in Tyrolean history and legend as M. Maultasch, 'the pocket-mouth.' Louis IV., Ger. king and Rom. emperor (1314-47), secured the mastery of Tyrol by separating her from her husband, son of John, the powerful king of Bohemia, and making her (1342) the wife of his own son, Louis, to whom, in 1322, he had granted the march of Brandenburg. The son of M., duchess of Brandenburg, and Louis, Meinhard III., who succeeded to the county on his father's death in 1361, *d.* two years later. M. was finally forced to abdicate (1363) and thereupon assigned all her possessions to the house of Hapsburg, and from that time Tyrol formed part of the hereditary dominions of the archdukes of Austria. She is the subject of Feuchtwanger's *Die hässliche Herzogin* ('The Ugly Duchess'), 1926.

Margaret of Navarre (1492-1549) (also known as Margaret of Angoulême), sister of Francis I. of France, married to the duke of Alençon in 1509 and to Henry d'Albert, titular king of Navarre, in 1527. She never reigned in Navarre, but kept a court at Nérac. She afforded protection to the Protestant reformers, and was a patroness of art and literature. Besides being an enthusiastic patron of such men of letters as Rabelais, Clément Marot, and others, she was an accomplished writer herself. Her poetry is a curious mixture of gallantry and mysticism. In the *Chansons spirituelles*, which reveal the spirit of the Reformation, she shows genuine feeling. She also com-

posed humorous epistles in the manner of Marot, and *dizains* on the model of Petrarch. She had already pub. *Le Miroir de l'âme pécheresse* (1531) and *Marguerites* (1547), when she planned a series of poetic narrations which were to form a 'Decameron' in imitation of Boccaccio. Her death prevented the completion of more than seven of the intended ten sections of the work. These seven were first printed in 1558, under the title of *Histoires des amans fortunez*; the second ed., which appeared in the following year, was ed. by Claude Grugnet, who gave it the title of *Heptaméron*. See M. W. Freer, *Life of Marguerite d'Angoulême*, 1895.

Margaret of Parma (1522-86), illegitimate daughter of the Emperor Charles V., first married to Alexander, duke of Florence (1533), and then to Ottavio Farnese, duke of Parma (1542). From 1559 to 1567 she was regent of the Netherlands. See monographs by F. Rachfahl, 1895, and Van de Essen, *Alexander Farnese*, 1933.

Margaret of Scotland (c. 1425-45), eldest child of James I. of Scotland and wife of the Dauphin Louis, afterwards Louis XI., whom she married at Tours in 1436. He disliked and neglected her, and she devoted a good deal of her time to poetry. She is said to have been a pupil of Alain Chartier. See J. J. Jusserand, *English Essays from a French Pen*, 1898.

Margaret (Margot) of Valois (1553-1615), daughter of Henry II. of France and Catherine de' Medici, married in 1572 to Henry of Navarre. On the massacre of St. Bartholomew, Henry fled from court and was not rejoined by his wife for six years. Later, she again abandoned him, and was finally divorced in 1599. Her *Mémoires* were pub. in 1628 (Eng. trans. by Violet Fane, 1892).

Margaret Rose, second child of King George VI. *B.* at Glamis Castle, Angus, Scotland, Aug. 21, 1930. Honorary colonel of the Highland Light Infantry; commandant-in-chief, St. John's Ambulance Brigade Cadets. Visited S. Africa and S. Rhodesia with her parents and Princess Elizabeth, landing at Cape Town, Feb. 17, (1947) and returning Portsmouth harbour May 8. Visited Italy and France in 1949.

Margaret Tudor (1489-1541), daughter of Henry VII., and wife of James IV. of Scotland, whom she married at Edinburgh in 1503, the whole of her subsequent life being a series of political intrigues of one kind or another. She had three children by James, two sons, one of whom later became James V. of Scotland, and a daughter, Margaret, mother of Lord Darnley. Her great-grandson, James VI. of Scotland, succeeded Elizabeth as James I. of England. (See illustration, p. 14.)

Margaric Acid, an acid $C_{15}H_{27}COOH$ which was supposed to result from the saponification of certain fats, melting point $60^{\circ}C$. but now known to be a eutectic mixture of stearic and palmitic acids. M. A. is obtained by the hydrolysis of cetyl cyanide by caustic potash. It is said to occur in certain dead tissues.

Margarine, butter substitute, was first made by Mège-Mouries (in 1870), who was awarded the prize offered by Napoleon III. for the manuf. of an efficient butter substitute. In the preparation of M. a large variety of fats and oils are employed. They include animal fats such as oleo-M., lard and *premier-jus*; vegetable oils such as coconut oil, peanut oil, and cottonseed oil; as well as the more recently manufactured hardened oils made by the catalytic hydrogenation of liquid oils such as whale oil and soya-bean oil, using nickel catalysts (see HYDROGENATION). To prepare M. a suitable mixture of liquid and solid fats and oils, having a melting point of about 22–27°C., is run in the melted state into a mixing vessel, which can be

MARGARET TUDOR

kept at a regulated temp. At the same time milk—and more recently artificial milk—which has been previously pasteurised, and soured by means of special lactic acid forming organism cultures, is run in and intimately mixed with the oils, so that complete emulsification takes place. About 30 gallons of milk and 30 gallons of water are needed for each ton of melted fat. The product is chilled by a spray of ice water subsequently, or by means of brine kept at a temp. of –7°C., after which it is rolled and mixed with salt, flavouring materials, and preservatives. Since the dietary importance of vitamins has been recognised, suitable quantities of these substances have been incorporated in M., thus greatly increasing its food value.

Margarita Island, in the Caribbean Sea, belonging to Venezuela, 45 m. long and from 5 to 20 m. broad. The name derived from the pearls formerly found in large quantities. It consists of two mountainous portions. The coasts are barren, but the interior is fertile, producing maize, cotton, coffee, sugar, etc.

Salt is mined. It was discovered by Columbus in 1498. Cap. Asunción. Pop. 69,200.

Margaritone d'Arezzo (c. 1215–92), It. painter, sculptor, and architect, b. at Arezzo. The best known of his paintings is his 'Madonna, with Scenes from the Lives of the Saints,' now in the National Gallery. He also painted a 'Coronation of the Virgin,' in the Liverpool Institute.

Margate, seaport and municipal bor., in the Isle of Thanet, Kent, a few miles from the N. Foreland, and one of the most popular seaside resorts of England, 74 m. E. by S. of London. It has bracing air, excellent sands and bathing facilities, and a fine pier and jetty. Some damage was done in air raids in the Second World War, notably to the winter garden and near the jetty. Pop. 39,800.

Margaux, tn. in the dept. of Gironde, France, on the Gironde estuary, 16 m. N. of Bordeaux. It is a centre for Médoc wines. Pop. 2,000.

Margay (*Felis tigrina*), species of tiger-cat about the same size as the domestic cat, native of the forests of Brazil and Guiana.

Marggraf, Andreas Sigismund (1709–1782), Ger. chemist, b. at Berlin, studied chem. at Berlin and Strasburg, and medicine at Halle. In 1738 he was elected to the Berlin Academy of Sciences, in 1760 being appointed director of the physics class. He is noted for his discovery of sugar in beetroot. His papers were collected into two vols. of *Chymische Schriften* (1761–67).

Margilan, or Marghilan, tn. in the Uzbek S.S.R., 160 m. S.E. of Tashkend. It is in a healthy position, surrounded by gardens, and, according to local tradition, is the place where Alexander of Macedonia d. Its chief industries are silkworm culture and the manuf. of silk, woollen, and camel-wool cloths. Pop. 59,000.

Margin: 1. In *Business Generally*.—(a) In a transaction in which money is advanced on security, the difference between the amount advanced on the security and the market value of such security. As regards trustees mortgaging the property of their beneficiaries, the effect of the Trustee Act, 1893, is that a trustee must not lend more than two-thirds of the surveyor's valuation even if the surveyor advises that a greater proportion may be advanced. If he does he will be liable for any resulting loss; but this statutory precaution relates not to the nature, but apparently only to the value of the security, and hence a trustee who lends on property of a speculative or wasting character (e.g. factory, or other trade property) will probably be liable for loss irrespective of the proportion to value advanced. (b) In banking practice the M. depends on the nature of the thing charged or pledged, but may be said to fluctuate from 10 up to 25 per cent. (c) In 'cover' transactions (see COVER), or speculation upon Ms. through outside stockbrokers, the speculator deposits a certain M. or sum to cover prospective differences in price, which cover is said to

run off if the difference turns out to be greater than he anticipated.

2. In *Economics*.—In the Ricardian theory of rent that land which will just pay for cultivation if it be let at a nominal rent is said to be the M. of cultivation, and in the absence of exceptional circumstances land below that M. cannot be cultivated with profit. In regard to labour generally, there is a 'final' or marginal disability when the increment of utility from the given employment just balances the increment of pain (Jevons). In other words if the physical and mental disadvantages just outweigh the reward, no one will be found to perform the work. As regards consumers the term M. is used by Maria Edgeworth (*Palgrave's Dictionary of Political Economy*) to denote the utility procured by a unit of money, or in simpler phraseology, the outlay, beyond which a consumer will not go. See A. Marshall, *Principles of Economics*, 1890, and J. M. Keynes, *The General Theory of Employment, Interest, and Money*, 1936.

Margrave (Ger. *Markgraf*, count of the mark), formerly a governor entrusted with the care of a 'mark,' or frontier (margrave), who stood immediately under the king or emperor. Margravates existed as early as the time of Charlemagne. In the twelfth century they became hereditary, and later a M. held the same rank as a prince of the empire.

Marguerite, general term for a number of daisy-like flowers in the section *Thlasioideae* of the family *Compositae*. The common ox-eye daisy (*Chrysanthemum leucanthemum*) and the grand ox-eye (*C. uliginosum*) are often so called; but the name specially applies to *C. frutescens*, the Paris daisy, with fine white or yellow flowers. The blue M. is *Felicia amelloides*.

Mari, autonomous republic of the R.S.F.S.R. lying to the N.W. of the Tatar republic. It is part of the N. forest area and there are large paper, wood-working, and cellulose plants. A canal connects the Volga with Kotlas. The inhabs. are remnants of an original Finnish stock. Cap. Joshkar-Ola.

Maria, Christina (1806-78), daughter of Francis I. of Sicily, and wife of Ferdinand VII. of Spain. On his death she became regent for their daughter Isabella II. In 1840 she was forced to abdicate in consequence of Carlist disturbances, and fled to France, where she lived for the greater part of her life.

Maria Laach, Benedictine abbey on the shores of the Laacher See, in the E. of the Rhineland, Germany. The five-towered church, a Romanesque masterpiece, was built from 1093 to 1177 and 1220 to 1230.

Mariana, Juan de (1535-1623), Sp. historian, b. at Talavera. He entered the order of Jesuits, was ordained priest in 1561, and subsequently held professorships of theology at Rome, at Loreto, in Sicily, and in Paris. He became famous after the pub. of his *Historia de Rebus Hispaniae* (trans. into Eng. as *General History of Spain*). Of this the first part, written in Lat., appeared in 1592; its success was such that he trans. it into Sp. and republished it with a second part in

1601; a third part followed in 1605. As a writer he seems to have incurred odium with different parties. His treatise, *De Rege et Regis Institutione* (1599), was held to favour the doctrine of tyrannicide; *De ponderibus et mensuris* (1599), aimed at the malversations of the duke of Lerma, caused him to be imprisoned. Other works: *Tractatus VII.* (1609) and *Scholia in Velus et Novum Testamentum* (1620). See J. Laures, *The Political Economy of Juan de Mariana*, 1928.

Marianas, see LADRONES.

Marianna, episcopal tn. of Minas Geraes, Brazil, 170 m. N.W. of Rio de Janeiro. Pop. 6000.

Marianne Islands, see LADRONES.

Mariano Comense, com. in the prov. of Como, Italy, 8 m. S.E. of Como, has an important silk industry. Pop. 7000.

Marianus Scotus: (1028-82) Irish chronicler. He became a Benedictine monk, and entered the monastery of St. Martin at Cologne in 1058, passing his later life at the abbey of Fulda and of Mainz. He left a *Chronicon Universale*, first printed at Basle in 1559.

Maria Theresa (1717-80), empress of Germany, the daughter of the Emperor Karl VI., was b. at Vienna. By the Pragmatic Sanction (q.v.) her father appointed her heir to his hereditary thrones. In 1736 she married Francis Stephen, Grand Duke of Tuscany, to whom she gave an equal share in the gov. when she became queen of Hungary and Bohemia, and archduchess of Austria, on the death of her father, Oct. 21, 1740. Prussia, Bavaria, Saxony, Naples, and Sardinia, stirred up by France, put forward claims to portions of her dominions, chiefly founded on the extinction of the male line of the house of Hapsburg. The War of the Austrian Succession, after lasting more than seven years, terminated in her favour by the peace of Aix-la-Chapelle in 1748. She lost only Sillesia and Glatz, and the duchies of Parma, Placenza, and Guastalla, whilst, on the other hand, her husband was elected emperor. During the time of peace she made great internal reforms. She found in Kaunitz (q.v.) a minister possessed of the wisdom and energy requisite for the conduct of affairs. In the Seven Years war (q.v.) she joined with Russia and Prussia in the partition of a third part of Poland (1772). Galicia and Bukovina were added to her dominions between 1772 and 1777. The Bavarian War of Succession ended in her acquisition of the Innthal, but led to the formation of the Fürstenbund (q.v.). See Hres by J. F. Bright, 1910; M. Moffatt, 1911; H. Kretschmayr, 1925; M. Goldsmith, 1936; and C. L. Morris, 1938.

Maria-Theresiopol, see SZABADKA.

Marianské Lázně, see MARIENBAD.

Mariazell, tn. of Styria, Austria, 60 m. S.W. of Vienna. Its shrine of the Blessed Virgin is the object of a popular pilgrimage. Pop. 2000.

Maribo, Dan. co., which includes the is. of Lolland and Falster. Pop. 132,700. The cap. of the same name, is on Falster. Pop. 4400.

Maribojo, or Maribojoo, tn. on the is. of

Bohol, Philippine Is., exports tobacco and sugar. Pop. 10,000.

Maribor, see **MARRBURG**.

Maricao, tn. in the prov. of Rio de Janeiro, Brazil, on the shore of a coastal lagoon, 21 m. E. of Rio de Janeiro. Pop. 8000.

Marie, Alexandra Victoria, Dowager Queen of Rumania (1875-1938), granddaughter of Queen Victoria by her father, the duke of Edinburgh, who married the Grand Duchess Marie, only daughter of Tsar Alexander the Second. *B.* at Eastwell Park, Kent, she lived part of her life

E.N.A.

MARIE ANTOINETTE

in Malta when her husband commanded the Mediterranean fleet, and then in Coburg, Germany. She married in 1892 Ferdinand von Hohenzollern, who was to become king of Rumania. As a writer she began her career by penning various tales and legends connected with Rumania. For a brief time, after the death of her husband, and during the exile of King Carol, she (with the three regents of the country) ruled affairs. The most ambitious of her books was *The Story of my Life* (3 vols., 1934-35); the first two vols. describe her early years and her unhappy experiences as a young bride under the tutelage of King Carol I.; the third vol. contains a vivid picture of life in the unconquered part of Rumania behind the Ger. lines in 1917-18. In *My Country* (1916), and again in *The Country that I Love* (1925) she described Rumania as seen through the eyes of an artist and a poet. Her first child, Charles (Carol), was b. in 1893. There were five other children:

Elizabeth, who married, in 1921, the king of the Hellenes; Marie, who married King Alexander of Yugoslavia; Nicholas; Ileana, who married the Archduke Anton of Hapsburg; and Mirosca (d. in infancy).

Marie Antoinette, Josephine Jeanne (1755-1793), wife of Louis XVI. of France. She was the fourth daughter of Maria Theresa and of the Emperor Francis I., and was b. at Vienna. She married the dauphin of France, afterwards King Louis XVI., in 1770, but her unconventional behaviour and her extravagance made her very unpopular. On the accession of her husband to the throne (1774), her Austrian sympathies, and her opposition to the demands of the popular party, increased her unpopularity. At the outbreak of the revolution she showed indomitable courage. She was hampered by her weak and vacillating husband, as well as by her own self-will and inability to understand the point of view of her enemies. She was guillotined on Oct. 16. See *Mme Campan, Mémoires*, 1823; de Lescaur, *La Vraie Marie Antoinette*, 1863; and G. Lenôtre, *La Captivité et la mort de Marie Antoinette*, 1897; also lives by E. and J. de Goncourt, 1838; M. de la Rochetier (Eng. trans.), 1893; H. Belloc, 1909; K. Anthony, 1933; S. Zweig (Eng. trans.), 1933; and A. Leroy, 1946.

Marie de France, Fr. poetess of the late twelfth century who lived mostly in England. She trans. into Fr., from an Eng. version, 103 animal fables under the title *l'isopet* in octosyllable couplets. She dedicated them to 'Count William,' identified with Wm. Longsword of Salisbury. Her other poems are twelve Breton *lais*, also in octosyllable verse, and a long poem on the purgatory of St. Patrick. The *Lais* are delightfully fresh and graceful, the chief being *Le Chêrefeuille*, *Eliduc*, and *Milon*. The best ed. of the *Lais* is that of Karl Waruko (1885), and of the *lais* and fables together, Roqufort (2 vols., 1820). There is an Eng. trans. by Edith Rickert (1901), and paraphrases by A. O'Shaughnessy (1872). See monograph by E. Levi, 1924; also E. Hoepffner, *Les Lais de Marie de France*, 1935.

Marie de' Medici (1573-1642), daughter of Francis of Tuscany, and queen-consort of France, b. at Florence. In 1600 she was married to Henry IV. of France, and her eldest son, later Louis XIII., was b. in the following year. After Henry's assassination in 1610 she became regent, and was entirely under the influence of her it. favourites, Leonora Galigai and her husband, Concini, who was created marquis d'Ancre. In 1614 she was compelled to buy the submission of the discontented nobles, but in 1616 Louis XIII. asserted himself, ordered the assassination of the Concinis, and virtually imprisoned the queen at Blois. In 1619 she escaped and headed a new revolt, but was reconciled to her son through the mediation of Richelieu, who then gained royal favour. Her attempts to displace Richelieu led to her exile to Compiègne in 1630, whence she escaped to Brussels in 1631, and later to Cologne. See Julia S. H. Pardee, *Life*

and *Memoirs of Marie de' Medici*, 1852; A. P. Lord, *The Regency of Marie de Medici*, 1904; L. Batiffol, *La Vie intime d'une reine de France* (Eng. trans.), 1908; and C. J. Burckhardt, *Richelieu*, 1936.

Marie Louise (1791-1847), daughter of Francis I. of Austria, and second wife of Napoleon Bonaparte, whom she married in 1810 on the divorce of Josephine. She had one son, called the king of Rome, with whom she lived at Schönbrunn whilst Napoleon was in exile. In 1814 she was appointed ruler of the duchies of Parma, Piacenza and Guastalla by the Allies. A vol. of her *Correspondence* was pub. in 1837. See life by J. A. von Helfert, 1873; and the *Memoirs* of her maid of honour, Mme Durand, 1885. See also F. Masson (ed.), *Diaries*, 1922; E. M. Oddie, *Marie-Louise, Empress of France, Duchess of Parma*, 1931.

Marie Galante, Fr. is. of W. Indies, S.E. of Guadeloupe, Pop. 29,350.

Mariénbad (Czech, *Marianské Lázně*), watering-place of Bohemia, Czechoslovakia, 40 m. N.W. of Pilsen. It has a beautiful position among forest-clad hills, and possesses cold saline and chalybeate springs. As a watering-place it dates from 1808 and was a favourite resort of Goethe. Pop. 7200.

Marienburg, see **MATBORK**.

Mariendorf, tn. in Brandenburg, Germany, 4 m. S. of Berlin. Pop. 22,000.

Marienwerder, see **KWIDZYN**.

Marietta: 1. Co. seat of Washington co., Ohio, U.S.A., on the Ohio R., 50 m. S.E. of Zanesville. It manufactures, and automobile and carriage accessories. Pop. 11,500. 2. Co. seat of Cobb co., Georgia, U.S.A., 18 m. N.W. of Atlanta. There is stock-raising, and marble is mined in the dist. Pop. 8600.

Mariette, François Auguste Ferdinand (1821-81), Fr. Egyptologist. b. at Boulogne. In 1850 he went to Egypt in search of Coptic MSS., and discovered the Serapeum and the catacombs of the Apis bulls. In 1858 he became keeper of the Egyptian monuments, and devoted himself to archaeological exploration of the Nile valley. He pub. *Le Serapeum de Memphis* (1857); *Aperçu de l'histoire d'Égypte* (1864); *Abydos* (1870-80); *Denderah* (1873-75); *Karnak* (1875); *Deir-el-Bahari* (1877); and *Itinéraire de la Haute Égypte* (1877).

Marigliano, tn. of Caserta prov., Italy, 12 m. from Naples. Pop. (com.) 13,000.

Marignano, see **MELEGNANO**.

Marigold, name for sev. flowering plants. The Fr., African, and Mexican Ms. (*Tegetes*) are valuable half-hardy garden plants. Seeds are usually sown under glass in March, and planted out at the end of May. The colours vary from pale lemon to brown, and bloom all the summer if faded flowers are removed. See **CALENDULA** and **MARSH MARIGOLD**.

Marigo, Le, see **CAPESTERRE**.

Marinsk, or **Marinsk**, dist. and tn. in the Novosibirsk Region of the R.S.F.S.R., on the Trans-Siberian Railway. It is a gold-mining centre, and there are brick-works, soap factories, and tanneries. Pop. (tn.) 12,000. *

Marikanve, Lake, largest artificial expanse of water in India, in N. Mysore. It is 35 sq. m. in area, the water being used for irrigation and power plant, and was finished in 1908.

Marin, tn. of Pontevedra prov., Galicia, Spain, 5 m. S.W. of Pontevedra on a bay of the Atlantic. Pop. 9000.

Marin, Le, tn. on S. coast of Martinique, W. Indies, 28 m. N.E. of Port de France. The extinct volcano of **Martin** is near. Pop. 5000.

Marinduque, is. of the Philippines, S. of Luzon, N.E. of Mindoro. Boag (N.W.) is the chief tn. The port Marilanga is on the S.E. Rice, hemp, and coco-nuts are produced, and seepages of petroleum have been found. Pop. 50,000.

Marine Biology is that branch of biology concerned with organisms living in the sea. The scope of this science is very wide, for not only is it concerned with the nature and development of organisms, but also with the environment influencing their development. The effect of water on light, the pressure of water, the variability of its depth, air content, and salinity are all factors affecting marine organisms and determining their distribution. Consequently M. B. is closely associated with oceanography, hydrography, and biochemistry. (See articles on these topics.) The early development of M. B. has been slow and diffuse, and in many countries was directly or indirectly due to the fishing industry. Probably on account of the economic value of certain fishes, molluscs, and crustacea, general interest in marine zoology was aroused before interest was extended to the much wider subject of M. B., which was not really developed until the nineteenth century. One of the pioneers of M. B. was Karl August Möbius (1825-1908), who investigated Kiel Bay, and described its plants and animals and their ecology. Victor Hensen (1825-1924), also at Kiel, investigated marine plankton, the mass of organisms floating on the surface of the water, and invented a statistical method to advance the study of fishes used as food. The first 'Challenger' expedition (1872-75) did much to stimulate Brit. interest in M. B. The Marine Biological Association of the United Kingdom was founded in 1884, and four years later a laboratory was completed at Plymouth, primarily to facilitate research on food fishes and molluscs, and to improve the industries dependent on these. Its secondary aim was to increase the knowledge of marine life in general. The work of the Plymouth station has been concerned mainly with life in Plymouth Sound and in the Eng. Channel. Shortly before this station was opened a Scottish marine station was estab. at Granton. One large boat, the *Ark*, was used as a floating laboratory and aquarium; another, the *Medusa*, for sounding and dredging. In 1885 the Liverpool M. B. committee was formed to investigate the fauna and flora of the Irish Sea and did much to advance knowledge of life and condition in this area. The work of the committee has, since 1920, been continued by the Dept. of Oceanography of Liverpool Univ.

In 1925 the Falkland Is. Dependencies initiated a series of voyages, first in Capt. Scott's old vessel, *Discovery*, and later in the better-equipped *Discovery II*, whereby many new facts were elucidated and new species discovered. In 1933 Dr. Wm. Beebe (q.v.) of the New York Zoological Society descended to the previously unexplored depth of $\frac{1}{2}$ m., and described the habits of animals which had previously been known from dead specimens only; more recently (1948) Prof. Piccard of Brussels attempted unsuccessfully to reach a depth of 2½ m. off the coast of W. Africa. The Swedish research ship, *Albatross*, in 1948 collected specimens at over 25,000 ft. (a depth nearly equal to the height of Mt. Everest), and collected samples of the sea-bed from 30,000 ft. For the discovery in 1939 of *Ladimeria*, a fish belonging to an order thought to have been extinct since the Cretaceous period (80,000,000 years ago), see the article on FISH.

Marine biological stations are now estab. on the coasts of most countries of the world, and contributions have been made to every branch of biological science. Amongst the interesting facts discovered is a distribution of plants and animals in the sea analogous to their distribution at different altitudes on land. In deep seas, as the depth of water increases, its temp. decreases, and plants and animals found near or at the surfaces of polar seas are found at some depth in the warmer seas. In this way some Arctic species spread continuously from pole to pole. Nitrogen-fixing bacteria flourish in colder seas, and consequently more plants are found in these than in warm ones. Another factor influencing plant distribution is the intensity of light. Blue-green and green algae are found on the surface and in shallow water, brown algae in slightly greater depths, and red algae at lower levels. From depths where sufficient light cannot penetrate, plants and the animals dependent on them are absent. Moreover, since these animals live in darkness, they are either blind or provided with luminescent organs. (See FISH.) In contributing its quota of new species of plants and animals, M. B. has helped to elucidate some of the problems of evolution. There is still considerable scope for research in this branch of biology. See also under ABYSSAL FAUNA; CEPHALOPODA. Brightwell, *Neptune's Garden*, 1937; N. B. Fales, *Littoral Fauna of Great Britain*, 1939; M. Duncan, *Wonders of Neptune's Kingdom*, 1948; and F. D. Ommanney, *The Ocean*, 1949.

Marine Engine, see STEAM ENGINE.

Marine Insurance, see INSURANCE.

Mariner's Compass, see COMPASS.

Marines. The Royal M. are essentially sea-soldiers. They may serve at sea, on land, and in the air, and though they have many of the characteristics of a military regiment, they have their own traditions and mode of life. In rank they corre-

spond with the army, and the corps is commanded by a general. But they are an integral part of the Naval Service, their organisation being the function of the Admiralty. Every cruiser and hoavier type of ship carries a detachment of the corps. On board they are trained to seamen's duties, they man part of the ship's armament, provide guards and sentries, and are ready to land, whenever required, as a military unit, to assist the navy in keeping the peace. The Royal M. also man the navy's landing craft flotillas. On shore they work frequently with the army and provide men for the Commandos, where they specialise in landings and general water-borne assault. Royal Marine officers may also volunteer to serve as pilots of naval aircraft. The uniform is blue, with red facings and white belts. On their colours the men bear the word 'Gibraltar', in the famous defence of which fortress they bore an heroic part. M. were first estab. as a nursery from which to obtain seamen to man the fleet, by order in council of Oct. 16, 1664. During the great Fr. war the number of M. rose above 30,000 men, but a great reduction took place after peace was concluded. In the First World War their strength was about 40,000, and they proved valuable in such enterprises as Zeebrugge and Gallipoli, besides serving with the general forces elsewhere. See E. Fraser and L. G. Carr-Langton, *The Royal Marine Artillery, 1804-1923*, 1931. In the Second World War the M. fought in Norway (notably at Narvik), Holland, France, Crete, Singapore, on the Irrawaddy, and at Dunkirk, besides carrying out their seagoing duties of supplying a part of the armament of the ships in which they serve, and the bands. As to the last-named, a boy bugler sounded 'Actions Stations' at the R. Plate, and another bugler was a survivor of H.M.S. *Prince of Wales*. The M. were the first seaborne troops to land as spearhead of the allied invasion in Sicily, and among the first to land in Italy. In Crete, of the 2200 Royal M. who landed with the mobile naval base only 1000 returned. In Iceland it was the M. who surprised the Ger. consul-general at Reykjavik, and seized his confidential books and papers. On the Irrawaddy a force of M. formed a flotilla (Force Viper) which assisted in demolitions and fought a desperate battle with the Jap. at Padaung. Of the original force of 107 here only 48 eventually made their way to Calcutta. Madagascar was another of the scenes of successful operations of the M. Finally, the M. also took part in the amphibious operation of launching the invasion of Normandy in June 1944, and subsequently in the operations to cross the Rhine in 1945. See H.M.S.O., *The Royal Marines: the Admiralty Account of their Achievements, 1939-43*, 1944.

Marinette, co. and city of Wisconsin, U.S.A., co. seat of Marinette co., on the Menominee, 20 m. from Oconto. Lumbering is the chief industry. Bridges connect it with Menominee, Michigan. Pop. 36,200.

Marinetti, Emilio Filippo Tommaso (1876-1944), lt. writer, b. at Alexandria, Egypt. While being the veritable founder of the It. poetic school of Futurism, his prin. work was written in Fr. M. claimed that futurism was the idea that inspired Cubism, Dadaism, and Surrealism in France, Imagism in England and America, and Expressionism in Germany.

Marinha-Grande, tn. of Estremadura prov., Portugal, 5 m. from Leiria, with noted glass manufs. It has a pine forest, 'Pinhal de Leiria.' Pop. 5000.

Marini, or Marino, Giovanni Battista (Giambattista) (1569-1625). It. poet b. at Naples, and a friend of Tasso. His works were very much admired by contemporaries throughout Europe. If, however, he achieved an enviable reputation as a writer of verse—mainly of a rather flamboyant nature—he earned an equally unenviable one for the dissipation of his life. His excesses were eventually the cause of his being obliged to leave Italy (where he had at last exhausted the patience of a wealthy patron) and retro to Paris, where he lived under the patronage of Marie de Medici. He subsequently returned to Italy, and d. at Naples. The term 'Marinism' connotes the influence of his ornate and affected style on early seventeenth-century poetry. It., Fr., and Eng. His works include *Canzone de baci* (Giambattista) (1569-1625). It. poet b. at Naples, and a friend of Tasso. His works were very much admired by contemporaries throughout Europe. If, however, he achieved an enviable reputation as a writer of verse—mainly of a rather flamboyant nature—he earned an equally unenviable one for the dissipation of his life. His excesses were eventually the cause of his being obliged to leave Italy (where he had at last exhausted the patience of a wealthy patron) and retro to Paris, where he lived under the patronage of Marie de Medici. He subsequently returned to Italy, and d. at Naples. The term 'Marinism' connotes the influence of his ornate and affected style on early seventeenth-century poetry. It., Fr., and Eng. His works include *Canzone de baci* (1589); *La Strage degli Innocenti* (trans. as *The Slaughter of the Innocents*) (1610); *Rime*, later eds. called *La Lira* (parts 1 and 2, 1602, part 3, 1614); *Dicerie sacre* (1614); *Epithalamii* (1616); *Il Rapimento d'Europa* (1618); *La Sampogna* (1620); and *L'Adone* (1623). See B. Croce, *Poesie varie*, 1913; R. Basalino (ed.), *Le più belle pagine di Giambattista Marini* (Crivelli), 1925; and C. Culcasi, *Poesie e prose*, 1930. See also lives by M. Menghini, 1888, and A. Borzelli, 1927; and C. W. Calvoen, *L'influence de Giambattista Marini sur la littérature française dans la première moitié du XVII^e siècle*, 1904.

Marino, tn. of Italy, on the Alban Hills, 13 m. S.E. of Rome, in the prov. of Rome; noted for wine. It was formerly a stronghold of the Orsini and of the Colonna (twelfth to fifteenth century). Pop. 10,000.

Mario, Giuseppe, Cavaliere di Candia (c. 1810-83), It. singer, the greatest operatic tenor of his time. For a short time he studied under Ponchard, Michelet, and Bordogni, making his début at the Paris Opéra in *Robert le Diable* (1838), and appearing in London (1839) in *Lucrezia Borgia*. He left the Opéra for the Théâtre-Italien (1840), toured in Russia (1845-50), and in America (1851). M. played in the operas of Rossini, Bellini, Verdi, and Donizetti, and was universally admitted to be the most perfect stage lover ever seen. M. sang with Giulia Grisi (q.v.) whom he married (c. 1844), for many years. He retired from the stage in 1867. See G. Pearson and F. Herd, *The Romance of a Great Singer*, 1910.

Marionatry (Gk. *maria* and *harpia*, adoration), the worship of the Virgin Mary. This term is chiefly used by polemical writers as one of disapproval, to express the veneration paid to the Mother

of God, and to statues and pictures of her in the Rom. Catholic and E. churches. Protestant controversialists declare that the supreme worship of *harpia* is accorded to her, while Catholics and Orthodox maintain that it is only the highest veneration or 'hyperdulia' (*υπεροουλεια*), and that prayers to her, such as the 'Ave Maria' so constantly used, are but petitions imploring her intercession with Christ for sinners. From paintings of Mary in the catacombs it may be inferred that the earliest Christians felt a special veneration for her. Epiphanius, the Gk. father of the fourth century, wrote against the Collyridians, a sect who had inaugurated a sacrificial worship to the Virgin (see *Hæc.* 79). The epithet *θεοτοκος* ('Mother of God') was probably first applied to Mary by Alexandrian theologians in the third century. The Nestorian movement was a protest against the title *θεοτοκος*, which was, however, solemnly affirmed by the Œcumenical Council of Ephesus (431). After this the full development of the cult of the Virgin, so obnoxious to Protestant controversialists, soon followed, and went unchallenged for many centuries. The Reformers of the sixteenth century protested against M., and it is condemned in the 22nd Article of the Church of England and in the Westminster Confession (chap. xxi. 2). See R. Pusey, *Eirenikon*, 1865, which should be read with J. H. Newman's *Letter to the Rev. E. B. Pusey on his Eirenikon*, 1866, for a summary of the controversy by able exponents. See also J. J. Bourassé, *Summa Aurea da Laudibus Beatissimæ Virginis Mariæ*, 1866; J. Northcote, *Celebrated Sanctuaries of the Madonna*, 1868; Rudnik, *Die Berühmtesten Wallfahrtsorte der Erde*, 1891; Walsh, *Apparitions and Stories of Heaven's Bright Queen*, 1904; and T. J. Gerrard, *The Cult of Mary*, 1913.

Marion, Francis (1732-95), Amer. soldier, b. near Georgetown, S. Carolina. He served in 1759 as a lieutenant in Governor Lyttelton's expedition against the Cherokees, and in 1761 as a captain in that of Col. Grant. Appointed brigadier-general in 1780, the scene of his activities was the country between the Pedee and the Santee from Camden to the coast, and he gained many victories over the Brit. troops. In 1781 he was joined by Lee's legion, and took part in the battle of Eutaw. After the war he was returned to the State Senate, and in 1790 was a member of the State Constitutional Convention.

Marion: 1. Co. seat of Grant co., Indiana, U.S.A., 57 m. N.N.E. of Indianapolis in M. co. Natural gas and oil are found. There are machine shops, and manufs. of iron, glass, paper, and rubber. Pop. 26,700. 2. Co. seat of M. co., Ohio, U.S.A., 45 m. N.W. of Columbus. It is a railway centre and manufs. engines and farming implements, and has limestone quarries. Pop. 30,800. 3. Co. seat of Williamson co., Illinois, U.S.A., 92 m. from St. Louis, Missouri. Pop. 9200. • **Marionettes**, full-length puppets made of wood, metal, or plastics, jointed and

controlled by a manipulator, from above the stage, by strings or wires. The name is thought to have been originally a diminutive of Marie. M. are of great antiquity, performances being recorded in Greece as early as 420 B.C., and of wide distribution. Almost every country, including China, Java, France, and Russia, has its own traditional types and sets of characters. Shakespeare, Ben Jonson, and Cervantes all mention them. In modern times there has been some revival, particularly in schools. See C. Magnin, *Histoire des Marionnettes en Europe*, 1862; Helen H. Joseph, *A Book of Marionettes*, 1920; and H. Whanslaw, *Everybody's Marionette Book*, 1935.

The Sierra Nevada borders it on the N.E. Much gold is produced. Cap. Mariposa, 137 m. from San Francisco.

Mariposa Lily, see *CALOCHORTUS*.

Mariquina, pueblo of Luzon Is., Philippines, 8 m. N.E. of Manila, on a trib. of the Pasig R. Pop. 10,000.

Maris, name of a family of Dutch painters of the nineteenth century. Of the three brothers, *Matthijs* (1835-1917), *Jakob* (1837-99), and *Willem* (1843-1910), Jakob is perhaps the most famous. Matthijs studied at the academies of The Hague and Antwerp, and in Paris after 1869. His works are remarkable for tender colouring and poetic feeling, and include 'Souvenir d'Amsterdam,' 'The Little

E.N.A.

MARIONETTE THEATRE: INDIA

Mariotte, Edmé (c. 1620-84), Fr. mathematician and physicist, of whose life little is known. He was b. in Burgundy, was a priest by profession, and resided in early life at Dijon. He was one of the earliest Fr. experimental philosophers, and a member of the Académie des Sciences (founded 1666). His chief work, *De la nature de l'air* (1676), contains a statement of Boyle's law of gases, known in France as Mariotte's law. He was noted for his discoveries in hydrodynamics. M. discovered the law of elastic fluids which now goes by his name; that is, of the elastic force being exactly in the inverse proportion of the space which a given mass of fluid occupies. Subject to such alterations as difference of temp. may require, the formula derived from this law is now one of the fundamental parts of aerostatics. He discovered that air, and air in a state of condensation, exist in liquids. His *Collected Works* were pub. in 1717 and 1740. See Condorcet, *Éloges des Académiciens*, 1779.

Mariposa (Sp., butterfly), co. of central California, U.S.A., containing the Yosemite valley and the Mammoth Tree Grove with its famous sequoias (*S. gigantea*).

Daughter of the Artist Swan,' 'A Fairy Tale,' 'Mädchen mit Tauben,' 'Hausliche Geschäfte.' Jakob is especially noted as a landscape painter of water, clouds, and misty skies. He was a pupil of De Keyser and Van Lorus at Antwerp, and then of Hébert in Paris (1866-71). His works include 'Holländische Stadtaansicht,' (1878); 'Am Meeresufer,' 'Souvenir of Dordrecht,' 'Grey Tower, Old Amsterdam,' 'The Seaweed Gatherers,' 'The Baby and the Kitten,' (1877); 'A Village Scene.' See J. Veth in *Onze Kunst*, 1902; T. de Bock, *Leben*, 1904. Willem preferred the bright, cheerful aspects of nature. His works include 'Watende Kuhe,' 'Enten,' 'Ein Sommertag.' Influenced by the Barbizon school, they in their turn influenced the growth of the Glasgow school. See P. Zilleken, *Peintres hollandais modernes*, 1893; M. Rooso, *Dutch Painters of the Nineteenth Century*, 1899; E. Fromentin, *Masters of Past Time*, 1912; R. H. Wilemski, *Introduction to Dutch Art*, 1927; and see also life of Matthijs by E. D. Fridlander, 1921.

Marischal, Earl, title created by James II. of Scotland (c. 1458), and bestowed on Sir Wm. Keith. The Keith family since

the time of David I. had possessed part of Keith in E. Lothian. From the early seventeenth century the office of Great Marischal became hereditary in this family, being conferred as an honour by Bruce for their services from Bannockburn (1314) onwards. *George, fifth Earl* (c. 1553-1623), founded Marischal College, Aberdeen (1593). *William, seventh Earl* (c. 1617-61), became head of the N. Covenanters. He supported Charles II. (1650), but was taken prisoner at Alyth (1651). On the Restoration (1660) he became keeper of the privy seal of Scotland. *George, tenth Earl* (c. 1693-1778), fought for the Pretender at Sheriffmuir (1715), and was in consequence attainted, while the office of marischal fell into abeyance (1716). He escaped to the Continent, and finally served under Frederick the Great. See J. D'Alembert, *Éloge de Milord Maréchal*, 1779; W. Buchanan, *Ancient and Noble Family of Keith*, 1820; K. Douglas, *Scottish Peerage*, II., 1904; R. Chambers, *Biographical Dictionary of Eminent Scotsmen*, 1832-34.

Marist. Member of the Rom. Catholic Society of Mary, devoted to the work of foreign missions, and to teaching. The M. Society was founded at Bellay, France, in 1816. The M. fathers and associate laity maintain schools all over the world, and sev. missions in New Zealand and Polynesia.

Maritain, Jacques (b. 1882), Fr. writer. Ph.D. of the Sorbonne. Educated as a Protestant, but, being attracted by the character of St. Thomas Aquinas, he became a Rom. Catholic (1906), and conspicuous in the Catholic revival. Prof. at the Institut Catholique, Paris (1913-40), and regarded as the leading neo-Thomist of the times. After the collapse of France he joined the Institute of Medieval Studies, Toronto, and was visiting prof. at Princeton and Columbia univs. His *Art et Scolasticisme* (1930), trans. into Eng. as *Art and Scholasticism* is a classic of erudition and subtlety, if somewhat too heavy. He belongs, however, rather to the philosophers and the historians than literature proper. Of his earlier works those trans. into Eng. include also *An Introduction to Philosophy* (1930); *Prayer and Intelligence* (with his wife) (1931); *The Angelic Doctor* (Aquinas) (1931); *The Degrees of Knowledge* (1932); *Freedom in the Modern World* (1935); and *True Humanism* (1939). His later works are *Introduction to Logic* (1937); *Science and Wisdom* (1940); *Living Thoughts of St. Paul* (1942); *Redeeming the Time* (1943); *Rights of Man and Natural Law* (1944); *Dream of Descartes* (1946); and *St. Thomas Aquinas: Angel of the Schools* (1948).

Maritime Alps. div. of the W. Alps on the frontiers of France and Italy, extending from the Col di Tenda (N.W. of the gulf of Genoa), N.W. to the Col de l'Argentera and alps of Dauphiné. E. and N.E. come the Cottian and Ligurian Alps. Among the chief peaks are Punta dell' Argentera (10,794 ft.), Cima dei Gelas (10,286 ft.), Monte Matto (10,128 ft.), Mont Pelat (10,017 ft.), Mont Clapier (9994 ft.), Mont Tintras, 9948 ft.), Mont

Enchastraye (9695 ft.), Monte Bego (9426 ft.). The chief passes include the Passo del Pagarin (Vésulie valley to Valdiéri), Col della Cirlegia, Col de Pourriac (Tinée valley to Argentera), Col della Lombardia (Tinée valley to Vinadio), Col de la Cayolle (Var valley to Barcelonnette, carriage road), Col del Sabbione (Tenda to Valdiéri). For the dept. of France see under ALPES-MARITIMES. See E. Ball, *Alpine Guide*, 1898; P. Garnier, *Mémoire sur les Alpes-Maritimes*, 1888; Sir W. Conway, *The Alps from End to End*, 1895; F. S. Smythe, *Alpine Journey*, 1934; and R. L. G. Irving, *The Romance of Mountaineering*, 1935.

Maritime Laws, see OLERON, JUDGMENTS OF, and SEA LAWS.

Maritime Province (Primorskaya Oblast'), former prov. of Asiatic Russia, extending along the Siberian coast of the Pacific from Korea to the Arctic Ocean, including Kamchatka and small is. on the coast, later known as the Far E., and now Khabarovsk Region (q.v.) of the U.S.S.R.

Maritza (anct. Hebrus), chief riv. of European Turkey, rising on the slopes of the Rilo-Dagh and Rhodope Mts. (N.E. Balkans). It flows through E. Rumelia, past Philippopolis and Adrianople into the N.E. Aegean Sea, near Enos. Length about 300 m., navigable for small vessels to Adrianople. A battle was fought on its banks (1364) between Ottomans and Serbs. There are coal-mines in the vicinity.

Mariuccia, see MAROZIA.

Mariupol, seaport in the Stalino Region of the Ukrainian S.S.R. on the N. coast of the sea of Azov, 63 m. S.W. of Taganrog. It has considerable coasting trade and exports corn and other cereals, coal, steel, etc. The iron and steel works at M. use the oilfield ores of the Kerch peninsula. There are also tanneries and flour mills. In the invasion of Russia in 1941 the Germans reached M. on Oct. 7, and after sev. days of hard fighting captured it. The Russians retook it on Sept. 10, 1943. Pop. 222,000.

Marius, Gaius (157-86 B.C.), Rom. general, b. near Arpinum, of humble origin, was brought up to despise the new Gk. culture then becoming so fashionable in Rome. He possessed the stern and severe virtues of an anct. Rom., and at first he was characterised by great integrity and industry, but living in a licentious age his virtues soon degenerated into vices, and being without the tempering influence of literature and art, his sternness produced cruelty, and his love of country became love of self. He saw his first service in Spain (134) under the great Scipio Africanus, who raised him to the rank of an officer, and in 119 B.C. was elected tribune, becoming praetor in 115, in which capacity he subdued Further Spain. He distinguished himself in the war with Jugurtha, 109-106, and was elected consul for the first time in 107 (a great honour for a *novus homo*), finally with Sulla bringing the war to a close. He was next appointed to the chief command against the Cimbric and Teutonic, and defeated the invaders at Aquae Sextiae

(modern Aix) (102), and near Vercellae (modern Vercelli) on the Raudian plain (101), becoming consul for the fifth time the same year. In 100 he was again consul, but he had secured his election by means of the demagogues, Saturninus and Glaucia, and so had alienated the plebs. In consequence of this he went to Asia, but returned to take part in the Social war of 90, and when Sulla was appointed chief in command against Mithridates in 88, succeeded in getting the office transferred to himself. This led to an open rupture between the two generals which resulted in Sulla defeating M., who fled to the marshes of Minturnae. He subsequently went to Carthage, and returning to Rome in Sulla's absence became consul a seventh time, he and Cinna naming themselves to office without going through the form of an election. See A. H. Reesly, *The Gracchi, Marius, and Sulla* (4th ed.), 1884.

Marivaux, Pierre Carlet de Chamblain de (1688-1763). Fr. writer, b. at Paris. He began his literary work by a parody on Homer, but soon turned his attention to comedy and the novel. His work is characterised by its verbal affectation, afterwards known as *marivaudage*, and by its analysis of character. His works include *Marianne* (his most famous novel, 1731-41) and *Les Fausses Confidences* (1737). See life by G. Deschamps, 1897.

Marjoram (*Origanum*), genus of aromatic herbs. The leaves of sweet M. (*O. Majorana*) are used for seasoning. Oil of M. is used in farriery, and a dye is also obtained from the plant.

Mark, or John Mark, traditional author of the second gospel, is mentioned many times in the N.T., though nowhere by name in the Gospels. He is spoken of in Col. iv. 10 as the cousin (ἀνεψιός) of Barnabas. His mother Mary (Acts xii. 12) seems to have been a woman of some position whose house was a frequent resort of the Christians of Jerusalem. He accompanied Paul and Barnabas on their return from the visit to Judaea (Acts xii. 5), and later set out with them on the first missionary journey. On their arrival at Perga in Pauphlyia he left them for some unexplained reason, and this defection later caused a sharp dispute between Paul and Barnabas which led to their taking different roads. We next read of M. as reconciled to Paul, and as being with him at Rome (Col. iv. 10; Phil. 24). Later he seems to have visited Asia (2 Tim. iv. 11). Tradition makes him the founder of the Church in Alexandria, and later legend weaves many elaborate myths around his name.

Mark, The Gospel according to St., second book of the N.T., is now very widely regarded by critics as the first of the Gospels to be consigned to writing. Eccles. tradition has held that St. Mark was its author, in accordance with the testimony of Papias (second century), who says that St. Mark was the 'interpreter' of St. Peter, and that he wrote his gospel at Rome from information derived from the apostle. In the last century the Tübingen school entirely reversed the

traditional view, and placed the second gospel later than the other two synoptic narratives, holding it to be an adaptation of these two works intended to remove all that could offend either of the two great parties of the Early Church which the Tübingen school postulated. This view may now be said to be entirely abandoned, and it may be considered as an ascertained fact of criticism that St. Mark's Gospel was used by St. Luke and the author of the first gospel. Harnack dates it between A.D. 65 and 70, so that the date offers no difficulty to accepting the traditional authorship, strengthened as its claim is by internal evidence. St. Mark's Gospel is characterised by great vividness of narrative and a wealth of incidental detail. There is no attempt at a literary style, effect being gained mainly by the repetition of words and ideas. Either St. Mark's Gospel or an earlier form of it was used in the compilation of both the other synoptic gospels. See commentaries by H. B. Swete, 1902; A. W. Blunt, 1929; and B. H. Branscomb, 1937; see also H. B. Menzies, *The Earliest Gospel*, 1901; A. Lagrange, *L'Évangile selon St. Marc*, 1920; W. Lowrie, *Jesus according to St. Mark*, 1929; J. Chapman, *Matthew, Mark, Luke*, 1937; and article in J. Hastings's *Dictionary of the Bible*, 1898.

Mark: 1. Ger. geographical term, signified primarily the *mark* of a country's limits (the *march*); and hence was applied as a designation of the border countries or dists. of the Ger. Empire, conquered from the Slavonians, Hungarians, Wends, and other neighbouring nations. Thus we read of the Ms. of Austria, of N. Saxony or Brandenburg, Lausatia, Schleสวิг, Moravia, Steternmark, etc. The governors entrusted with the charge of these border dists., or *marks*, were called *Markgrafen*, corresponding to the Eng. and Scottish wardens of the marches (see *MARKISH*). 2. The name of a silver coin of Germany containing 100 pfennige. Originally it was a measure of weight (chiefly for gold and silver) used throughout W. Europe, and equal to about 8 oz. In 1194, after the Conquest, a M. represented in England 160d. (20d. to 1 oz.), or 13s. 4d., two-thirds of £1. In Scotland it only had one-twelfth of the Eng. value. Ms. were first issued in Germany about 1875. There are 10- and 20-M. gold coins, and 1-, 2-, 3-, and 5-M. silver pieces. The nominal value of the Reichsmark of 100 pfennige in Brit. currency was 11½d., and that of the Deutschmark introduced in 1948 1s. 3d. On the depreciation of the M. in the period following the First World War see EXCHANGES, FOREIGN.

Markanda, see under SAMARKAND.

Mark Antony, see ANTONIUS, MARCUS.

Market (from Lat. *mercatus*, trade). This word is used either of the fixed place to which purchasers and retail merchants resort for purpose of buying and selling (such as, in London, Covent Garden M. for fruit and flowers, Leadenhall M. for meat and poultry), or of a body of people met together for commercial transactions, such as the sale of provisions, live-stock, etc., exposed in public, often at a fixed

time and place. From early times the right to estab. a M. anywhere belonged to the Crown; market rights became very valuable, and their illegal assumption was checked by Edward I.'s 'Quo Warranto' inquiries. The word was not commonly used in England before the twelfth century. In the Middle Ages the term included weekly and semi-weekly Ms., and the ann. mart or 'fair.' Until comparatively recent times the duke of Norfolk owned the Ms. in Sheffield, and the duke of Bedford owned Covent Garden M. To-day nearly all the Ms. are owned and controlled by the city or bor. councils; while the great London Ms. are controlled by the City Corporation or the L.C.C. Many tns., e.g. Nottingham and Peterborough, had a large open square or M. place in which the M. was held, traders setting up their stalls there. Some of them remain. Cattle Ms. are still held in uncovered places, but these are now generally distinct from ordinary Ms. Owing to modern facilities of inter-communication there is little variation in the price of a given commodity at different places (see also FAIR).

M. is also used to describe the whole range of transactions, in a particular commodity, such as cotton or wool, or the dealings in credit instruments which form the money M. The London Stock Exchange with its numerous subdivisions (consols, foreign stock, mining, etc.) is an example of a highly organised M. See Elton and Costello, *Report for the Royal Commission on Market Rights*, i., 1889; J. Huvelin, *Essai historique sur le droit des marchés et des foires*, 1897; and C. Maughan, *Markets of London*, 1931.

Market Bosworth, see BOSWORTH.

Market Deeping, mkt. tn. of Lincolnshire, England, on the Welland, 7 m. E. by N. of Stamford. Pop. 2000.

Market Drayton, or **Drayton-in-Makes**, mkt. tn. of Shropshire, England, on the Shropshire Union Canal. It is an old tn. and is in the centre of an agric. dist. Agric. implements are made. There is a sixteenth-century grammar school, and near by is Blore Heath, scene of a battle in the Wars of the Roses. Pop. 4800.

Market Gardening, see under GARDENING.

Market Harborough, par. and mkt. tn. of Leicestershire, England, on the Welland and the Grand Union Canal, 16 m. S.E. of Leicester. It is a much frequented hunting centre. Corsets, patent foods, rubber goods, and brushes are among its manufs. It has an old Gothic church and a seventeenth-century grammar school. Pop. (with Bowden) 10,700.

Marketing. A word used as an alternative to sales management (q.v.) to cover the two activities of advertising and personal salesmanship. There is a tendency in commerce to separate M. from all the other branches where possible. This is more generally the case among manufacturers than among wholesale and retail traders, the very nature of whose business is in itself M. Broadly speaking, the larger the percentage of the price of a commodity that can be earmarked for

selling costs, the greater the tendency to make M. a separate dept. In some speciality trades, that is trades in such goods as vacuum cleaners, cash registers, and books of reference, where sales are made direct to the ultimate consumers or users without passing through the ordinary channels of trade, an entirely separate business from that of production may be organised solely for the purpose of M. the commodity. It was once thought that the effect of spending money largely on press and poster would be to reduce other salesmanship costs; but, generally speaking, this expectation has not been fulfilled, and indeed so far from this having resulted, it has proved to be unnonnervative to advertise at the existing high rates unless personal salesmen are sufficiently numerous to draw the full benefit of the outlay. Consequently, while non-advertising houses may send representatives to visit their customers at intervals of many weeks or even months, it is usually the advertising houses which provide for the fortnightly or weekly call.

The great bulk of the heavy business of the world is still done in commodities in which there is little or no national publicity. M. in many such cases is rather outside the range of ordinary commercial travelling as well as of advertising. It means rather the discovery of buyers and the adjustment of plant and works to meet their needs. The various forms of M. have brought into being a new class of educator: the teacher of salesmanship. In some of the modern univs. M. in its two forms of publicity and personal selling is recognised as one of the commercial subjects (see also EMPIRE MARKETING BOARD).

There is another sense in which the term M. is being largely used: co-operative or united M. A good illustration is the union of the farmers or fruit-growers of a suitable area to unite and nominate a single person or body to carry out their selling arrangements, the principle being that such a central authority could make more effective bargains and allow the growers more time and freedom for their other work. In recent years agric. M. boards have been instituted in Great Britain by agric. producers in order to obtain the advantages of long-term organisation as authorised by schemes framed under the Agricultural Marketing Acts, 1931-33. Important schemes for large-scale M. of agric. products include those dealing with pigs and bacon, milk and its derivative products, and hops. See *Report on Agricultural Marketing Schemes for 1936* (Cmd. 5734 of 1938); *White Paper on Milk Policy* (Cmd. 5533 of 1937); and *Hops: Report of Reorganisation Commission* (Ministry of Agriculture, Economic series). See also the *Livestock Industry Act, 1937*, which provides for the improvement of the facilities for the slaughter of live-stock and the rationalisation of the system of live-stock auction markets, the control being vested in independent commissions appointed by the gov. The Ministry of Agriculture and Fisheries now includes a new dept. known

as the Agric. M. Facilities Committee for Great Britain.

See H. M. Conacher, *The Agricultural Marketing Acts*, 1935; J. T. Horner, *Agricultural Marketing*, 1935; L. W. Lyde, *Man and his Markets*, 1935; D. W. Malott, *Problems in Agricultural Marketing*, 1938; and J. B. Condillo, *The Reconstruction of World Trade*, 1941.

Market Overt. The legal term M. O., or open market, is used in reference to the acquisition of a good title by the purchaser of goods where the seller's title was defective. The general rule is that the owner or his agent alone can sell so as to confer ownership, but among the various exceptions to this rule is the statutory provision (Sale of Goods Act, 1893, founded on the common law) that where goods are sold in M. O. according to the usage of the particular market, the buyer acquires a good title to the goods provided he buys in good faith and without notice of any defect or want of title on the part of the seller. As a fact, the buyer has no great protection, because (1) if the owner of stolen goods secures the conviction of the thief he gets his goods back again, the buyer being reimbursed from moneys found on the thief; and (2) although anciently, when shops were very few, the general practice was to sell and buy in markets and fairs, the almost universal rule at the present day is to buy in shops, and markets and fairs (apparently the Act includes 'fairs' or 'markets') are now more or less the survivals of a bygone age. In the City of London, however, every shop which is open to the public between sunrise and sunset on all weekdays is, by customary law, M. O. (The Shops Act, 1912, in no way affects this custom, and a City shop is still M. O., though it must close long before sunset on one day in the week.) But City shops are only M. O. for such goods as the shopkeeper proposes to deal in, nor (apparently) does the custom apply where the shopkeeper is himself the buyer. Outside the City, certain days are set apart by grant, prescription, length of time, or custom in which at the particular tn. or vil. M. O. is held. The protection extends only to goods vendible in the market. The transaction, to be protected, must have begun and ended in M. O.; for example sale in a private room, or sale by sample where the bulk of the goods is transferred otherwise than openly, do not constitute sale in M. O. Also, in the case of markets in which tolls are payable, the buyer to be protected must pay the tolls due upon the sale. See J. Pease and H. Chitty, *The Law Relating to Markets and Fairs*, 1899.

Market Rasen, mkt. tn. and urb. dist. of Lincolnshire, Eng., on the little Rasen R., and 13 m. N.E. of Lincoln. Pop. 2500.

Market Research. see under SALES MANAGEMENT.

Markham, Mrs. (1780-1837), pseudonym of Elizabeth Penrose, daughter of Edmund Cartwright (q.v.), inventor of the power-loom; married the Rev. John Penrose in 1804. She is noted as a writer of hist. and other books for the young.

The best known are *Mrs. Markham's History of England* (1823) and *Mrs. Markham's History of France* (1828). Other works include *Amusements of Westernheath, or, Moral Stories for Children* (1824); *A Visit to the Zoological Gardens*, (1829); and *Sermons for Children* (1837). See S. Smiles, *A Publisher and his Friends*, 1891.

Markham, Charles Edwin (1852-1910), Amer. poet, b. at Oregon City, Oregon, worked on a farm in California. He wrote many poems, the prin. of which was *The Man with the Hoe* (1899), which secured him world-wide attention. He was asked by the U.S. Gov. to write the poem to be used in the national celebration of Washington's bi-centennial birthday. He was elected to the Amer. Academy in 1930 and became honorary president of the Poetry Society of America. His other works include *Lincoln and other Poems* (1901); *The Shoes of Happiness*, etc. (1915); *Gates of Paradise* (1920); *California the Wonderful* (prose, 1924); *The Ballad of the Gallows Bird* (1926); *The Star of Araby* (1937); *Collected Poems* (1940); and *Children in Bondage* (prose, 1911).

Markham, Sir Clements Robert (1830-1916), Eng. traveller and geographer, b. at Stillingfleet, Yorkshire, son of the Rev. David F. M., vicar of that place. Educated at Cheam and Westminster, he was in the navy, 1844-52, and served in the Arctic expedition, 1850-51. He introduced quinine-yielding cinchona-trees from Peru to Brit. India, 1859-62, and also the *Hevea brasiliensis*, or rubber-bearing tree, into Malaya. M. was geographer to the Abyssinian expedition; assistant-secretary to the India Office, 1867-77; secretary to the Royal Geographical Society, 1863-88; secretary, 1858-87, and president, 1893-1905, of the Hakluyt Society. Among his works are *Lives of Lord Fairfax*, Columbus, John Davis, Maj. Rennell, Adm. J. Markham, R. Hakluyt, and Sir L. McClintock; also *Travels in Peru and India* (1862); *Memoir of the Indian Surveys* (1871); *The Threshold of the Unknown Region* (1874); *Life of Richard III.* (1906); *Quichua Dictionary* (1908); and *The Incas of Peru* (1910).

Markham, Gervase (Jervis) (c. 1568-1637), Eng. soldier, translator, compiler, and miscellaneous writer. During the Civil war he served in the Royalist Army. He wrote much, among his original writings being *The most honorable tragedy of Sir Richard Grinville, Knight* (1595); *The Poem of Poems; or Son's Muse* (1595); *The dunbr Knight* (comedy, 1608); *The English Husbandman* (1613, 1614); *Hunger's Prevention* (1621); *The True Tragedy of Herod and Antipater* (with Wm. Sampson, 1622); and various works on sport and rural pursuits, including *A Discourse on Horsemanship* (1593) and *A Way to get Wealth* (1631). See D. F. Markham, *History of the Markham Family*, 1854; and Sir C. R. Markham, *Markham Memorials*, 1913.

Markiewicz, Constance Georgine, Countess (1884-1927), Irish politician, daughter of Sir Henry Gore-Booth, and wife from

1900 of a Polish count. Active first in the Labour and then in the Sinn Féin movement, she was sentenced to death for taking part in the Easter 1916 rebellion, the sentence being commuted. In de Valera's Flanna Fail Gov. she was made minister of labour. She was the first woman to be elected to the Brit. House of Commons, being returned for St. Patrick's Dublin in Decr., 1918, but she never took the oath nor her seat.

Markinch, burgh and coal-mining centre in the co. of Fife, Scotland, 11 m. S.W. of Cupar and 33 m. from Edinburgh. The other chief industries are bleaching and the manuf. of paper. It is served by the Scottish Region railway. Pop. 2000.

Markiroh, see STE MARIE-AUX-MINES.

Marking Ink, see INK.

Markneukirchen, tn. of Saxony, Germany, 28 m. S.S.W. of Zwickau. It is chiefly engaged in the manuf. of musical instruments. Pop. 8700.

Markova, Alicia (Alice Marks) (b. 1911), Eng. danseuse. Joined Diaghilev's Russian ballet in 1925, dancing the *adagio* of *The Swan Lake* in the same year. After Diaghilev's death she danced with the Young Eng. Ballet at the Camargo Society, the Ballet Club, Sadler's Wells, and with her own company. With Anton Dolin (an Englishman who became *premier danseur classique*) she was the first star of the Vic-Wells Ballet founded by Ninette de Valois (see BALLETS). As the particular star of the Wells company, the ballets were constructed round her personality and aptitudes and the classics revived for her, such as *The Swan Lake*, which was first produced in 1877. In *Giselle*, the oldest (1811) ballet in the pre-war repertoire of the Wells company, M. gave an excellent rendering in a role in which Pavlova was supreme. Other classic roles in which she danced were *Casse-Noisette* and *Turandot's Wedding*. In physique and temperament M. is a classical dancer in the direct line of Pavlova and Spessiva. She occupies a unique position in contemporary ballet and has played a major part in the hist. of the art in England.

Markovka, tn. in the Voronezh Region of the R.S.F.S.R., 150 m. E.S.E. of Kharkov. Pop. 8000.

Markranstadt, tn. of Saxony, Germany, 7 m. S.W. of Leipzig. Pop. 8000.

Mark System. The name applied to the agrarian polity, common to all auct. Teutonic races, by which the whole arable land of the community or settlement was annually or triennially allotted among the freemen, to be held till the time came for it to lie fallow, while the pasture land was both held and used in common. The M. S. as described in Tacitus is evidently a sign of the transition between the nomadic and agric. conditions of tribes, or between a genuine community of land tenure and an inchoate system of private ownership (Geffroy, *Rome et les barbares*). The term mark (in Tacitus *vicus*) in this context meant community, but its primary meaning 'boundary' points to the salient feature of the M. S. as described by Tacitus, namely, the fact that the

tribal habitations and fields were, for purposes of defence, bounded by huge unoccupied stretches of waste land or 'marches.' Despite much controversy it seems probable that the M. S. preceded the feudal system, which everywhere reduced the freeman to a condition of serfdom or villeinage. In England, at any rate, the M. S. failed to take root with the migration of the Saxons (see TENTH). For the social, political, and judicial aspect of the M. S., see R. Schmidt, *Gesetze der Angelsachsen*, 1832; H. Maine, *Village Communities*, 1871; W. Stubbs, *Constitutional History of England*, vol. I., 1875; G. L. von Maurer, *Geschichte der Markenverfassung, Dorf- Hof- Städte-verfassung, and Einleitung*; T. Hodgkin, *History of the Anglo-Saxons*, 1906; R. Collingwood, *Roman Britain and the English Settlements*, 1923; A. Doppeh, *Die freien Marker in Deutschland*, 1933; and F. M. Stenton, *Anglo-Saxon England*, 1943, 1947.

Mark Twain, see CLEMENS, SAMUEL LANGHORNE.

Marl, loose appellation for all compounds of clay and carbonate of lime which are soft and friable. Shell M. is a soft white, crumbling deposit formed on the bottom of lakes and ponds by the accumulation of the remains of mollusca, entomostraca, and partly of fresh-water algae. When such calcareous deposits become compact stone, they form what are known as fresh-water or lacustrine limestones, which are generally white or pale coloured, smooth in texture, rarely splintery, and break with a slightly conchoidal fracture. Cricket pitches are treated with M. in order to bind and improve the turf.

Marlborough, John Churchill, first Duke of (1650-1722), Eng. soldier, was educated at St. Paul's school, and was for a while page to James, duke of York. He entered the army in 1667 as ensign in the foot guards, and after serving at Tangiers, was promoted captain (1672). In 1678 he became colonel, and in the same year married Sarah Jennings (1660-1744), maid of honour to Princess Anne, over whom she had great influence. He was created Baron Churchill in 1682, and three years later took an active part in suppressing Monmouth's insurrection. For this service he was made major-general. He vowed fidelity to James II., and at the same time promised William of Orange to support him. When William landed, Churchill joined him. He was given an earldom in 1689, and after serving in Flanders, was in 1690 appointed commander-in-chief. On the accession of Anne he was made captain-general of the forces and master-general of the ordnance; and, on the declaration of war against France, commanded the forces in Holland. After the successful campaign of 1702 he was created duke. One of England's greatest soldiers, a brilliant exponent of the use of mobility and fire-power, among his great victories were Blenheim (1704), Ramillies (1706), Oudenarde (1708), and Malplaquet (1709).

In the meantime his influence at home was steadily waning, partly owing to changes in the political atmosphere, partly

to the imperious behaviour of the duchess of Marlborough towards the queen, who in 1710 dismissed her from her service, and partly to Harley's intrigues. Peace was declared by the Tories in 1711, and Marlborough, returning to England, was accused of malversation and dismissed from all his offices. The charges of peculation were, however, not proceeded with. He went abroad during the following year, and took an active part in securing the Hanoverian succession. After the accession of George I. he was reinstated as captain-general and master of the ordnance, which offices he held until his health gave way in 1716. He was hardly a scrupulous statesman, but due account

DUKE OF MARLBOROUGH
Engraving after a painting by G. Kneller.

must be taken of the times in which he lived. The most serious charges laid against him are that he betrayed James II. and William III. in turn; but such charge should be consistently made against all the great nobles who supported the bloodless revolution of 1688. Again, it is true that M., in common with Danby, Shrewsbury, and most of William's ministers conducted a correspondence with the Jacobites of St. Germain. This was well known to William, who was quite content that James should be duped with flattering but vain assurances that England was prepared to revolt on his behalf. Macaulay's more serious charge that M. communicated to the enemy the Eng. Gov.'s intention to attack Brest in 1694 has been convincingly refuted in Mr. Winston Churchill's *Marlborough* (4 vols., 1933-38; 2 vols., 1947). His letters and dispatches were pub. by Sir G. Murray (1845-46). See lives by D. B. Clidsey, 1920; Sir J. Fortescue, 1932; and M. Ashley, 1939. • **Marlborough:** 1. City in Middlesex co., Massachusetts, U.S.A., 25 m. W. of Bos-

ton. It carries on a considerable trade in boots and shoes. Pop. 15,100. 2. Tn. in the co. of Wiltshire, England, on the R. Kennet, 26 m. N.E. of Salisbury. It is an old tn. with interesting buildings, and a college for boys (see MARLBOROUGH COLLEGE). It was here Henry III. held the Parliament which enacted the 'Statutes of Marlbridge.' Pop. 5800. 3. Dist. in N. Is., New Zealand, having an area of 4220 sq. m. The chief minerals found are gold, coal, and copper. Pop. 17,000.

Marlborough College, Eng. public school, was founded in 1843 for sons of the clergy, being opened to laymen's sons ten years later. It accommodates about 660 boys, partly in hostels, and partly in boarding houses. It is situated at Marlborough, Wiltshire.

Marlborough House, mansion in Pall Mall, London, built by Wren for the great duke of Marlborough c. 1710, and since 1817 owned by the gov. It has been used as a residence by Edward VII. when Prince of Wales, Queen Alexandra, and Queen Mary, widow of George V.

Marline-spike, or **Marlinspike** (from *marline*, a small line of two strands for seizings, etc.), wire pin used on board-ship for unravelling the strands of a rope and as a lever in tying knots, etc.

Marlow, or **Great Marlow**, tn. in Buckinghamshire, England, on the Thames, 5 m. N.W. of Maidenhead. The riv. is crossed here by an iron suspension bridge. There are extensive beech woods, and the surrounding scenery is remarkably attractive. The chief manufs. are paper and lace. Pop. 6500.

Marlowe, **Christopher** (1564-93), Eng. dramatist and poet, was the son of a shoemaker, and was educated at King's School, Canterbury, and Corpus Christi College, Cambridge. Presently he joined the earl of Nottingham's theatrical company, by which most of his plays were produced. He wrote about 1587 the great blank verse tragedy, *Tamburlaine*, and followed this with *The Troublesome Reigne and Lamentable Death of Edward the Second*, *King of England* (1594); and *The Tragedy of Dido Queen of Carthage* (with Nash, 1594). After his death appeared *The Massacre at Paris* (c. 1600); *The Tragical History of D. Faustus* (1604); and *The Famous Tragedy of the Rich Jew of Malta* (1633). A number of other plays have also been wholly or partially ascribed to M., and it has been asserted by some critics that he was part author of Shakespeare's *Titus Andronicus*, of the second and third parts of *Henry VI.*, and of *Edward III.* As a poet he is best known as the author of 'Come live with me and be my love' (pub. in *The Passionate Pilgrim*, 1599). It was declared that M. was an atheist, and in 1593 the Privy Council issued a warrant for him to be brought before them. Before it was served M. was killed in a drunken brawl at Deptford. M. raised both the themes and treatment of the drama to a higher level by taking large serious subjects for dramatisation that appealed to popular imagination, and by converting the old stiff blank verse into a medium of

delicate and plastic beauty. His plays show no outstanding power of characterisation or even of constructive skill, but they carry the reader away by the force and beauty of their language and by the heroic visions they conjure up. Tamburlaine, his earliest, crudest creation, enters on the stage driving a team of kings before his chariot; M. found the raw material for his play *Tamburlaine* in such books as Pedro Mexia's *Life of Times* (pub. at Seville in 1543 and trans. into Eng. in 1571) and the *Vita Magni Tamerlanis* of Petrus Perondinus. But the thunderbolts of invective were his own, and it is the dramatist who makes the Scythian peasant and mass murderer into a poet. *Tamburlaine* is no doubt an expression of the overmastering prodigality of youth, but in the play M. lit the fires of Eng. heroic drama. By contrast his poem *Hero and Leander* reveals him in a gentle mood of sweet sensuousness in the vein of Spenser. Barabas in *The Jew of Malta* rules the world by the power of gold; Faustus sells his soul for the powers of a magician; each is impelled by a lust of power and the tragedy consistently follows its appointed course from vaulting triumph to a tremendous fall. The technique M.'s highest achievement is his *Edward II.*, but in poetry and psychological interest it falls well below *Doctor Faustus*, which latter became the accepted model of the finest philosophical drama of modern times, Goethe's *Faust*. *Doctor Faustus* is a great symbolic tragedy on a theme which, besides reflecting M.'s inner experience, exploits that pride of intellect which was the very spirit of the Renaissance. The story is of the Middle Ages but M., by giving it a renaissance setting, thereby transformed the anxious alchemist into an ardent idealist, besides softening the crude horrors of the medieval version. The opening scenes in which Faustus barter his soul, are admirable, and the closing presentation of the hour of retribution touches a fund of pathos which seems to have been exhausted in this play, for M. never reaches it again. The weakness is in the middle scenes, some of which are so grotesque that some have doubted M.'s authorship. *Edward II.* is, comparatively speaking, a sober play, and even if it misses the fire and glamour of *Tamburlaine*, its structure is better and its interpretation of character more varied. M. not only saw that the romantic drama was admirably suited to the spiritual requirements of the needs of the nation as expressing its full and strenuous life; but also that for the romantic drama to achieve beauty as well as force the medium of blank verse must be used. M. no doubt shows the defects of the temperament of his age—excess of imagination, a lack of restraint, and at times an extravagance approaching the ridiculous, but no criticism can hide the fact that M. found the drama crude and formless and left it a mighty force in Eng. literature. His *Works* have been ed. by A. H. Bullen (1885); Havelock Ellis (1887); O. F. T. Brooke (1910); and R. H. Case (1930-33). See A. W. Verity, *Marlowe's Influence on*

Shakespeare, 1886; J. H. Ingram, *Marlowe and his Associates*, 1904; Una M. Ellis-Fermor, *Christopher Marlowe*, 1927; P. H. Koehler, *Christopher Marlowe*, 1947; and C. Norman, *The Muses' Darling*, 1948.

Marmagao, seaport tn. in the Portuguese ter. of Goa, India. It is connected by rail with the W. Ghats, and is in the centre of a manganese and iron dist.

Marmalade, see JAM.

Marmande, tn. in the dept. of Lot-et-Garonne, France, on the Garonne, 30 m. N.W. of Agen. It manufs. cotton and woollen goods and brandy. Pop. 12,100.

Marmolata, highest mt. of the S. Tyrol. Dolomites, Italy. Height 11,020 ft.

Marmont, Auguste Frédéric Louis Viesse de, Duke of Ragusa (1774-1832), marshal of France, b. at Châtillon-sur-Seine, entered the army at an early age, served as a brigadier-general in Egypt, returned with Bonaparte to France, supported him in the revolution of the 18th Brumaire, and afterwards continued in active military service. Having defended the Ragusan ter. against the Russians and Montenegrins, he was made duke of Ragusa. He joined the Grand Army in 1809, the day before the battle of Wagram, won the battle of Znaim, and was made a marshal. He was thereafter for eighteen months governor of the Illyrian provs. M. succeeded Masséna in Spain in May 1811. On the news of Soult's defeat by Beresford at Albuera (May 16) he moved rapidly southward, forcing Wellington to give up his siege of Badajoz. Deadlock ensued for two months, and in fact the offensive spirit of the Fr. was gone. From Aug. to Sept. Wellington blockaded Ciudad Rodrigo, and M., seizing upon an opportunity afforded by the dispersed condition of Wellington's troops, advanced. He refused to close with his enemy, who succeeded in taking up prepared defensive positions; Wellington's manoeuvres were, in Graham's words, 'very pretty—but spun rather fine.' In 1812 Wellington went over to the offensive, captured Ciudad Rodrigo and Badajoz, M. being hampered by Napoleon's fatal system of trying to conduct the Sp. operations from Paris. In June Wellington advanced into Leon, and M. retired behind the Douro to await reinforcements. In July he took the offensive, manoeuvred Wellington from his positions, and threatened his communications with Portugal. Both armies then moved on parallel lines, M. attempting, but failing, to cut his opponent's retreat. At Salamanca (July 22) M. made the fatal mistake of over-extending his line, in his persistent attempt to menace Wellington's retreat. The latter seized his opportunity and attacked. M. was completely defeated and beat a precipitate retreat, with the loss of nearly 15,000 men. In 1813 he commanded a *corps d'armée*, and fought at Lützen, Bautzen, and Dresden. He maintained the contest with great spirit in France in the beginning of 1814, and it was not until further resistance was hopeless that he concluded a truce with Barclay de Tolly, on which Napoleon found himself compelled to abdicate. On the return of

Napoleon from Elba he was obliged to flee. On the outbreak of the revolution in 1830, at the head of a body of troops, he endeavoured to reduce Paris to submission, and finally retreating with 6000 Swiss, and a few battalions that had continued faithful to Charles X., conducted him across the frontier. From that time he resided chiefly in Vienna. In 1832 he engaged in an effort for the fusion of the Fr. Legitimists and Orleanists, but *d.* at Venice on March 2 of that year. His memoirs were pub. 1857-58.

Marmontel, Jean François (1723-99), Fr. novelist and dramatist, *b.* at Bort in Limousin. An acquaintance with Voltaire brought him to Paris in 1745. Voltaire introduced him to sev. persons of distinction, and the success of his first tragedy, *Denis le tyran* (1748), stamped him as a dramatic poet. His celebrated *Contes moraux* (1765) gained him great reputation. On the death of Duclos he became historiographer of France; and in 1783 he was made secretary to the Académie in the place of D'Alembert. He lost his appointments and his property on the breaking out of the revolution, and he removed some distance from Paris in a state of destitution. In 1796 he became a member of the National Institute. His best achievement was the posthumous *Mémoires d'un père* (1804). See K. Knauer, *Ein Künstler poetischer Prosa in der französischen Vorromantik*, 1936.

Marmora, Alfonso Ferrero La, *see* LA MARMORA.

Marmora, Sea of (anct. Propontis), between Europe and Asia, connected with the Ægean Sea by the strait of the Dardanelles, and with the Black Sea by the Bosphorus. Its length is 175 m., and its greatest breadth about 50 m., while in some parts it is over 4000 ft. deep. Among the is. in this sea is that of M., celebrated for its marble quarries.

Marmosets, or *Ouistitis* (Hapalidæ), family of S. Amer. monkeys, sometimes called bear-monkeys (Aotopithecini) from their somewhat bear-like extremities, the feet having paws and claws which are

necessary for the M.'s mainly insectivorous habits. The face is short, and the thirty-two teeth include only two molars on each side. The tail is not prehensile. M. are all arboreal in habit, climbing and jumping with great activity. They are not very intelligent, but their gentleness and pretty appearance make them interesting pets. The common M. (*Haplateachnus*) is about the size of a squirrel, with darkish brown fur and long bushy tail marked with alternate rings of black and grey. The side of the head bears a long tuft of whitish hair over the ears.

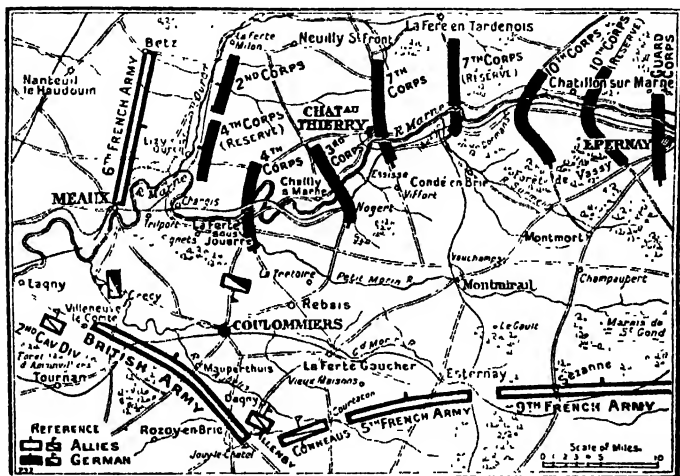

Marmot (*Marmota*), genus of rodents, usually ranked among the Muridæ, but regarded as forming a connecting link between that family and Sciuridæ; resembling squirrels in their dentition, although in their form and habits they more resemble rats and mice. They have two incisors and two premolars in each jaw, four molars on each side above, and three below. The common M., or alpine M. (*M. marmota*), is a native of the Alps, the Pyrenees, and the more N. mts. of Europe, up to the limits of perpetual snow. It is not a native of Britain. It is about the size of a rabbit, greyish-yellow, brown towards the head. It feeds on roots, leaves, insects, etc., and is gregarious, often living in large societies. It digs large burrows with sev. chambers and two entrances, generally on the slopes of the mts. They spend the winter in their burrows, in one chamber of which is a store of dried grass, but the greater part of the winter is passed in torpidity. The alpine M. is easily tamed. The Quebec M., found in Canada in woody dists., is a burrowing but not a gregarious animal.

Marne: 1. Riv. of France, the anct. *Matrona*, the longest trib. of the Seine on the right. It rises in the plateau of Langres, and joins the Seine at Charenton, 4 m. above Paris. Its length is 325 m., and it is navigable for 126 m. It is rather a rapid stream, and in most places with a wide bed. The commerce carried on upon this riv. has been extended by means of canals, which link up the Rhine and the Aisne. The most important of these is the one completed in 1851 connecting it with the Rhine. 2. Inland dept. in the N.E. of France, formed out of the old prov. of Champagne, is traversed by the R. Marne, and extends southward from the frontier dept. of Ardennes. Area 3167 sq. m. The soil is very fertile in the S., but chalky and arid in the N. The surface is undulating in the centre of the dept., the remainder being of a level character. It is in the dry and chalky soil of the N. of this dept. that the best varieties of the famous Champagne wines (*q.v.*) are grown. Other industries include tanning, iron and copper founding, brewing, and pottery manuf. The rearing of a Sp. breed of sheep is a chief branch of industry, and woollen manufs. are largely carried on. Cap. Châlons-sur-Marne. Pop. 386,900. See also MARNE, HAUTE.

Marne, Battles of the (1914; 1918). The first battle of the M. (fought Sept. 6-9, 1914) was one of the decisive battles of the First World War (and of all time), and had

a direct bearing on Germany's ultimate defeat. The victorious sweep of the Ger. right wing under von Kluck (*q.v.*) pressed back the Allies' left flank, first in a S.W. direction, changing to S., then S.S.E., in an endeavour to envelop it and bring about a hasty collapse, in accordance with the approved Ger. plan. The Brit. Expeditionary Force was on the left of the Allies' line for a time, but in retreating to S. of the M., Joffre (*q.v.*), the commander-in-chief, formed a new army under Gen. Maunoury on the Brit. left. He formed another new army under Gen. Foch, which took up a position in the centre of the left section of the Allies'

den move caused a gap to appear on Kluck's left and Bulow's right, at which the Brit. struck with great effectiveness, and drove the Gers. back beyond the Grand Morin and Petit Morin. This disorganised the entire Ger. front on this flank, and at 11 a.m. on Sept. 9 Kluck received the order to retire. This exposed von Bulow's right still more, and gave Foch the opportunity for which he had been waiting. A considerable number of Gers. being held fast in the bogs about the marshes of Saint-Gond, Foch struck hard at Bulow's centre, right, and left. Maunoury had also driven the Gers. from the Ourcq and the Brit. then crossed the

THE FIRST BATTLE OF THE MARNE, 1914

The 1st issue

line which faced N., 'holding the débouchés to the south of the marshes of Saint-Gond and posting a part of its forces on the plateau to the north of Sezanne.' When von Kluck changed direction he exposed his own right flank to Paris, and Gen. Gallieni (*q.v.*), the governor, communicated with Joffre as soon as this movement became discernible. Joffre, thereupon, made arrangements to fall upon Kluck as soon as he was deeply committed to the new direction. He allowed him to advance over the M. and the Grand Morin. On Sept. 1 Joffre issued orders for an attack to be launched on Sept. 6. The situation on Foch's front was extraordinary, in that there existed a gap fifteen kilometres wide, but fortunately a similar gap existed in the Ger. line. Great pressure was brought against the Allies' line towards the E. of the marshes of Saint-Gond on Sept. 8. Maunoury, on the extreme left, however, now began to attack Kluck, who, realising that he had exposed his right flank, at once faced W. to meet the danger. This sud-

den move caused a gap to appear on Kluck's left and Bulow's right, at which the Brit. struck with great effectiveness, and drove the Gers. back beyond the Grand Morin and Petit Morin. This disorganised the entire Ger. front on this flank, and at 11 a.m. on Sept. 9 Kluck received the order to retire. This exposed von Bulow's right still more, and gave Foch the opportunity for which he had been waiting. A considerable number of Gers. being held fast in the bogs about the marshes of Saint-Gond, Foch struck hard at Bulow's centre, right, and left. Maunoury had also driven the Gers. from the Ourcq and the Brit. then crossed the

M. at Chateau-Thierry (*q.v.*). The Ger. right was now in full, but orderly, retreat. See C. le Goffic (trans. by Lucy Menzies), *Foch at the Marne*, 1918.

The second battle of the M. arose out of the final Ger. offensive. This offensive was launched in March 1918, and the initial result was the creation of a large salient in the Allies' line in the direction of Amiens. In May a great effort was made by the Gers. between Soissons and Rheims to break through to Paris. On this occasion the M. was reached about Chateau-Thierry. On July 15 the Gers. launched a further offensive in this area and crossed the M. between Chateau-Thierry and Ruell (E. of Rheims), thus creating another and dangerous salient. Against the W. face of this bulge Foch launched a Franco-Amer. force on July 15, the Amers. capturing Courchamps, Torcy, and Belleau. The fighting was very stubborn, and 16,000 prisoners and fifty guns fell to the Allies. This victory showed the weakness of the Ger. position on the M., and they gradually withdrew.

They recrossed to the N. bank by July 20, under pressure, but without undue loss. Château-Thierry was abandoned the next day, and the withdrawal continued daily but the retreating forces clung desperately to Buzancy (q.v.), which was not taken until July 29. On the 31st the Amers. defeated the Gers. at Serings, thus wiping out the salient altogether. This ended the second battle of the M. See also FRANCE AND FLANDERS, FIRST WORLD WAR, CAMPAIGNS IN; WAR, THE FIRST WORLD.

Marne, Haute-, dept. of N.E. France, formed from the S.E. part of Champagne, with parts of Burgundy, Lorraine, and Franche-Comté, divided into three arrons.: Chaumont, Langres, and Vassy. The centre of the dept. is formed by the plateau of Langres, the highest point being Haut-du-Seo (1695 ft.) in the S.W. To the N.E. are the Monts Faucilles. The low country forming the remainder of the dept. is called the Bassigny. The dist. contains the upper basins of the Marne, Ouse, and Aube, tribs. of the Seine, the Meuse, and some small tribs. of the Rhône. There is considerable forest land. The soil is mostly poor, but cereals and vines are produced in parts. There are iron-mines and mineral springs. Cap. Chaumont. Area 2420 sq. m. Pop. 181,800.

Marnix, Philipp van, Baron Sint Aldegonde, see **SAINT-ALDEGONDE**.

Maroc, or **Marocco**, see **MOROCCO**.

Marochetti, Carlo, Baron (1805-63), It. sculptor, settled in Paris after 1827, and was a pupil of Baron Bosio. His works include 'A Girl Playing with a Dog' (1827); 'The Battle of Jemappes', a relief on the Arc de Triomphe of Paris; equestrian statues of Emmanuel Philibert and the duke of Orleans; and in Great Britain an equestrian statue of Richard Coeur de Lion (1851), now at Westminster. Statues to Queen Victoria (1854) and Wellington at Glasgow, and the Inkerman monument at St. Paul's are by him.

Maronites, oriental religious body, so called from their Syrian founder, St. Maro (fl. before 423). Their first home was Mt. Lebanon, and they also dwelt in Anti-Lebanon and Hermon, and near Antioch. Originally Monothelites, becoming prominent in 713, owing to the Monothelite controversy, they became united to the Rom. Church (c. 1182), and since 1216 have been steadfast Catholics. Their head, styled the patriarch of Antioch, resides at the monastery of Kanobin on Mt. Lebanon. In 1584 a Maronite college was founded at Rome for training their clergy. See Schnurrer, *De ecclesia Maronitica*, 1810; F. J. Bliss, *Palestine Exploration Fund Quarterly Statement*, 1892; and P. Dill, *Étude sur la liturgie maronite*, 1919.

Maroons, or **Negres Marrons** (Sp. *cimarrón*, fugitive, or, possibly, *cima*, mt.-top), name applied in Jamaica and Dutch Guiana to runaway Negro slaves. The term was first used of the Negroes of Jamaica who fled from their defeated Sp. masters to the mt. fastnesses in the W. Indies after the Eng. occupation of Jamaica (1655). They long resisted the

Brit. colonists and, although treaties were made with them from time to time, they were not finally pacified until 1796, when, following a rebellion and the Maroon war (the cost of which was \$350,000), many of them were transported to Nova Scotia and thence to Sierra Leone. In the same period the M. of St. Lucia also gave trouble to the Eng. Gov. and the is. was designated by the Fr. Convention 'the Faithful' on account of the support which its inhab. gave to Fr. revolutionary principles (see **ST. LUCIA**). Maroon Town, once called Trelawny Town, in Jamaica, where the M. made their last stand against the gov. in 1795, has practically disappeared, and Accompong, still a Maroon settlement, is also in the wild and romantic cockpit country, a dist. about 150 sq. m. in area in the W. central part of the is.

Maros River, riv. in Rumania and Hungary, and a trib. of the R. Theiss, which it joins at Szegedin. It rises in the Carpathians and is 450 m. long.

Maros Vasarehely, tn. and the cap. of Maros-Torda co., Hungary, on the Maros R., 52 m. N.N.E. of Sibiu. Pop. 25,000.

Marot, Clément (c. 1496-1544), Fr. poet, b. at Cahors, son of Jean des Mares, surnamed Marot—one of the *rhétoriqueurs*—through whose influence he was introduced to court circles and entered (1518) the service of Margaret d'Alençon, afterwards queen of Navarre. In 1525 he accompanied the campaigns of Francis I. in Italy (1520 and 1525) and is said to have been wounded and taken prisoner at the battle of Pavia. Soon afterwards he was imprisoned for heresy (c. 1526) despite his protestations, but through the intervention of Margaret, his patroness, he was set at liberty some months later. He had, however, made enemies by his witty satires against the Sorbonne and, being suspected of sympathies with Protestantism, had to flee to the court of Queen Margaret and later to that of the duchess of Ferrara. He returned to France in 1536 on condition of a formal recantation, but once more he was forced to leave France, his trans. of the Psalms (I. to I.) (1543) having been condemned by the Sorbonne (this work was subsequently completed by Bozal). M. went to Geneva, but the austerity demanded of the true Calvinist was beyond him and he went on to Turin, where he d. The works of M. consist of trans. and allegories such as the trans. of the *Metamorphoses* (books I. and II.), his *Temple de Cupido* (1515), his *Adolescence* (*Clémentine* (1532-33), and his allegorical satire *Enfer*; of *chants royaux*, *rondeaux*, *ballades*, and *épigrammes*; of occasional pieces such as *étrennes* and *blasons*; and of his trans. of the Psalms (1541). In poetic inspiration and education M. belongs to the preceding century and his learning is that of the Middle Ages. Boileau indeed exaggerates when he credits M. with new and original rhythmical combinations, for M. changed very little in the traditional medieval verse-forms and although he occasionally shows the influence of the classics, Virgil or Catullus or Ovid, he remains essentially a national poet. He is a poet of charm

but not of higher flights and his work is in the main pretty rather than beautiful. But his great service to Fr. poetry is that he restored naturalness and simplicity and replaced artificial excess of ornament and allegory by native grace. His rondeaux, epigrams, epistles, and ballades are examples of his best poetry. Among the most notable are the two epistles to the king, one *Pour avoir été dérobé* and the other *Du temps de son exil à Ferrara*, and his famous rondeau *Au bon vieux temps au train d'amour regnoit*. In epigram he has rarely been surpassed and indeed the phrase 'Marotic style' refers to this kind of verse. La Fontaine and others imitated the style *marotique*. His *Collected Works* appeared in 1538 and 1544; P. Jannet's ed., 1868-72; Piffreau's ed., 1885; G. Guiffrey's ed., i-iii, 1875-81, iv-v, 1929. See lives by E. O. Douen, 1878-79; H. Morley, 1871; P. A. Becker, 1926; and J. Plattard, 1938; also C. A. Sainte-Beuve, *La Poésie française au XVI^e siècle*, 1828, and C. E. Kinch, *La Poésie satirique de Clément Marot*, 1940.

Marozia, or **Mariuccia**, Rom. lady of the tenth century (d. c. 938), daughter of Theodora, noted for her beauty and profligacy. She married successively Alberic I. of Tuscany, Guido of Tuscany, and Hugo, king of Italy, and was probably mistress of Pope Sergius III. She had Pope John X. deposed and murdered (c. 928), and was instrumental in raising her sons John XI., John XII., and Leo VIII. to the papal throne. She had thus entire control of Rome for some years, but was imprisoned by her son, Alberic II. (932).

Marple, urb. dist. and par. in the co. of Cheshire, England, 9 m. S.W. of Manchester. It is engaged in cotton manuf. Pop. 7400.

Marprelate Controversy, Puritan attempt to defy the power of Whitgift, archbishop of Canterbury, and the Star Chamber. John Penry commenced the struggle in 1587 with a petition to Parliament accusing the bishops and clergy in Wales of gross neglect of their duties. He was arrested, but only suffered a slight imprisonment. Then from 1588 the country was flooded with bitter pamphlets issued from a secret press under the pseudonym of 'Martin Marprelate,' possibly Job Throckmorton, but John Udall was one of the suspected authors. The *Cambridge History* (iii. 378 ff.) dates the first extant pamphlet Nov. 1588, and the seventh and last Sept. 1589. These were answered in equally bitter and unrestrained language by the Anti-Marprelatists, chief among whom were John Lyly and Thomas Nash. Public opinion would not allow harsh treatment of the Marprelatists, but when the heat of the controversy had died down, Henry Barrow and John Greenwood were arrested and hanged in 1593. See W. Pierce, *John Penry, 1559-93*, 1923; J. Davies, *Sir Martin Mar-Prele*, 1923; and W. Haller, *Rise of Puritanism*, 1938.

Marquand, John Phillips (b. 1893), Amer. novelist, b. in Wilmington, Delaware, U.S.A. Served with the artillery in the First World War. Chiefly known

for his satires of the upper classes of New England striving to retain their aristocratic Puritan pretensions in a modern world, as exemplified in *The Unspeaking Gentleman* (1922) and *Wickford Point* (1939). For his *Late George Apley* (1937), a story satirising the life of a Boston Brahmin, he was awarded the Pulitzer prize (1938). Other novels: *Four of a Kind* (1923); *The Black Cargo* (1925); *Ilavens End* (1933); *No Hero* (1935); and *Thank You, Mr. Moto* (1936), with other detective stories fashioned on the character of Moto, a Jap. sleuth.

Marque, Letter of, see LETTER OF MARQUE.

Marquesas, or **Marquezas**, Isles are, properly speaking, the S. group of the Mendana Archipelago, in Polynesia, the N. group bearing the name of the Washington Is.; but the name is now applied to the whole archipelago. The M. I., in lat. 7° 30' to 10° 30' S., long. 138° to 140° 20' W., were discovered by Mendana de Neyra, a Sp. navigator, in 1595; the Washington Isles were discovered in 1791 by Ingraham, an Amer. Sev. of the Is. were visited by Cook in 1774. The largest is. are Nukahiwa (the seat of the Fr. commissioner) and Hivaoua. The Is. are of volcanic origin, and are mountainous, rising in some cases to over 3800 ft. above sea level; the soil is rich and fertile, and the climate hot, but healthy. Coco-nut, bread-fruit, bamboo, and papaw trees are grown, and bananas, yams, plantains, oranges, and sugar-cane are cultivated. The inhab. are degraded in their religion and in many of their customs. Cannibalism, once practised, is now suppressed. Resolution Bay, in Tahuata, and Port Jarvis, in Roapoa, are the best harbours in the Is. In 1842 the M. I. submitted to the Fr., and now form a Fr. protectorate. Total area 480 sq. m. Pop. 2988, having decreased from 100,000 during the last century. See R. P. Linton, *Archæology of the Marquesas Islands*, 1925.

Marquetry (Fr. *marqueter*, to variegate, inlay), name of a kind of inlaid work similar to mosaic work, especially used for the decoration of furniture. It consists of veneering or inlaying plain white wood with costly woods of varied tints, or with other materials, such as tortoise-shell, ivory, metal, mother-of-pearl. Shaped pieces are so combined as to form beautiful designs. M. is a later development of intarsia; the pieces are affixed to a matrix by glue. The art was known from the earliest times to the Egyptians and Gks. and other E. peoples, and was introduced from Persia to Venice in the fourteenth century. The Dutch and Fr. *marqueteurs* (P. Gole, Vordt, Jean Macé, and A. C. Boule) are some of the most noted. Roentgen, Reisner, and Oeben were famous Ger. *chénistes* of the eighteenth century. See Eliza Turck, *Practical Handbook to Marquetry*, 1899; F. H. Jackson, *Intarsia and Marquetry*, 1903; and P. A. Wells, *Veneering, Marquetry, and Inlay*, 1904.

Marquette, co. seat of M. co., Michigan, U.S.A., on the S. shore of Lake Superior. Large quantities of iron ore are shipped from the docks, and the tn. manufs.

machinery and engines, and has iron foundries, lumber works, and fishing industry. Farming is carried on in the surrounding country. Pop. 15,900.

Marquis, Frederick James, see WOOLTON, BARON.

Marquis, or **Marquess** (at first an adjective, march count, O.F. *marquis*, from Romance *marca*, boundary). Originally in European countries this was the title of the rulers of certain frontier lands or marches (lords-marchers of

Marradi, Giovanni (1852-c. 1923), It. poet, b. at Leghorn. After leaving the univ. he became inspector of education for Massa-Carrara. His chief works are *Fantasia marine* (1881); *Nuovi Canti* (1891); *Ballate moderne* (1895); *Rapsodie Garibaldi* (1899-1904). An ed. of all his poetry was issued in 1904 under the title of *Poesie, nonamente raccolte ed ordinate*. As a poet he is noted for his elegant style and his love of nature.

Marradi, tn. in the prov. of Florence, Italy, 30 m. N.E. of Florence. Pop. 12,100.

Marrakesh, or **Morocco**, old cap. of the Moorish Empire, on the N. side of the Great Atlas range, 90 m. from the Atlantic coast, and 250 m. S.W. of Fez; has manufs. of carpets and leather, and is the centre of the trade of S. Morocco. The city was founded in 1072, and had a pop. of 700,000 in the fourteenth century, which has now declined to about 190,000.

Marriage and Marriage Law. REQUIREMENTS OF A VALIDLY CELEBRATED MARRIAGE—*The Religious Ceremony.* In Rom. times consent was of the very essence of a valid M. and religious ceremony a merely accessorial matter designed rather to bring the wife into the power of the husband and initiate her in the *sacra* of her new family. Later, mere dissent would suffice to dissolve the marriage state, with the inevitable result of a moral laxity that paved the way for Christian teaching. In England, prior to the decrees of the Council of Trent in 1563, it was the general European law that a mere agreement to marry, supplemented by cohabitation, was enough to constitute M., and that no formal, secular or eccles. ceremony was necessary. The Church, however, through the eccles. courts, could compel the parties to such informal arrangement to celebrate and register the M. in due form. But the validity of these informal Ms. was directly destroyed after 1540 by an Act which provided that a subsequent *formal* M. with another person constituted a valid M.; and some twenty years later the decrees of the council of Trent made a religious ceremony practically a *sine qua non* for all Catholic countries—decrees which after the Reformation had, of course, no civil force in Great Britain. It was only in 1753 that an Act was passed (Lord Hardwicke's Act) with the object of making a formal ceremony essential to an Eng. M. This Act was superseded by the Marriage Act of 1823, though the question of validity of informal as opposed to irregular Ms. (e.g. Ms. by 'Eccles. parsons,' see below) was left open; and again, informal Ms. are valid to this day in Scotland (see also HABIT AND RITE). Since the decision of the House of Lords in the case of *Regina v. Mills* in 1843, it is generally agreed that all secular forms of M. other than those allowed by statute, e.g. Ms. before a registrar, are invalid. Jews and Quakers, however, enjoy certain privileges. The indirect effect of this legislation was to foster the action of breach of promise, for the power of the eccles. courts to compel parties to marry

E.N.A.

MARRAKESH

The mosque of Sidi-Bel Abbas.

Great Britain, *marquesses* (*Markgrafen*) of the Continent). This foreign equivalent was very common on the Continent. Then it came merely to indicate a certain degree of the peerage in England, ranking below a duke and above a count or earl. Robert de Vere, ninth earl of Oxford, was the first M. in this sense, created 1385. He was created M. of Dublin by Richard II., to the great offence of the earls, who had to yield to him precedence. The marquessate became firmly estab. under Henry VI. in 1442. It was adopted in the Scottish peerage in 1599, when the Ms. of Huntly and Hamilton were created. The marquessate of Winchester, created by Edward VI., dates from 1551, and is the oldest in existence. the title is usually territorial in form, but may stand before a surname, the form 'marquess' now being used.

who had contracted to do so informally was abolished. One extraordinary result follows from the sanctity of the religious ceremony; a girl of twelve and a boy of fourteen can be married by the Church of England, though they would be incapable of contracting civilly. See, however, below.

English Statutory Provisions.—The Marriage Act of 1823 covers the chief points of the law relative to M. in Great Britain. In the case where the parties contracting the M. reside in different pars., the bans of M. must be pub. in both pars. The law prescribes the audible pub. according to the rubric, after the second lesson, on three Sundays preceding the ceremony. If three months elapse between the time of pub., and the proposed date of the M., the bans become void, and the parties must obtain a licence or agree to a republishing of bans. A M. may be performed in church on the authority of the superintendent registrar's certificate subject to the incumbent's consent. There are two kinds of M. licences: (1) The licence granted by the archbishop and bishops, through their surrogates, for M. in any church or chapel duly licensed for M.; (2) the special licence granted by the archbishop of Canterbury for M. at any time in any place on good reason being shown. The M. may be solemnised at any time between 8 a.m. and 6 p.m. and with open doors. It is a felony for any clergyman to conduct a M. where the bans have not been pub. or a licence obtained. The officiating clergyman must see to it that there are at least two witnesses present, and that the entries in the register-books are witnessed by two persons. M. with a deceased wife's sister was legalised in 1907 and M. with deceased brother's widow in 1921. By an Act of 1931 M. with various other persons (formerly within the prohibited degrees of relationship) was legalised as a civil contract; with the deceased wife's brother's (or sister's) daughter; with the father's (or mother's) deceased brother's widow; with the deceased wife's father's (or mother's) sister; and with the brother's (or sister's) deceased son's widow. The law with regard to the M. of infants is contained in the Guardianship of Infants Act, 1925, which provides that where both parents are alive the consent of each must be given; if one is deceased, the survivor must consent (and where a guardian has been appointed by the deceased, the survivor and the guardian must consent). By the Age of Marriage Act, 1929, M. under sixteen years of age is forbidden. Ms. may be conducted in a dist. register office or in a Nonconformist building registered for Ms. by certificate or by licence. Notice must be given personally to the superintendent registrar, a registrar of births and deaths, a registrar of Ms. or to the deputy registrar. A M. at a register office must take place in the presence of the registrar of Ms., and the superintendent registrar. If both parties reside in the same registration dist., the duration of such residence must have been at least seven days before the notice of M.

can be given. If the parties reside in different registration dists., notice by each must be given to a registration officer, such notice being valid only after a seven days' residence in one of the dists. In the case of M. by licence, one notice is necessary whether the parties live in the same or in different registration dists. Where both live in the same dist., one of them must have lived there for fifteen days before the notice can be accepted. If they live in different dists., notice may be given in either of the dists., provided the residential qualification has been fulfilled. Where this qualification has been fulfilled by one of the parties, the other must have been resident in England or Wales at the time of such notice. The Marriage Act, 1939, gives certain facilities in the case of one party residing in Scotland and the other in England; but the provisions as regards a M. in Scotland apply only to 'a regular M.' whereas no such distinction is necessary where the M. is to be solemnised in England. A certificate for M. (without licence) may be issued by the superintendent registrar after the lapse of twenty-one clear days from the date of entry of the notice in the notice-book, provided no impediment is shown. The M. may then take place within three calendar months from the date of entry of the notice. A certificate and licence for M. may be issued by the superintendent registrar, provided no impediment is shown, after the lapse of one week-day (Christmas Day and Good Friday excepted). The M. may then take place within three calendar months from the date of entry of the notice.

Foreign Marriages, or Marriages Abroad of British Subjects, and Marriages between Persons one at least of whom is not Domiciled in England.—The Foreign Marriage Act of 1892 provides that Brit. subjects may contract a valid M. in a foreign country provided they conform to the provisions of the Act. It is sufficient that one of the contracting parties be a Brit. subject. The M. officer must satisfy himself, where a M. according to local law is valid by Eng. law, that: (a) both parties are Brit. subjects; or (b) when only one is a Brit. subject the other is not a subject or citizen of the country; (c) When only one is a Brit. subject, and the other is a subject or citizen of the country, proper facilities do not exist for the solemnisation of the M. in the foreign country in accordance with the law of that country; or (d) when the man is a Brit. subject and the woman a subject or citizen of the country, no objection will be taken by the authorities of the country to the solemnisation of the M. under the Act. In the case of any M. under the Act, where the woman is a Brit. subject and the man a foreigner, the M. officer must be satisfied that: (a) the M. will be recognised by the law of the country to which the foreigner belongs; or (b) some other M. ceremony in addition to that under this Act has taken place, or is about to take place, between the parties, and that such other ceremony is recognised by the law of the country to which the foreigner belongs; or (c) the leave of

the secretary of state has been obtained. By the Marriage with Foreigners Act, 1906, notice of an intended foreign M. must be given by the King, party to a registrar in England, and a certificate showing that such notice has been given must be sent by the registrar to the M. officer. There is also provision in the Act for reciprocal action by foreign countries who inhab. desire to marry in England.

Marriage in the U.S.A.—The law regulating M. is not uniform throughout the U.S.A. The question is left to the law-making bodies of each individual state. The marriageable age varies widely. With parental consent, the age for males ranges from fourteen to twenty-one and for females from twelve up to eighteen. Without the consent of parents, the age for males ranges from fourteen up to twenty-one, but in most states the latter age is required. Without consent of parents the age for females ranges from twelve to twenty-one, but in the majority eighteen is the age required. In some states a child can be disinherited by law for marrying below the legal age without parental consent. A M. licence of some kind is required in every state of the union, usually obtainable from the co. clerk's office. Throughout the U.S.A. M. is now on the civil contract basis, but religious ceremonies are authorised in all states, provided a M. licence has been obtained. In many states there is no delay in issuing the licence or in marrying as soon as the necessary papers have been secured. In New York state a M. certificate must be filed within seven days, and all under twenty-one who wish to marry must present a birth certificate or other proof of age. In a considerable number of states a delay of five days is required before a M. licence is issued. In the S. M. between whites and negroes is unlawful, and in sev. S. states there is a similar prohibition of M. between whites and Indians. Many states also require proof that both the man and the woman are free from venereal infection. Common law M. of a year's duration or more without either licence or ceremony are now validated by the courts in most states upon proper proof and particularly where children or property are involved. In most Amer. states weddings can be performed at any time and place that suits the contracting couple. The number of M. reported for the U.S.A. in 1929 was 1,232,559 or 10.10 per 1000 pop. In 1946 the total number was 2,286,000 or 16.3 per 1000 pop.

MARRIAGE CUSTOMS, ANCIENT AND MODERN: Britons.—Among the anc. Britons a daughter was obliged to marry whomever her father selected for her husband. Courtship was of short duration, and the M. was celebrated at a cromlech in the open air, while sacrifices were offered.

Romans.—The oldest Rom. form of M. was called *confarreatio*, the name, and ceremony being derived from the time-honoured association of M. with the cultivation of corn. The *confarreatio* form of M. was competent only to those patricians who had the privileges of the *ius*

sacrum, and hence patricians and plebeians could not at one time intermarry. The plebeians had no analogous ceremony, and the wife only fell under the power (*manus*) of the husband either by a process of fictitious sale called *coemptio*, or by implication from remaining with the husband for one year; but *confarreatio* necessarily involved marital power. The civil form of *usus* was not introduced out of grace to the plebeians, but rather for the express purpose of preserving the patriciate; for otherwise the *sacra* would have had to be extended to the plebeians. The union of mere slaves was called *contubernium*, and was never regarded as more than a promiscuous relationship. The peculiarity of these old Rom. forms of M. was that they did not in themselves constitute the tie; they merely decided the position of the wife so far as the question of subjection to her husband's power was concerned. The tie itself was apparently constituted by the mere consent given on both sides, and the nuptials or rites and ceremonies of initiation into the husband's *sacra* were looked upon as merely accessory to such facts as evidenced the consent, e.g. the reception into the husband's home. The bar against patricians intermarrying with plebeians was removed four years after the decemviral revolution, viz. by the Cornelian Law (444 B.C.). In A.D. 9, after the extension of citizenship by the celebrated *Lex Papia Poppæa*, Romans were permitted freely to intermarry with foreigners and freedmen. By the time of Justinian, M. was a purely communal relationship subsisting only so long as the parties mutually consented to live with each other.

Greeks.—With the anc. Gks. the nuptial ceremony was a symbolic representation of the forcible carrying away of the bride, by way of allusion, it seems, to the Gk. tradition that a bridegroom should only be entitled to his bride by performing some heroic feat or subtle stratagem; e.g. the mythical hero Theseus is famous for the traditional abduction of Helen, daughter of Leda. On the wedding day, the betrothed pair, having lavied themselves in water drawn from some special fountain, went to the temple, followed by friends singing psalms of praise. Sacrifices were made at the altar, and the bride, at least if of the wealthier classes, was conducted to her new home in the evening in a chariot drawn by oxen or mules.

Egyptians.—In Egypt *mahr*, or dowry, is indispensable to union with a chosen female. The compact of M. is settled by the woman's *wakeel* (deputy). Among the upper classes the man has next to no chance of ever seeing the woman's face before M., and has perforce to satisfy himself with the description of her by professional *khdt'behs* or women whose vocation is to give men information about eligible girls. The M. contract is witnessed by two Moslems, and all present recite the Fât'eh or opening chapter of the Koran, the various phases of this ceremony being performed or controlled by a *shek* (schoolmaster). Formerly there were a great many more tedious

customary steps before the M. was completed. The curious part about Egyptian Ms. was that it was only at the last moment that the bridegroom, having paid what is called the 'price of the uncovering of the face,' had a chance of satisfying himself on the question of his bride's personal appearance. If he was not satisfied he generally retained her for a week or more before divorcing her (see E. W. Lane, *Modern Egyptians*, 1836). M. is no bar to the right of having concubines, who are, however, inferior in status to the legal wife.

Chinese.—According to the Chinese, M. goes by destiny, from the fact that the Buddhist teaching is to the effect that those connected in a previous existence become united in this. Once Yuelao, the deity of the moon, has united all predestined couples with a silken cord, nothing can prevent their ultimate M. Courtship and M. among the wealthy (Chinese are matters settled exclusively by the parents, who fix the time of the nuptials and consult, therefore, the calendar for a propitious day. The solemnisation of M. is always preceded by three days' 'mourning,' during which time all the relatives abstain from every kind of amusement, the reason for this custom being that the Chinese regard the M. of their offspring as a presage of their own deaths. Chinese fathers may sell their daughters in M. to whom they please. A son dare not refuse the bride selected for him by his father any more than the daughter can, but it is only among the lower orders that purchase and sale are common.

French.—In France a prov. M. requires both a civil and religious ceremony for its completion, all the pomp and parade being reserved for the latter occasion. The civil M. is performed at the mayor's office before a registrar, who, having made the necessary entries, reads passages from the Code Napoléon relative to the law of M. Prior to the church ceremony the parties have to produce their tickets of recent confession.

Hebrew Customs.—According to scripture the custom of purchasing brides prevailed among the descendants of Abraham and undoubtedly the custom still exists in many parts of the E. The alternative for a poor man was to obtain a bride by servitude. Conformably with oriental custom espousals began at a very early age, and males at the age of eighteen and females at twelve were competent to marry. The bride's hair was always disposed in ringlets, and so has been frequently compared to that of goats on Mt. Gilend. The ceremony itself was performed, as a rule, at the house of the bride's father, and usually, the latter acted as the 'celebrator,' if not, the rabbi or *hazzan* of the synagogue performed the duties of that office, which consisted in covering the head of the bride with the extremity of the bridegroom's *thelot* and consecrating a cup of wine. After the ceremony there was usually a procession with dancing and music by torchlight to the groom's house, the pair walking

or being borne along under a canopy. Modern Jewish weddings are, or were till recently, remarkable for the curious custom of 'sitting for joy,' by which is meant that the bridegroom, after visiting the synagogue for the 'reading of the Law,' sits in his bride's home and for the whole day receives congratulations.

Scottish Customs: Gretna Green Marriages.—Gretna Green is celebrated in hist. as having been the first convenient halting-place for fugitive couples from England. The rule of law being that a M. was valid if contracted according to the law of the place where the parties enter into the contract, the couple being in Scotland had but to make a mutual declaration of M. before a witness—the work of a moment—and such ceremony obviated all difficulties of age, consent of parents or guardians, banns, and so forth. (see R. Elliott, *The Gretna Green Memoirs*, 1842.) The efficacy of Gretna Green Ms. was destroyed by the provision in the Marriage Act, 1856, which requires residence for three weeks in Scotland of at least one of the parties (see also GRETTA GREEN). 'Handfasting' was an old customary form of M., which for long prevailed in Eskdale and neighbourhood. According to Sir John Sinclair's *Statistical Account of Scotland* (1794), couples chose each other at some time-honoured fair, and, after a year of cohabitation, they continued together for life if such probationary period proved mutually satisfactory. If not, they separated, and the disaffected one was saddled with the issue. If each was disaffected it seems the husband had the issue. Later, such Ms. were looked upon as perfect only when subsequently confirmed by a priest. Betrothal by hands clasped across a brook in which the pair had been previously washed has a more spiritual flavour about it, and is celebrated as the ceremony that took place between Burns and 'Highland Mary.' In many rural dists. the name of 'ponny weddings' was popularly given to those weddings which were characterised by the observance of the ant. custom of levying a penny (equivalent to a modern shilling) from all who were going to be present at the celebrations. It seems that during the seventeenth century these weddings degenerated into scenes of disorder, and in 1645 they were condemned by the General Assembly. See C. Rogers, *Scotland, Social and Domestic*, 1869.

Welsh Customs.—The old custom of giving 'bidding letters' intimating an intended M., its date, and the intent of the parties to make a bidding at some inn to ask for the pleasure of the company and support of the parties to whom the letters were sent, was formerly almost universal. There was also an old Brit. custom called 'purse and girdle,' by which the bride's goods, comprising generally an oak chest and feather bed, were taken on the day before the M. to the bridegroom's house, while the groom in the evening received his friends' gifts. Cardigan weddings were often characterised by a procession of friends headed by a harper or fiddler.

Fleet Marriages.—These were clandestine M.s., that generally took place at the Fleet prison without pub. of banns by real or pretended clergymen, known to posterity and the readers of Tom Brown's works as Fleet parsons. The first recorded M. at the Fleet is that mentioned in a letter from Alderman Lowe to Lady Hickee in 1613, wherein the writer states that a mutual acquaintance of theirs, one George Lester, having on the previous day in the 'Fleette' married the wealthy mother-in-law of one Thomas Fanshawe, would be able to 'lyve and mayntayn himself in prison.' Formerly these M.s. took place at Duke's Place and Holy Trinity, Minories, until checked by the State, after which they were continued in unabated vigour at or in the vicinity of the Fleet by parsons, real or bogus, who were generally prisoners in the Fleet with neither money nor credit to lose by any proceedings which the bishop might see fit to institute against them. The last of the Fleet weddings was in 1754 when, after years of abortive legislation, Hardwicke's Marriage Act of 1754 came into operation.

Marrickville, tn. in Cumberland co., Nev. S. Wales, 3½ m. S.W. of Sydney. Pop. 22,000.

Married Women's Property, see HUSBAND AND WIFE.

Marriott, Sir John Arthur Ransome (1859-1945), Eng. historian. He was educated at Repton and New College, Oxford, where he was a lecturer. As secretary of the univ. extension delegacy he showed administrative ability and no mean powers as a lecturer to large audiences. In 1914 he was elected to a fellowship at Worcester College, where he was already lecturer in modern hist. He sat as Conservative M.P. for Oxford City from 1917 to 1922, and for York, 1923-28. Known widely as a historian of modern times, and as a writer on constitutional and imperial subjects, modern diplomacy in relation to the E. question (q.v.), European hist. from Waterloo to the Versailles Treaty of 1920, and the growth of the Brit. Empire were his main chosen fields. He wrote also on economics and finance. His later works include *The Eastern Question* (1917); *Economics and Ethics* (1923); *A History of Europe from 1816 to 1923* (1931); *The English in India* (1932);

Oxford: its Place in National History (1933); *Commonwealth of Anarchy* (1937); *The Evolution of the British Empire* (1939); *English History in English Fiction* (1940); *A Short History of France* (1942); *Federalism and the Problem of the Small State* (1943); *Anglo-Russian Relations* (1944); and *Memoirs of Fourscore Years* (pub. 1948).

Marrow, fatty substance filling the central cavities of tubular bones and the interstices of cancellous or spongy bone. It consists of fat cells, red corpuscles fully developed and some in process of formation, and giant cells called myeloplaxes. There are two kinds of M.: red M., which is associated with the early life of animals, and yellow M., which fills the tubular bones in later life. The function of the M. is the formation of red corpuscles, and in certain forms of anaemia the diseased condition is probably due to a disturbance of this function. In some such cases the M. has been found to have undergone great changes, and to tend to revert to its embryonic condition. M. has been employed in the treatment of pernicious anaemia.

The vegetable M. is a kind of gourd (q.v.). **Marrow Controversy**. In 1718 an old Eng. puritanic book called *The Marrow of Modern Divinity*, first pub. in 1646, was republished by some Scottish divines, including Thomas Boston of Ettrick in Selkirk. Its extreme Calvinism caused the General Assembly to condemn it as antinomian in 1720. This caused a great religious struggle in Scotland, at its fiercest from 1718 to 1722. This controversy eventually led the General Assembly to depose the Rev. Ebenezer Erskine, and three others. They anticipated this decision by seceding and forming an 'Associate Presbytery' in 1733. Differences among the seceders themselves eventually led to the formation of 'burghers' and 'antiburghers.'

Marrucinian Dialect, see under LATIN LANGUAGE AND LITERATURE.

Marryat, Frederick (1792-1848), Eng. sailor and novelist. b. at Westminster, and second son of Joseph M., who was at one time M.P. for Sandwich. He received a private education and joined the *Impériuse*, under Lord Cochrane, in 1806. He formed a lasting friendship with Sir Charles Napier and Houston Stewart. In 1812 he was promoted to the rank of lieutenant. He married, in 1819, Catherine, second daughter of Sir Stephen Shairp, of Houston, Lulithgow. He took command of the *Beaver* sloop in 1820, and was employed on the St. Helena station until the death of Napoleon. Serving in the Burma war of 1824 it was on his suggestion that the *Diana* was used, the first employment of a steamship on active service. He succeeded to sev. other appointments, but finally gave up the sea after being nominated C.B. in 1830. He was elected a fellow of the Royal Society in 1819, through adapting Sir Hume Popham's system of signalling to a code for the mercantile marine. In 1833 the king of France decorated him with the Legion of Honour.

After his retirement from the navy he gave himself up to novel writing. Included in his works are *The Naval Officer, or Scenes and Adventures in the Life of Frank Mildmay* (1829); *Peter Simple* (1834); *Mr. Midshipman Easy* (1836); *The Phantom Ship* (1839); *Masterman Ready* (1841); *Percival Keene* (1842); *The Settlers in Canada* (1844); and *The Children of the New Forest* (1847). He wrote a pamphlet, *Suggestions for the Abolition of the Present System of Impressment in the Naval Service* (1822), which created a profound impression in naval circles at the time. He pub. sev. caricatures of a political and social nature. His stories, taken from personal experience, are full of life, humour, and stirring narrative. See *Life and Letters of Captain Marryat* by his daughter, Florence (herself a novelist), 1872; and also a life by D. Hannay, 1889. See also M. McGrath, *A Century of Marryat*, 1929; and C. Lloyd, *Captain Marryat and the Old Navy*, 1939.

Mars, Mlle (Anne Françoise Hippolyte Boutet-Monvel) (1779-1847), Fr. actress, the favourite actress of Napoleon I., especially distinguished in comedy. She joined the Comédie Française (1799), her first great success being in *L'abbé de Pépée*, 1803. In the plays of Molière, Marivaux, Scarron, and Beaumarchais she was unrivalled, and she created parts in many less known plays. Mlle M. retired in 1841, appearing as Céliénne in *Le Misanthrope* and Araminte in *Les Femmes savantes* for her 'benefit.' She made great reforms in stage costume. Her *Mémoires and Confidences* (pub. by R. de Beauvoir, 1849, 1855) are of doubtful value.

Mars, Mavors, Marmar, or Marmars, in Rom. mythology the god of war (Gradivus), early identified with the Gk. Ares. As patron of agriculture he was known as Silvanus, and as protector of the Rom. state was worshipped as Quirinus. He was held next in importance to Jupiter, and never entirely lost his essentially Il. character. See W. H. Roscher, *Apollo and Mars*, 1873; W. Warde Fowler, *Roman Festivals*, 1908; and G. Wissowa, *Religion and Kultus der Römer*, 1912.

Mars, whose orbit lies between those of the earth and Jupiter, and which is therefore the fourth planet from the sun, has been known from very early times. When nearest to the earth (about 35,000,000 m.) M., which shines with a reddish light, has more than twice the brightness of the brightest star, viz. Sirius, the dog-star. The mean distance of M. from the sun is 141,500,000 m., or about one and a half times that of the earth from the sun, and its diameter is 4230 m., or about half that of the earth. As a wealth of detail is visible on the surface of M., its period of rotation has been calculated to a nicety, being slightly more than that of the earth, viz. 24 hrs. 37 min. 23 sec.

M. is possessed of two very small satellites, whose diameters cannot be more than 7 m. Both satellites are very near to M., the nearer, Phobos, being only 5800 m., the outer, Deimos, being 14,600 m. from the centre of M. These minute

bodies were observed by Asaph Hall with the large refractor of Washington observatory in 1877. So Dean Swift, when he made Mr. Lemuel Gulliver relate that the astronomers of Laputa had discovered two Martian satellites, was merely shooting an arrow at a venture, but it happened to hit the target. One of the most interesting of scientific speculations is as to whether life is possible on M., and much has been written on this subject. The arguments in favour of life are the 'canals,' or sharp thin lines on the planet's surface, which would appear to be the product of intelligences, and the seasonal waxing and waning of the white polar caps, which may be of snow, thereby indicating the presence of water, a prime necessary of life; they may, however, be of carbon dioxide, which does not imply water. On the other hand it is suggested that the 'canals' are merely the interpretation given by certain observers to natural features on the planet. In addition the spectroscope shows that the Martian atmosphere must be of extreme rarity. Recent work by Dr. G. P. Kuiper has estab. the presence of carbon dioxide in the atmosphere, in quantity equal to that in the earth's atmosphere; ammonia and methane would seem to be absent. He supports the theory that the polar caps are of water-vapour and ordinary snow. Also there are seasonal green patches, the nature of which may be determined by infra-red spectrograph. See P. Lowell, *Mars and its Canals*, 1906; and *Mars as the Abode of Life*, 1908; G. H. Hamilton, *Mars at its Nearest*, 1926; R. T. Gould, *Canals*, 1929; H. Spencer Jones, *Worlds without End*, 1935, and *Life in Other Worlds*, 1940; and F. Whipple, *Earth, Moon, and Planets*, 1941.

Mar Saba, deep canyon on the E. side of the plateau of Judea, Palestine, where it abruptly slopes to the Lower Jordan and the Dead Sea. The Arabs use the natural caves in the *wadis* for camps for their families. Between Bethlehem and the Dead Sea at the head of the canyon lies the orthodox monastery of St. Sabbas (or Mar Saba), an ant. settlement of ascetics estab. in the fifth century. Ladies are not admitted to the monastery, which stands precipitously on the side of the canyon, but are able to overlook it from a medieval tower outside the porch. About forty-five monks inhabit the monastery, where they lead lives of great austerity. (See illustration, p. 38.)

Marsala, fortified seaport of Trapani prov., W. Sicily, 58 m. W.S.W. of Palermo. It is on the site of Lilybæum, the chief Carthaginian stronghold in Sicily, which long resisted siege by Pyrrhus and the Romans, but eventually surrendered in 241 B.C. It has a cathedral, a vibrating bell-tower, and a noted grotto and well. There is a trade in wines, grain, and oil, wine and brandy being the chief exports. It has salt mines and white marble caves near. Garibaldi and his patriots landed here (1860). In the invasion of Sicily in 1943 the churches of S. Girolamo, del Collegio, Madonna della Cava, and S. Salvatore were destroyed and some damage was sustained by those of S.

Antonio di Padova, del Carmine, S. Giuseppe, and others; and the civic museum was almost completely destroyed, the Flem. triptych of the 'Adoration' being lost under the debris. Pop. 60,200.

Marsala, name of various wines manufactured at M. by building up and strengthening the wines of Sicily, especially of a light-coloured wine resembling sherry. It contains 20 to 25 per cent of alcohol. M. wine is often sold as Madeira, port, etc.

as *Le Chant de guerre pour l'armée du Rhin*. It was an instant success and became known far and wide before it appeared in print on July 7, 1792, in *Affiches de Strasbourg* (or *Strasburgisches Wochenblatt*). It was sung by the volunteers of Marseilles (hence its present name) as they entered Paris (July), and at the storming of the Tuilleries (Aug.). Forbidden under the Restoration and the second empire, it again became the national song during the Franco-Ger. war. See A. Rouget de

D. McEash

THE TERRACED MONASTERY OF MAR SABA, NEAR THE DEAD SEA

It was founded in the fifth century by St. Sabbas. Its wealth during succeeding centuries caused it to be repeatedly plundered and it became necessary to fortify it.

Marsden, William (1751-1836), Eng. orientalist and numismatist, went to Sumatra (1771) in the service of the E. India Company, and estab. an E. India agency at Gower Street, London (1785). He was secretary to the Admiralty (c. 1795-1804). His works include *History of Sumatra* (1783); *Dictionary and Grammar of the Malay Language* (1812); a trans. of Marco Polo (1817); *Numismata illustrata Orientalia* (1823-25). He presented his coin collection to the Brit. Museum (1834), and his library of oriental books and MSS. to King's College, London.

Marsden, small tn. in the W. Riding of Yorkshire, England, in the Colne Valley, 7 m. W.S.W. of Huddersfield. It has silk, cotton, and woollen factories. Two reservoirs of the Huddersfield water supply are at M., and a canal tunnel is in the neighbourhood. Pop. 7000.

Marseillaise, stirring Fr. national anthem, composed by Rouget de Lisle (1792)

Lisle, *La Vérité sur la paternité de la Marseillaise*, 1865; A. Loquin, *Les Mélodies populaires de la France*, 1879; monographs of F. N. Le Roy de Saint-Croix, 1880; A. Loth, 1886; and H. Wendel, 1936.

Marseilles (Fr. *Marseille*), first seaport of France and of the Mediterranean, and cap. of the dept. of Bouches-du-Rhône, is situated on the gulf of Lions, 410 m. in a direct line S.S.E. of Paris. M. is a military place of the fourth class, and is defended by a citadel and other works; the roads are protected by the fortified isles of If (crowned by a castle, once a state prison), Pomégué, and Ratonneau. Its harbour is formed by an inlet of the sea running eastward into the heart of the city and has great natural and artificial advantages. Immediately N. of the harbour is the old tn., with narrow streets, lined with high, closely piled houses. It contains the cathedral, a structure originally built out of the ruins of a heathen

temple in the fourth century. Westward from the old tn., and connected with it by a beautiful street, Le Cours, is situated the modern tn., elegantly built and laid out. Here the shops and houses rival in splendour the finest in Paris. Other fine streets are the Cours Bonaparte and the Promenade de Tourette. The site of the city is a valley surrounded by hills, the highest of which is Notre-Dame de la Garde. M. has schools of hydrography, medicine, drawing, and music; five hospitals, an

with the whole of Provence, to France in the reign of Charles VIII. In 1720, when it had again risen to great importance, it was ravaged by a fearful epidemic, and 40,000 of its inhabs. swept away. In the Second World War M. was occupied by the Gers. from 1940 to 1944. It fell to the Fr. maquis supported by Franco-Amer. invading forces on Aug. 23, 1944. It required another five days after the Allies entered M. to eliminate knots of resistance in the city. but, meanwhile, the

MARSEILLES

observatory, various learned societies, a fine public library, a cabinet of natural hist., botanical gardens, and a picture gallery. Shipbuilding and the allied employments of a seaport are carried on. Many million tons of shipping are entered and cleared annually, and there is extensive trade in grain, coal, soap, oil seed, and petroleum. During a portion of the year the climate of M. is delightful, but in summer and autumn the heat is often intense.

M. was founded by a Gk. colony from Phocæa, in Asia Minor, about 600 years B.C. Its anct. name was Massalia, written by the Roms. *Mossilia*. It was an important member of the anct. Gk. community, planted numerous colonies along the N. Mediterranean shores, and introduced the genius of Gk. civilisation into Gaul. In the eighth century it was destroyed by the Arabs and the maritime republics of Italy inherited the commerce of the Mediterranean, which formerly had been centred in M. It was united,

sweep N. of the city of the Amer. Seventh Army carried the invaders swiftly to the Rhône. Pop. 636,200.

The Harbour of Marseilles.—Up to the middle of the nineteenth century the port had only one dock, the Lacydon or Vieux-Port, whose first quays had been constructed in the sixteenth century and then enlarged at some time before being reconstructed in the nineteenth century. The great expansion in the nineteenth century came with the development of steam navigation, and development during the closing years of that century and the first decades of the next was so active that before the outbreak of war in 1939 the port installations comprised from N. to S., eight large docks: Vieux-Port, Joliette, Lazaret, Arène, Gare maritime, National, Pénée and Président Wilson. There are also two docks of lesser importance, including a floating dock, which are not used commercially but managed by the M. Dock Company, whereas most of the other docks are run by the M. chamber of

commerce. Access to these various docks is easy, except in a violent N.W. wind, when ships can anchor in the lee of the Frioul Is. or in the roadsteads of Endoume or Estaque. A breakwater nearly 10 km. in length, parallel with the coast, shelters the port installations on the seaward side. The length of quays is 26,337 metres, of which 18,479 metres are accessible to ships. Before 1939 the port had 270 cranes with a lifting capacity of 1 to 10 tons, 40 floating cranes and pontoons, a 'Goliath' floating crane with a lifting capacity of 150 tons, 70 tugs, and 600 lighters. The scale of these installations made M. the busiest port in France (the figures for 1938 were: M., 9,793,000 tons; Rouen, 7,702,000; Le Havre, 6,667,000; and Bordeaux, 4,115,000). Before the war the total net tonnage of ships entered and departed from M. was 32,558,666 and the tonnage of merchandise was 9,792,563. During the Second World War most of the installations, previously hit by aerial bombardment, were destroyed systematically by the Gers. before their retreat and by Aug., 1944, the greater part of the quays had been destroyed by 2000 mines, while 173 ships had been sunk in the harbour. Yet by the beginning of 1947 reconstruction had proceeded so well that the appearance of the port had been entirely changed. Over 5000 metres of quayage had been restored to use and by the first day of the year the port had in use 60 cranes, 10 lighters, 107 tenders, and 21 tugs, etc. The tonnage of ships entered and cleared, which in 1945 was 3,241,000, had risen to 12,000,000 in 1946, while the number of ships using the port rose from 1536 to 5332. The distribution of trade had, however, changed considerably; thus Britain had yielded the first place, which she occupied in 1938, to the U.S.A., only 103 Brit. ships entering M. in 1946 as compared with 928 in 1938, while Amer. ships increased from 91 in 1938 to 386 in 1946; Norwegian increased from 148 to 210; and It. fell from 645 to 28. The construction, now in hand, of a new dock (the Mirabeau) of vast dimensions in the northward prolongation of the harbour, will enable it to meet all developments of traffic while rendering the port more easily accessible to ships of the largest size. The new dock will be encircled by two great wharves, the one constituted by a mole 1000 metres long by 275 metres wide, dividing the present N. outer harbour in two; the other, still larger, running from the Rhône canal between Maureplane and Cape Janet. The construction of this dock will increase the total quayage by 4000 metres. Two new graving docks of 250 and 300 metres will provide facilities for repairing the largest ships.

In 1948 a block of flats was commenced in M. to the design of Le Corbusier (q.v.). Called by its creator a 'vertical community,' it will house 1600 people in 330 separate flats.

See H. Brennier, *Le Port de Marseille*, 1927, and M. Clerc, *Massalia: Histoire de Marseille dans l'Antiquité*, 1927-29.

Marsh (later Marsh-Caldwell), Mrs. (née Anne Caldwell) (1791-1874), Eng. novelist.

Among her most popular books are *Two Old Men's Tales* (1834); *Tales of the Woods and Fields* (1836); *Emilia Wyndham* (1846); *Norman's Bridge* (1847); *Havenscliffe* (1851); *Margaret and her Bridesmaids* (1856) and *Lords and Ladies* (1866); many of them pub. anonymously. She inherited the Lindley Wood property, Staffordshire, in 1838.

Marsh, George Perkins (1801-82), Amer. philologist, b. at Woodstock, Vermont. He was elected to the Supreme Executive Council of the State in 1835, and to Congress in 1842 and 1849. He was then U.S. minister resident at Constantinople, and in 1852 went on a special mission to Greece. Between 1857 and 1859 he was railroad commissioner for Vermont; and from 1861 until his death was the first U.S. minister to Italy. His most important works are *Grammar of the Icelandic Language* (1838); *The Camel* (1856); *The Origin and History of the English Language* (1862); and *The Earth as Modified by Human Action* (1874).

Marsh, Othniel Charles (1831-99), Amer. palaeontologist, b. at Luckport, New York, prof. at Yale (1866), noted for his discoveries of many new species of extinct vertebrates, largely from the Rocky Mts. His chief works are *Odontornithes: a Monograph on the Extinct Toothed Birds of North America* (1880); *Dinocerata: a Monograph on an Extinct Order of Gigantic Mammals* (1884); *Sauropoda* (1888); and *The Dinosaurs of North America* (1896).

Marshal, William, first Earl of Pembroke and Strigill of the Marshal line (c. 1146-1219), Eng. nobleman and soldier, trusted knight of Henry II., and tutor to his son, Prince Henry. After 1187 he fought in the Fr. campaigns. He became marshal of England under Richard I., on the death of his brother John (1194). On Richard's death M. supported John's claim to the throne (1199), and held office under him. On John's death (1216) he became regent of England for Henry III. during his minority. See *Histoire de Guillaume le Maréchal*, c. 1225, a long Fr. poem discovered by P. Meyer in the Phillips Library.

Marshal (Fr. *maréchal*, from Low Lat. *mariscalcus*, a furrier), word which originally meant a man who took care of horses. The importance of the persons appointed to take charge of the royal horses gradually increased, until the word M. signified one of the highest officers of the court. The word now in England usually means the officer who regulates questions of precedence, etc., at official functions. In U.S.A. a M. is an executive or administrative officer for the U.S. Supreme Court, appointed by the president. With various additions M. represents various ranks, etc., as in field-M., M. of France, air M., M. of the hall, etc. See also FIELD-MARSHAL.

Marshall, Alfred (1842-1924), Eng. political economist, b. July 26 in London, was educated at Merchant Taylors' School and St. John's College, Oxford. Lecturer in moral science at Cambridge, 1865, and prof. of political economy there 1885-1908, he became principal of Univ. College,

Bristol, 1877, and in 1883 fellow and lecturer at Balliol College, Oxford. He was prof. of political economy at Cambridge, 1885-1908, and a member of the royal commission on Labour, 1891. His pubs. include *Economics of Industry* (1879, with his wife); *Principles of Economics* (1890-91); *The New Cambridge Curriculum in Economics* (1903); *Industry and Trade* (1919); *Money, Credit, and Commerce* (1923). See A. C. Pigou (editor), *Memorials of Arthur Marshall*, 1925.

Press Portrait Bureau

GEORGE C. MARSHALL

Marshall, George Catlett (b. 1880). Amer. soldier and statesman, b. at Uniontown, Pennsylvania, son of a Kentucky coal merchant, rose from private to be the head of the Amer. Army. Unable on account of his father's Democratic leanings to get the necessary political recommendation to W. Point, he went to Virginia Military Institute for a soldier's education. Commissioned second lieutenant in the regular army he went to the Philippines during the insurrection of 1896. During that war he drew up a field order which was considered the best plan for the defence of Manila. After this revolt he helped to settle the Is.'s internal affairs. He entered the First World War as a captain, and was, in France, temporarily promoted to a colonelcy. He was an instructor at the staff school, at Leavenworth, Kansas. A brilliant student of tactical problems and a soldier of great administrative skill, his work as an operations officer for America's 1st Div. during the Fr. attack at Cantigny in May 1918, won him the Croix de Guerre. Later,

as operations chief to the First Army in France, before the Meuse-Argonne offensive, he moved nearly 500,000 troops and 2700 guns up to the front in under a fortnight. He helped to refashion the Amer. Army after the war from horse-gun fixed-front tactical theories to the modern mechanised type. Moving unspectacularly as an instructor from Washington to China, to Georgia, to Illinois and back to Washington, he did not become a brigadier until 1936, and was promoted a general on the day that the Gers. invaded Poland, when he was promoted by President Roosevelt over the heads of thirty seniors to be chief of the U.S. Army general staff. M. took a standing army of 200,000 and converted it into the vast and mobile machine of the Second World War. He served for some time in China, where he endeavoured, unsuccessfully, to mediate between the National gov. forces under Chiang Kai-shek, and the Communists. (See further under CHINA, History.) He succeeded Mr. Byrnes as secretary of state to the U.S. Gov. in Jan., 1947, and produced the 'Marshall Plan,' for the financial and economic rehabilitation of war-shattered Europe. See ORGANISATION FOR EUROPEAN ECONOMIC CO-OPERATION. See K. T. Marshall, *Together*, 1947.

Marshall, John (1755-1835), Amer. jurist, of Eng. descent. With George Washington and James Madison he was a powerful factor in bringing Virginia to adopt the U.S. constitution. President John Adams appointed him to his Cabinet as secretary of state and, in 1801, chief justice of the supreme court, a position he held for thirty-four years. M. was probably the greatest judge the U.S.A. has produced. It was his decisions which gave the U.S. Supreme Court the great power it now possesses, for it was M. who decided that the court had power to pass judgment on the validity of national and state law. In fact, M. was responsible for the whole trend of judicial decisions calling upon the powers inherent in the Federal constitution. M. wrote a *Life of George Washington* (1804-7). See lives by A. B. Magruder, 1885; J. F. Dillon, 1903; H. Flanders, 1905; A. J. Beveridge, 1916-19; and Lord Craigmyle, 1933. See also R. W. Griswold, *Prose Writers of America*, 1847; J. P. Collon's ed. of his *Constitutional Decisions*, 1905; and A. Johnson and E. S. Corwin, *The Age of Jefferson and Marshall*, 1921.

Marshall, cap. of Harrison co. E. Texas, U.S.A., 40 m. from Shreveport, Louisiana. It has locomotive shops and foundries, and railroad shops. Pop. 18,400.

Marshall Hall, Sir Edward (1858-1927), Eng. lawyer. Called to the Bar at the Inner Temple, 1888, he practised in London and on the S.W. circuit. He was Conservative M.P. for the Southport Div. of Lancashire, 1900-6, and for E. Toxteth div. of Liverpool, 1910-16. As a criminal advocate, especially for the defence in murder trials, he was without a rival. Among the most notable of his forensic triumphs were the Wood, the Peasenhale, the Greenwood, the Seddon, and the Thompson-Hywater cases, all murder

trials. See life by E. Marjoribanks, 1929.

Marshalling, in equity (*q.v.*) means such an arrangement of the assets of a deceased person as will secure their fair distribution to the various persons entitled to share in them. There are two prin. applications of the term: (1) M. as between creditors. Equity compels specialty creditors (*i.e.* those whose debts are evidenced by a deed) to resort primarily to the real assets (*i.e.* land), in order that the personality (property other than freehold or copyhold land) may be left as unexhausted as possible for the simple contract creditors (*see* CONTRACT); and generally where two persons, X and Y, are creditors of the same debtor, and X has two funds, A and B, of the debtor to resort to, while Y is limited to A, Y will be permitted to stand in X's place as regards payment of his debt out of B, if X has resorted to fund A (M. of securities, or M. as between secured creditors). But where the different funds belong to different persons, M. is not allowed to the prejudice of third persons. The doctrine of M. of securities is of especial importance in regard to second mortgages by a person of two (or more) of his estates, the equitable principle being that in such cases the first mortgage will be apportioned between the two properties according to their respective values. (2) M. as between beneficiaries entitled under a will, where creditors have depleted the estate. The general principle herein is that if any beneficiary in the subjoined list is disappointed of his benefit under the will through a creditor seizing upon the fund or property intended for such beneficiary, he may compensate himself by going against the fund or funds of those coming immediately after him in the list, who in their turn may do likewise, with the result that those who come last may get nothing at all. The order is as follows: (1) Widow; (2) specific and residuary devisees and specific legatees; (3) pecuniary legatees; (4) charged devisees (specific and residuary); (5) heir-at-law (*q.v.*); (6) devisees upon trust; (7) next of kin or residuary legatees.

Marshall Islands, group of coral formation in Micronesia, Pacific Ocean, N.E. of the Ladrone Is., Polynesia. There are two groups, Ratak (E.), and Ralik (W.), both ranging S.E. to N.W. The whole archipelago is composed of some thirty-three atolls, 158 sq. in. in area. They were annexed to Germany (about 1885), and administered by the Jaluit Company of Hamburg till 1906. The administration was then taken over by the Ger. colonial authorities, forming a dist. under the New Guinea Gov. They were captured by Japan in Sept. 1914, and administered under the mandate of the League of Nations. Copra and phosphate are exported. The Micronesian inhab. are skilled navigators. Pop. 10,500, and a few Europeans.

In the Pacific campaigns of the Second World War the Amers. made diversionary air attacks on the M., beginning in mid-Nov., 1943. This bombing attack continued for two months at long range, with

daily raids throughout Jan. 1944. Then Amer. forces invaded Kwajalein Is., in the heart of the M., the attack being opened by a very strong force, which stood offshore for two days, pouring shells into the defences. The landing was effected on Jan. 31, and by Feb. 4 the Jap. resistance was overcome. The remaining Jap. bases in the M. were then isolated, and eventually all taken. After their capture the Is. were administered by the Amer. Navy, with an interim civil gov. On July 19, 1947, the U.S. formally took over the rule of the former mandated Is. in the Pacific under United Nation's trusteeship, and a permanent civilian staff was then estab.

Marshall Plan, *see* EUROPE, History; ORGANISATION FOR EUROPEAN ECONOMIC CO-OPERATION.

Marshalltown, co. seat of Marshall co., Iowa, U.S.A., near the Iowa R., 48 m. N.E. of Des Moines, the centre of a fine agric. region. It has an important distributing trade and manufs. machinery, car accessories, and furnaces. It has packing estabs., and manufs. of furniture, engines, etc. Farming and stock-raising are carried on. Pop. 19,200.

Marshalsea, prison formerly existing in Southwark, London, used latterly for debtors, and abolished in 1849. It was connected with the M. Court, held by the steward and marshal of the king's household. It was united with the Queen's Bench and the Fleet (1842). *See* C. Dickens, *Little Dorrit*, 1855-57.

Marshfield, banking city of Wood co., Wisconsin, U.S.A., 180 m. N.W. of Milwaukee. It has trade in lumber and manufs. of wood-veneer, springs, mattresses, etc. Pop. 9,000.

Marsh Frog, *Rana ridibunda*, either a variety of the edible frog, *Rana esculenta* or a separate species. Although scientific opinion has recently held the latter view, it seems doubtful whether the opinion of Boulenger given in 1897 that it is not a separate species will not eventually prevail. The frog is also called the Hungarian frog, but M. F. is its popular name—not unsuitable, seeing that the frog is firmly estab. on Romney Marsh in Kent. The M. F. is said to have been first introduced to Romney in 1935, and there are now probably tens of thousands over the area from Hythe to Iye, and around Tenterden. The ground colour of the M. F. is like weathered cement and, in pattern, the most observable peculiarity is a series of square dark brown spots on the legs which remain through all colour changes. When basking in the sun on a bank it assumes a striking grass-green hue. In size the M. F. much exceeds all other Brit. frogs or toads. In general, the M. F., like the edible frog, is very aquatic, and never seems to be more than a distance of one leap from the water. A six-foot leap is not beyond the powers of a full-grown specimen. Despite the scientific name, it is difficult to detect anything resembling laughter in its croaking.

Marsh Gas, *see* METHANE.

Marsh Mallow, or *Althaea*, genus of biennials or perennials (order Malvaceae). The common M. M. (*A. officinalis*) is a downy

plant occurring in marshes near the sea and bearing cymes of rose-pink flowers. A demulcent is prepared from the root. The rare hispid M. M. (*A. hirsuta*) is the only other Brit. species.

Marsh Marigold, or *Callia palustris*, handsome plant with large kidney-shaped, glossy leaves and golden-yellow sepals, the petals being absent. It is common in watery places.

Marsh's Apparatus, see ARSENIC.

Marso, proverbially brave and warlike people of the Sabellian race, dwelt in the centre of Italy. They were the prime movers of the celebrated war waged against Rome by the Socii or It. allies in order to obtain the Roman franchise, and which is known by the name of the Marsic or Social war. Their chief tn. was Marruvium.

Marsico Nuovo, com. and tn. of Potenza prov., S. Italy, 16 m. S.W. of Potenza. Pop. about 7000.

Marillac, Prince de, see LA ROCHEFOUCAULD, FRANÇOIS.

Marsipobranchii, see CYCLOSTOMATA.

Marsivan, or Merzifun, tn. in the Amassia sanjak of Sivas vilayet, Asiatic Turkey, at the foot of the Tavshan Dagli, 85 m. S.S.E. of Sinope. There are silver mines and vineyards near and hot baths at Khavza. Pop. 18,000.

Marske-by-the-Sea, watering-place on the N. coast of Yorkshire (N. Riding), England, 2 m. S.E. of Redcar, with ironstone quarries. Pop. 3000.

Marsman, Hendrik (1899-1940), Dutch lawyer, poet, and short-story writer, b. at Zeist, in Utrecht. He began to write poetry when he was twenty, and he pub. his first vol. of poems, *I ergen*, in 1923. After sev. years of travel he studied law, and became an attorney at Utrecht. He eventually chose to devote himself entirely to a literary career, and he and his wife led a wandering life in Europe. In June 1940 the ship they were on was torpedoed, and the poet's life was lost. His collected works, *I erzamelde Werk*, were pub. in 1938, and his last great poem, *Tempel en Kruis* (trans. *Temple and Cross*), in 1939.

Marston, Baron, see BOYLE, JOHN.

Marston, John (1575-1634), Eng. dramatist and satiric poet. As early as 1601 he was satirised under the name of Demetrius, in Ben Jonson's *Portaster*. However, in 1605, M. dedicated to Jonson, with expressions of affection and esteem, *The Malcontent*. In the same year he was associated with Jonson and Chapman in the composition of *Eastward Hoe*. For some reflections against the Scots in this comedy the authors were imprisoned. Shortly after this M., in his preface to his *Sophonisba*, hints at the plagiarisms from Rom. authors in Jonson's *Caifine* and *Sejanus*. M. and Jonson were the protagonists in the 'stage war' which then agitated London. With little of the imitative and inventive genius of the dramatist, M. had much of the spirited vigour and pungent wit of the satirist. In *The Scourge of Villanie* (1599) he is lofty and intrepid in his censure of vice, but is often carried by his vehement invective to the verge of coarseness. His other works

are *The Metamorphosis of Pigmaliions Image* (a satire, 1598); *The History of Antonio and Melida* (a tragedy, 1602); *Antonios Revenge* (a tragedy, 1602); *The Dutch Courtesan* (a comedy, 1605); *Parasitaster, or the Favone* (a comedy, 1608); *What You Will* (a comedy, 1607); *The Insatiate Countesse* (a tragedy, 1613). There are eds. of his works by J. O. Halliwell-Phillips (1856) and A. H. Bullen (1887); and of his poems by H. H. Wood (1934). See J. H. Peniman, *The War of the Theatres*, 1897; M. S. Allen, *The Satire of John Marston*, 1920; and Una M. Ellis-Fermor, *The Jacobean Drama*, 1936.

Marston, John Westland (1819-90), Eng. dramatist and critic, b. at Boston, Lincolnshire, the son of the Rev. Stephen M., Baptist minister. He left the legal profession for literature and the theatre. His first play, *The Patrician's Daughter* (1812), brought out by Macready, was accompanied with a prologue by Dickens. *The Heart of the World* (1847) was a failure, but *Strathmore* (1849) obtained a great success. Among his many dramas are *Marie de Méranie* (1850); *Donna Diana* (1864); *The Favourite of Fortune* (1866); *A Hero of Romance* (1867); *Broken Spells* (1873); and *Under Fire* (1885). He also wrote a number of poetical and critical works. He was joint editor of the *National Magazine* in 1837, and contributor to the *Athenæum* from 1863. His claim on posterity is that he was long the main prop of the poetic drama on the Eng. stage, though his own powers were by no means equal to the task. A collection of his dramatic works, some much revised, was ed. by himself in 1876. See T. Powell, *Pictures of the Living Authors of Britain*, 1851.

Marston, Philip Bourke (1850-87), Eng. poet, b. in London, was the only son of J. Westland M. (q.v.). Through an accident received during childhood he lost his sight at an early age. His poems, *Song-tide* (1871), *All in All* (1875), and *Wind-voices* (1883), bear the impress of this affliction, and of the death of his sister, Cicely (1878), his amanuensis, followed in 1882 by that of his poetic ally, Gabriel Rossetti. See memoir in Louise C. Moulton's ed. of his *Collected Poems*, 1892.

Marston Moor (Yorkshire), Battle of, fought on July 2, 1644, between the Royalists, under Prince Rupert, the earl of Newcastle, and Lord Goring, and the Parliamentarians, commanded by Lord Fairfax and the earl of Manchester, Cromwell commanding some cavalry on the left. The Royalists were completely routed after a bitter struggle.

Marsupials (from Lat. *marsupium*, pouch), also called Didelphia or Metatheria, form an important sub-div. of mammals, lying between the sub-divs. Prototheria, or Monotremata, and Eutheria, the placental mammals. The name Marsupialia (introduced by Tyson about 1698) is derived from the characteristic ventral pouch of skin supported by two epipubic bones in which the young, born very imperfectly developed after a short period of gestation, are carried and nourished by the females. Cuvier considers them, under the designation

Marsupiala, as a sub-div. of his Carnassiers (Carnivora). Existing M. are mainly restricted to the Australian and Austro-Malayan regions. The two main divs. are (1) Polyprotodontia (America and Australasia), including the Didelphyidae (Amer. opossums), dasyures, the thylacine or Tasmanian wolf, marsupial moles (*Notoryctes typhlops*), and bandicoots. They are mostly carnivorous and insectivorous and the pouch is often absent. (2) Diprotodontia (Australasian, and a few in E. Austro-Malayan Is.), including the wombat, koala, or sloth, cuscus kangaroo (Macropodidae family), wallaby, and phalanger. These are herbivorous, and represent the most highly evolved forms

MARSUPIAL: SLOTH

of the M. Fossil species of this group are found in the Trias of Europe and the Jurassic of N. America. See GEOGRAPHICAL DISTRIBUTION; MAMMALS.

Marsyas, Phrygian satyr who found Athena's flute, which of its own accord emitted the most beautiful music. Thereupon M. challenged Apollo to a musical contest, the conditions of which were that the victor should do what he pleased with the vanquished. The Muses decided in favour of Apollo, who bound M. to a tree and flayed him alive. His blood was the source of the R. M. There is a statue of M. in the forum of Rome. See Ovid, *Metam.*, vi., 382-99, and Sir J. G. Frazer in *Adonis, Attis and Osiris* (chap. vi.), 1906.

Martaban, vil. of Lower Burma, on the Salween R., 10 m. N.W. of Maulmain. Formerly, the cap. of Pegu and a place of importance.

Martaban, Gulf of, inlet of the bay of Bengal, which receives the three rivs., Irrawaddy, Sittaung, and Salween.

Martel, Charles, see CHARLES 'MARTEL.'

Martel de Janville, see GYP.

Martelli, Pier Jacopo (1665-1727), It. dramatist, b. at Bologna. Here in 1707, he was appointed prof. of eloquence. He wrote a religious poem entitled *Dignità Occhi di Gesù*, and sev. tragedies, comedies, and farces. His collected works appeared

at Bologna in 1733, and Colognerà wrote his biography in the *Opuscoli*, II., 1729. M. employed the Alexandrine verse rather than the It. form in most of his works.

Martello Towers, round towers formerly used in Eng. coast defence. The name is derived from Mortella Point in Corsica. In 1794 an Eng. fleet, under Lord Hood, supported the Corsican insurgents, and a small round tower on the point withstood their fierce cannonade. The strong resistance shown by this tower led to towers of a similar nature being erected along the Eng. shores, especially on the S. and E. coasts. They are about 40 ft. high and situated on the beach.

Marten (*Mustela*), name given to a number of animals of the weasel family, but applying specially to the pine M. (*M. martes*), and the beech or stone M. (*M. foina*). The pine M. still occurs in the N. of England and Scotland. In shape it resembles a stoat, but its body is much longer, the tail alone being often a foot long, the legs are short, and the paws have sharp, clawed digits. The fur is a beautiful dark brown with a large yellow patch on the breast. The beech M. or stone M. of the S. of Europe (with a white patch) supplies the fur trade with stone or baum M. skins. Other species include the pekan (*q.v.*), or fisher M. (*Martes pennanti*), and the sable (*q.v.*). The lion M., or founart, is the polecat (*q.v.*). All the Ms. are arboreal, frequenting coniferous woods, where a nest of leaves or moss is made, and feeding on small animals and birds. If taken young Ms. are easily tamed, and the beech M. was kept in Athens and Rome to catch mice.

Martens, Conrad (1801-78), Australian artist, b. in London, studied art under Copley Fielding. For two years M. was official topographer in the *Beagle*. He settled in Sydney, and was one of the first to win a reputation as an Australian artist. His most successful paintings are his studies and sketches of Sydney Harbour.

Martensen, Hans Larsen (1808-81), Dan. ecclesiastic and theologian, b. at Flensburg. Became prof. of theology at Copenhagen and court preacher. Among his theological pubs.—which often diverged in some degree from strict Lutheran orthodoxy and revealed a leaning to mysticism—were treatises on Christian dogmatics and ethics, moral philosophy, and, especially, a life of the famous Ger. mystic Jacob Boehme (*q.v.*). In a new ed. of this work by Stephen Hobbhouse (1949) is told the strange story of the discovery in 1931 by Dr. Werner Buececko of Göttingen of the original MS. of Boehme's *Aurora* in which the mystic sets down his apocalyptic visions—and many Boehme letters, all of which had been handed down as heirlooms within the confines of a secret fellowship of admirers of Boehme for some 250 years. M. was appointed bishop of Zealand in 1884. An 'official' panegyric which he pronounced on Bishop Mynster on his death in 1854 brought down the fierce invectives of Kierkegaard on the text 'a witness of the truth.'

Martensite, constituent responsible for the hardness of quenched steels, consisting of needle-shaped crystals interlaced at 60°. The structure is caused by carbide being deposited along the planes of cleavage of the original austenite grains, and the more carbon there is in the steel the greater is the hardness of M.

Martha, St., traditional sister of Mary and Lazarus, the patron saint of good housewives, represented in art in homely garb, with a bunch of keys in her girdle and a pot in her hand. Festival, July 30.

Martha's Vineyard, is. in the Atlantic Ocean off Massachusetts, U.S.A., 23 m. long. It forms the greater part of Duke co., and was so named by the Gosnold expedition on account of the excessive growth of vines. Pop. 5600.

Martialis, Marcus Valerius (c. A.D. 40-c. 104), epigrammatic poet, b. at Bilbilis in Spain. He went to Rome in 66; and after residing in the metropolis thirty-five years he returned to the place of his birth in 100. His death cannot have taken place before 104. His fame was widely extended, and he secured the patronage of the Emperors Titus and Domitian. His extant works consist of a collection of short poems, all included under the general appellation *Epigrammata*, divided into fourteen books. They are distinguished by fertility of imagination, flow of wit, and felicity of language; but they are defiled by impurity of thought and expression, and by base flattery of the Emperor Domitian. M. throws a valuable light on the social life of Rome in the first century of our era. Eds. of M. include those of Schneide-win (d. 1856), Friedländer (with commentary) (1886), and M. Lindsay (1903). There are Eng. trans. of the *Epigrams* in the Loeb Classics and the Broadway Translations.

Martial Law. This expression is used by writers on constitutional law in a three-fold sense: (1) The suspension of the ordinary or municipal law of a country in favour of the temporary gov. of the country or parts of it by military tribunals. In the Code Napoleon of France there is express provision for the proclamation of 'a state of siege' in certain circumstances of civil disorder, the effect of which is that military tribunals are empowered to try civilians by military law. The absence of precedent for such course of proceeding since the Petition of Right, 1628—which, *inter alia*, complained of the enforcement of M. L. against private individuals—led many writers to assume that it is unknown in England. But the decision of the Privy Council in the case of *Marais v. General Officer Commanding*, in 1902, on the appeal of a civilian, Mr. Marais, against his detention under military arrest during the S. African war, is that there never was any doubt that in time of war the ordinary courts have no jurisdiction over the action of military authorities, the difficulty being to establish when in fact a state of rebellion or insurrection could be said to have existed. This can only be effected by an *ex post facto* decision of the civil courts, with

whom, therefore, the last word remains as to the legality of the actions of the military authorities. An Act of Indemnity may of course be passed to protect these latter from actions brought as a result of the application of M. L. (2) The term is sometimes erroneously used to denote the *common law* right and duty, of the Crown, its servants and all citizens to repel force by force in the case of any violent resistance to the law, whether by invaders or rioters. (3) As a synonym for military law, or the law administered either (a) by the long-abolished Court of Chivalry of the earl marshal and lord high constable in affairs of honour, and generally in 'matters of arms and deeds of war,' or (b) by courts-martial at the present day in matters of military discipline. See also DEFENCE OF THE REALM ACT. See Sir C. G. Robertson, *Select Statutes, Cases and Documents illustrating English Constitutional History, 1660-1832* (7th. ed.), 1936; S. T. Banning, *Military Law* (24th ed.), 1942; and see also bibliography to CONSTITUTIONAL LAW.

Martignes, Prince de, see GALLIFFET. MARQUIS DE.

Martigny, three united hamlets in the canton of Valais, Switzerland, 16 m. S.W. of Sion. It is the starting-point of routes over the Great St. Bernard and the Col de la Forclaz, and is situated on the Simplon Railway, 24 m. S.E. of the lake of Geneva. It has some interesting Rom. remains. Altitude 1560 ft. Pop. 3200.

Martigues, seaport in the dept. of Bouches-du-Rhône, France, near the Étang de Berre, 21 m. S.W. of Aix. It is built on three is. connected by bridges, and has fisheries and lignite mines. Pop. 11,200.

Martin, Saint (316-400), bishop of Tours, and a saint of the Rom. Catholic Church, b. in Pannonia (now Hungary). He entered the army first under Constantine, and afterwards under Julian the Apostate. The virtues of his life as a soldier are the theme of more than one interesting legend. On obtaining his discharge from military service, M. became a disciple of Hilary, bishop of Poitiers. On his return to Gaul about 360, he founded a convent of monks near Poitiers, where he led a life of austerity and seclusion; but in 371 he was drawn by force from his retreat and ordained bishop of Tours. The only extant literary relic of M. is a short *Confession of Faith in the Holy Trinity*, which is pub. by Galland, vol. vii. 599. In the Rom. Catholic Church the festival of his birth is celebrated on Nov. 11. In Scotland this day still marks the winter term, which is called Martinmas (the Mass of St. Martin). He was the greatest pioneer of W. monasticism before St. Benedict. See monographs by C. Babut, 1912, and P. Ladoué, 1930.

Martin, name of five popes:

Martin I. (649-53), b. at Todi, in Umbria, taken captive to Constantinople in 653 and then banished to Kherson by the Emperor Constans II. for his opposition to the Monothelites. He d. in 655. He is canonised by the Gk. Churches.

Martin II., or improperly named

Marinus I. (882-84), had been sent by Adrian II. as legate to Constantinople to preside over the eighth general council (869-70), concerning the controversy excited by Photius.

Martin III., or **Marinus II.** (942-46), was merely a puppet of Alberic (d. 954), a prince and senator of the Romans.

Martin IV. (1281-85), a Frenchman named Simon de Brle, supported Charles of Sicily against Peter of Aragon and excommunicated Michael Paleologus.

Martin V. (1417-31), whose name was Oddo Colonna, b. at Cennazano, was chosen pope by the Council of Constance, thus ending the Great Schism. He left Avignon for Rome 1418, and made separate concordats with Germany, France, and England. See F. Hayward, *History of the Popes*, 1931.

Martin, Gregory (d. 1582), Eng. biblical translator, native of Mansfield, Nottingham. He organised the Eng. College at Rome (1577), and removed with that institution to Rheims, where he remained for the rest of his life. He trans. the Bible into Eng. from the Lat. Vulgate, the first ed. appearing at Rheims; it was reprinted at Antwerp in 1600; revised by Bishop Challoner (1749-50), and reprinted by George Leo Haydock in 1812, and by Frederick Charles Husenbeth in 1850.

Martin, John (1789-1854), Eng. painter, b. near Hexham, in Northumberland. In 1806 he went to London, and six years later his 'Sadak in Search of the Waters of Oblivion' was hung in the Royal Academy, attracting considerable attention. His paintings give the impression that they were inspired by dreams. Massive perspectives, gigantic crags, and towering battlements have the unreal quality of nightmare. The effect is heightened by the smallness and multitude of his human figures, all executed in precise detail, and by a recurring tunnel theme, achieved by architectural design or the circular movement of wave or cavern. But doomed cities and the wrath of God are not his only subjects, and there is a luminous serenity in the 'Paradise Lost' engravings and in his last picture, 'The Plains of Heaven.' See T. Balston, *John Martin 1789-1854: his Life and Works*, 1948.

Martin, Lady, see FAUCIT, HELENA SAVILLE.

Martin, Sir Theodore (1816-1909), Brit. author, was the son of an Edinburgh solicitor, and followed his father's profession. In 1846 he set up as a parl. agent, and soon acquired a large practice and amassed considerable wealth. In 1851 he married Helena Faucit, the actress. (q.v.). He was early attracted to letters, and with Aytoun wrote the *Bon Gaultier Ballads* (1842-44), a series of parodies after the style of *Rejected Addresses*, but inferior to that collection. In 1866 he was invited to write the official *Life of the Prince Consort*. The work was pub. in 5 vols. (1871-80). He also wrote a biography of Lord Lynnhurst (1883), and trans. the *Odes of Horace*, Dante's *Vita Nuova* and Goethe's *Faust*.

Martin, William (c. 1767-1810), Eng. naturalist, b. at Mansfield, Nottingham-

shire. He is famed for his works on Brit. fossils: *Petrifasta derbiensia*; or, *Figures and Descriptions of Petrifications collected in Derbyshire* (1804); and *Outlines of Extraneous Fossils on Scientific Principles* (1809).

Martin, name for some members of the swallow family, but usually implying the house martin (*Chelidon urbica*), which builds a mud nest under the eaves of the houses. It is 5½ in. long. The plumage of the upper parts is black with violet reflections, and of the lower pure white. It differs from the swallow chiefly in having a white band across the lower back. Other Ms. include the sand M. (q.v.), the Amer. purple M., and the fairy M.

Martina-Franca, tn. in the prov. of Lecco, Italy, 17 m. N.N.E. of Taranto, has a fine ducal palace. Pop. 25,000.

Martin de Porres (1579-1639), saintly S. Amor. Negro and patron of social justice, b. at Lima, Peru. As a boy he picked up the medical knowledge of the time, and in 1603 was admitted to the Dominican order. Thereafter his wonderful powers of healing and his saintly personal life, especially among the poor and outcast, estab. him as the pioneer social worker and friend of coloured peoples. Beatified by Gregory XVI. in 1837.

Martin du Gard, Roger (b. 1881), Fr. novelist, b. at Neuilly-sur-Seine of a Catholic family, was educated at the Lycée Condorcet and later spent three years at the École des Chartes where he was awarded a diploma as archivist and paleographer. His archaeological thesis, *Étude archéologique des ruines de Jumièges*, was written at this time and pub. in 1909, the same year as his first novel, *Dérenir*. This work showed the influence of Flaubert and Tolstoy. His second novel, *Jean Barois* (1913), was a more capable work and revealed M. as a penetrating social historian. Following the success of *Jean Barois* he became interested in the formation of the theatrical group, the 'Vieux Colombier,' for which he wrote two farces, *Le Testament du père Zélu* and *La Gouffe*. In his novels he follows the tradition of the Fr. realists of the nineteenth century, and brings to his subject a capacity for scientific observation and objective research. He has a lucid, detailed, and restrained style and places his narrative against a background of the events of the time. His ample construction allows a variety of incident and a careful building up of character. Such are the characteristics of his long series of novels which under the general title of *Les Thibault* carry the story of two families, one Catholic and one Protestant, through eight books, *Le Cahier gris* (1922), *Le Pénitencier* (1922), *La Belle Saison* (1923), *La Consultation* (1928), *La Mort du père* (1929), *L'Été 1914* (1936), and *Épilogue* (1940). The first two, *The Grey Note-book* and *The Reformatory*, were pub. in an Eng. trans. in 1933, and *High Summer* and *Consulting Day* in 1934. A new trans. of the whole work was pub. in 1940 with the

title *The Thibaults*. After the pub. of *L'Été 1914* M. was awarded the Nobel prize for literature (1937). M.'s work is remarkably unaffected by political ideology. He himself has remained aloof from politics, and after the fall of France in 1940 he escaped into the unoccupied part where he remained for the remainder of the war. See R. Lalou, *Roger Martin du Gard*, 1937.

Martineau, Harriet (1802-76), Eng. novelist and political economist, b. at Norwich, England, suffered in youth from bad health and later for a time from something akin to religious mania. Without any intention of devoting herself to literature, she wrote, at the suggestion of her younger brother, a short paper on 'Female Writers on Practical Divinity' which was reprinted in the *Monthly Repository* (1821). This encouraged her, and she composed some verses, short stories, and a theological novel. *Devotional Exercises* appeared in 1823, *Traditions of Palestine* in 1830. Between 1832 and 1834 she brought out in nine vols. *Illustrations of Political Economy*, and followed this with *Poor Laws and Paupers Illustrated* (1833-34) and *Illustrations of Taxation* (1834). She wrote a *History of England during the Thirty Years' Peace* (1819-50) and a work on *Household Education* (1849). She issued books on mesmerism (1815) and the *British Rule in India* (1857) with equal facility and unbounded confidence. She was the author of sev. stories. Perhaps the best thing she wrote was *Facts on the Flood*. Her autobiography was pub. in 1877. See lives by Mrs. Fenwick Miller, 1884, and Theodora Bosanquet, 1927.

Martineau, James (1805-1900), Eng. Unitarian theologian, younger brother of the preceding, b. at Norwich. Possessed of considerable inventive and mathematical talents, he was originally intended for engineering, but studied for the Unitarian ministry, to which he was ordained in 1828. In 1840 he became prof. of mental and moral philosophy in the Manchester New College (subsequently removed to London), and principal in 1869-85. Among his writings, which were very influential, are *Rationale of Religious Inquiry* (1836); *Ideal Substitutes for God* (1879); *Study of Spinoza* (1882); *Types of Ethical Theory* (1885); *Study of Religion* (1888); *Seat of Authority in Religion* (1890); and religious poems and hymns. See J. Estlin Carpenter, *James Martineau, Theologian and Teacher*, 1905.

Martinet, military term, used usually in an uncompromising sense, implying a strict disciplinarian. Derived from one Jean M., an officer in the army of Louis XIV.

Martínez de la Rosa, Francisco de Paula (1789-1862), Sp. statesman and man of letters, b. in Granada. He took part in the national cause when Spain was invaded by France (1808), being sent to Gibraltar to negotiate with the Brit. Gov. In 1812 he was elected deputy to represent Granada in the Cortes, where he so identified himself with the Liberal cause as to arouse the hostility of Ferdinand VII.,

who exiled him. In 1820 he was again elected, and again had to resign. He then resided in France. In 1833 he was recalled to Spain and held various political offices until 1861—twice being chief minister. One of his ministries is famous in the hist. of Spain by the treaty with Lord Clarendon, abolishing the slave trade. Some of his works are *La Viuda de Padilla* (1814) and *Aben Humeya* (1830) (both dramas); *Zaragoza* (1809, a poem); *El Espíritu del Siglo* (Spirit of the Age, 1835-51); and a life of *Pérez del Pulgar*. See life by L. de Sosa, 1930.

Martínez, Ruiz José (b. 1873), Sp. essayist, critic, novelist, and dramatist, who wrote under the pseudonym of Azorín, was b. at Monóvar, Alicante. He was educated at a religious boarding school, his experiences forming the subject of *Las confesiones de un pequeño filósofo* (1904), and later studied law at Valencia Univ. He went to Madrid about 1899, soon attracting attention by his radical writings and campaigns. Pamphlets and critical works were pub. containing strong attacks on accepted values, literary and social. Two autobiographical novels, *La Voluntad* and *Antonio Azorín*, appeared in 1902 and 1903. Together they constitute a witness for the unrest of spirit amongst intellectual youth of his time, for the many conflicts, between reason and sentiment, energy and inaction, tradition and progress, which beset them. In the greater part of his writings, over 50 vols. in all, he strives to convey the essential spirit of Spain viewed by a critical and poetical observer, in whom sentiment is ultimately stronger than criticism. The feeling for atmosphere and for time finds its centre in Castilian landscape and hist., in works such as *Los Pueblos* (1905), and *Castilla* (1912). In all his work, criticism, essays, drama, and novels, is an intensely personal tone, and he is at the forefront of the intellectual subjectivist movement of the 'Generation of '98.' His influence in the first two decades of the century was very powerful, and in his turn he was much affected by modern European literature, especially the Impressionists and symbolists of France. His dramatic works include *Old Spain* (1926) and *Brandy, much Brandy* (1927); some of his short stories were trans. (1931) into Eng. as *The Syrens and other Stories*; his literary criticism is exemplified in *Lecturas españolas* (1912); *Clásicos y modernos* (1913); *Los valores literarios* (1913); and *Al margen de los clásicos* (1915). There is a vein of pure poetry in works such as *Don Juan* (1922; Eng. trans., 1923); *Doña Inés* (1925); and *Félic Fargas* (1928). See essay by S. de Madariaga in *The Genius of Spain and other Essays on Spanish Contemporary Literature*, 1923; and W. Muller, *Azorín* (Sp. trans. from the Ger.), 1930.

Martínez Sierra, Gregorio, see SIERRA.

Martin-Harvey, Sir John (1863-1944), Eng. actor, b. at Wyvenhoe, Essex, son of

John Harvey, naval architect. He was educated at King's College School, London, with a view to taking up naval architecture, but abandoned this for the stage, and studied elocution under John Ryder. He made his first appearance at the Old Court Theatre under John Clayton, but ultimately joined Sir Henry Irving, with whom he remained for many years. Early in his career he married Angellita Helena de Silva, daughter of Don Ramon de Silva Ferro, a capable and charming actress, who was his leading lady through most of his stage life. The choice of the part of Sydney Carton as that best suited to his talents was due to her suggestion, as also was the writing of the play, *The Only Way*, from Dickens's *A Tale of Two Cities*, by the dramatist Freeman Wills. This play estab. him in his position as actor-manager, and though he still played much in the provs., as when he had toured with Irving's consent in old Lyceum successes, he now had a regular London season. In the repertory of romantic drama he won fresh popularity with the parts of Lt. Hreshby, 'The Rat,' in *The Breed of the Treashams*, and Skariatuc in *A Cigarette-Maker's Romance*, as well as in *The Bells*, *The Lyons Mail*, and others of Irving's successes. Among his most striking performances was his Pelléas to Mrs. Patrick Campbell's Mélisande in Maeterlinck's play, while his impressive production of *Edipus Rex* afforded scope for the stagecraft of Max Reinhardt (q.v.). Other parts included the Prophet Samuel in Burrie's *The Boy David*, and the burgomaster in Maeterlinck's *The Burgomaster of Stilemonde*. During the First World War he gave, for the benefit of the Red Cross, a series of Shakespearian performances, playing Hamlet, Petruchio, Richard III., and Henry V. Among his productions were also *Eugene Aram*, *Great Possessions*, *The World and his Wife*, *The Last Heir*, *An Idyll of Seven Dials*, and *The Shewing' up of Blanco Posnet*. During his career he managed the Lyceum, the Prince of Wales's, the Court, the Royalty, and the Apollo theatres, and Covent Garden Opera House. His *Autobiography* appeared in 1933. See M. W. Discher, *The Last Romantic*, 1947.

Martini, Frederic (1832-97), Swiss engineer, was Hungarian by birth and Swiss by adoption. After serving in the Austrian Army in the war of 1859, he estab. machine works at Frauenfeld in Switzerland. Here in 1871 he invented the breech-loading mechanism of the rifle which bears his name—the M.-Henry. Henry was the name of the inventor of the barrel.

Martini, Giovanni Battista, or **Giam-battista** (1706-81), It. priest, composer, and teacher, was b. at Bologna. Entering the Franciscan monastery at Lago he was ordained in 1722. In 1725 he returned to Bologna, became chapel master at the church of San Francesco, and continued his musical studies, with Pertti. He collected a vast musical and scientific library, devoting himself to mathematics as well as to music. He became the most famous musical theorist and teacher of his

time, Mozart being amongst his many famous pupils. A hist. of music, *Storia della Musica* (1757-81), and a treatise on counterpoint, *Saggio di Contrapunto* (1774-75), are among his works. His musical compositions include masses, Requiem, motets, and other church music, as well as oratorios, songs, keyboard pieces, arias, etc. See L. Busi, *Ulpadre Martini*, 1891.

Martinique, is. of the Windward group, W. Indies, belonging to France. It is very irregular in form, and is about 50 m. in length from N.W. to S.E., by about 15 m. in mean breadth. Area 382 sq. m. The surface is uneven and mountainous, and has sev. volcanoes. The highest point in the is. is the volcano Mont Pelée, which rises to the height of 4450 ft. An eruption of this volcano in 1902 destroyed the tn. of St. Pierre with all its inhab., some 26,000 lives being lost. St. Pierre, before this eruption, was one of the chief ports of the W. Indies, but this whole section of M. was utterly devastated by that catastrophe. In the past 300 years there have been over thirty severe hurricanes, seven earthquakes, three volcanic eruptions, and five serious conflagrations. Alcohol and rum are the chief products of M. Sugar cane was introduced from Brazil in 1654, and by the beginning of the eighteenth century M. had become one of the wealthiest of the Caribbean is. The plain of Lamentin, bordering the bay of Fort de France, is the only large area of level land in the is. and is covered with cane-fields to the exclusion of any habitations. No other commercial crops have ever received much attention in M. Coffee, cacao, cotton, vanilla, bananas, and pineapples are grown from time to time, but without any great success. Rum from M. has a very high reputation. The coast, being indented by numerous bays and inlets, affords many good harbours. Fort de France is the chief tn. and the political cap. It is also the prin. naval station of France in the W. Indies. M., the native name of which is *Madiana*, was discovered by the Spaniards in 1493 (according to some historians M. was discovered by Columbus in 1503), and colonised by the Fr. in 1635. It was taken by the Eng. in 1762, and again in 1794 and 1809; and was finally given up to France in 1814. Pop. 261,600. See L. Hearn, *Two Years in the French West Indies*, 1889, and P. E. James, *Latin America*, 1941.

Martinmas, feast of St. Martin of Tours, Nov. 11, and in Scotland one of the four term-days for paying rent.

Martino, Edoardo de, It. marine painter, b. at Malta, near Naples, and appointed marine painter in ordinary to Queen Victoria in 1876. His paintings include four pictures of the battle of Trafalgar.

Martins Bank, estab. as the Bank of Liverpool by deed of settlement in 1831; registered as limited, 1882. Name changed to Bank of Liverpool and Martins Ltd. in Dec. 1918 and to its present title in Jan. 1928. It acquired the undertakings of Arthur Heywood Sons and Company in

1883; Liverpool Commercial Banking Company in 1889; Craven Bank in 1906; Carlisle and Cumberland Banking Company in 1911; N.E. Banking Company in 1914; M. B. Ltd. in 1918; Halifax Commercial Banking Company in 1920; and the Lancashire and Yorkshire Bank in 1928. Authorised capital, £20,791,120; issued capital, £20,602,272; called up £4,160,042 in 939,556 shares of £20 (with £2 10s. paid) and 1,811,152 (part of 2,000,000) shares of £1 (fully paid). Of the £17 10s. uncalled on the £20 shares, £5 10s. is callable and £12 a reserve liability. Reserve, £4,100,000. Current, deposit, and other accounts, £212,691,885. Head office, Water Street, Liverpool; London city office, 62 Lombard Street, E.C.

Martinsburg: 1. Bor. in Blair co., Pennsylvania, U.S.A., in a fertile valley known as Morrison's Cove, 15 m. S. by E. of Altoona. Pop. 1200. 2. Tn. of W. Virginia, U.S.A., co. seat of Berkeley co., 71 m. N.W. of Washington. Fruit, particularly apples and pears, is grown, and canned in large factories. There are also lime and flour factories, woollen mills, and railroad shops. Limestone is quarried. Pop. 15,000.

Martin's Ferry, banking city of Belmont co., Ohio, U.S.A., 2 m. from Wheeling. Coal is found in abundance and there are engine and machine works, glassworks, tin mills, etc. Pop. 14,700.

Martinů, Bohuslav, Czech composer, b. 1890 at Policka, was a pupil of Suk at Prague and of Roussel in Paris. For a time he was a violinist in the Czech Philharmonic orchestra, but in 1928 he attracted attention as a composer at the Siena festival. His work includes operas, ballet music, radio operas, and a great variety of symphonic pieces, concertos for violin and for piano, preludes, etc. There is in his music a strong vitality and sense of rhythm, as well as a resonance and a supple strength of construction.

Martius, Karl Friedrich Philipp von (1794-1868), Ger. naturalist and traveller, director of the botanic garden (1820) and prof. of botany (1826) at Munich. Among his works are *Historia Naturalis Patmarum* (1823-53); *Reise nach Brasilien* (1824-31); *Nova Genera et Species Plantarum* (1821-32); *Icones Plantarum Cryptogamicarum* (1828-34), etc.

Martos, tn. of Andalusia, Spain, 10 m. W.S.W. of Jaen, on a steep hill. Noted for its wines and mineral waters. Pop. 20,000.

Martyn, Henry (1781-1812), Eng. missionary, b. at Truro, and educated at Cambridge. At Dinapore he trans. the N.T. into Hindustani, and superintended the Persian trans. of the N.T. by Sabat and Sebastiani. At Shiraz in Persia he revised the Persian and Arabic trans. of the N.T., also completed a new trans. of the Psalms.

Martyr (Gk. *μάρτυρ*, or *μάρτυς*, a witness), term used to designate those people who in the conflict between Paganism and Christianity bore 'witness' to the truth of their convictions by sacrificing their lives rather than abandon their faith.

Many instances are recorded, and the number is probably exaggerated, but that a very great number suffered for the truth's sake is certain. Such persons who met their death, often with the utmost heroism, were regarded with the greatest admiration by their fellow men, and it was considered a special privilege to receive the benediction of a M., to visit him in prison, or to kiss his chains. Then, too, after death he was regarded as a saint, his grave was the scene of pilgrimage, his clothes, portions of his body, books, etc., were honoured as relics, and the day of his martyrdom was celebrated with peculiar honour as his natal or birth day. The first recorded M. of Christianity was Stephen, an account of whose death is given in Acts vi. and vii., and the proto-M. of Britain was Alban of Verulam, who suffered about 286 under Diocletian. The use of a *Martyrology*, a list or catalogue of Ms. or saints, arranged in the order of their anniversaries, is common to both the Rom. and the Gk. Church (although in the latter it goes under a different name, i.e. *menology*), and was intended as a guide to the faithful in their devotions. The most important anc. martyrology is the Hieronymian, falsely said to have been compiled by St. Jerome, and next to this came the Lesser Rom. and Bede's martyrology, the last of which has come down to us in that of Florus of Lyons; Rhabanus Maurus (c. 845); Ado of Vienne (c. 875); Usuard of Paris (c. 875), the most famous, on which the Rom. martyrology was based; Notker (896); and St. Gall (912). The official 'Roman martyrology' designed for the entire Church, was pub. in the time of Gregory XIII. (1581), and two years later Baronius pub. an annotated ed. It was revised under Benedict XV. (1922). The best known list of the Gk. Church, or 'menology,' was that compiled by order of the Emperor Basil, the Macedonian, in the ninth century. This was ed. in 1727 by Cardinal Urbini. In 1866 Thomas Wright (1810-77), in the *Journal of Sacred Literature*, pub. a Syriac martyrology which had been written about 412. Protestant Ms. of the sixteenth century are celebrated in Jean Crespin's *Histoire du Martyrs*, and the chief Eng. work on the same subject is John Foxe's *Book of Martyrs*. See A. Schlatter, *Der Martyrer in den Anfängen der Kirche*, 1915; A. Butler, *Lives of the Saints*, 1926-37; A. Ehrhard, *Die Kirche der Martyrer*, 1932; and G. H. Doble, *The Ereter Martyrology*, 1933.

Marugame, seaport of Japan, 80 m. W.S.W. of Kobe, on the is. of Shikoku. Pop. 30,000.

Maruthas, bishop and saint (d. c. 1415), was a prominent personality in the Syrian Church. Bishop of Maiferkat in Mesopotamia, he devoted himself to the reorganisation of the Church in E. Syria and Persia. He collected the *Passiones* of the Persians and Syrians martyred under Shapur, and wrote hymns in their honour.

Maruts, Vedic storm and wind gods, companions of Indra. In anc. mythology the sons of Rudra and Prisu, in later the sons of Kasyapa and Aditi.

Marvell, Andrew (1621-78), Eng. poet and politician, b. at Winstead in Yorkshire, and educated at Hull Grammar School and Trinity College, Cambridge. Early became known for his verses. About 1650 he was appointed tutor to Mary, daughter of Lord Fairfax, and later to Cromwell's ward, Wm. Dutton. He made the acquaintance of Milton, and in 1657 became his assistant in the Lat. secretaryship. Three years later he was returned to Parliament by Hull, and he represented that constituency until his death. In 1663 he accompanied Lord Carlisle as secretary on a mission to the courts of Russia, Sweden, and Denmark, and pub. an account of the embassy (1669). Little, however, is known of his life, and little has been written about him, except in occasional essays, and the man himself remains difficult to envisage. Thus the general steadiness of his temper can almost be deduced from his poetry, but not the outbursts of violence which sometimes characterised his personal relations. Yet a man who could attend Parliament, and such a Parliament as that of Charles II., for twenty years as member for Hull, and faithfully report to his constituents what was happening, and how he served them, was a man either of great patience or of great serenity. Through it M. seems to have maintained that glowing vitality of feeling and thought which finds such an exquisite expression in his poetry; its mild luminance shines out even in his controversy about toleration with the infamous Parker. He wrote verses eulogising Cromwell, notably the *Horatian Ode upon Cromwell's Return from Ireland* and the lines *Upon the Death of his late Highness the Lord Protector*, and after the Restoration wrote satires upon the king and other members of the reigning house. He was an active pamphleteer. His prin. prose works are *The Itearsal Transposed* (1672) and *An Account of the Growth of Popery and Arbitrary Government in England* (1677). His poems were first collected in 1681, and the best ed. is that ed. by G. A. Aitken in 1892. See lives by J. Dove, 1832; A. Birrell, 1905; and M. C. Bradbrook and M. G. Lloyd Thomas, 1940.

Marwar, see JOHUPTR.

Marx Brothers, Jewish-Amer. family of film comedians; Arthur (Harpo) was b. 1893, Julius (Groucho) in 1895, and Leonard (Chico) in 1891. Herbert (Zeppo) was b. in 1901, and retired from the troupe after 1934. They estab. a distinctive style of clowning and achieved very great popularity. Among their film successes are *A Night at the Opera* (1930); *A Day at the Races* (1937); *The Big Store* (1941); and *A Night in Casablanca* (1946).

Marx, Heinrich Karl (1818-83), founder of revolutionary socialism, was a Ger. subject of Jewish extraction, b. at Trier. After starting the soon-suppressed *Rheinische Zeitung* at Cologne he was, from 1843 to 1845, in Paris, where he was converted to Socialism by reading Proudhon. Here also he met Engels, his lifelong partner and friend. From France he was expelled for publishing another jour., *The Vorwärts*, and he came to London, which

he made his permanent home. With Engels he pub. the *Communist Manifesto* in 1847. Thereafter he devoted himself almost exclusively to the development of his economic ideas, for although he was virtual leader of the International Working Men's Association, he never held high office in it. His works include the famous *Capital*, the first vol. of which appeared in 1873 (the second and third vols. were prepared); *Revolution and Counter-Revolution in Germany, 1848-49* (1891); *The Poverty of Philosophy* (1910); *The Civil War in France* (1921); *Critique of Political Economy* (1922); *The Class Struggle in*

Cole, *What Marx Really Meant*, 1934; E. H. Carr, *Karl Marx*, 1938; L. Berlin, *Karl Marx*, 1939; L. Schwarzschild, *The Red Prussian*, 1948; and L. Trotsky, *Marr*, 1948.

Mary, The Virgin, Mother of Jesus. The only authentic sources for her life are the Gospels. In St. Luke we learn of the announcement to her by the angel that she should conceive a son by the overshadowing of the Holy Ghost, of her being espoused to Joseph, a carpenter belonging to the house of David, of the events connected with the birth of Jesus, and of the presentation in the temple; of the flight

into Egypt we learn in Matt. II., and of the finding of the child Jesus twelve years later, after he had disappeared from the caravan returning from Jerusalem, in Luke II.; of her presence and action at Cana in John II., of her presence when Jesus was preaching in Mark III. 31, and of her presence at the foot of the cross and the word of Our Lord consigning her to the care of the apostle John in John XIX. 26. Finally her presence among the apostles after the Ascension is mentioned in Acts I. 14. Nothing is told us of her death. The apocryphal gospels give many untrustworthy details of her early life. According to tradition she was the daughter of Joachim and Anne, and on her death she was taken up bodily into heaven, an event celebrated by the E. and Rom. Catholic Churches in the feast of the Assumption, Aug. 15. Other feasts commemorating events in the life of M. are the Nativity (Sept. 8), the Presentation of M. in the temple (Nov. 21), the Annunciation or Lady Day commemorating the visit of the archangel Gabriel, Luke I. 26, 27 (March 25), the Visitation, or visit made to her cousin Elizabeth, Luke I. 39, 40 (July 2), the Purification or churching after the birth of Christ, popularly known as Candlemas, Luke II. 25 (Feb. 2), and the Immaculate Conception (Dec. 8). This last, instituted by Pius IX. in 1854, has nothing to do with the Virgin Birth or birth of Christ without the agency of man, but commemorates the complete freedom of M. from all taint of sin, i.e. she was conceived immaculate or unstained. The title of Mother of God (*Θεοτόκος*) was formally awarded to M. by the Council of Ephesus in 431, after the controversy occasioned by the patriarch Nestorius of Constantinople; it was inferred from the fact that she was the mother of Christ, who was God. M. has been the object of profound popular devotion in both the E. and W. Church, for by her motherhood of Christ she is deemed the supreme intercessor with her Son. The countless images and paintings of M. with her Child are all inspired by the thought that through the Virgin Mother of God the human touched the divine. The most striking phenomenon in modern times in devotion to Our Lady is the apparition claimed for her at Lourdes in S. France, on eighteen occasions in 1858. This has received official recognition by the Rom. Catholic Church, and numerous miracles are claimed. Vast pilgrimages go there every year from all parts of the world. In recent times a similar phenomenon has been claimed for Fatima in Portugal in 1917, which has also received much publicity, though no official final report has yet been issued. See also MARIOLATRY. See W. B. Ullathorne, *The Immaculate Conception of the Mother of God*, 1855; J. Northcote, *Mary in the Gospels*, 1885; B. W. Randolph, *The Virgin Birth of Our Lord*, 1903; A. Schaefer and V. Brossart, *The Mother of Jesus in Holy Scripture*, 1913; O. R. Vassall-Phillips, *Mary, Mother of God*, 1927; Canice, O.S.F.S., *Mary*, 1936; and, F. Izard, *The Meaning of Lourdes*, 1938.

Mary I. (1516-58), queen of England, the elder daughter of Henry VIII., by his marriage to Catherine of Aragon. Like all the Tudors, she received a good education and was a distinguished linguist and scholar. She was brought up in the faith of the Catholic Church and nothing afterwards would induce her to be unfaithful to her religion. After the divorce of her mother she was treated with harshness by her father, being deprived of her rank and precedence, and made to live in a secluded, restricted manner. After her father's death she lived in retirement until the death of Edward VI. called her, in 1553, to the throne of England. She was the popular choice of the country and easily put down the movement in favour of Lady Jane Grey. The main conspirators were executed, and M. proceeded to

MARY I.

restore the old religion as cautiously as she possibly could, but finally lost her popularity by her marriage to Philip II. of Spain. Wyatt's rebellion was quelled, but Lady Jane Grey and her husband were executed, and even the Princess Elizabeth spent some time in the Tower. In 1554 her marriage with Philip took place and the religion of the country was restored to that of the time of Henry VIII. Then began the period of persecutions which have given M. the title of Bloody M. and the reign the character of one of the blackest of our annals. At least 300 'heretics' were put to death at the stake. Finally, in 1558, M. d., deserted by a husband to whom she had borne no children, and heartbroken by the desolateness of her life and by the loss of Calais, the last Eng. possession in France. See J. M. Stone, *History of Mary I.*, 1901; J. A. Froude, *The Reign of Mary Tudor*, 1910; A. F. Pollard, *History of England, 1547-1603*, 1915; H. S. Jackson, *Spanish Marriage*, 1933; and B. White, *Mary Tudor*, 1935. **Mary II. of England (1662-94)**, elder daughter of James II. of England by his marriage to Anne Hyde, the daughter of

Clarendon, the lord chancellor. She was *b.* in London, was brought up in the Protestant faith, and was married to her cousin, William of Orange, stadtholder of Holland, in 1677. Eleven years later she ascended the throne of England, as joint-sovereign with her husband, after the revolution of 1688. Her husband had a great affection for her, and trusted her with the government of the country during his absences on the Continent and elsewhere. She *d.* in 1694 of smallpox, leaving no children. See N. M. Waterson, *Mary II.*, 1928; and M. Bowen, *The Third Mary Stuart*, 1929.

Mary (Victoria Mary Augusta Louise Olga Pauline Claudine Agnes), queen consort of George V., king of Great Britain, etc., *b.* May 26, 1867, at Kensington Palace, only daughter of Francis Paul Charles Louis Alexander, duke of Teck. Her mother, Mary Adelaide Wilhelmina Elizabeth, duchess of Teck, was younger daughter of Adolphus Frederick, first duke of Cambridge. Her childhood's home was White Lodge, Richmond, where she studied music under Tosti. From 1883 till 1886 she lived with her parents in Italy, and, until her marriage, was popularly known as Princess May. On Dec. 7, 1891, was pub. her engagement to Prince Albert Victor, duke of Clarence, then second in the succession of heirs to the throne. Feb. 27, 1892, was fixed for the wedding, but the duke of Clarence *d.* on Jan. 14. On May 3, 1893, was announced her engagement to that duke's younger brother, her future husband—then duke of York—to whom she was married in the Chapel Royal at St. James's Palace on July 6, 1893. She bore him five sons and one daughter (John, the fifth son, *d.* in 1919). She accompanied her husband, as princess and as queen, in all his important voyages and progresses. Early in the First World War (Aug. 20, 1914) she inaugurated the Queen's Work for Women Fund, which estab. workrooms for women workers displaced by the outbreak of war—until these were absorbed into munition-making and other industries. She also organized Queen Mary's Needlework Guild for the provision of garments for those suffering through the war. In July 1917 she visited the hospitals in France. A popular figure with all classes, she received the sympathy of a large public on the death of King George V. in 1936, after sharing with him the joy of their silver jubilee in the previous year. See lives by C. Cavendish, 1930; Sir G. Arthur, 1935; and L. Wulff, 1949.

Mary of Guise, called also **Mary of Lorraine** (1515-60), daughter of the duke of Guise. She married, in 1534, the duke of Lorraine, who, however, *d.* in 1535. She next married James V. of Scotland, to whom she bore a daughter, afterwards the famous Mary Queen of Scots. After her husband's death at Solway Moss (1542), she became regent for her weak-old daughter. The times in Scotland were troublous, since the Reformation party was struggling against the court party for the recognition of the Reformed religion. Mary attempted to carry out

the ambitions of the Fr. crown in Scotland, but her regency did not last long and she was declared deposed in Oct. 1559.

Mary, Princess Royal, Countess of Harewood, Brit. princess, given the title of princess royal in 1932. Only daughter of King George V. and Queen Mary, she was *b.* at York Cottage, Sandringham, April 25, 1897, and christened Victoria Alexandra Alice Mary. On Feb. 28, 1922, she married Viscount Lascelles, afterwards sixth earl of Harewood (*d.* May 24, 1947). Two sons were *b.*: George Henry Hubert, earl of Harewood, *b.* Feb. 7, 1923, and Hon. Gerald David Lascelles, *b.* Aug. 21, 1924. Princess M. is colonel-in-chief of the Royal Corps of Signals, Royal Scots, W. Yorkshire Regiment, and Royal Canadian Signals, and controller-commandant of the Women's Royal Army Corps.

Mary Queen of Scots (1542-87), daughter of James V. of Scotland by his marriage

MARY QUEEN OF SCOTS

to his second wife Mary of Guise, *b.* at Linlithgow. She was *b.* immediately after the disastrous defeat at Solway Moss (1542), and was a queen before she was a week old. Her father on his deathbed made the famous and mistaken prophecy: "It came with a lass, it will go with a lass." She was promised to Edward VI. as wife, but finally after the battle of Pinkie married the dauphin of France, son of Henry II. She was sent to France at an early age, and there her education was completed. She conveyed by the marriage treaty the crown of Scotland to the king of France in the event of her dying childless, and also passed on by the same treaty her right of succession to the Eng. crown. In 1559 her husband became the king of France, but he *d.* in the following year. Charles IX. succeeded to the throne of France, and the real power passed into the hands of Catherine de' Medici, the queen mother. In the meantime, the death of the queen mother in Scotland, Mary of Guise, had left the gov. without a head and the presence of the young queen was urgently requested, especially since the Reformation had already gripped Scotland very closely. In 1561 she

arrived in Scotland and found that the Reformation had received what it considered to be a parl. sanction for itself. M. did not interfere, in fact for a time she allowed matters to follow their previous course. She allowed the Reformed Church to continue without molestation, but stipulated for a private use of her own faith. Her chief minister, Murray, succeeded in crushing an insurrection of the Catholics under the earl of Huntly in the N., and for a time M. reigned not only in peace but also with the approbation of her subjects. Her attention, however, was next turned to her second marriage. A number of princes were proposed to her. Elizabeth of England quixotically proposing her own favourite, the earl of Leicester. M., however, desired a Sp. marriage, and endeavoured to bring about her marriage with Don Carlos of Spain. It is important to bear in mind the fact that M. was the heiress to the Eng. throne as well as the occupant of the Scottish, and that, therefore, in the eyes of Europe, her position and prospects were magnificent. Failing in her attempt to bring about a marriage with Don Carlos, she suddenly surprised everybody by marrying her cousin Darnley, the nearest heir after her to the throne of England and Scotland.

Darnley was weak in character and insolent in manner; immediately after his marriage he was given the title of king, but was granted but few privileges to accompany the title. He early disgusted M. by his frequent love intrigues, and he in turn, failing seemingly in his attempt to gain his desires and ambitions towards the Scottish crown, began to intrigue in order to bring about these ends. He was jealous of Rizzio, the It. favourite, and the practical minister of M., and conspired with Moray, Ruthven, and Morton to murder him. This was done in Holyrood Palace on the evening of March 9, 1566. M., however, won Darnley from the conspirators, whom he betrayed, and for a time their relations were friendly. Finally, after the birth of James, their son, afterwards James VI. of Scotland and I. of England, the rupture became complete, and later all Scotland was horrified to learn that the house in which Darnley lay ill of smallpox had been blown up and his body found in the garden of the house. The queen could not be directly accused of complicity, but there were many who believed that she was not altogether guiltless, especially as the chief instigator of the murder had been her new favourite Bothwell. He was brought to trial and acquitted, immediately after which he seized the person of the queen and conveyed her to Dunbar, nominally a prisoner. All Scotland, however, had no doubt of the complicity of M. in the murder and the abduction when she publicly pardoned Bothwell and after he had obtained a divorce married him. An insurrection immediately broke out, and she, deserted by almost all her nobles, was defeated at Carberry, forced to abdicate in favour of her young son, and imprisoned in Loch Leven Castle. From here, in 1568, she

escaped, raised a small army, and was again defeated, at Langside. She fled this time, and placed herself under the protection of Elizabeth of England.

Elizabeth's position was difficult; whilst she could not approve of rebellion against the queen, she equally could not allow M. to escape from her now, since M. was her greatest rival. M., therefore, found herself a prisoner for life. During the next nineteen years she passed from prison to prison in England. She had many supporters in that country, and one long conspiracy was kept up during her imprisonment. One may almost safely say that Elizabeth's position was unsafe as long as M. lived. Finally, in 1586, the conspiracy of Anthony Babington was discovered, and M. was accused of complicity. The whole evidence was based on the authenticity of the Casket Letters. M. denied complicity, as she denied the jurisdiction of the court which tried her. Finally, however, she was found guilty and sentenced to death, and in Feb. 1587 Elizabeth signed the death warrant. She was executed on Feb. 8, and d. in the eyes of her followers a martyr, protesting her innocence and strong in the faith of the Catholic Church. Buried first of all at Peterborough, her body was in 1612 removed to Westminster Abbey by her son James I. See also CASKET LETTERS. See lives by D. Hay Fleming, 1897; E. Linklater, 1933; M. Bowen, 1934; S. Zweig (Eng. trans. 1935); and M. P. Willcocks, 1939; also T. F. Henderson, *The Casket Letters and Mary Queen of Scots*, 1889; A. Lang, *The Mystery of Mary Stuart* 1901, 1904; A. F. Stuart (editor), *Trial*, 1923; M. Baring, *In My End is My Beginning*, 1931; and Sir E. A. Parry, *The Persecution of Mary Stuart: a Study in Criminology*, 1931.

Mary, Turkestan S.S.R., see MERV.

Maryborough: 1. Or Port Laorhise, a tn. of Eire, cap. of Leix co., is situated on a small trib. of the Barrow, 50 m. S.W. of Dublin. It has sev. good public buildings. It has woollen manufs. and flour mills. The public buildings include a mental hospital and co. infirmary. Pop. 3000. 2. City of March co., Queensland, on the Mary R., 184 m. N. of Brisbane. It is an industrial city, the chief industries being shipbuilding, locomotive and general engineering works, and saw-milling. There are also flour-mills, and butter, sugar, and bacon factories. Bricks and earthenware pipes are also manufactured in the locality, and there are coalfields within 12 m. of the city. M. is centrally situated in the Wide Bay dist., is a railway centre, and has a first-class aerodrome. Pop. 16,000. 3. Tn. of Talbot co., Victoria, 110 m. N.W. of Melbourne. Originally a rich gold-mining area but now an industrial tn., with knitting-mills, flour-mills, small tool and twist drill factory, butter factory, and furniture and joinery factory. The tn. is an important railway junction for four main lines and is surrounded by a dist. devoted to mixed farming. Pop. 6300.

Mary-bud, see CALEDONIA.

Maryland, maritime state of the U.S.A.,

bounded on the N. by Pennsylvania, W. and S. by W. Virginia and Virginia, and E. by Delaware and the Atlantic; it is known as the Free State. It covers a total area of 10,577 sq. m., of which over 690 sq. m. are water, Chesapeake Bay alone having an area of 1203 sq. m., and lies in three distinct regions, viz. the coastal plain, Piedmont Plateau, and Appalachian Plateau, the last named being traversed by the Alleghany Mts. The most important riv. is the Potomac, which drains the W. portion of the state and forms its S. boundary. Other rivs. are the Susquehanna, Patapsco, Choptank, Sassafra, and Winconico, all, except the Susquehanna, of which the mouth alone is in the state, being small and comparatively unimportant. The climate varies greatly; in the S. the normal winter is mild and summer hot, whereas in the W. the normal winter is cold and summer cool. The state contains important coal-fields; clay products are also valuable, and sand, talc, lime, and rock cement are obtained. On the whole the soil is well adapted for agriculture and under good cultivation. It is particularly fertile in the W. cos. The chief crops are wheat, maize, hay, potatoes and other vegetables, tobacco, and fruit. Horses, mules, cattle, sheep, and pigs are reared. The fisheries, especially of oysters, are extensive. Steel manuf. and copper smelting and refining are its chief industries; coal, coke, cement, asbestos, and some potash salts are produced. The chief tn. is Baltimore (pop. 1,046,700), but Annapolis (pop. 13,070) is the seat of government. Cumberland (39,500), Hagerstown (32,500), and Frederick (15,900) are other important cities. M. is administered by a senate of twenty-nine members and a house of delegates of 123, both elected for four years, and is represented in Congress by two senators and six representatives. There is an excellent system of free public schools and a number of higher educational institutions, the most important being the Johns Hopkins Univ. (q.v.). The univ. of M. is at Baltimore. Communication by water and land is excellent; there are good roads and over 2000 m. of railway, steam and electric. There are thirty-nine airports. Baltimore, which is one of the best ports on the coast, has a large export trade. Total state pop. 2,215,000, of whom about 17 per cent are Negro.

M. was named after Henrietta Maria, queen consort of Charles I. of England. It was first explored by Capt. John Smith in 1608. A charter granted by Charles I. to Lord Baltimore to found a colony for Rom. Catholic recusants gave him practically royal power over the region. In 1638 the people were conceded the right to initiate legislation. The assembly passed the famous Act of Toleration in 1649 by which freedom of worship was granted to all Christians. This, however, provoked the Puritans to rebellion and in 1652 the colony was seized by the commissioners of Parliament, but was restored to Lord Baltimore in 1657. M. was one of the thirteen original states. See M. P.

Andrews. *History of Maryland Province and State*, 1929, and *The Founding of Maryland*, 1934; P. Wilsbach, *Tidewater Maryland*, 1931; Federal Writers' Project, *Maryland: a Guide to the Old Line State*, 1940; and D. Cunz, *The Maryland Germans: a History*, 1949.

Marylebone (in full, **St. Marylebone**, i.e. St. Mary's on the bourn or brook, the brook being the Tyburn), bor. of the co. of London. It lies between Hampstead and Oxford Street, Paddington being on the W. side. It includes the dists. of St. John's Wood, the greater part of Regent's Park, Cavendish and Portman Squares, Harley and Wimpole Streets, and the railway stations of M. and Baker Street. It also contains Lord's cricket ground, Bedford College, Queen's Hall (burnt out in a Ger. air raid), and Madame Tussaud's. Much of the land forms the Portland estate, the property of the Lord Howard of Walden. It is a single par. div., returning one member. Pop. 98,000.

Marylebone Cricket Club, see under CRICKET.

Mary Magdalene, see MAGDALENE, MARY.

Maryport, seaport of Cumberland, England, on the Ellen, 28 m. S.W. of Carlisle. So called from the landing here of Mary Queen of Scots on her flight from Scotland. It has shipbuilding yards, iron foundries, tanneries, breweries, etc. The exports consist principally of coal and iron. Pop. 3200.

Marysville: 1. City in Yuba co., California, U.S.A., 43 m. N. of Sacramento. Dredge gold-mining is carried on, and it has an iron foundry, woolen mills, fruit canneries, etc. Pop. 6600. 2. Post vil. of Hastings co., Ontario, Canada, 34 m. W. of Kingston, on the Grand Trunk railway. Pop. 3000.

Masaccio ('shiftless') (1401-28), nickname of Tommaso di Giovanni di Guidi, a Florentine painter, b. in the Arno Valley. He is sometimes called the father of modern art, and is celebrated for his frescoes in the Brancacci chapel in the Carmine and in Santa Maria Novella at Florence, which became a school of instruction for Florentine painters of the succeeding generations. He also painted sev. pictures now in the Berlin Museum, and his 'Madonna and Child with Angels' is in the National Gallery, London.

Masai, people of Hamitic-negroid stock, living in Kenya and other parts of E. Equatorial Africa, speaking a Nilotic language. Up to the early years of this century they occupied a considerable part of the large plains which extend from about 1° N. lat. to 6° S. lat., situate in both Brit. E. Africa, and what was formerly Ger. E. Africa (Tanganyika). Those living in Kenya commonly call themselves *Il-Masac*, while those in Tanganyika are often known as *Il-Oikop* or *Il-Lumbwa*. But the encroachments of the white settlers on the famous Rift Valley and the high plateaux, where formerly they held fierce and exclusive sway, has for many years threatened them with extinction and already their numbers have been reduced to about 40,000. Sinewy,

thin-lipped, and tall, they are or were of warlike character, but have now for some time lived peaceably under the Brit. regime, and on their own reserves. They are a nomad people, averse to labour for white settlers, and to agriculture, preferring cattle-raising, which they regard as their true source of wealth regardless of the quality of the cattle. The thoughts, ideas, sayings, language, and customs of the M. are recorded in detail in Sir A. C. Hollis's *The Masai: their Language and Folk-lore*, 1905. See also KENYA. See J. W. Gregory, *The Great Rift Valley*, 1896, and Lord Hailey, *An African Survey*, 1938.

MASAI

F.N.A.

Masampo, Korea, former free port of foreign commerce on the S.E. coast, 180 m. S.E. of Seoul.

Masaniello, see ANIELLO, TOMMASO.

Masaryk, Jan Garrigue (1856-1937), Czech statesman and patriot, *b.* in Prague, son of Thomas Garrigue M., and educated at Prague. He emigrated to the U.S.A. in 1907, but when the Czech republic was formed in 1918 he entered the ministry of foreign affairs there. Between 1919 and 1922 he was in the diplomatic service in Washington and London, returning to Prague in 1922 as secretary to the foreign ministry. From 1925 to 1938 he was Czech minister to Great Britain, and throughout that time was an outstanding success, witty and shrewd, and a devoted representative of his country, who persistently kept its interests before the Brit. Gov. After the Munich pact, however, he deemed it necessary to conclude his London mission in order to conduct a

lecture tour in America to save, not so much his country's frontiers, as Europe itself. In 1939 he was back in London, where he introduced the first news bulletin in the Czech language to be broadcast from the B.B.C. His national programme was a free Czechoslovakia in a free Europe, and he proved much the most popular and influential broadcaster his country had ever known. In particular he exposed the long-premeditated Nazi plan to extinguish the culture of his nation. In July 1940 he was appointed minister of foreign affairs in the Czechoslovak provisional gov. and in 1941, Deputy Prime Minister as well. After another visit to the U.S.A. for discussions with President Roosevelt he returned to Great Britain in July 1942, where he played a prominent and effective part in the conferences between the various provisional govts. which had their headquarters in London during the war. In April 1945 he accompanied Beneš to Moscow for discussions with Stalin and Molotov. In Aug. of that year he flew to London to take part in the discussions of the U.N.R.R.A. Council, and in the conference of the preparatory committee of the United Nations Organisation. He was uncompromising in his view that the Sudeten Gers. should leave Czechoslovakia, and unwilling to yield to Poland in the long-standing dispute over Teschen. Late in 1946 he was nominated, against Rom. Catholic opposition, as head of the Czechoslovak delegation to the United Nations Assembly. Though by upbringing and inclination he leaned more to the W. than to the E. he strove, after the liberation of his country, to get each side to understand the point of view of the other, as was demonstrated in his address as president of the World Federation of the United Nations Associations at Mariánské Lázně (Marienbad) in Aug. 1947, and if he failed, it was because Prague was again conquered by a harsh and alien system of gov. Inspired by Russian communism as opposed to the philosophy of individual freedom. In March 1948 he committed suicide by jumping from the window of his apartment in the Foreign Office, Prague, dying a victim of this conflict. M. was a Czech patriot, for whom patriotism meant a free country, proud of her Slav blood, and of her liberal culture.

Masaryk, Thomas Garrigue (1850-1937), first president and 'liberator' of Czechoslovakia. *B.* at Hodonin in Moravia. At an early age he was apprenticed to a blacksmith; but, largely owing to his mother's determination, he was enabled to continue his education at school, and at the univ. with a view to becoming a teacher. In 1878 he married Charlotte Garrigue, an Amer., whose name he added to his own, and, until her death in 1923, she was his ardent helper in all his work. He had been a teacher for some time when, in 1879, he was elected *privatdozent* or unsalaried lecturer in philosophy at the univ. of Vienna. In 1882 he became a prof. at the new Bohemian univ. of Prague. In 1891 he entered Parliament in Vienna, but resigned in 1893. In 1907 he returned to

Parliament as a representative of the Realist party. He was an outspoken opponent of Germany's encroachment upon Austria, and more especially of Austria's encroachment upon the Balkans and the policy of amassing ter. in Bosnia. He also succeeded in exposing the forgeries of the Austrian Embassy in Belgrade which were used in the Agram and the Friedjung trials. In 1914, after the outbreak of the First World War, he fled to Italy, and from there and in Switzerland, France, and England carried on a ceaseless propaganda on behalf of the national aspirations of the Czechs and the Slovaks. In London he became a prof. at King's College. Two years later, in 1917, he went to Russia, and then to the U.S.A., where he secured recognition of the Czech National Council, of which he was president. On Nov. 14, 1918, he was elected president of the newly formed republic of Czechoslovakia, being re-elected in 1920 for seven years, and again in 1927 for a further period. On his eighty-first birthday his enthusiastic fellow-countrymen presented him with the sum of 20,000,000 crowns (£122,000), which M. allocated to humanitarian and educational institutions. (See CZECHOSLOVAKIA.) In addition to being one of the most respected statesmen in Europe, M. was a scholar and a renowned realistic philosopher. The following is a select bibliography of his works: *Seberrazda* (1881); *Théorie Pravděpodobnosti a Humeova Skepsis* (*The Theory of Probability and Hume's Scepticism*), (1882); *Blaise Pascal* (1883); *Česká Otázka* (*The Czech Question*) (1896); *The Philosophy of History and Religion in Russia* (1913); *The New Europe* (1918); *Světová Revoluce* (1925; Eng. trans., *The Making of a State*, 1927). See lives by D. A. Lowrie, 1930; E. Ludwig (Eng. trans. J. Murphy, 1936); R. J. Kemer, 1938; V. Cohen, 1941; P. Selver, 1941; and K. Čapek, *President Masaryk tells his Story*, 1933.

Masaya, tn. of Nicaragua, cap. of the dept. of M., 13 m. W.N.W. of Granada, near the lake, and at the foot of the volcano, both of the same name. Sugar, tobacco, rice, and coffee are produced in the area. Pop. 36,300.

Masbate, one of the Philippine Is., S. of Luzon and W. of Samar. Length 60 m., breadth 20 m., and it covers an area of 1262 sq. m. Gold is found, and it is very fertile, yielding tobacco, gums, resins, etc. The chief tn. is Masbate. Pop. of is. 51,000.

Mascagni, Pietro (1863-1945), It. operatic composer, b. in Leghorn, son of a baker, was educated at Leghorn and at the academy in Milan. His father destined him for the law but, through the interest of a patron, he was enabled to go to the Milan Conservatoire. His success in 1889: counterpoint work prompted him to go on to study for the job of conductor of a small touring operatic company, an idea which explains alike his success and failure in life. Later, he settled in to Lord J., where he gave pianoforte lessons, of the tin conducted the local band. Confid- would scarcely have been less

promising for a young musician, but he had written *Giulietta Ruffini*, an opera on a gloomy subject of Heine's, set out in an ineffective libretto, and *Cavalleria Rusticana*. The latter was chosen in a competition organised by the It. music publisher, Sonzogno. The opera was produced on May 1, 1890, at the Costanzi Theatre, Rome, and was an instant success. A vii. tale of passion and jealousy, it is clear and rapid in action, and skillfully portrays simple and strong emotion, with music which, if sometimes commonplace, always reinforces the spirit of a situation. *Cavalleria Rusticana* was M.'s first success, and might with little exaggeration be described as his last. Many other operas followed, but he never again approached this initial success. *L'Amico Fritz* (1891), now neglected, deserved a better fate, for there is much in it which is charming. *Pinoia*, composed as early as 1880, was not performed till 1932, when it was produced under M. with what was computed to be the 13,000th performance of *Cavalleria Rusticana*. *Giulietta Ruffini* was first performed in 1895; it has been revived in more recent years, and is still occasionally given in Italy. His last work was *Nerone*, first given in 1935. His cantata *In Filanda* (1881) created no impression. His other operas are *L'Intanto* (1892); *Silvano* (1895); *Zanetto* (1896); *Iris* (1898); *Le Maschere* (1901); *Amica* (1905); *Isabeau* (1916); *Lodolella* (1917); *Si* (opera, 1919); and *Il piccolo Murat* (1921). Besides operas, he wrote some occasional works, cantatas, and the incidental music for Hall Caine's *The Eternal City*, produced in London in 1902. Most of his operas are to be heard now and again in Italy, but outside his own country they count for little, partly because early success made him careless, partly because his talent was limited; but nothing can minimise the magnitude of his one outstanding achievement. He became a member of the It. Academy in 1929. See lives by G. Orsini, 1926; C. Cogo, 1931; E. Mascagni, 1936; and A. Terzi, 1931.

Mascara, tn. of Algeria, 45 m. S.E. of Oran. The former residence of Abd-el-Kader, it was destroyed by the Fr. in 1835, and occupied by them in 1841. It trades in cereals, wine, and oil. Pop. 32,000.

Mascarene Islands, group comprising Mauritius, Réunion, and Rodriguez Is. in the Indian Ocean. Réunion was discovered in 1545 by the Portuguese Mascarenhas, who called the group after himself.

Mas-d'Azil, Le, tn. in dept. of Ariège, France, 12 m. W.S.W. of Pamiers. There is a grotto with prehistoric remains. Pop. about 2000.

Masefield, John Edward (b. 1875), Eng. poet, playwright, novelist, and critic, b. at Liverpool. He went to sea as a boy, in the ship *Conway*, whence the admirable sea scenes in some of his tales. He made many voyages and land journeys, and worked on farms as a gardener, and as a bar-tender in U.S.A. He returned to England and became a journalist, editing the miscellany column of the *Manchester*

Guardian. Later, he settled in Bloomsbury, forming a warm friendship with J. M. Synge. Between 1901 and 1911 he wrote poems, plays, novels, short stories, essays, and criticism, all with moderate success, and was an established writer by the time 'The Everlasting Mercy' appeared in the *English Review* (1911). This long narrative poem in octosyllabic couplets, representing the spiritual conversion of a prodigal 'tokened to the devil,' evoked much enthusiasm among the critics. M. was, in fact, a pioneer in the revival of the long narrative poem in England. Other

Press Portrait Bureau

JOHN MASEFIELD

such poems are *The Widow in the Bye Street* (1912), *The Daffodil Fields* (1913), and *Dauber* (1913), all somewhat marred by the artificiality of manufactured rhymes and effort at ultra-realism as expressed in the crude language and occasional blasphemous sentiments in the mouths of characters who, in ordinary life, would not doubt express themselves in that manner. *Dauber*, however, is relieved by some magnificent passages of sea verse. *Reynard the Fox* (1919), also a narrative poem, the record of a fox-hunt, is notable for its truly Chaucerian vignettes of human character. M.'s sea experiences have been a great source of inspiration to him, from his first vol., *Salt-Water Ballads* (1902), onwards. His versatility is shown in his felicitous lyrics and other short poems, in *Ballads* (1903); *Lullington Downs* (1917); *Songs of Good Cheer* (1926), and in his dramas and novels.

The Tragedy of Nan was produced in 1909. Opinion is divided on its merits, but at the lowest estimate it is one of the few twentieth-century plays that approach true tragedy. But after 1919, apart from a few experimental performances in London, M.'s new plays got little further than the private theatre in his home at Boar's Hill, Oxford. In *Good Friday* (1916) and *The Trial of Jesus* (1925), alternative versions of the same gospel incidents, he cramped himself in the effort to adhere to the scriptural record. There is a real element of dramatic and psychological interest in his portrayal of Pilate and Herod and others, but these religious plays would seem to suffer from the handicap of a static central figure. Among his energetic and thrilling novels are *Jim Davis* (1911); *Sard Harker* (1924); *Odtaa* (1926); *The Bird of Dawning* (a swift-moving story of the tea-clippers, 1933); *The Taking of Gry* (1934); *The Country Scene* (1937); and *Badon Parchments* (1947). His miscellaneous works include studies of *Shakespeare* (1911); *Synge* (1915); and *Ruskin* (1920); the well-known war books *Gallipoli* (1916), *The Old Front Line* (1917), and *Nine Days' Wonder* (1941, about Dunkirk); and a standard work on *Sea Life in Nelson's Time* (1905). M. succeeded Bridges in 1930 as poet laureate, and was awarded the O.M. in 1935; he became the chairman of the National Book League (q.v.).

Maseru, dist. of Basutoland. Chief tn. and settlement of the dist. is M., 100 m. N.N.E. of Alwal N. It links with the Bloemfontein-Natal railway at Marseilles. Pop. 2300.

Mashal, see PROVERBS, BOOK OF.

Masham, Abigail (d. 1734), was daughter of Francis Hill, a merchant of London, who married the sister of Mr. Jennings, the father of the duchess of Marlborough. Her relative, then Lady Churchill, procured her the place of waiting-maid to the Princess Anne. She retained her situation after the princess ascended the throne and acquired great influence over her. Miss Hill married Samuel Masham (son of Sir Francis Masham, of Otes in Essex) in 1707. Harley, afterwards earl of Oxford, connected himself with the new favourite; a change of ministry took place, and in 1711 Masham was raised to the peerage. He and his wife appear to have engaged in intrigues in favour of the Stuarts. See W. S. Churchill, *Marlborough: his Life and Times*, 1933-38, 1947.

Masham, small tn. in the N. Riding of Yorkshire, England, 8 m. N.W. of Ripon, on the R. Ure. There is an eighteenth-century grammar school. The main industries are brewing and trade in agricultural produce. Pop. 2000.

Mashonaland, region of S. Rhodesia, came under Brit. rule in 1890. The chief inhab. tribes are the Mashonas, a peace-loving people. Our earliest information of the country records the settlement of the Bantu Negroes, in the sixteenth century, whose hereditary chief, Monomatapa, had his cap. in M. The people appear to have entered into a commercial treaty with the

Portuguese. But through a succession of tribal wars they lost cohesion. The next we hear is of the Matabele, an offshoot of the Zulus, whose chief, Mosilikatja, entered into a treaty with the governor of Cape Colony. From about 1816 to 1870 the Matabele power held sway over the Mashonas and other Makalanga tribes. A pioneer force was sent into M. under Colonel Pennycuik, and settled on the sites which are now the towns of Salisbury, Victoria, and Charter. A dispute with the Portuguese, who claimed a tract of terr., was settled by force of arms, in which the Brit. S. African police were the victors. The Matabele resented Brit. occupation, with the result that Dr. Jameson, Major Forbes, and Allan Wilson raided their native kraals. Wilson and his force were slain as the result of the Shangani R. rising and preventing reinforcement. Lobengula, their chief, d. in 1894, thus quelling for a while the Matabele spirit. They and the Mashonas revolted, however, in 1896, but their resistance gave way in 1897. Industrious and generally peaceful, the Mashonas make very successful farmers. They excel in the crafts, the smelting and forging of iron, in pottery, and weaving. They are good hunters, fond of music, and use the bow and arrow, assegai, and axe. They were anciently supposed to be the builders of the ruins of Zimbabwe, which show that a large pop. at one time inhabited S. Rhodesia. Legend has it that Solomon got his gold from this region, and that M. is the biblical land of Ophir, but there is no continuous goldfield anywhere in Rhodesia as on the Witwatersrand. The pioneers, under licence from the Brit. S. Africa Company who constituted the first expedition to M., had been promised fifteen gold claims apiece, and were soon occupied in prospecting near the anct. workings, without, however, finding a goldfield of any considerable importance. Sev. potentially good dists. in the S.E. and N.W. of M. have, however, been neglected owing to their remoteness from the railways. In general the deposits are widely scattered, and many are small and easily worked, conditions that favour the individual miner but do not attract the large corporation. M. is no longer a political div., but with Matabeleland forms S. Rhodesia (q.v.). Pop. probably about 400,000, but separate census figures for M. and Matabeleland are not now pub. See J. T. Bent, *Ruined Cities of Mashonaland*, 1892, and C. Bullock, *The Mashona* (the indigenous tribes of S. Rhodesia), 1927; also Bishop Knight-Bruce, *Gold and the Gospel in Mashonaland*, 1888, ed. by C. E. Fripp and V. W. Hillier, 1949.

Maside, com. in prov. of Orense, Spain, 10 m. N.W. of Orense. Pop. about 6500.

Masinissa, or **Massinissa** (c. 238-149 B.C.), king of the Numidians, ruler of the Massylians in E. Numidia, and later king of Numidia. He fought in the second Punic war, first as an ally of the Carthaginians, and afterwards of the Romans, when he served with Scipio against Syphax (204-203) and in 202 at the battle of Zama. He

reigned till 118 B.C., and was given most of Syphax's terr. after the conquest of Carthage, thus becoming ruler of all Numidia.

Mask, name given to artificial covering for the face for the purpose of disguising or protecting the wearer. The making of Ms. representing human, animal, or grotesque faces dates back to prehistoric times, and the use of the M. in ceremonial dances, incantation ceremonies, or other ritualistic occasions survives among primitive peoples down to the present day. The M. was believed to have a demonic power which transferred to the wearer the attributes of the character represented, its purpose being either to create an illusion in the beholders or to give courage to the wearer, frightening evil spirits and enabling him to conquer his enemies, or to propitiate his gods. There exist African, Melanesian, and Polynesian Ms. which owe their origin to this urge among primitive peoples to identify themselves with the objects of their veneration. Knowledge of the M. in Europe begins with its use in the theatre of the anct. Gks. It doubtless had its origin in the early mystery cults, but in the Gk. and later the Rom. theatre it survived as a representational convention. In China, Japan, and the Far E. the theatrical Ms. had the same uses but retained more of their magical qualities. In the Middle Ages in Europe Ms. were made with a Christian significance but not primarily to be worn. In the sixteenth century the M. gained a new vitality through the *Commedia dell'Arte*, and from this developed the Venetian social M., simply a covering for the eyes and nose, leaving the mouth free. It signified licence from social restraint and to that extent retained some of its primitive magical character. The M. is also a means of preserving a likeness of the features of a person once living, and in this connection, too, it has a long hist. The anct. Egyptians made death masks of thin gold plate. The Romans used wax. Later methods are to apply oil or grease to the face, and then coat the features with plaster of Paris, which hardens and can be removed to form a mould from which the M. can be cast. Ms. are also used in modern industry as a protection to the face, necessary in various processes such as, for instance, oxy-acetylene welding. The use of poison gas as a weapon in the First World War resulted in the invention of the gas M. or respirator.

Maskelyne, John Nevil (1839-1917), Brit. illusionist, b. at Cheltenham; apprenticed to a watchmaker. Began his entertaining at the age of sixteen. In 1865 he exposed the Davenport brother 'spirit-speaking' séances showing that they used watch-spring devices. In 1873 he moved to London, where he founded and toured with an illusionist show. Performed at Crystal Palace, 1867; Egyptian Hall (London), 1873; royal command performance, 1879; world tour, 1881; in partnership, later, with David Devant (q.v.). He rebuilt and opened St. George's Hall (London) in 1904 for illusionist displays and was founder and first president of the Magic Circle. Shortly after that

time M. and Devant had become the most famous illusionist show in the world. John Nevil M.'s son, Nevil (1871-1926) introduced new disappearing and other illusions, and, during the First World War, carried out experiments in photographing and timing artillery shells in flight, and put at the Admiralty's disposal a fire-resisting formula which was later used by naval gunners. He also supplied illusionists who performed 'magic' for Lawrence of Arabia before Arab chieftains. His son, Jasper (b. 1903) carried on the business, his first public appearance being in 1912 and his first world tour 1930. St. George's Hall was sold to the B.B.C., 1933, following his second royal command performance in 1932.

NEVIL MASKELYNE

Maskelyne, Nevil (1732-1811), Eng. astronomer, graduated at Trinity College, Cambridge, in 1754. In 1755 he took orders, but he had previously been led to turn his attention to astronomy by the solar eclipse of 1748. In 1761 he went to St. Helena to observe the transit of Venus, and to detect, if possible, the parallax of the fixed stars. In 1764 he acquired that knowledge of nautical astronomy which led to the formation of the *Nautical Almanac*. In 1765 he was appointed astronomer royal.

Maskinongy, see under Pike.

Mask Lough, lake in Eire, about 11 m. long by 3 m. broad, forming a portion of the boundary of Mayo and Galway cos. and remarkable for its beautiful scenery.

Mason, Alfred Edward Woodley (1865-1948), Eng. novelist, educated at Dulwich and Trinity College, Oxford, where he was president of the union and took honours in classics. Joining Sir Frank Benson's company, he appeared in Shaw's *Arms and the Man*, but soon gave up the stage. He became a Conservative political agent and also occupied himself with church work. He produced his first novel, *A Romance of Walsdale* (which he afterwards suppressed) in 1895 and, in

1896, was very successful with his second, *The Courtship of Morrice Buckler*. In 1902 came his best-known novel, *The Four Feathers*, written in a vein of heroic adventure in a contemporary setting. Meanwhile M. stood for Parliament in the Liberal interest and was elected (1906) for Coventry; but, though he seems to have made a good impression with his first speech, he did not stand again. His novel *The Turnstile* (1912) describes the effect of the House of Commons on those who become members. Among other novels of his earlier years were *Running Water* (1907), which contains a famous account of the old Brounva Church on Mont Blanc, *The Broken Road* (1907), for the background of which latter book he had spent some time in India, and *At the Villa Rose* (1910), the first novels in which appeared his highly popular character Inspector Hanaud of the Paris Sûreté. He served in the First World War in the Royal Marine Light Infantry and as a naval intelligence officer. Among the many novels he wrote in the next thirty years are *The Summons* (1920); *The Winding Stair* (with a Moroccan setting, 1923); *The House of the Arrow* (1924), and *The Prisoner in the Opal* (1929), in both of which Hanaud appears; *No Other Tiger* (1927); *The Dean's Elbow* (1930); *Fire over England* (1936, a story of Armada days, stirring and spectacular); *Königsmark* (1938); *Musk and Amber* (1942); and *The House in Lordship Lane* (1946, a Hanaud novel). M. dramatised sev. of his novels; his comedy, *Colonel Smith*, was produced in 1909.

Mason, George Heming (1818-72), Eng. painter, spent some years in Rome, and whilst in that city painted his 'Ploughing in the Campagna.' His finest paintings are 'The Evening Hymn' (1868) and 'Harvest Moon' (1872).

Mason, James Murray (1798-1871), Amer. political leader, b. in Fairfax co., Virginia. He was a member of the National House of Representatives, 1837-1839, and the U.S. Senate, 1847-51, when he resigned with other S. senators. Appointed confederate commissioner to Great Britain, he was seized with John Slidell on board the Brit. ship *Trent* by Capt. Wilkes of the *San Jacinto*. Great Britain demanded his release, and war was imminent, but Lincoln recognised that the *Trent* was a neutral ship, and released the commissioners. M. was not officially recognised in Great Britain. He lived at Paris and in Canada, returning to the States in 1869. See life by his daughter, Virginia Mason, 1903.

Mason, John (1586-1635), governor of Newfoundland in 1606. In 1622 he obtained grants in Mariana (now N. Massachusetts) and the prov. of Maine, and in 1629 in New Hampshire and Laconia.

Mason, William (c. 1724-97), Eng. poet, attended St. John's College, Cambridge. From 1751 he held various livings in the Church. He was a profound admirer of Gray, who praised his dull classical tragedy *Caractacus* (1759), but pointed out also his plagiarisms and his grammatical

and other blunders. M. ed. the *Life and Letters of Gray* (1774). See J. Mitford (ed.), *The Correspondence of Thomas Gray and William Mason*, 1853; J. W. Draper, *William Mason: a Study in 18th Century Culture*, 1924.

Mason and Dixon's Line, boundary line (lat. 39° 43' 26" 3" N.) separating Maryland from Pennsylvania. Charles Mason and Jeremiah Dixon were two Eng. astronomers who surveyed it between 1763 and 1767, and thus put an end to the disputes between the Baltimores and Penns. the respective proprietors of the two colonies. This line was part of the boundary between free and slave (N. and S.) states. Since 1820 it has been a popular name for the whole of that boundary.

Mason City, cap. of Cerro Gordo co., Iowa, U.S.A., 115 m. N.N.E. of Des Moines. Its chief manufs. are bricks, cement and tiles. It has also foundries and machine shops. Pop. 27,000.

Masonry, art of building in stone in a similar manner to building in brick; the fundamental difference between M. and brickwork (*q.v.*) being that in the former the stones are often of irregular and heterogeneous shape and size, as opposed to the uniform mass of bricks. This renders it difficult to obtain a bond in the work, as well as causing the walls to be thicker than brick walls. M., however, from these features, is better suited to imposing and beautiful structures, as work of greater projection can be included than is possible with brickwork. The art of M. is of great antiquity, the pyramids of Egypt being perhaps the most noteworthy examples in the world of M. without mortar.

The tools which a mason uses include squares, hammers of various shapes, 'hoasters,' chisels, saws, axes, picks, wedges, trammel heads for setting off distances, nippers for lifting the stones, etc.

Building stone after being quarried is left exposed to the air for a period to season. The manner in which stones are treated either before or after building is described in various technical terms. Scrabbling is taking off the salient angular projections of the stone; when the stone is used in this condition the work is called rustic work. Hammer-dressing and half-sawing are terms which explain themselves. Half-plain work is the term applied to stone which has been roughly levelled, whilst plain work has been more accurately smoothed. Combed work has been treated by a steel scraper or comb; hoisted or dromed work has parallel chisel marks, which do not extend quite across the surface, as in tooled work. Sunk work is below the level of the surrounding stone, moulded work is work formed with a change of curvature, whilst chisel-draughted margins are smooth narrow spaces enclosing combed, hoisted, or plain work. Rubbed work is rubbed with another stone and with sand, water, etc., whilst polished work is brought to a high polish generally by machinery. Most building stones are composed of layers or

laminations, and it is of the utmost importance when using them that they are correctly bedded. In the case of stones resisting heavy compressive forces, the laminae must be at right angles to the thrust, otherwise there is a tendency for the surface to peel off. All joints in M. must be at right-angles to the pressure which they have to bear. Joints between two blocks of stone are formed by dowels, cramps, and various types of joggles. Great care must be taken to prevent the formation of rust when using iron for securing joints, because the consequent expansion is capable of splitting the stone.

Stone walls may be divided into three main classes, according to the manner in which the stones are set up: rubble, block in course, and ashlar. The first category includes a great variety of methods, of which the chief are known as flint; random rubble set dry; random rubble set in mortar; Kentish rag; random rubble built in courses; uncoursed; squared or 'snecked' rubble built up to courses, and regular coursed rubble. 'Rubble' as a generic term means thinly bedded stone, generally taken as less than 9 in. in depth. When it is of irregular shape it is 'random,' and when squared into shape it is said to be coursed. The various kinds of rubble walls thus explain their composition by their names. In random rubble set in mortar the bond is obtained by using one bond stone in every superficial yard in the face. In flint work, windows and door dressings and groins are set with brick or squared stone for strength and appearance. 'Kentish rag' is built of a kind of unstratified sandstone which is found in Kent, and the blocks of which are usually roughly dressed to a polygonal form. 'Snecks' are small stones which are inserted where required in snecked rubble to prevent long vertical joints. Block in course work is made of stones larger than those used for coursed rubble, with hammer-dressed faces, squared and brought to a good joint; it resembles good coursed rubble or ashlar, and is very strong and durable. Ashlar is the name given to carefully worked stones of more than 12 in.; owing to its heavy cost ashlar is backed either by brickwork or by rubble. The backing should be built in cement mortar and brought to a level at every bed-joint of the ashlar. The facing of the ashlar may be plain, rebated, or chamfered. See W. R. Purchase, *Practical Masonry*, 1904; and C. C. Williams, *The Design of Masonry Structures and Foundations*, 1922; E. Warland, *Modern Practical Masonry*, 1929; T. Corkhill (ed.), *Brickwork, Concrete, and Masonry*, 1931.

Masonry, Free, see FREEMASONRY.

Masons' Marks, as used in medieval buildings, were devices cut in the stones to identify the responsible mason or master-mason. Their origin, however, may conceivably be traced to early Rom. times. A series of marks has been found on buildings of the regal period, particularly those on the stone of the agger wall and the marks of the *cella* or granaries on the Palatine near the Scala Caeli (one of the three approaches to the aet. city). They

are deeply cut, generally on the end of the quarried blocks, and average a foot long. They take the form of single letters, monograms, or numbers. M. M. are found in the Old World in widely distant regions wherever hist. shows that there have been building operations on a large scale. They bear so close a mutual resemblance despite their diversity of location that the palaeographer H. K. Brugsch suggested that the stones in the quarries were marked according to a definite system, and that the old craft-guilds of stonecutters possessed a cryptic alphabet which was handed down to the seventeenth century. A study of eccles. architecture in Britain shows that some master masons identified themselves with their work as, for example by a symbolical device representing their names; see e.g. YEVELL, HENRY bk.

Maspero, Sir Gaston Camille Charles (1846-1916), FR. Egyptologist; b. in Paris, entered the École Normale Supérieure of Paris in 1865, and became lecturer on Egyptian archaeology at the École des Hautes Études in 1869. For many years he was a prof. at the Collège de France. He discovered many royal sarcophagi at Heir-el-Bahari and made further discoveries in clearing the temple of Karnak. His most valuable pub. is *Histoire ancienne des peuples de l'Orient classique* (1891-1900).

Masque was a species of dramatic entertainment which reached its highest popularity in the reign of James I., but which was also a favourite diversion at the courts of Henry VIII. and Elizabeth. 'Essential masque,' says the Rev. Ronald Bayne, 'was the appeal of the moment to the eye and the ear, the blaze of colour and light, the mist of perfume, the succession of rapidly changing scenes and tableaux, crowded with wonderful and beautiful figures.' Many look to Italy for the origin of the M., but it seems at least likely that it grew out of the 'mummings' which are heard of in England as early as 1377. The growth of opera accounts for the speedy waning of the M.; in the latter, pageantry and spectacular display were of supreme importance, whilst in the former these were rightly subordinated first of all to music and then also to character-drawing and plot. Ms. were played commonly before royalty and in the homes of nobility. Thus Daniel's *Vision of the Twelve Goddesses* was produced at Hampton Court in 1601, shortly after James's accession; when, he it noted, Queen Anne and her ladies were the masquers, and *The Masque of Queens* of Ben Jonson was presented at Whitehall in 1609. The *Hymenai*, also by Jonson, was performed in 1606 to celebrate the marriage of Essex with Frances Howard, whilst his *Pleasure Reconciled to Virtue* was played at court on Twelfth Night in 1618. It was this libretto of Jonson, the great master of the literary M., which inspired Milton's *Comus*, a composition better described as a pastoral than a M., as there is no dancing nor disguise. Inigo Jones often designed the scenery, dresses, and mechanical contrivances; such composers as Luller and Ferrabosco con-

tributed the music, and the dances were specially arranged by profs. of the art. Money, time, and thought were freely lavished, the sole aim of the inventor being to multiply his gorgeous effects, and to make the spectacle as full and varied as he could. See H. A. Evans (ed.), *English Masques*, 1897; W. W. Greg, *List of Masques, Pageants, etc.*, 1902; E. K. Chambers, *The Elizabethan Stage*, vol. iv., 1923; M. S. Steele, *Plays and Masques at Court, 1558-1642*, 1926; E. Wellesford, *The Court Masque*, 1927; and A. Nicoll, *Masques, Mimes, etc.*, 1931.

Masquerade, festive gathering, the participants in which all assume some disguise. The name suggests that when Ms. first came into vogue the mask was a necessary part of the disguise. Weekley suggests an origin (Arabic *maschara*, laughing-stock) different from that of mask, masque. Ms. first appeared in England in the reign of Henry VIII.; they were introduced into France by Catherine de' Medici. Fancy-dress balls, are, it would seem, their modern development.

Mass, term used in physics to denote the quantity of matter in a body. Weight (*q.v.*), with which it should not be confused, is proportional to M. See ACCELERATION; DYNAMICS; GRAVITATION; INERTIA; WEIGHT.

Mass (Lat. *missa*) is the name for the eucharistic service of the Rom. Catholic Church in the W., and corresponds to the term liturgy in the E. churches. The name originated in the words *Ite missa est* (Go, it is ended) with which the rite concluded, the word *missa* coming to mean dismissal and finally becoming the name of the rite itself. The Eucharist was originally performed in Gk. even in the W. including Rome, but Lat. came in in the third century. In the first ages there was no doubt considerable variety of detail in the order of the service, and documentary evidence is not sufficient to establish if there was one rite, and what it was. Universal however was the eucharistic anaphora or prayer by which the bread and wine were changed into the body and blood of Christ, and in which Christ was offered up to God the Father as a victim in renewal of the sacrifice on Calvary. This prayer or canon was preceded by prayers, psalms, and readings from sacred scripture, forming almost a separate service, modelled on that of the synagogue. The first part came to be called the M. of the Catechumens, as the non-baptised were present at it; then they withdrew, and there followed the M. of the Faithful or Eucharist proper. The main rites were the bringing up of the bread and wine by the faithful to the celebrant, the consecration of these elements, and the communion of the faithful. Of the early fathers Justin Martyr (*Apol.* i. 65, 66) gives the fullest account of these rites. After the peace of Constantine began the era of ch. building and greater freedom for the Church. Solemn chants were introduced, the introit for the processional entry, the *Kyrie* or litany of supplication (still in Gk.) at the beginning,

the hymn *Gloria in excelsis*, and a good deal later the singing of the Nicene creed. Chants were devised to cover the time spent in bringing up the offerings (offertory) and in communicating (communion). The *Sanctus* chant marked the beginning of the canon, and the *Agnus Dei* (about 700 A.D.) filled the time taken up in breaking the bread before communion. To-day the old form of the rite is best seen when performed pontifically, i.e. by a bishop or abbot. This is relatively rare in the Rom. Church. In a High M. the celebrant is assisted by a deacon and sub-deacon, whose especial functions are the chanting of the gospel and epistle respectively. It is always sung, with the choir taking up their parts much in the ant. manner. The Low M. is one in which the priest recites the whole text, being answered only by a server; in a variety of this known as the dialogue M. the whole congregation recites the responses. The original music of the M. is known as plain-song or Gregorian chant from Pope Gregory I. (590-604), who did much to organise it and settle its distribution, etc., though how much is not clear. Later ages introduced polyphonic music, Palestrina's *Missae Papae Marcelli* being particularly famous. The introduction of instrumental music and the development of solo singing in Italy and elsewhere marked a deterioration in the style of the M. as a religious service, and the Ms. of the eighteenth- and early nineteenth-century Catholic composers (e.g. Haydn, Mozart, Weber, and Schubert) though musically effective have not the devotional qualities of the earlier chant. In recent years the Catholic Church has tried to exclude ornate and instrumental music and to revert for devotional reasons to Gregorian chant and the simpler forms of polyphonic music. See J. O'Brien, *History of the Mass*, 1879; F. Cabrol, *Origines liturgiques*, 1906; A. Fortescue, *The Mass: a Study of the Roman Liturgy*, 1912; G. Dix, *The Shape of the Liturgy*, 1943; I. Schuster, *Sacramentary*, vol. 1 (Eng. trans. 1924); J. Norman, *Handbook to the Liturgy*, S.P.C.K., 1944.

Massa, joint cap. with Carrara of the prov. of M. e Carrara, Italy, 26 m. N.W. of Pisa, near the gulf of Genoa. It is here that the Carrara marble quarries are, and silk is also manufactured. Much damage was done to the town, chiefly by heavy shell fire, in the Second World War. The cathedral was badly damaged, and many other churches were hit more or less severely, notably S. Giovanni Decollato, the Carmine, and the Chiesa della Misericordia, besides the convent of Ortola, the castello Malaspina and the ducal palace, which was devastated by shell fire, and its interior wrecked. Pop. 11,800.

Massachusetts, one of the thirteen original states of U.S.A., often called the Bay State, Bean State, or Old Colony State. It is in the N.E. in New England, and has an area of 8257 sq. m., including 350 sq. m. of inland water. It has a fine rocky coast with many bays, the largest being Buzzards' Bay, Cape Cod Bay, and Boston Bay and Harbor. Its area includes two large ls., Nantucket and

Martha's Vineyard, which lie S. of the curiously shaped promontory of Cape Cod. Inland the country rises gradually to the beautiful Berkshire hills, a favourite summer resort, and numerous small lakes are a marked feature of the landscape. The chief rvs. are the Merrimack and Connecticut. The climate is temperate, and the beauty of the spring and autumn in M. is notable. Agriculture was, in the first part of the last century, the primary industry, but in the middle and latter part a great tide of emigration towards the W. states took place. There are still many farms, however (comprising over 2,000,000 ac.), hay, maize, potatoes, tobacco, and onions being grown, and fruit farms, which produce chiefly apples and cranberries. To-day M. is essentially a manufacturing state, the textile and boot and shoe industries being of prior importance; but a large trade is done in paper manufacturing and sugar-refining. There is a cod-fishing industry, centred at Gloucester. Boston (pop. 766,400), a great seaport and the oldest in America, is the cap. Other tns. are Worcester, Springfield, Lowell, centre of cotton industry; Plymouth, where the Pilgrim Fathers landed (1620); and Fall R., a large seaport on Mt. Hope Bay, 50 m. from Boston.

The Puritan ancestry had a marked effect on the inhab. of this state, but waned because of the large influx of Irish, It., and Fr.-Canadian settlers. In its early days it was remarkable for its extreme religious intolerance, and later the great Unitarian movement made its headquarters in Boston. There are over 2000 m. of steam and electric railway in the state; the New York, New Haven, and Hartford railway follows the coast-line, and connects with the New York railway systems. The Boston S. railway terminus is one of the largest railway termini in the world. There are sixty airports, of which fifteen are municipal. The educational system includes Harvard (12,000 students) and Boston (17,800) univs., the M. Institute of Technology (founded in 1861) at Cambridge, and Wellesley College for women students at Wellesley, near Boston.

Its legislative body, the General Court of M., consists of a Senate of forty members, elected biennially, and a House of Representatives of 240. Two senators and fourteen representatives are sent to Congress. Pop. 4,725,000.

M. derives its name from an Indian tribe. The first permanent settlement was made by the Pilgrims from Holland, at Plymouth, in Dec. 1620. In 1628 a few settlers at Salem were joined by John Endicott and some colonists, and a charter was granted by Charles I. The charter was taken away in 1684, but a new one was granted in 1691, which united, under the name of M. Bay, New Plymouth, Maine, Acadia, or Nova Scotia, and M. Bay; in 1783 Nova Scotia remained in the possession of the Eng. M. took a leading part in the War of Independence. See J. S. Barry, *History of Massachusetts*, 1857; L. A. Frothingham, *Brief History of Constitution and Government of Massachusetts*, 1925; A. B. Hart, *Commonwealth*

History of Massachusetts, 1928; and Federal Writers' Project, *Massachusetts: a Guide to its Places and People*, 1937.

Massachusetts, N. Amer. aborigines, members of the Algonquin family, The original inhab. of the state which bears their name. Only a small remnant remains.

Massacre of St. Bartholomew, see BARTHOLOMEW, MASSACRE OF ST.

ailments such as sciatica, neuritis, neuralgia, in insomnia, and after fracture of a limb. The other forms of M. in general use are effleurage, stroking, petrissage, frictions, and tapotement.

Effleurage is a form of stroking performed so that the motion is always directed towards the heart. Superficial effleurage relieves pain; deep effleurage is stimulating, promotes circulation and

Parts of the city's industrial and business section. The building with the dome in the right center is the State House of the Commonwealth of Massachusetts. The waterfront is at the top of the picture.

Massafra, tn. in the prov. of Lecce, Italy, 10 m. N.W. of Taranto. Pop. 12,000.

Massage is a scientific manipulative treatment applied to the softer body tissues in certain diseases and convalescence, when the usual innumerable movements of the body exciting tissue metabolism are in abeyance or impossible. The operator (*passeur*, *masseur*, *masseuse*) placing the patient in suitable positions, proceeds to aid movements of the limbs and joints; to stroke, pinch, press, knead the muscles. By this means the small muscles, cell tissue of all kinds, capillaries, etc., are agitated, and normal waste and repair of the healthy body promoted. A modern extension is the application of vibration, especially to joints in cases of rheumatoid affections, by mechanical or electric vibrators. The treatment has become usual in nervous

tissue nutrition, and counteracts inflammation.

Stroking is applied in the opposite direction, and by different movements from effleurage, and should have a soothing effect.

Petrissage consists of kneading, wringing, and picking up tissues. The last operation is used to reduce obesity, and the two former ones in the treatment of muscles of the limbs. In addition to beneficial effects similar to those of effleurage, petrissage aids the elimination of waste matter from the muscles.

Frictions are circular movements used especially to remove thickenings and adhesions, to reduce inflammation, and to help fat absorption.

Tapotement, sometimes called percussion, consists of hacking, clapping, beating, and pounding the tissues. It aids muscular contraction and metabolism,

and stimulates the skin. Hacking is beneficial in nervous affections.

Vibrations, performed manually or by vibratory mechanisms, are used in the treatment of painful nervous diseases, such as neuritis and neuralgia.

In addition to sprains, muscular weakness, obesity, contusions, and other ailments commonly treated by M., constipation, indigestion, gastritis, and other disorders of the alimentary canal may similarly be relieved. The cause of the disorder, however, must be considered; when it has arisen as a result of irregular habits M. may be particularly helpful. M. has always been used by athletes, and was in regular use among the Gks. Recently it has been employed in conjunction with carefully regulated series of exercises performed by the patient, as a means of rehabilitation, e.g. after war injuries.

Certified masseurs have to undergo a long training at schools of M., usually connected with some great hospital. Degrees are granted by the Chartered Society of M. and Medical Gymnastics. In physiology, anatomy, and pathology the masseur's training is similar to that of a medical student; in addition he is taught the technique of M., including the science of remedial exercises. The chartered society has a register of qualified practitioners.

See J. Arvedson, *Medical Gymnastics and Massage in General Practice*, 1926; B. M. Copestake, *Theory and Practice of Massage*, 1927 (6th ed. 1942); and M. V. Lacey, *Massage and Medical Gymnastics*, 3rd ed., 1945.

Massa Lombarda, vil. 18½ m. W. of Ravenna, Italy. The walls and roof of the par. church were partly demolished in the Second World War. Pop. 4000.

Massa-Marittima, small cathedral city, 27½ m. S.W. of Siena, in the prov. of Grosseto, Italy. Zinc and lignite are mined. It is the port of Massa (q.r.). Pop. 18,000.

Massaua, or **Massawa**, see MASSOWAH.

Mass Education, term used for any scheme of universal education of the young, but more particularly for any scheme covering the whole people and thus, as in backward countries, involving schemes for the education of the young of both sexes, and of the adolescent and the adult. In this article the term is used chiefly in its latter connotation and as illustrated by M. E. movements in China, Russia, Turkey, the Negro S. of the U.S.A., and Brit. and Dutch colonies. In this wider context the 'curriculum,' so to speak, of M. E., especially in its application to colonial communities, may be conceived as including all kinds of activities which promote the progress of the common people. M. E. covers, therefore, not only experimentation in health, agriculture, and rural economics, but the building up of strong units of local gov., sound family

and social life, and those recreational and leisure-time activities without which people can long survive. Surveys of M. E. and of adult literacy campaigns in certain countries provide useful landmarks to guide colonial planning. In three of these countries, Russia, China, and Turkey, the urge for M. E. has come from within, being part of the rising tide of nationalism (q.r.). In the Netherlands E. Indies the M. E. measures have been part of a deliberate gov. policy and superimposed from above. In the Negro S. of the U.S.A. there has been no widespread M. E. movement, but a great deal of experimental community work. India illustrates more clearly than any other area surveyed the close connection between M. E., economic progress, and social development. Sex attempts have been made in different provs. in India to launch adult education campaigns along the lines of adult literacy, but the results have been disappointing and discouraging. In the Netherlands E. Indies the Desa school system was originally estab. in 1907 to provide M. E. for the vils., and from 1928 to 1938 the expansion of these schools was very marked. One criticism of this system, however, is that the Desa schools are, admittedly, not linked closely enough with indigenous culture and vil. welfare, though, on the other hand, the children who attend them remain in the vils. and do not drift away to the tus. M. E. in China received its main impetus from Sun Yat Sen and has been carried on with outstanding success in spite of twenty years of internal strife culminating in the war with Japan. The Chinese Republic set M. E. in the forefront of its policy and found enthusiastic support in the hundreds of students returned from the U.S.A. and other foreign countries, imbued with ideas of democratic education. Without this leaven of highly trained personnel ready to serve their country in spreading education, it is doubtful whether the movement would have been successful. How far the different agencies in the Chinese movement continue to function in face of the Communist invasion can only be conjectural; but there was, within the Kuomintang areas, a measure of central direction and supervision under the Ministry of Education which, for instance, controlled the text-books as only authorised ones might be used in schools and adult classes. Another co-ordinating element was a widespread agreement on 'priority' in adult education. Literacy is put first in China, but is closely allied with rural economics, agriculture, health measures, citizenship training, and recreation.

In Russia, as in Turkey, plans for M. E. have involved a revision of the entire educational system. As in China, the objective is sought along a number of parallel lines, the gov. education service, the Red Army, and the trade unions. A decree by Stalin in 1936 ordered the removal of illiteracy in all persons under fifty, and ordained that all military conscripts must be literate. Special attention is paid to the training of teachers in

Russia for illiterate and semi-literate adults. There is a definite attempt in Russia to link all M. E., whether of children, adolescents, or adults, with their local environment, whether urb., industrial, collective farm, or rural vil. In the country dists. cottage reading-rooms, people's houses, and red corners supply books, papers, radio, and sometimes travelling cinemas and theatres. In Turkey M. E. involves adult classes as well as schools for children, for education is compulsory, and free, for adults under forty. In recent years classes in agriculture for men and in domestic science for women have been added to the adult education programmes, but priority was given, as in China, to the liquidation of illiteracy.

The situation in the Negro S. of the U.S.A. differs widely from the other areas considered above. It is perhaps nearer to that in some of the Brit. colonies, especially in the W. Indies and E. and W. Africa. There are no comprehensive plans for the education of the Negroes, covering the whole field. In the Negro S., as in most of Africa and parts of the W. Indies, the majority of schools are under church or mission authority, whereas some of the more recent forms of social service, such as the Rural Extension Service and the Civilian Conservation Corps, have been initiated and financed by state funds under the federal gov. The experience in the Negro S. is instructive on sev. aspects of M. E., especially at its most vital point, the rural community; for however excellent the general plans for co-ordinated M. E. may be, their real test is in the impact they make on each vil. or rural community. The Jeanes system in the Negro S. has in one sense separated school work from general community education, which was left to the rural extension service. The Jeanes teacher was concerned with the school system. The farm demonstration agent, the home demonstration agent, and the public health nurse operated as a team of social workers outside the school system, though sometimes using the school buildings and contacts to reach the parents. A recent trend, especially in experimental work, has been to draw closer the work in the school and that among the adults, and to integrate the curriculum and methods used in both through a revised programme for rural teacher training. The Brit. Gov. has borrowed and used in Africa both ideas and methods in rural education from among those found in the Negro S. of America, the Jeanes rural supervisory teacher being but one illustration of what is owed to Amer. initiative. In the Jeanes type of school, which had its origin in a bequest by Anna T. Jeanes for the training of visiting teachers for Negro schools in America, the Jeanes teacher is given charge of a group of schools, and is expected to stay at each centre for some days and assist the vil. schoolmaster in his work and give friendly advice. See *Mass Education in African Society*, Col. No. 186, I.L.M.S.O., 1944 (reprinted 1946).

Masséna, André, Duc de Rivoli, Prince d'Essling (1756-1817), Fr. marshal, was a wine merchant's son, b. at Levens, near Nice. In 1775 he joined the Royal-Italian regiment. In 1795 he captured Oneglio and drove the Piedmontese from the heights of Saorgio. The following year he enabled Schérer to win the battle of Loano against the Austrians and Sardinians. So brilliant were his successes during the campaign of 1796-97 that Napoleon called him 'l'enfant gâté de la victoire.' From that time onward, till he was repulsed by Wellington in Spain (1810-11), his career was one long, triumphal progress, and honours fell thick and fast upon him. In 1805 he received his marshal's baton. Having assured to Joseph Bonaparte the possession of the Neapolitan crown (1806), he was put in command of the left wing of the 'Grande Armée' in Poland, and was accorded the title of duc de Rivoli for the splendid services he rendered against the Russian foe. His proudest title, that of Prince d'Essling, was given in recognition of his brilliant generalship at Eckmühl, Essling, and Wagram. After his Sp. campaign (1811), the failure of which he attributed with some justice to the insubordination of Ney, Junot, and other of his lieutenants, M. was never again entrusted with any responsible command. Wellington repulsed him at Busaco, and fell back to the lines of Torres Vedras. M. was completely halted, and his lines of communication cut. He retreated in March 1811 into Spain, and an attempted resumption of the offensive was defeated at Fuentes de Oñoro on May 5. See E. Gachot, *Histoire militaire de Masséna*, 1901-13, and P. Sabor, *Masséna et sa famille*, 1926.

Massena, tn. 35 m. N.E. of Ogdensburg, St. Lawrence co., New York, U.S.A. The chief industries are connected with flour, lumber, paper, aluminium. Pop. 11,300.

Massenet, Jules Émile Frédéric (1812-1912), Fr. composer; b. at Montaud, near St. Etienne. Studied harmony at the Paris Conservatoire under Bazin and Reber, and composition under Ambrose Thomas, and won the Prix de Rome in 1863. He met with some difficulties in obtaining recognition, but the success of *Marie-Magdeleine*, a sacred drama or oratorio (1873), opened all doors to him. His originality at first sight is not very striking; yet he created for himself a characteristic style which certainly had its imitators. He delighted in the facile lyrical melodies which won such success with his public, but his very voluptuous music lacks the dignity of Gounod's, by which, however, it was influenced. A number of his orchestral compositions are frequently performed, including, especially, those of a series of five suites called 'Scenes'—*Hungarian Scenes* (1860), *Picturesque Scenes* (1874), *Neapolitan Scenes* (1876), *Fairland Scenes* (1879), and *Asiatic Scenes* (1881)—composed during travels in Germany and Hungary. He gradually made progress as an operatic composer, producing *The King of Lahore* in 1877; *Herodias* (known as *Salome* in England) in 1881; *Manon* in 1884—

probably his most popular work; *Werther* in 1892; *Thais* in 1894; *Suppho* in 1897; and *Le Jongleur de Notre Dame* in 1902. Of their class *Manon* and *Werther*, with their love-duets and dramatic scenes, are masterpieces. In them M. practises 'the art of half-tints, light and fine, transparent and voluptuous, in which he excels' (Henri Prunières). Mention may also be made of his *Don Quichotte* (1910), which was popularised by Chaliapin's staging of the titular part. Among his song books are *Poème d'avril* and *Poème d'un soir*. He also composed some overtures, a piano concerto, incidental music to plays, and many songs. See lives by A. Soubies, 1912; A. Pongin, 1913; and R. Brancourt (5th ed.), 1930. Also J. d'Udine, *L'Art du lied et celui de Massenet*, 1931.

Massey, Gerald (1828-1907), Eng. poet and mystic, b. near Tring, Hertfordshire. As a boy he worked in a silk factory, but in 1843 he came to London, where he was taken up by Maurice and Kingsley. His first book was pub. in 1851, and this was followed by four others; a selection from these was pub. in 1889, entitled *My Lyrical Life*. Later he wrote and lectured on spiritualism, and produced prose works on the origin of myths and mysteries in *The Book of Beginnings* (1881); *The Natural Genesis* (1883); and *Ancient Egypt: the Light of the World* (1907). He also wrote a book on the sonnets of Shakespeare.

Massey, Vincent (b. 1887), Canadian statesman, educated at St. Andrew's College, Toronto, Toronto Univ., and Balliol College, Oxford. Lecturer in modern hist. in Toronto Univ., and dean of residence, Victoria College, 1913-15. He was appointed minister without portfolio in the dominion Cabinet after the First World War, and in 1925 contested Durham (Liberal). He was member of the Canadian delegation to the Imperial Conference in London, 1926, and honorary Canadian minister to U.S.A., 1926-30; president of the National Liberal Federation of Canada, 1932-35; and high commissioner for Canada in the United Kingdom from 1935 to 1946. On his retirement in 1946 Mr. Mackenzie King (q.v.) paid high tribute to his services in London which, during six years of war, had been carried out 'under arduous, exacting, and often dangerous conditions.' He was made Companion of Honour in 1946, and was chairman of the univ. of Toronto since 1947. Pub.: *Good Neighbourhood and other Addresses* (1931); *The Sword of Lionheart and other Wartime Speeches* (1943); and *On Being Canadian* (1949).

Massey, William Ferguson (1856-1932), New Zealand statesman, b. at Limavady, Co. Derry, Ireland. He migrated to New Zealand in 1870, and settled as a farmer near Auckland. Entering Parliament in 1894 he was opposition (Conservative) whip from 1895 to 1903, and in 1903 became leader of the Conservative opposition. He was made Prime Minister in 1912, being also minister of lands and labour. In the First World War he became a member of the Imperial War Cabinet (1917-18), his ability and character successfully bringing his country

through the war. He was New Zealand representative at the Paris peace conference in 1919 and, in 1921, New Zealand's chief delegate at the Imperial Conference, London; but his gov. was defeated at the general election of 1922. He was a member of the House of Representatives from 1891 until his death.

Massicot, yellow oxide of lead, the monoxide, PbO, sp. gr. 9.3, occurs native, but generally prepared by heating lead or white lead in air up to about 600° C. It is mostly used in the manuf. of red lead, the dioxide, and as a pigment.

Massillon, Jean Baptiste (1663-1742), Fr. bishop, b. at Ilyères, near Toulon, joined the congregation of the Oratory, and after lecturing at Pézenas and Montbrison, entered the priesthood at Vienne in 1692. Seven years later, at the king's own request, he preached the Advent sermons at Versailles. The greater part of his life was passed in Paris, where he was principal of the seminary of Saint Magloire, but in 1717 he accepted the bishopric of Clermont. His sermons were remarkable for their tender compassion and for their freedom from dogmatic disputation; among the finest are those on *The Small Number of the Chosen*, on *The Death of the Sinner*, and on *The Prodigal Son*. Among his contemporaries he was famous for his funeral oration on Louis XIV. Posterity cherishes his *Petit Carême*, a course of Lenten sermons preached before Louis XV. in 1718. See lives by A. E. Blampignon, 1879 91, and L. Panthe, *Massillon, sa prédication sous Louis XIV. et Louis XV.*, 1908.

Massillon, city of Stark co., Ohio, U.S.A., 50 m. S. by E. of Cleveland. In this region large quantities of coal are found, and white sandstone is quarried. It is also engaged in blasting and iron manuf. and manufs. threshing machines. Pop. 26,600.

Massine, Léonide (b. 1896), Russian-born dancer and choreographer, b. in Moscow. Trained at the Imperial Ballet School, Moscow, being a pupil of Enrico Cecchetti; he was choreographer and prin. dancer with the Diaghilev Ballet from 1914 to 1920. He began his career as a soloist in 1914, and as a choreographer in 1915, dominating the stage in both capacities, and establishing himself as one of the outstanding figures in the whole hist. of ballet. He succeeded Nijinsky in the Diaghilev Ballet Russe, beginning in the ambitious title-role of Richard Strauss's *Joseph's Legend*, and from the outset he showed exceptional ability and industry. Diaghilev entrusted his protégé's early artistic education to Larionov, a leading Russian modernist painter. With his first full-length ballet *Les Dames de bonne humeur*, M. realised his full potentialities, producing ballet after ballet until, for personal reasons, he left Diaghilev in 1921. Among these ballets were *La Boutique fantasque* (1919), and *Le Sacre du printemps* (1920), the first-named a one-act ballet with music by Rimski the latter representing a pagan dancing rite to the music of Stravinsky. He showed infinite variety, besides greatly enriching the

pattern of the dance, especially by bringing to it the dances of Spain, the inspiration of Hogarth, and the cubism of Picasso. Also very notable in the hist. of the new ballet were his symphonies, including Berlioz's *Symphonie fantastique* and also Tchaikovsky's ballet *Les Préludes*, experiments in which M. succeeded in creating a parallelism of movement and sound, besides extending the repertoire of choreography, though these aroused controversy among those who think that the symphony is unsuited to ballet, and that the success of M. proves nothing. Another considerable success of M. was his *Le Beau Danube*, a one-act ballet to the music of Johann Strauss, first produced in 1923. He founded a ballet school in London, 1925. He was with the Ballet Russe de Monte Carlo as producer and dancer, from 1932 to 1942. See A. Haskell, *Ballet*, 1938.

Massinger, Philip (1583-1640), Eng. dramatist, b. at Salisbury, and said to have been connected in some way with the 'noble family of the Herberts.' In 1602 he went to St. Alban Hall, Oxford, but applied himself to poetry and romance to the exclusion of the subjects associated with an academic course, and came down without a degree. He came to London about 1606 or '7; there is little certain knowledge of his career beyond the fact that he fell into debt and appealed to Henslowe for assistance. He speaks of his 'trod-down poverty' and his life would appear to have been a constant struggle. But he soon acquired fame as a playwright. In his earlier days, from 1613, he wrote in collaboration with John Fletcher until the death of the latter twelve years later, and one of their most successful efforts was *The Two Noble Kinsmen* (printed in 1634 as being by Fletcher and Shakespeare). The date of this play is, however, uncertain, and there is argument about the Fletcher-M. authorship. The plays written by M. alone, with the dates of first performance, are *The Duke of Milan* and *The Unnatural Combat* (before 1623); *The Bondman* (1623); *The Renegado* (1624); *The Parliament of Love* (1624); *A New Way to Pay Old Debts* (probably his masterpiece, the character of Sir Giles Overreach being familiar in the hist. of dramatic literature); and *The Roman Actor* (before 1626); *The Maid of Honour* (1626); *The Grand Duke of Florence* (1627); *The Picture* (1629); *The Emperor of the East* (suggested by the hist. of Theodosius the younger) (1631); *Believe as you List* (1631); *The City Madam* (1632); *The Guardian* (1633); *A Very Woman* (1634); *The Bashful Lover* (some say in collaboration with Dekker) (1636). With Nathaniel Field M. wrote *The Fatal Dowry* (1632); with Middleton and W. Rowley, *The Old Law* (1636). With Fletcher he collaborated in writing *Sir John van Olden Barnavelt* (acted in 1619) and in half a dozen other plays. *The Virgin Martyr* (licensed in 1620) is also ascribed to him. Of his extant tragedies *The Fatal Dowry* and *The Duke of Milan* are perhaps the best. The latter in its plot is superficially

reminiscent of *Othello* and is an impressive play. *The Virgin Martyr*, which suggests a miracle play, is also one of M.'s best plays, with its beautiful character St. Dorothy. His best comedy, as implied above, is *A New Way to Pay Old Debts*. Other good comedies are *The Guardian* (notable for the character of Durazzo) and *The City Madam*. Above all he excelled in romantic comedy. He shared much of the versatility of Middleton and also somewhat of Ben Jonson's power of exhibiting human nature as diseased, but he is a more severe satirist than Jonson. The best collection of his works is that ed. by F. Cunningham (1867). M.'s knowledge of the technique of the drama was great

PHILIP MASSINGER

but, while the construction of his plays leaves little to be desired, his characters are often lifeless. See lives by A. C. Swinburne, 1889; W. von Wurzbach, 1900; A. H. Cruikshank, 1920; and M. Eccles, 1931. See also G. Thorn-Drury, *A Little Ask*, 1921, and J. G. McManaway, *Philip Massinger and the Restoration Drama*, 1934.

Massingham, Harold John (b. 1888). Brit. literary critic and journalist, son of Henry Wm. M., editor of the *Nation*, 1907-1923. Educated at Westminster School and Queen's College, Oxford, he joined the staff of the *Morning Leader* and, from 1912 to 1914, that of the *Athenæum*, becoming a regular weekly contributor to the *Nation* and *Athenæum* from 1916 to 1924. He is especially noted for his studies of bird and animal life, folklore, and studies of the Eng. countryside. His works include *Some Birds of the Countryside* (1921); *Untrodden Ways* (1923); *In Praise of England* (1924); *Downland Man* (1926); *Pre-Roman Britain*

(1927); *The Heritage of Man* (1929); *The Friend of Shelley* (1930); *Country* (1934); *Genius of England* (1937); also *Remembrance*, an autobiography (1942).

Massinissa, see MASINISSA.

Mass Observation, systematic study of social habits and conditions by means of applying the techniques of anthropological research to modern highly civilised societies. The term has gained currency by being given to a new type of social research organisation founded by Tom Harrison and Charles Madge in 1938 with headquarters in London and Bolton. Harrison (b. 1911), the author of *Savage Civilisation* (1937), had spent a number of years in studying the primitive peoples of Central Borneo and the New Hebrides, and on his return to England he determined to apply similar methods of fieldwork to the study of the people of his own country. The scientific observation and recording of the habits and conditions of life of a modern community as a basis for sociological planning had been developed on the Continent and in the U.S.A., and Harrison's conception of M. O. gave an impetus to a similar movement in the United Kingdom. See T. Harrison, *Mass Observation*, 1937, and *Britain by Mass Observation*, 1939.

Masson, André, Fr. painter, b. in 1896 at Balagny, in the Oise dept. His early work was in a diluted post-cubist manner, resembling that of Gris, but an essential romanticism came to the fore, and he joined the surrealist movement soon after its inception in 1924. With Yves Tanguy and Salvador Dalí, M. introduced surrealism to America. He has, like many of his generation, been faced with the conflict of poetic chaos and formal order, but has striven, with varying success, to find some link between the two. His work has included *décor* for the ballet, and book decorations. See M. Lefris and G. Limbour, *André Masson and his Universe*, 1948.

Masson, Antoine (1636-1700), Fr. engraver and painter, b. near Orleans. He became engraver-in-ordinary to the king. His engravings excel in the representation of colour and texture, but are marked by a peculiar style of executing hair. His original portraits are of considerable merit. One of his best prints is Titian's 'Disciples at Emmaus.'

Masson, David (1822-1907), Scottish biographer and historian, b. at Aberdeen and educated at Marischal College, and at Edinburgh, where he studied theology under Chalmers. He began his literary career in 1844 with an article in *Fraser's Magazine*. In 1853 he was appointed prof. of Eng. literature at Univ. College, London, and in 1865 he went to Edinburgh Univ. to occupy the same chair. From 1859 for eighteen years he ed. *Macmillan's Magazine*. During many years he was engaged upon a monumental *Life of Milton*, narrated in connection with the political, eccles., and literary hist. of his time, the six vols. of which appeared between 1859 and 1880. In 1874 he ed. the poetical works of Milton, and he ed. also the works of Goldsmith (1869) and

De Quincey (1889-90). In 1893 he was appointed historiographer-royal for Scotland. Other works: *Essays, Biographical and Critical* (1856); *British Novelists* (1859, 1874); *Recent British Philosophy* (1865); *Drummond of Hawthornden* (1873); *De Quincey* (Eng. Men of Letters series) (1878); *Carlyle Personally and in his Writings* (1885). See his autobiographical *Memories of London in the Forties* (1908).

Massorah, term applied to a marginal directory on the Heb. O.T. It was the work of trained scholars, named Massoretes, and consists of two parts. The Massoretic text, which is represented by all our Heb. MSS., has for its object the preservation of the traditional consonantal text and the fixing of its pronunciation by the most scrupulously careful system of vowel-points and accents. The compilation of notes, to which the name M. is usually applied, deals with difficulties and peculiarities of the text and with variant readings. From the sixth to the ninth century the M. is anonymous, but in the tenth century it is connected with the names of Ben Asher of Tiberias and Ben Naphtali. See J. ben Hayyim, *Bomberg Bible*, 1524; E. Levita, *Massoreth ha-Massoreth* (both trans. and ed. by C. D. Ginsburg), 1867; and C. D. Ginsburg's ed. of the M. (4 vols.), 1880-1906; the Massoretic ed. of the Heb. Bible (1891), and the introduction to this (1897); also P. Kahle, *Der massoretische Text des alten Testaments nach der Überlieferung der babylonischen Juden*, 1902; *Massoreten des Ostens*, 1913; and *Massoreten des Westens*, 1927-30.

Massowah, Massaua, or Massawa, fortified seaport, cap. of the former It. colony of Eritrea, on a small sterile coral is. in the Red Sea, 1 m. in circumference and 200 yds. from the mainland. It is connected with the shore by an embankment containing the water conduit. There is a good harbour between the is. and the mainland, and an active trade is carried on with Arabia, Suez, India, etc. It is the chief port for Abyssinia and the Sudan, exports, pearls, salt, ivory, ostrich feathers, jewels, coffee, tobacco, hides, etc., and has a wireless station. It is very hot and unhealthy. M. was occupied by Brit. forces on April 12, 1941. Pop. (1939) 17,000 (6000 Its., 11,000 natives). See ITALIAN EAST AFRICA, CAMPAIGN IN.

Mass Production in the U.S.A. Mass production and its concomitant, rationalisation, are, so to speak, modern American inventions, in which scientific management and scientific machinery were placed at the service of industry. The goal aimed at was not only vast quantity in production of a given article or articles, but, at the same time, to safeguard the general average of quality as well; not only to increase for the owners and shareholders the profits to be gained from a given plant, but so to increase the scale of wages paid to the workers as to give them an active interest in the success of the undertaking. A further aim was so to decrease the selling price of the goods manufactured as to create a wide market for it, and so secure

continuous production of a fixed programme throughout the working year. The case of Henry Ford, the automobile manufacturer, is always cited as the classic example of M. P. He entered a highly competitive field, and by M. P. was not only able to pay his ordinary workers the highest wages in the world, but also to sell his product at the lowest price and still make huge profits. The old discarded business method was to pay the workmen

the famous shoe manufacturer of Zlin in Czechoslovakia. During the Second World War Henry J. Kaiser (q.v.) produced both ships and aircraft by M. P. methods, with a great increase in output.

Mass Psychology, study of the collective mind and emotional unity characteristic of a crowd of people responding to the same stimuli. Physical contiguity is an essential element, thus differentiating the crowd from the 'public,' but M. P. may

'New York Times' Photos

MASS PRODUCTION: THE FORD MOTOR COMPANY'S ROUGE PLANT AT DEARBORN, MICHIGAN

as little as possible and sell the manufactured goods at as high a price as possible. The new method pursued is in its essence this: to take the manuf. of any article and split it up into a multiple of very simple operations, which can easily be taught to the workmen. Each man has to do one comparatively easy thing all day long. The final operation comes in the assembling-room, where the various parts are put together. This presupposes that tools and machinery play an increasingly large part in the scheme of things. It is upon them that the manufacturer depends for accuracy and quality. The one great disadvantage in this kind of production is the deadly monotony of the work done by the men and women. In Europe the man who probably most nearly approached the Amer. ideal of M. P. was Thomas Bata,

be extended to cover the behaviour of any society as a whole which takes on the characteristics of a crowd, especially when acting under any widely shared emotion, whether in times of stress or general rejoicing. The psychology of the individual taking part in crowd activities is modified as the result of the predominance of the subconscious mind and a weakening of individual intellectual effort. The psychology of a crowd is therefore different from the average psychology of its individual members. Cruder impulses come into play and inhibitions to which the individual is normally subject are liable to be loosened or removed. Thus the crowd is more fickle, credulous, or courageous than would be any average member of it acting separately, and is liable to outbursts of hysteria, brutality,

or bravery. The individual becomes in effect assimilated with a new combination of impulses and reactions, and is thus part of a collective personality capable of a unified response to a common stimulus. The conscious application of stimulus in order to produce a desired reaction among large numbers of people whose individual psychology is merged in that of the crowd is known as mass suggestion. M. P. has been studied in particular by two Fr. psychologists, Gustave le Bon (1841-1931) in *La Psychologie des foules* (1895; Eng. trans. *The Crowd*, 1896) and G. Tarde (1843-1904) in *L'Opinion et la foule* (1901); also by the It. sociologist Scipio Sighele (1868-1913), whose *La folla delinquente* appeared in 1891. See also S. Freud, *Massenpsychologie und Ich-Analyse*, 1921 (Eng. trans. 1922).

Mass Radiography, method of examining a number of people in quick succession to detect latent chest disease, particularly tuberculosis. An X-ray apparatus, producing an image of the chest on a fluorescent screen, is integrated with a camera that simultaneously photographs this image on a miniature film which, in enlarged projection, enables a trained observer to tell whether or not the chest is normal and so to sift out any person with an abnormality calling for further investigation by estab. diagnostic methods. M. R. for the civil pop. began in Great Britain in 1943, and mobile units are operated by regional hospital boards.

Mass Spectrograph. When the light emitted by atoms in a gas is passed through a spectroscope or spectrograph to a photographic plate, the system of lenses and prism causes the light to be deviated in such a way that light of a particular wave-length (*i.e.* of a particular colour) is concentrated along a single line on the plate. The spectrum registered by the plate thus consists of a series of parallel lines, each corresponding to light of a different wave-length. The M. S. is not an optical instrument, but it derives its name from the fact that its mode of operation bears certain similarities to that of the spectroscope; moreover, the result of its action may be to produce on a photographic plate a pattern that is very similar to the one given by its optical analogue. Just as a spectroscope separates out light of a particular wave-length, so the M. S. can be used to separate from a mixture of charged atoms or groups of atoms those whose charge bears a fixed ratio to their mass. If an electric discharge is passed through a mixture of gases at low pressure, many of the atoms of the gas acquire a charge and become accelerated to high speeds. A stream of such high-speed atoms and groups of atoms can be allowed to escape through suitably placed slits into another vessel in which the pressure is so low that collisions between the gaseous atoms are relatively rare, and where they form a well-defined beam. Here the flying atomic projectiles can be deviated by the use of electric and magnetic fields, the amount of the deflections being determined not only by the strength and extent

of the fields, but also by the charges, masses, and velocities of the particles. By a suitable choice of the strength and disposition of the fields it can be arranged that particles of the same ratio of mass to charge are all concentrated to collide along a particular line on a photographic plate, while particles having other ratios are concentrated along other lines. A spectrum is thus formed whose lines correspond to particles having definite ratios of mass to charge. Since the charges of the particles, however, can only be integral multiples of the charge of an electron, and are normally equivalent to that of either one or two electrons, the masses of the particles are readily inferred, and can be compared with high precision after measurement of the distances apart of the lines on the plate. The M. S. was developed by F. W. Aston, following Sir J. J. Thomson, and has proved a powerful weapon for determining the presence of isotopes (*q.v.*), and for measurement of their masses. Modern high-powered M. Ss. have an important industrial application. See SPECTRUM and SPECTROSCOPE.

Massys, Quentin, see MATSYS.

Master: 1. The chief or president of a society, guild, corporation, or association, as the M. of Trinity College, the M. of a masonic lodge (see FREEMASONRY), the M. of the Stationers' Company, and the Grand M. of Malta. 2. In the navy, an officer who ranks immediately above a lieutenant, and who navigates the ship under the direction of the captain. 3. In commercial navigation, the captain of the ship (skipper is used in the Merchant Shipping Act for the captain of a fishing vessel), or person entrusted with the care and navigation of the ship and cargo. He must be a properly qualified person, and upon him is the responsibility of having a proper crew and equipment. He enjoys very wide powers, *e.g.* he may hypothecate, sell, tranship, or jettison the cargo when circumstances warrant any such course or courses being taken (see BOTTOMRY, HYPOTHECATION, RESPONDENTIA). He has the same rights as an ordinary seaman, *e.g.* a maritime lien, to recover his wages and disbursements made within his authority. See MERCHANT SHIPPING.

Master and Servant. The relationship of M. and S. has been profoundly altered during the last century by the passing of the Factory Acts, the Employers' Liability Act, Workmen's Compensation Acts, Truck Acts, Minimum Wage Acts, and the Acts repealing the combination laws (see under these titles). Formerly the relationship, though nominally contractual, was purely one-sided, the servant perforce accepting as the inevitable incidents of his service all the chances of sickness, accident, sweated labour, and low pay. At the present day, though there is still room for considerable amelioration, the position of a servant, so far as precautions for his safety and hygienic surroundings, and (in some cases) the rate of his wages are concerned, marks a great advance in social reform.

The terms of a contract of service may

be either oral or in writing, unless the term of service exceeds one year, when the contract to be enforceable must be in writing (see CONTRACT; FRAUDS, STATUTE OF). In the absence of express or implied terms or custom to the contrary, most classes of servants are understood to be employed for a year, and neither party can terminate the contract before the year has expired. For the most part, however, the length of notice is ruled by trade custom, which may vary in different cases. It is to the advantage of the servant to get the length of notice expressed in the contract if he can, rather than leave the matter to the uncertain decision of a jury. It is to be understood that no notice is required in the case of dismissal for disobedience to proper orders, dishonest conduct, drunkenness, incompetency, permanent disablement, and, generally, conduct incompatible with his duties towards the master. The question of what conduct is incompatible with duty depends on the facts of each particular case.

The wrongful termination of the engagement by a master renders him liable to an action of damages for wrongful dismissal; but in the great majority of cases the action is next to useless, for the measure of damages is no more than the loss of pay during the period for which notice ought to have been given. There is no obligation on a master to give reasons for dismissal unless called upon to justify his action in a court of law. In the case of domestic servants it is to be noted that if the master chooses to pay a month's wages instead of giving notice the servant has no claim for board or maintenance. (As to contracts of service with infant employees, see CONTRACTS; INFANT.) Under the Truck Acts a master is forbidden to pay manual workers' wages in goods or kind. (If, however, a transaction involving a truck element could be lawfully effected by the use of an alternative form, legal proceedings under the Truck Acts to recover wages may be restrained under an Act of 1939.) The Factories Act, 1937, prohibits (generally speaking) deductions from wages. Fines may not be inflicted on a servant as a rule, except by express agreement, though it is obvious most servants have no voice in the matter.

The contract of service implies a number of duties on either side. The master is bound to indemnify the servant against all responsibility for acts done in the course of employment and ostensibly for the benefit of the master; while, conversely, the master is liable for everything his servant does in such circumstances (for *qui facit per alium facit per se*). A servant may not make a secret profit at his master's expense (see COMMISSION, SECRET). As to a master's statutory liability generally for injuries sustained by his servant in the course of employment, see under EMPLOYERS' LIABILITY and WORKMEN'S COMPENSATION.

There is no obligation on a master to give a servant a character; but if he does so he must give it in good faith. A good character given to a servant who is bad to the knowledge of the master may well

render the master liable to an action for damages at the suit of a second master. Where a master suspects his servant of theft, his best course is to dismiss him without reasons if he cannot prove the theft; but if he suspects the servant of having stolen property in his possession he should get out a search warrant from the police, for he may not himself search his servants' boxes or other private receptacles. In the bankruptcy of a master, all wages or salaries of servants or clerks for services rendered during the four months prior to the date of the receiving order, up to £50, and all wages of labourers or workmen not exceeding £25 for services rendered during two months prior to that date, have priority in the distribution of assets.

Master Mariners, Honourable Company of, is a livery company of the city of London founded in 1526. Membership is open to mariners who have held an ordinary master's certificate for five years, and now number over 600; 200 of these are freemen and liverymen of the city. There is a cadet scheme which enables young merchant navy men to begin a connection with the company early in their careers: entrants must be of first-class character, and be approved by the company's cadet committee. The *Wellington*, a sloop of 990 tons, has been moored off the Victoria Embankment to be the headquarters of the company, and to contain a nautical museum.

Master of Arts. The univ. degree next above the bachelor (see DEGREES IN ARTS). The word *magister* originally had the significance of teacher, and the term was used in medieval univs. of the holder of the *licentia docendi*, or right to teach. It is now mainly used in England in the faculty of arts, the corresponding degree in other faculties being that of doctor. The title of *magister artium* is abbreviated to M.A.

Master of the Ceremonies, see CEREMONIES, MASTER OF THE.

Master of Sacred Theology, post-graduate degree in divinity conferred by certain foreign univs., e.g. Gregorian and Angelico Univs. in Rome. It ranks above D.D. (Doctor of Divinity).

Master of the King's Musick, official who, since the time of Charles II., has presided over the private band of the Eng. monarch. This band used to play to the monarch at meals and at state ceremonies, and to combine with the gentlemen and children of the Chapel Royal (q.v.) for the performance of king's birthday odes and New Year's Day odes, while its string section took part in the services of the Chapel Royal. It accompanied the monarch wherever he went. By 1837 the band had been reduced to a small body of wind instrumentalists, but Prince Albert reorganised it three years later. Edward VII. abandoned the giving of state concerts and the band, at present, though consisting of some thirty eminent orchestral players, is rarely called upon to perform. Elgar was master at the time of his death (1934), being succeeded by Walford Davies (q.v.), who in turn was

succeeded in 1942 by Sir Arnold Bax (*q.v.*) (P. Scholes, *Oxford Companion to Music*).

Master of the Rolls, see ROLLS, MASTER OF THE.

Master-singers, see MEISTERSINGERS.

Masterton, bor. tn. of Wairarapa dist., North co., North Is., New Zealand. 67 m. N.E. of Wellington. It is the centre of one of the richest farming areas in New Zealand. Has good trout fishing and wild game shooting. Pop. 10,500.

Mastic, resin produced by a small tree (*Pistacia lentiscus*). It occurs in small

The M. is believed to be the oldest breed of dog in England. There is a theory that the Phœnicians may have introduced Assyrian Ms. into England. It is estab. that the M. was known in A.-S. times; every two villeins were required to keep one M. for the destruction of wild animals. By the forest laws of Henry III. only privileged persons were allowed to keep any other dogs but Ms., which were much used for bull and bear baiting. In later times Cheshire and Derbyshire had two well-known strains of the animal. The

MASTODON AMERICANUS

A representation by G. M. Gleason. From the painting in the National Museum, Washington.

grains or tears which are soluble in rectified spirit and oil of turpentine, and are used in the manu. of varnishes.

Mastiff, typically Brit. dog bred to its present type for sporting purposes, but now kept only as a guard or pet. It is usually docile and good-tempered, and it is very powerful and fiercely courageous. The head is large and broad, the muzzle deep, square, and broad, the ears small, and the eyes wide apart. The forelegs are straight and strong, and the hind-quarters broad and wide. Brindle was the original colour, but fawns are common. The ears and muzzle are black, and there is black round and between the eyes. The coat is short and close. At a recent census of the old Eng. M. in this country only seven dogs were found and it was suggested (1949) by the Old Eng. M. Club that without careful planning for five years, during which quarantine regulations and currency restrictions might be expected to act as delaying factors, the breed might become extinct.

M. is widely mentioned from Shakespeare to Coleridge.

Mastodon, fossil primitive elephant, belonging to the Pliocene and Miocene periods, and of a simpler type than the mammoth. The name (Gk. *μαστός*, breast, and *δόντις*, tooth) was given by Cuvier on account of the nipple-shaped tuberculations on the teeth. Ms. have been found in many parts of the world. The earlier types known as long-chinned Ms. (or *Tetrabelodon*) have two pairs of tusks, the lower jaw being prolonged to support the upper pair.

Masudi, Abul Hassan Ali (d. 957), Arabian historian, b. at Bagdad. Much of his life was spent in travel, and he visited Persia, Ceylon, Madagascar, China, Palestine, Syria, and Egypt, collecting materials in every place. His chief work was *Annals* (30 vols.), but he is best known by his historical narrative entitled *Meadows of Gold and Mines of Gems*. A Fr. trans. by de Meynard was completed in 1877.

Masulipatam, seaport in the Kistna dist., Madras, India, 215 m. N.E. of Madras. The tn. used to be famous for its chintzes, carpets, etc., but since vessels have to anchor outside the port, its trade has lessened considerably. Pop. about 50,000.

Masuria, see E. PRUSSIA.

Masurian Lakes, Battle of, see TANNENBERG, BATTLE OF.

Masurium, symbol Ma. atomic number 43, atomic weight unknown. Nodack and Tacke, after an examination of certain platinum ores and of the mineral columbite, in 1925 claimed to have obtained definite evidence of a new element which fitted in with the requirements of Mendeléeve's predicted eka-manganese. They relied largely on observations of X-ray spectra, and named the new element Ma. Since that time other minerals, such as sperryllite, gadolinite, and fergusonite, have been said to contain traces of Ma. Little has been heard of the new element of late years, however, and there is considerable doubt as to whether the claims made can be substantiated.

Matabele, branch of the Zulu Kaffirs, S. Africa. They originally lived in Natal, but in 1827 left it for the Transvaal under the leadership of a chief named Umsilikatze. Here they had ten years of conquest, subduing the Mashona, Makalaka, and other tribes, and in 1837, when driven out by the Boers, they had an enormous army recruited from all the conquered tribes. They then settled in the rich plains between the Zambesi and Limpopo Rrs., and estab. a military despotism over the lesser nations. Their only occupations were war and hunting, and their frequent raids upon Mashonaland led to an outbreak of war with Great Britain from Oct. to Nov. 1893, resulting in the defeat of the M. and the capture of Bulawayo. They are now engaged in cattle breeding and agriculture. The 'religion' of the M., like that of other Bantus, consists in a belief in the active existence of the spirits of their departed ancestors and finds expression in observances founded on that belief. The practice of witchcraft is connected with this to the extent that it embraces the use of occult means of propitiating the spirits. The superstition of 'Mlimo,' a being supposed to have played an important part in the rebellion of 1896, was borrowed by the M. from the Kalanga. The Mlimo is a deity to whom the M. used to resort as the Gks. to the Delphic oracle. Sorcery or witchcraft still figures in the social economy of the M. and the proper use of *is-Anusi* (magic) enables them to hasten the advent of rain and to foretell events, adverse events being attributed to some illicit invocation by the uninitiated. Formerly witch doctors were the instruments used by chiefs for the removal of those obnoxious to them, and missionaries have recorded stories of the most revolting cruelties practised through witchcraft. The paramount chief was once the judge in all disputes, serious or trivial, and, in the days of Lobengula, a great part of

his time was spent in hearing and deciding cases, his retentive memory being a great aid to him in dispensing justice. Last century every male adult M. was a soldier, and the nation was divided into military dists. An estimate made in 1889 put the fighting power of Lobengula's army at 11,550 of pure M. or non-indigenous blood, and a further 10,000 composed of Makalanga from the W. and Mashona and others from N. of Bulawayo. Fighting or raiding was then the recognised and regular profession of the M. The younger soldiers were braggarts, impatient of authority, and overbearing to the last degree. Their one idea was to kill and so attain the reward of marriage, and they were constantly urging the chief to allow them to 'wipe out' the European residents. Pop. (European) in 1941 was 31,519 (males 17,244; females 14,275). See H. M. Holt, *The Making of Rhodesia*, 1926.

Matabeleland, or **Matabilliland**, country in the interior of Rhodesia, which, together with Mashonaland, now constitutes S. Rhodesia. Much of the surface consists of rich plains traversed from S.W. to N.E. by the Matoppo and Izimunte Mts., and watered by tribs. of the Zambesi, Lundi, and Limpopo Rrs. There is much mineral wealth, especially gold. Cereals, cotton, and sugar are grown, and there are large tracts of forest, while cattle and sheep are bred in the dists. free from the tsetse fly. The chief tn. is Bulawayo, pop. 52,700 (including 17,500 Europeans). Area 70,800 sq. m. See further under RHODESIA, SOUTHERN.

Matadi, chief riv. port of Belgian Congo, on the l. b. of the Congo below its lowest falls, opposite Vivi. It is the cap. of a dist. and the starting place of the Congo railway. Pop. 22,400.

Matador, see BULL-FIGHT.

Matagalpa, dept. in the centre of Nicaragua. Its chief productions are coffee and tobacco. The cap. is M. Pop. 51,100.

Matamoros, tn. in the state of Tamaulipas, Mexico, on the S. bank of the Rio Grande, opposite Brownville, Texas. A 200-m. highway joining M. and Oaxaca, Mexico, was opened in 1945. It exports hides, wool, horses, and specie. Pop. 2000.

Matanzas: 1. Prov. of Cuba, bounded by Havana, Santa Clara, and Florida Strait. Largely mountainous, especially in the N., it is watered by the Yumuri, San Juan, Palma, and Sagua Rrs. In the S. is the great swamp, Gran Ciénaga Occidental de Zapata. Sugar, cereals, fruit, cotton, and tobacco are grown. Area 3260 sq. m. Pop. 361,100. 2. Fortified port and cap. of above prov. on M. Bay, and the San Juan and Yumuri Rrs. It has large sugar factories, and exports sugar and other produce. Pop. 74,000.

Matapan, Battle of Cape (March 28, 1941), most sweeping Brit. naval victory since the battle of Trafalgar, fought between the Brit. Mediterranean fleet under Adm. Cunningham and the It. main fleet under Adm. Riccardi. The victory was without precedent in that it was won without any Brit. casualties, or even the slightest material damage to the Brit.

ships, though one naval aircraft was lost. The forces opposed were Brit.: 3 battleships, 1 aircraft carrier, 4 cruisers, and a number of destroyers; It.: 3 battleships, 11 cruisers, and 14 destroyers. The Its. lost the heavy cruisers *Zara*, *Pola*, and *Fiume*, all sunk; a 6-in. gun cruiser of the Colleone class sunk; the large destroyers *Vincenzo Gioberti* and *Maestrale* were both sunk, and another destroyer was seriously damaged. A new battleship of the Littorio class also sustained serious damage, and other units were also damaged, but inasmuch as the chief action took place at night the precise loss was not known. The battle was the first in hist. in which skilful co-ordination of naval operations with attacks launched by naval aircraft resulted in enemy ships' speeds being so reduced as to force them to action. Some 55 It. officers and 850 men from It. sunken vessels were picked up by Brit. and Gk. destroyers. Adm. Castroni, commanding the It. heavy cruiser squadron, was lost in the *Zara*. Some hundreds more It. survivors would have been rescued by allied forces had not their life-saving operations been interrupted by dive-bombing attacks by the Ger. Air Force, one Junkers 88 being shot down.

At noon on the previous day R.A.F. Sunderland planes spotted the It. fleet putting to sea. Adm. Cunningham and the main fleet were then at Alexandria. Concluding that the It. ships intended to attack convoys carrying supplies from Egypt to Greece, the Brit. admiral ordered Vice-Adm. Pridham-Whippell, commanding the light-cruiser force, to sail to a position S. of Crete, from which he could intercept ships interfering with convoys. The commander-in-chief, with the flagship *Warspite* and the other battleships *Barham* and *Valliant*, the aircraft-carrier *Formidable*, and some destroyers, steamed N.W. in the afternoon in the hope of intercepting the enemy. Briefly what happened then was that the vice-admiral in the light cruiser *Orion*, acting as a decoy, for hours lured the unsuspecting enemy ships towards the main Brit. fleet, until they were caught about 100 m. S.W. of Cape Matapan. This was no easy task, and the vice-admiral at times lost touch with the enemy, as indeed might have been expected from the fact that he had to manoeuvre so as to save his ship from being hit by the fire of It. battleships or heavy cruisers. Shortly before 8 a.m. of the following day Brit. reconnaissance aircraft reported an enemy force comprising one Littorio-class battleship, six cruisers, and seven destroyers some 35 m. S. of Gavdo Is. (about 25 m. S. of Crete). This force was soon afterwards joined by two more cruisers and two more destroyers. The Brit. vice-admiral's forces were then some 40 m. S.E. of the enemy, and Adm. Cunningham was some 95 m. away, and steaming N. westward, a direction he held throughout until the dramatic denouement at night when the Brit. ships opened fire on the It. cruisers S.W. of Cape Matapan. It seems that at about 9 a.m. the It. cruisers turned

N.W. too, steaming on a parallel course with the Brit. main fleet, some two battleships and three cruisers being N. of the Brit. fleet and another battleship and eight cruisers, further S., crossing and re-crossing the bows of the Brit. ships without suspecting their presence. Prior to the final act of the drama Brit. naval aircraft from the *Formidable* launched several highly effective attacks, thrice hit the Littorio-class battleship, and made two direct hits on a cruiser and one on a destroyer. The hits on the battleship drastically reduced its speed, and at dusk two more attacks were made, one cruiser being hit by a torpedo. The combined Brit. light and heavy forces were now in full pursuit of the enemy who, alarmed by the naval aircraft, was now speeding for his bases. Shortly after 10 p.m. Adm. Cunningham turned the battle fleet to engage the cruiser *Pola* which had stopped evidently damaged, some 3 m. distant. At the same time three more It. cruisers crossed the bows of the Brit. ships at the culminating point 100 m. S.W. of Cape Matapan. As the It. cruisers passed ahead of the Brit. main fleet's destroyer screen the destroyer *Greyhound* illuminated the leading It. heavy cruiser. The Brit. battle fleet at once opened fire. The enemy was taken completely by surprise. The first salvoes hit the It. ships at the amazingly short range of 4000 yds., and wrecked two heavy cruisers. It is therefore not surprising that these cruisers disintegrated. Enemy destroyers now turned to fire torpedoes, and the Brit. main fleet turned away to avoid them, leaving destroyers to complete the sinking of the *Zara* and *Pola*. It is probable that the battleship of the Littorio class, which had turned off between the Brit. fleet and It. cruisers, became heavily engaged in the darkness and confusion with her own forces, and so multiplied casualties. At this juncture a force of Gk. destroyers steamed out to the W., but the rest of the It. forces had made good their escape. See A. Hurd, *The Battle of the Seas*, 1911; C. King, *Rule, Britannia*, 1941; and H. G. Thurstield, *Action Stations*, 1942.

Mataram, cap. of the Is. of Lombok, Dutch E. Indies, situated near the W. coast.

Matariyeh, vil. of lower Egypt, 5 m. N.E. of Cairo. It is built on the site of the ant. tn. of On or Heliopolis.

Mataro, city in the prov. of Barcelona, Spain, on the Mediterranean. Its chief manufs. are cotton and woollen goods, chemicals, glass, and soap. Pop. 24,700.

Matches. Tinder, or dried cotton fibre, had been partly replaced by paper soaked in saltpetre, and largely by wood tipped with sulphur, in the early nineteenth century. In 1805 M. Chancel coated the sulphur with a paste of chlorate of potash, sugar, and gum, which ignited on touching concentrated sulphuric acid conveniently carried soaked in asbestos fibre. Phosphorus, which inflames at ordinary temps. when dry and exposed to the air, was next experimented with, but with little success at first. The 'Lucifer' was tipped with the chlorate of potash paste with anti-

mony sulphide, and ignited by friction on sandpaper. In 1827 'Congreves' came into use, the tips being of sulphur, phosphorus, and chlorate of potash, or of phosphorus and nitre, slight friction only being required. By about 1830 commercial manuf. was started, the industry centring in Austria and Germany. In 1845 amorphous phosphorus (*q.v.*) was discovered by von Schrötter of Vienna, and used in 1855 by Lundström of Sweden in 'safety' M., patented in England by Bryant & May. The phosphorus was transferred from the match tip to the frictional surface on the box, friction elsewhere not igniting the match. Amorphous phosphorus is innocuous in processes of manuf., but white phosphorus, being cheaper, is still used, though in most countries its abolition has been attempted, *e.g.* in Great Britain by the White Matches Prohibition Act of 1908. Factory inspection has improved conditions and practically removed chance of disease. It still remains, however, to find a completely safe but equally economical substitute.

Ignition Paste.—The substances used are known chemically as oxidising agents, substances which readily part with oxygen, and reducing agents or substances which readily combine with oxygen; one for the match tip, the other for the frictional surface. Among oxidisers are chlorate of potash, dichromate of potash, manganese peroxide, nitre, and red oxide of lead; reducers: white and amorphous (red) phosphorus, sulphide of antimony, and certain sulphocyanides and thiosulphates. As a simple mixture chlorate of potash, dichromate of potash, antimony sulphide and red lead for the match tip; amorphous phosphorus and antimony sulphide for the frictional surface. In addition, glue or dextrine, sand, powdered glass, whitening, and various colouring matters are used. 'Strike anywhere' M. usually contain for the tip a mixture of phosphorus sulphide, P_2S_5 , an oxidising agent (*e.g.* potassium chlorate), glue, and powdered glass. They are first impregnated with paraffin or with sulphur.

Manufacture.—The industry tends to move naturally to regions where timber is readily available, as in Norway and Sweden. England and Belgium import timber and have large factories. Germany, Austria, France, and the U.S.A. also export largely. In France the manuf. is a farmed gov. monopoly; in the U.S.A. taxes and duties have led to trust monopoly. *Splints* are of pine and aspen. In the Swedish or continental method logs of calculated size are placed on a turning lathe: a knife, acting on the full length and advancing at each rotation, cuts off a ribbon. The ribbons are packed together and cut into long bands as broad as the length of a match. The bands are then fed into a machine which rapidly jerks them forward, the distance of each movement being the breadth of a match, while a synchronised knife cuts completely through. The splints, after being dried, are sifted and arranged by machinery and the same method is universally adopted as with the round splints (*see below*), *i.e.*

punched into endless conveyor plates and dipped by pressing on to composition table or running over roller which is revolving in composition. In Britain V. L. Long's machinery is used, which deals with blocks which are cut by two slicings, vertical and horizontal. Round splints are split by circular cutters in rows. They are carried in drums to tanks, where they are immersed in an impregnating solution of salts (to prevent the wood from breaking off and from glowing after use), dried, and blown up a large pipe into vibrating screens, from which they are collected and sorted. From these they are pushed by rods into slightly smaller holes in an endless band; after dipping in paraffin they are carried over a synchronously moving roller covered with ignition paste, dried by passing a considerable distance in the air on endless belts (about 400 ft.), punched out, and automatically packed.

Matchlock, see FIREARMS and GUN.

Mate, term generally applied to any person who is an assistant or a deputy in any work. In the navy the term is now applied only to petty officers who do not hold his majesty's commission, *e.g.* boat-swain's M. In the mercantile marine, however, the M. occupies the position of an officer in the navy. The first M. ranks as the chief officer, and is second only to the master of the vessel. Nearly all merchant ships carry three Ms. and large ships carry more.

Maté, or Paraguay Tea, dried leaves of the Brazilian holly (*Ilex paraguayensis*), an evergreen shrub, grown in 'yerbales' in Paraguay and Brazil. The best quality of M. (*caaciyys*) is made from the unexpanded buds; the second (*caa-miri*) from leaves from which the midrib has been removed, and the third (*caa-gazu*, or *yerva dos polos*) from the whole leaf. The leaves are infused in water and sugar, and either milk or lemon is added to the liquid, which is rather bitter in taste, but has restorative qualities.

Matera, tn. in the prov. of Potenza, Italy, 34 m. W.N.W. of Taranto. It has a picturesque situation and is close to the troglodyte caves of Monte Scaglioso, still used as dwelling-places. It manufs. leather. Pop. 22,000.

Materialism, form of monism (*q.v.*), is the philosophy of the material as opposed to the idealistic. It denies the existence of non-material or spiritual being and regards all phenomena, real and abstract, as explicable by physical science. It regards matter as the one ultimate fact, 'uncreatable as it is indestructible' (Vogt), and mind as a product of matter. M. is to be found in all philosophical systems, from ant. Buddhism and Gk. Epicureanism and scepticism down to Gassendi, Hobbes, Locke, Hume, Comte, Helvétius, and Mill; and later Huxley, Spencer, and Haeckel. M. flourished in Europe during the eighteenth century under De la Mettrie and Holbach as a reaction against Christian mystic-idealism, and during the nineteenth century under Moleschott and Buchner as a reaction against the idealism of Kant and Hegel. The obvious objections are (1) that, as Caird points out, the

recognition of the existence of matter presupposes the existence of mind as the medium of such recognition; and (2) that, taking, for example, imagination as one particular aspect of consciousness, the mind can originate an idea when wholly abstracted from matter, whilst matter cannot originate an idea when abstracted wholly from mind. Recent research in physiology, while seeming to confirm the materialistic hypothesis of the relation between neurosis and psychosis, and so giving an enhanced value to sensuous perception as the fundamental source of cognition, yet offers no justification for the belief of the eighteenth-century Fr. school of sceptic encyclopaedists, that mental experience, faculty, idea, and function are merely transformed sense experience.

During the nineteenth century the mass of scientific thought supported M., and especially was this support found among the profs. of physics, astronomy, and philosophy. M. was discussed by them, particularly in relation to evolution. The indubitable fact of evolution provides speculation as to its causes and purpose; but whatever view was held as to these there was general agreement that evolution was a purely material process.

The conclusions of investigators who examine the constituency of matter down to the analysis of the atom itself disprove the solidarity of material things. Even the dogma that material effects flow from material causes is regarded with scepticism, especially since the theories of Einstein have proved the accepted findings of Newton to be in error. Biologists assert that the conduct of a material thing is merely a form of reply to an external stimulus, but that in living creatures such instincts as the preservation of life can be explained by no such creed, that in a dead body all the material parts are present and the departed power to function, the will, comes within no laws governing matter. In the region of physics modern discoveries show that the material universe can no longer be regarded as tangible, occupying any defined position, and though there are undoubtedly laws which direct it, those laws are as yet unfamiliar and involved in mystery. The solidarity of matter is found to be merely a form of energy. Space itself eludes the limitations imposed upon it by Euclid, when considered by Relativists, and emerges from their studies with a fourth dimension involving the significance of time—that is, a body's position in space according to time, since its position changes with time. Psychologists add their evidence, especially in the study of memory, and Bergson has shown that the theory that the brain has any material connection with thought is fallible, since his own observations prove that living beings can continue to experience sensations hitherto claimed to emanate from a certain part of the brain after that portion has been removed by operation. Thus the present trend of opinion leads to the conclusion that M. will eventually claim significance merely as a curiosity of philosophical hist.

Dialectical M., a phrase coined by Karl Marx who, though neither a trained philosopher nor a natural scientist, convinced himself that he understood the philosophical implications of the scientific discoveries of his day, and that these implications constituted the general philosophy, which, deriving from the Hegelian dialectic, he called 'dialectical M.' Marxists assume that, unless the student has a proper idea of this philosophy, he cannot understand the objectives of Communism; but it would seem doubtful whether this obscure philosophy has any logical connection with the social theory professed by Communists. *Historical M.*, on the other hand, if not free from obscurities, is, on the whole, intelligible. It is clearly and vigorously stated by Marx in the *Communist Manifesto* (1847), and in the preface to his *Critique of Political Economy* (1859), and the gist of the theory is that to every system of production there is an appropriate system of property; that while the system of production changes continuously, the system of property before the Socialist society has come into existence, will necessarily resist this change; and that there is, consequently, in every society prior to the Socialist one, an inherent contradiction giving rise to a conflict of classes, each of which will evolve an ideology adapted to its own interests.

Lange, *History of Materialism* (trans. 1926); J. S. Haldane, *Materialism*, 1932; G. Sainsbury, *Dictatorship of Things*, 1933; and G. V. Plekhanov, *In Defence of Materialism*, 1948.

Materials, Strength of, subject which deals with the study of the distribution and effect of internal forces produced in M. of construction subjected to straining actions. It is not an exact science, like the mathematical theory of elasticity, which is concerned mainly with problems of a physical rather than an engineering interest, but is founded partly on the result of experiment, and partly on conclusions drawn therefrom by the application of the principles of mathematics and mechanics. Within practical limits it enables formulae to be estab. which allow the strength of a given part to be assessed, and in this way suitable material and dimensions may be chosen.

Stress.—The application of load causes internal stress in the material. Such stress is the force transmitted from a part of the material to the portion with which it is in contact, or it may be regarded as the force which the internal structure of the material exerts to oppose the tendency to alter its size and shape. The constituent forces, and therefore the stress, are distributed across the imaginary surface where interaction takes place, and the intensity of stress at a surface, generally referred to as stress, is estimated by the force transmitted per unit of area. However complex the loading, the states of stress existing within a body may be

reduced to the following: tensile stress, compressive stress, and shear stress.

Fig. 1a shows a bar of uniform cross-sectional area of A sq. in., subjected to an axial pull of P pounds. At any plane xx perpendicular to the axis of the bar, the

FIG. 1a

material is under a tensile stress, the intensity of which is $p = \frac{P}{A}$ lb. per sq. in. In Fig. 1b the direction of the force is reversed, and the material is being crushed.

FIG. 1b

The stress at any section xx is a compressive stress, and its intensity $p = \frac{P}{A}$ lb. per sq. in. Shear stress exists in a body when the action of the load tends to cause one layer of material to slide over an adjacent layer. This is illustrated by Fig. 1c.

FIG. 1c

where the material of the rivet is under a shear stress across the section xx , the average intensity of which is $q = \frac{P}{A}$ lb. per sq. in., where A is the area of cross-section of the rivet.

Strain is the alteration of shape or dimensions resulting from the stress. Thus a tensile strain is the stretch in the direction of the tensile stress, and a compressive strain is a shortening. If a length of l units is stretched to $l + \delta l$, then the tensile strain per unit length, called the fractional strain, is equal to $\frac{\delta l}{l}$. The compressive

strain is computed in a similar manner. The shear strain is slightly more complicated to visualise, and is generally reckoned as an angular displacement measured in radians.

If the material returns to its original shape and dimensions when the load has been removed, it is said to be elastic, and it is an important condition which must be satisfied by engineering M. under working conditions. In all bodies under increasing load there is some stress, up to which no permanent set or deformation is observed on the removal of the load; this

is called the elastic limit, the point below which the material may be regarded as quite elastic. Within the elastic limit the stress is proportional to the resulting strain; this is known as Hooke's law, and in the case of an elastic material subjected to a tensile or compressive load may be

written: $\frac{\text{Stress}}{\text{Strain}} = E$, where E is a constant known as the modulus of elasticity or Young's modulus for the particular material. E is generally expressed in Britain in pounds or tons per square inch. In the case of a material under a shear stress within the elastic limit, a similar

relation, viz.: $\frac{\text{Shear Stress}}{\text{Shear Strain}} = G$, holds, where G is a constant for each particular material and is called the modulus of rigidity.

The most commonly applied test of metals used in construction is the tensile test, which consists of stretching a specially shaped specimen by a gradually applied, uniformly increasing load until it fractures. From this test, by plotting stress and strain, the elastic limit and ultimate strength may be found. The ultimate strength is the ratio

Maximum load

Cross-sectional area of Specimen

Material which is subjected to frequently repeated fluctuating stresses will fracture at stress much lower than its ultimate static strength. Stresses of this type may vary in intensity from zero to a maximum, or they may alternate from tensile to compressive. In such circumstances the material is said to have become fatigued.

See J. A. Cormack and E. R. Andrew, *Properties and Strength of Materials*, 1939; A. Morley, *Strength of Materials*, 1940; and F. V. Warnock, *Strength of Materials*, 1945.

Materia Medica, branch of medical science dealing in as complete a manner as possible with the hist., preparation, properties, uses, and action upon the body, of the drugs used in medical prescriptions.

Ant. Egyptian, Chinese, and Jap. writings included extensive M. M. In the first century A.D. Dioscorides wrote on medicinal herbs, and some of his writings were trans. and incorporated in Arabian M. M. Nearly 800 medical plants were mentioned in a M. M. of India, written about the fifth century A.D. In most countries there are official pubss., e.g. *British Pharmacopoeia*, by the General Medical Council. This has been rendered necessary to combat medieval superstitious remedies as well as those of modern quacks, and indirectly is supported by law. The *London Pharmacopoeia* was first pub. in 1618, and prescribed foxes' lungs as a cure for asthma. Two other eds. pub. during the seventeenth century included such remedies as 'moss from the skull of a victim of violent death,' and Irish whiskey. An official list of drugs contains only those which have passed the test of experience, and of which

the knowledge is sufficient to render them safe in use. Many good drugs are introduced and in regular use before proprietary medicines, generally consisting of official drugs in a patent compounded form, appear. M. M. is very extensive, and includes widely different topics. Its most important branch deals with the preparation of drugs in the pure state, and the recognition of adulterations; this comes under the head of *Pharmacy*. *Pharmacology*, another branch, deals with the physiological action of drugs on the living body, in large and small doses, in health and disease, and of the chemical form, solution, etc., in which best administered for assimilation by the body. *Toxicology* confine itself to drugs of toxic or poisonous action, and ascertains particularly the range of 'safe doses.' All these branches merge into *Therapeutics*, which is the concern of the medical practitioner. Classification of drugs is very varied and overlapping; chiefly there is the ordinary chemical classification, e.g. alkaloids, salts, infusions; and classification according to therapeutic action, e.g. tonics, sedatives, stimulants. See S. O. Potter, *Therapeutics and Materia Medica*, 1931; R. H. Micks, *The Essentials of Materia Medica, Pharmacology, and Therapeutics*, 1947; and A. H. Douthwaite, *A. H. Hale-White's Materia Medica, Pharmacy, Pharmacology, and Therapeutics* (28th ed.), 1949.

Maternity and Infant Welfare. Public interest was not directed towards the welfare of infants and of women during M. until the twentieth century. The Notification of Births Act was passed in 1907, and in 1915 this was extended to give local authorities the right to levy rates for infant welfare work. The first welfare centre was opened in 1906 by Dr. Eric Pritchard in the bor. of St. Marylebone. The next to be opened was in St. Pancras, and came to be known as the 'School for Mothers' from the fact that class instruction was given to mothers in the care of infants, sewing, cooking, etc. By 1910 ninety M. and I. W. centres were in existence, but the majority of these, especially the lying-in hospitals, depended on voluntary work and subscriptions. By 1939 there were 2300 centres in England and Wales, nearly 75 per cent of which were maintained by local authorities, while the remainder were provided by voluntary associations. From 1910 to 1914 the Board of Education and the Local Gov. Board (now part of the Ministry of Health) helped to finance the M. and I. W. centres and institutions. In 1918 the Maternity and Child Welfare Act was passed, empowering co. and local authorities to give assistance, subject to the approval of the minister of health, to assist expectant and nursing mothers and children below the age of five. Provisions were also made towards a grant in aid of M. and I. W. centres, both voluntary and municipal. M. allowances were frequently discussed, but were not introduced in Great Britain until 1946, in which year was passed a National Insurance Act (g.v.), which provided *inter alia* a M. allowance of 36s. and

an attendance allowance of 20s., together with a M. grant of £4. There were schemes for such allowances in operation in other countries before this, e.g. in New Zealand (introduced in 1938), in some of the Canadian provs., and in Sweden, etc. With regard to midwifery, the standard was raised after the passing of the Midwives Act in 1902. M. homes have to be registered, and M. benefit was allowed under the National Health Insurance Act of 1911 (40s.), and this provision was repeated in the subsequent Acts, including the Act of 1941.

Local authorities have no power to establish birth-control clinics as such; but information regarding birth control may be given at M. and child welfare centres, or at special clinics for women suffering from gynaecological disorders. Such information is exclusively given to married women attending the clinics in whose cases further pregnancy would be detrimental to health. The Association of Infant Welfare and Maternity Centres, 117 Piccadilly, London, is one of the largest associations of its kind. In 1936-37 the cost of the public M. and welfare service in England and Wales was £3,590,000. The birth rate in 1928 was 16.7 per 1000 persons, and the infant mortality under one year was 65 per 1000 births. In 1916 the figures were, respectively, 19.1 and 43. Maternal mortality in England and Wales in 1938 was 19.7 (i.e. 2.97 per 1000 total births); in Scotland 43.2 (4.9 per 1000 births); and in N. Ireland 96 (3.80 per 1000 births). In 1945 the figures were, respectively, 12.57, 23.6, and 70. A survey of the social and economic aspects of pregnancy and childbirth in Britain was undertaken by a joint committee of the Royal College of Obstetricians and Gynaecologists and the Population Investigation Committee. Through the co-operation of 424 maternity and child-welfare authorities in Great Britain, it was possible for health visitors to interview some 14,000 women who had had their confinements during a week in March 1946. The findings of the committee were to some extent disquieting and disappointing in view of the large sums expended on the health services. The outstanding fact was the social class inequalities of the maternity services in Britain. Those women who belonged to the registrar-general's Social Class I. were much better off not only in material wealth, but also in the kind of attention they received when pregnant compared with the poorer women in Social Class V. Most of them had doctors in attendance at the time of confinement, so that they were sure of being given more analgesic drugs during labour. Furthermore they ceased work much earlier in pregnancy and arranged for ante-natal supervision sooner than those women who had to work, and who already had children. Finally the favoured group tended to have their confinements in hospitals or in private maternity homes. In the U.S.A. there is now some, but no unified, system of compulsory registration of births throughout the country. The rate of maternal

mortality is higher in the U.S.A. than in many of the prin. countries of the world. In 1938 the rate was 50 per 10,000 live births as compared with 30 per 10,000 births in Italy or Holland, and this was the lowest rate recorded in Amer. statistics. But M. and I. W. work has done much to reduce both that and infant mortality, and the Amer. system of M. hospitals is without equal. In other countries of the world the work has progressed, especially in Belgium and Holland, which were two pioneer countries, and M. and I. W. has been the subject of many recent conventions, the most important being the Geneva Declaration (1921). The Save the Children Fund is an international organisation which is devoted to M. and I. W. work. Practically world-wide laws exist to prevent women working immediately after confinement, and in some countries before. The women of Soviet Russia receive particular help, being allowed by the state full pay during two or three months before and after childbirth if they are employed, or a grant if their husbands only are employed. The League of Nations, through the International Labour Office, directed attention towards the need of protection of women both before and after child-birth, and a draft convention relating to this was adopted at the International Labour Conference, held at Washington in 1919. See Janet Campbell, *Maternal Mortality*, 1924; H. H. Gregory, *Infant Welfare*, 1926; E. Fuller (ed.), *The International Handbook of Child Care and Protection*, 1928; F. F. McCleary, *The Early History of the Infant Welfare Movement*, 1933, and *The Maternity and Child Welfare Movement*, 1935; and *Maternity in Great Britain* (a survey by a joint committee of the Royal College of Obstetricians and Gynaecologists and the Pop. Investigation Committee), 1949.

Mate-Szalka, tn. in the com. of Szatmar, Hungary, 44 m. N.E. of Debreczen. Pop. 7000.

Matre, Ermengau (c. 1250-1322), Provençal writer, b. at Béziers, spent the latter part of his life in the monastery of Béziers. His great work, the *Breviari d'Amor*, was begun in 1288. It has been pub. in 2 vols. by Azais (1862, 1881).

Mathematical Instruments, see CALCULATING MACHINES; COMPASSES; PLANIMETER; SLIDE RULE; MECHANICAL DIFFERENTIAL ANALYSER.

Mathematics (Gk. μαθηματική from μάθησις, to learn, and τέχνη, art) is the science of space and number, and is the basis of all other sciences. The attempts to create a philosophical basis for M. are very abstruse. For practical purposes M. is divided into pure M., of which the prin. branches are arithmetic, algebra, geometry, trigonometry and calculus, and applied M., which includes mechanics, kinetics, thermodynamics, the theories of light and electricity, astronomy, statistics, relativity, and quantum theory. There is no hard and fast dividing line, but broadly speaking pure M. is abstract and can be developed and studied without reference to physical laws, whereas applied M. is based on experimental

discovery, is designed to elucidate it, and is often the precursor of new advances in natural science.

The reader will find separate articles devoted to most of the branches of M. named above; the purpose of the present article is to give an outline of the development of the subject. It is true that the Chinese and Hindus in the earliest times evolved crude methods of counting and measuring; that the Babylonians devised a system of numeration is clear from their cuneiform writings, while 1 Kings vii. 23 shows that the existence of a relation between the diameter and the circumference of a circle had been noted, if incorrectly, at that time. Nevertheless the hist. of M. properly begins with Thales of Miletus (640-546 B.C.), for to him we owe the first theorems in plane geometry and the logical proofs of the same. Pythagoras (sixth century B.C.) did not merely make the valuable contributions to geometry with which we are familiar to-day; he estab. it as a dignified branch of learning among the Gks., so that Hipparchus, Pto., and Aristotle prepared the ground for the renowned school of geometers at Alexandria that produced Euclid, Archimedes, and Apollonius. This school flourished between 300 and 30 B.C., and the system of Euclid's geometry was the result of their work. The range of their research was so great that geometry made no further material advance until the seventeenth century A.D. The Gks. were not only geometers. Hipparchus was the most famous astronomer of their civilisation, and his contributions to M. include the beginnings of trigonometry. Archimedes has the greatest reputation of them all, because he also began the study of mechanics with his principle of the lever, and his researches in hydrostatics, or the mechanics of fluids at rest were the first contributions to that branch of M. Arithmetic made very little progress at the hands of these Gk. mathematicians, a fact that is not surprising when we reflect that they handicapped themselves by adopting the letters of the alphabet for their system of numbers. Ptolemy (second century A.D.) extended the work of Hipparchus, and Diophantus (fourth century A.D.) began the study of universal arithmetic or algebra, but he too was at a disadvantage because of the laborious arithmetic inherited from the Gks. Rom. civilisation added nothing of note to M., although Boethius became acquainted with a few of the theorems of Euclid, and he gave to Europe a Lat. trans. of his scanty knowledge of geometry.

The revival of M. in Europe began in the twelfth century, when Adelard of Bath became acquainted with a Lat. trans. of Euclid's *Elements*. This book he obtained from the Arabs, who had made an extensive study of M. from the eighth century onwards. They resurrected the geometry of Euclid, and they adopted the arithmetic of the Hindus who had found in Brahmagupta (seventh century A.D.) the source of inspiration of modern arithmetic. The Arabic system of arithmetic developed rapidly in Italy and in England, and the

study of algebra was based on a trans. of Al-Khwarizmi's treatise. With the invention of printing and the revival of learning generally during the Renaissance arithmetic gradually became simplified by the evolution of the ordinary processes of addition, multiplication, etc., that we know to-day, while algebraic symbols and operations slowly approached their present form.

The story of modern M. begins at the end of that epoch, viz. the close of the sixteenth century, and it is an uninterrupted account of brilliant achievements.

practically intact. Algebra, astronomy, optics, and other branches of physics bear the imprint of his genius; the honour of inventing the infinitesimal calculus he shares with Leibniz. The infinitesimal calculus is undoubtedly the greatest of all mathematical discoveries, the key which has unlocked the secrets of all the physical sciences. Its discovery marks the beginning of the modern period in M., which has contributed far more to mathematical knowledge than the previous 2000 years. The calculus provides a means of dealing in mathematical form with the

FIG. 1
PART OF THE DIGITAL ELECTRONIC COMPUTING MACHINE AT MANCHESTER UNIVERSITY

The section on the left contains the control circuit, in the middle rack of which is a cathode ray tube screen with (below) the control panel. The overhead cables carry information to and from the memory section of the machine (not shown). The racks nearest the camera contain the calculating circuit. The machine is 'fed' at the control desk and the answer is read on the cathode ray tube.

Geometry had been marking time since the days of Euclid, waiting as it were for a simple algebra. It took on a new lease of life with the invention of algebraic geometry by Descartes in 1637. His system is well known: a point is represented by a pair of numbers (x, y) that specify its position with respect to two fixed axes of co-ordinates. On this system of plane geometry a straight line is represented by an equation of the form $lx + my + n = 0$, and the conic sections by an equation of the second degree $ax^2 + 2hxy + by^2 + 2gx + 2fy + c = 0$. The time was ripe for the greatest mathematical genius of all time, and during the seventeenth century Newton made ample amends for the dark ages of M. His book the *Principia* gives us an idea of the debt M. owes to him. He built up mechanics at an amazing rate, and his system is still

concept of continuous variation, and the principle of continuity extended enormously the content of algebra and geometry, and led later to the theory of complex and imaginary numbers and the whole structure of projective geometry. During the eighteenth century the work of such men as Euler, Laplace, Lagrange, and Gauss, and the estab. of Taylor's theorem of infinite series provided the tools and the means of calculation required for the far-reaching technical developments in mechanics and electricity that were to come later. The nineteenth century saw the invention by Lobachevsky and Riemann of 'non-Euclidean' geometry, later to be used for Einstein's theory of relativity, and another revolution in mathematical calculation in the discovery of quaternions and vector analysis, which simplified the operations

of multiplication, division, etc., where both vector and scalar quantities are involved. In astronomy the foundations laid by Copernicus, Tycho Brahe, Kepler, and Galileo were rapidly surpassed, and new methods and ways of thought led firstly to a much vaster and more exact astronomy, and later to the quasi-metaphysical theories of the nature of universal space which have been a feature of the twentieth century. At the microcosmic end of the scale, the refinements of mathematical analysis led to those brilliant discoveries in the fields of wave-theory, X-ray, radio, and atomic structure, which are promising at present to increase the powers, and with them the responsibilities, of civilised man.

It is interesting to note some of the practical aids to mathematical computations that have proved their worth. The earliest of these is the abacus (*q.r.*) that was used in various parts of the world for the processes of addition and multiplication (by repeated addition). Another early piece of apparatus for addition was a flat polished tablet covered with sand on which figures were made with a stylus. Arithmetical computations were greatly simplified by the invention of logarithms (*q.r.*) by Napier (*q.r.*) in 1614; the logarithmic tables now in use are due to Briggs, who first pub. his tables in 1617. They are logarithms of the natural numbers to the base 10. Briggs is also credited with the improvement of the decimal notation first invented by Stevinus. Hipparchus constructed the first trigonometrical tables, and these were extended by Hindu mathematicians. The modern tables are based on those of Rheticus (sixteenth century) and Briggs, the latter being the first to publish tables of the logarithms of trigonometrical functions.

Mechanical aids to the ordinary processes of computation followed rapidly. Gunter designed his logarithmic line of numbers (*see* LOGARITHMS) that was simply a straight line with the numbers 1 to 10 arranged on it, the intervals between 1 and another number were directly proportioned to the logarithm of that number to the base 10. Shortly afterwards, in 1630, Wingate invented the first slide rule of the straight edge pattern, which was really two logarithmic lines of numbers placed side by side, one fixed and the other movable. The modern slide rule has descended from that of Mannheim, who in 1850 introduced the cursor, the travelling runner with its finely graduated line that enables the readings to be made across the scales with great accuracy. Hundreds of various patterns of slide rules have been patented since that time, and they are employed extensively in engineering and commerce. Recently calculating machines (*q.r.*) have been brought to a high pitch of perfection and flexibility. Mathematical models have also reached great perfection, both for elementary teaching and for the demonstration of advanced concepts.

Electronic Computation.—Electronic computing devices fall into two great classes: machines employing 'digital'

methods, and instruments using 'continuous-variable' or 'analogue' methods. Those in the first class perform mathematical operations by counting electrical impulses, usually in the scale of two. Their mechanical ancestor is the abacus. Electronic machines can count at rates exceeding 1,000,000 per sec., working to ten or twenty decimal places, and incorporate electronic 'memory units' to enable them to receive information and select appropriate instructions at a corresponding rate. This makes it possible for them to organise the details of their own activity to a limited extent as calculation proceeds. In some respects they can be made to resemble human brains, but the popular term 'electronic brain' is a misnomer; most machines are designed to eliminate undesirable resemblances to

D. M. MacKay, Univ. of London, King's College

A THREE-DIMENSIONAL GRAPH DRAWN ON THE CATHODE-RAY TUBE OF AN ELECTRONIC COMPUTING INSTRUMENT

the human brain as far as possible. Computing instruments rely on the measurement of some physical quantity, such as length or voltage, and are used where speed is more important than accuracy. Typical mechanical prototypes are the slide rule (*q.r.*) and the mechanical differential analyser (*q.r.*). Most electronic instruments rely mainly on the fact that the voltage across a resistance is proportional to the current flowing, while that across a capacitance is proportional to the time-integral of current. Voltages representing variables can thus be added, integrated, and so forth, according to the equation to be solved, and the solution is provided in the form of a graph. Present-day instruments can produce several thousand solutions per second, and use cathode-ray tubes to display them in graphical form. *See also* separate subjects referred to in this article, and CALCULUS; INSURANCE; INVOLUTION; LOGARITHMS; MAXIMA AND MINIMA; SLIDE RULE.

Mather, Cotton (1663-1728), Amer. divine and writer, b. at Boston, son of Increase M. He was ordained in 1684, and was a minister in Boston from that time till his death. He was a considerable linguist and a prolific writer. A firm believer in witchcraft, he entered vigorously upon the persecutions of the day. His *Memorable Providences relating to Witchcraft* appeared in 1689. Twenty executions took place at Salem in 1692. His works include *Magnalia Christi Americana* (1702), a collection of biographies and historical fragments dealing with New England church hist. See B. Wendall, *Cotton Mather: the Puritan Priest*, 1926, and R. P. and L. Boas, *Cotton Mather, Keeper of the Puritan Conscience*, 1928.

Mather, Increase (1639-1723), Amer. nonconformist divine, b. at Dorchester, Massachusetts, and educated at Harvard. In 1657 he came to England, and graduated the next year at Trinity College, Dublin. He returned to America, and was ordained at Boston in 1664. In 1680 he presided at the Boston Synod, and in 1683 was instrumental in procuring the refusal to give up the Boston Charter. From 1684 to 1701 he was president of Harvard College, and during that time came on sev. missions to England. He wrote some religious treatises. See K. B. Murdock, *Increase Mather*, 1925.

Mathew, Theobald (1790-1856), Irish priest and temperance reformer, b. near Cushel, joined the Capuchin Franciscans in Dublin, and took charge of a small chapel in Cork. In 1835 he signed the total abstinence pledge and advocated the policy all over Ireland, with remarkable results. In 1843 he came to London, and during 1849 and 1851 travelled in America. He worked energetically during the Irish famine. See memoir by J. F. Maguire, 1863.

Mathews, Charles (1776-1835), Eng. actor, b. in London and educated at Merchant Taylors' School. He made his bow in London in 1803, and acquired a reputation as a comedian. Having played long at Drury Lane and Covent Garden, he set up in management at the Adelphi Theatre in 1828. His memoirs were pub. in 1839. His son, Charles James M. (1803-78), also educated at Merchant Taylors', held a supreme place in the sphere of light comedy, and was especially successful in Fr. plays. See his life (2 vols.), ed. by Charles Dickens, 1879.

Mathews, Sir Lloyd William (1850-1901), Brit. naval officer and first minister of the sultan of Zanzibar, entered the R.N. by way of the *Britannia*, and served later on H.M.S. *London*. Following ser-

vise in the Mediterranean and on the W. African coast, he joined the E. African patrol in 1875. Sickened by what he saw of the slave trade he volunteered to train a force whose main purpose was to end it. The Admiralty consented, and in a few months M.'s African battalion, the first regular native force to be raised in E. Africa, was a smart and creditable body of men. This new force grew rapidly, chiefly owing to the unbounded influence exercised over it by M. In 1881 M. retired from the navy in order to take permanent service under the sultan of Zanzibar, with the title of 'General,' and gave the rest of his life to Zanzibar. When he died in 1901 he had served under five successive sultans, and from 1891, when Zanzibar became a Brit. protectorate, with a new constitution, he had filled the post of first minister. See Sir R. Comblard, *The Exploitation of East Africa, 1856-1890: the Slave Trade and the Scramble*, 1939.

Mathura, see MUTTRA.

Matteo (*Artauthe* or *Piper elongata*), shrub (order Piperaceae), the leaves of which yield a heavy pale green aromatic oil, and are used as a styptic.

Matilda, or Maud (1102-67), only daughter of Henry I. of England. Married to Henry V. of Germany, 1114. At his death in 1125 she returned to England. She married Geoffrey of Anjou in 1128. At the death of Henry I. (1135) she carried on an unsuccessful civil war with Stephen till 1142; her son afterwards ascended the Eng. throne as Henry II.

Matilda, Caroline, see CAROLINE MATHIDA, queen of Denmark and Norway.

Matilda, Countess of Tuscany (1046-1115), daughter of Count Bouffice 111., came into vast estates at an early age. She was twice married: to Godfrey V. of Lorraine and to Welf V. of Bavaria. Her life was spent in support of the popes against the emperor of Germany in the struggle over investiture. In 1074 she aided the pope against the Normans, and in 1077 Henry IV. underwent his humiliating penance before Gregory VII. at her castle of Canossa. Her estates were given to the Holy See in 1077, and the grant was renewed in 1102. See life by N. Grimaldi, 1928.

'Matin, Le,' Paris daily paper, founded in 1884 by Alfred Edwards as a Moderate Republican jour., devoting itself rather to the pub. of news from all over the world than to the propagation of political views. It pub. trans. of most of the telegrams in the London *Times*. It always opened its columns to all shades of opinion, whether republican, radical, or Bonapartist. Among its contributors were Emmanuel Arène, Graner de Cassagnac, Cornély, Vallès, Ranc, Jules Simon, Des Houx, and Scholl.

Matins, see BREVARY.

Matisse, Henri (b. 1869), Fr. painter, b. at Le Cateau, Nord. He left Amiens as a young man to study law in Paris, but soon gave up the idea of a legal career to begin his artistic life as a pupil of Gustave Moreau at the École des Beaux Arts. Early attracted to the Impressionist

movement, his work in 1898 was similar in technique to the *intimiste* paintings of Sickert and Bonnard. Thenceforward, however, he came completely under the influence of Gauguin, and was soon to become one of the foremost leaders of the Fauvistes. A better draughtsman than Gauguin, M. has much in common with E. painting, and his clear washes or planes of pure colour, as opposed to the mosaic method, achieve the maximum of expression with an astonishing economy of means. In their emphasis on linear design, many of his pictures are masterly in their summary expression of form and rhythm. Pictures like 'The Dance'—consisting of brick-red dancing figures in the nude against a background of raw blue

Derwent valley, and is surrounded by mt. scenery. It has famous hot springs and in the neighbourhood are stalactite caves, petrifying wells, and lead mines. Adjoining M. to the S. is M. Bath, with numerous hydropathic estabs. Combined pop. 18,100.

Matopos, or Matoppoos, range of hills in the Matopo dist. The Matopo area is a mass of compact hills, some of which approach in size the dignity of mts. The range extends for some 50 m. E. to W. and 25 m. N. to S. The highest point is on the N.E. of the range (5100 ft.). The chief hills are Sotjia, Impu, Solozzi, and Injelele. Many of the hills are associated in the Karanga mind with anct. racial traditions, some being 'venerated hills,' others

Canadian Pacific

THE TOMB OF CECIL RHODES IN THE MATOPO HILLS

and green— if anarchic in conception, are essentially expressive of life and movement; and the same observation applies even to those of his paintings such as 'The Toilet,' where there is undoubtedly some distortion of form. Among his other best known paintings are 'Desserte,' 'Italienne,' 'Odalisque,' 'Femme au Turban,' 'Le Jeune Marin,' 'Les Trois Sœurs,' 'La Musique,' 'Torse des Jeune Fille,' and 'Fenêtre à Tanger.' A large number of his canvases are in the Moscow State Collection of W. Art and in the various art museums of Europe and America. See studies by E. Faure, 1920; R. Fry, 1930; R. H. Barr, 1932; A. C. Barnes and V. de Mazia, 1933; P. Courthion, 1942; and J. Cassou, 1948; also F. Carco, *L'Ami des peintres*, 1944.

Matiya, tn. of prov. Asyût, upper Egypt, on l. b. of Nile, 129 m. S. of Cairo. Pop. 7000.

Matlock, tn. of Derbyshire, England, on R. Derwent, 15 m. N.W. of Derby. It is picturesquely situated on the slope, and at the bottom of the narrow and beautiful

'rain dance hills.' One was named by Cecil Rhodes 'The View of the World,' now commonly called 'The World's View,' and was chosen by him as his burial-place. Here there is a national park and the Matopo dam, which irrigates the surrounding area. The Bushmen, the first human inhab. of the country, made their homes in the inaccessible parts of the Matopo range from a dimly remote past in post-Neolithic times down to a few centuries ago. Rock paintings have been discovered. One of the chief points of interest is the phenomenon called the 'natural wall,' consisting of a dyke of diorite stone running from N. to S. through the centre of the range. Further in the range is the cave of the M'Rimo Priest, round which for centuries have hovered the religious ideas and superstitions of the Karanga. Injelele ('the slippery-sided') Mt., a conspicuous lal. mark and believed to be the third highest hill in the M., marks the locality of the cave, which, however, is not in the mt. itself. The M'Rimo was but a spirit, an ancestral shade, and dates from

the mid sixteenth century. It was, and still is, held to have the power of causing death, illness, and failure of crops or other injuries. Fear of evil consequences alone induced the natives to consult its oracle. The Matabele consulted it prior to their rising in 1896. The M. were the scene of sev. battles during this rebellion, as well as of the 'indaba,' in which Rhodes persuaded the chiefs to make peace.

Matriarchy, 'mother-rule,' is government by the mother or mothers. Various writers have recorded the existence of M. in primitive tribes, but Ofenbach (1861) claimed that in such cases 'mutter-recht' (mother-right) would describe more accurately the basis of organisation, since there was insufficient evidence to show that any society was truly matriarchal, whereas considerable evidence supports the theory of 'mother-right.' Most recent investigators uphold this view. Perhaps one of the nearest approaches to M. existed in early Egyptian hist., when women went about freely and followed industrial and commercial occupations, while the husbands stayed at home. Both married and unmarried women had power to dispose of their property as they wished and to get legal aid, but records do not show that the system of society was matriarchal. Iroquois women were represented in public councils and voted for war or peace. They ruled in the house, but performed the most menial tasks considered derogatory by the men, and the social status of the sexes was different. No recent civilisations are matriarchal, although their laws may retain vestiges of the influence of 'mother-right.' In the more primitive societies a few elements of a matriarchal system may be found, but no one society is known in which all the elements existed. Instances of matrilineal descent and inheritance are common, but usually the mother had no more power than in a patriarchal society. The position of authority was generally held by the mother's brother, the mother herself occupying a subordinate position. Among insects the bee colony is often cited as a typical M., but the queen bee has comparatively little freedom of action, and the hive is ruled mainly by sexually atrophied females, the workers. See L. H. Morgan, *Ancient Society*, 1877; L. T. Hobhouse, *Morals in Evolution*, 1906; E. A. Westermarck, *Sociological Papers*, 1906, and *The Origin and Development of Moral Ideas*, 1906-8; R. Briffault, *The Mothers*, 1927; L. T. Hobhouse, G. C. Wheeler, and M. Ginsberg, *The Material Culture and Social Institutions of the Simpler Peoples*, 1913; and J. H. Ronaar, *Woman in Primitive Mother-right Societies*, 1931.

Matricaria, genus of composite plants with leaves much divided into narrow segments, and white ligulate ray florets in a single row. *M. chamomilla* is the wild chamomile.

Matriculation (Lat. *matricula*, a public roll or register) denotes the entry or admission to membership in a body or society, especially in a college or univ. The term is most often used for the M. examination, or preliminary examina-

tion which (or a prescribed equivalent) must be passed by candidates for any degree in London and various other univs. in the United Kingdom. (The London M. is the best known and most widely taken of these examinations.) Candidates for any degree in the univ. of London, unless admitted as postgraduate students proceeding to a master's or higher degree, must matriculate at least three years before entry to the final examination for a bachelor's degree. In order to matriculate a candidate must pass either one of the three examinations conducted by the univ., viz. (i.) the M. examination; (ii.) the general schools examination; (iii.) the special univ. entrance examination, or one of the examinations accepted by the univ. in lieu of the M. examination. No person may matriculate in London Univ. unless he or she has completed his or her sixteenth year of age. A number of qualifications are recognised as giving exemption, such as the higher certificate of the Oxford and Cambridge schools examination board. Except in the case of holding a higher certificate the student must have passed with 'credit' at one and the same examination, in various specified subjects, with, however, a wide range of alternatives. The Joint M. Board of the univs. of Manchester, Liverpool, Birmingham, Leeds, and Sheffield accepts the school certificate of the general schools examination as exempting from its own M. examination, provided that the candidate has passed with 'credit' in various subjects. M. has become a recognised standard for employers of clerical labour.

Matrimony, see MARRIAGE.

Matrona, see MARE.

Matsui, quasi-monopolistic organisation which, together with others, especially the Mitsubishi, dominated Jap. industry, shipping, and banking before the Second World War. The Matsui (originally Takahira), a Jap. family connected with the great families of Fujiwara and Minamoto, was founded in the seventeenth century by Takatoshi M. After the restoration of 1868 (see JAPAN, History) the M. accumulated great wealth, and extended their activities to banking, insurance, and shipping. The M. and the Mitsubishi wielded considerable power, especially during the brief period of political party rule which flourished from 1920 to 1930 under their influence. To some extent the relatively liberal foreign policy of that decade was due to the international outlook of the M. and Mitsubishi, which derived from their interest in international trade and finance. Yet even at the zenith of their influence these economic leaders and others were so few in number and were indeed so closely interrelated with the bureaucracy that they were essentially agents for carrying out a national economic policy, subject to a control which, even if at times it was loose and partial, was easily intensified when war preparations demanded the completion of a totalitarian structure. The Sumitomo clan, descended from a remote emperor, was another instance of successful aristocratic incursion into industry and com-

merce. Even the house of Mitsubishi, the creators of the Jap. mercantile marine, though they might be *non homines*, were closely connected with the Marquess P. Okuma, one of the foremost figures in the revived empire of the latter part of last century. See O. D. Russell, *The House of Mitsui*, 1939, and Sir G. Sansom, *Japan* (Oxford Pamphlets on World Affairs, No. 70), 1944.

Matsukata, Prince Masayoshi (1835-1924), Jap. statesman, *b.* in Satsuma. He was minister of home affairs in 1880; minister of finance, 1881; Premier, 1891-1892; again minister of finance in 1895; Premier and minister of finance, 1896; and again minister of finance, 1898-1900. After the war with Russia he was made marquis, and, on retiring from public life in 1922, he was made prince.

Matsumai, see FUKUYAMA.

Matsumoto, *fn.* of Honshu, Japan, 115 m. W.N.W. of Tokyo. It is a trading centre, and has the remains of an old castle. Pop. 73,300.

Matsuoka, Yosuke (1880-1946), Jap. statesman, *b.* at Yamaguchiken. Graduating from the Oregon Univ. law school in 1900 he became secretary to the Jap. premier, 1919; secretary to the Jap. delegation to Versailles peace conference, 1919; managing director of the S. Manchuria railway company, 1921, becoming vice-president in 1927 and president in 1935 until 1939. He led the Jap. delegation to the League of Nations, 1929, and at the meeting of the League Assembly in Geneva, 1932, he conducted the case for the approval of Jap. policy in Manchuria (Manchukuo); though he lost the day he enhanced his prestige in his own country. He was foreign minister, 1940-41, in which capacity he conducted the negotiations through which Japan joined the Axis (*q.v.*), and signed a pact of non-aggression with the Soviet Union. In the Jap. House of Representatives (of which he was a member from 1932) in Feb. 1941 he declared his belief that the white race must cede Oceania to the Asiatics. He was replaced in the re-organisation of the Jap. Cabinet during the war. Arrested as a war criminal in 1946, he *d.* in hospital.

Matsushima, or Shioyama-no-Matsushima, pine-clad archipelago in Sendai Bay, E. coast of Shikoku, Japan, famous for its beauty.

Matsuya, *fn.* of Shikoku prefecture, Honshu, Japan, near W. coast, with paper manufs. Pop. 52,000.

Matsuyama, *fn.* of Shikoku, Japan, 155 m. S.W. of Kobe. Its port, Mitsui, 4 m. distant, is on the Inland Sea. Pop. 81,900.

Matsuzaka, *fn.* of Honshu, Japan, 58 m. S.W. of Kyoto. Pop. 14,000.

Matsys, or Massys, Quintin (1466-1530), Flem. painter, *b.* at Louvain, supposed to have been a blacksmith. In 1491 he became a member of the guild of St. Luke in Antwerp. His work is mainly religious, but includes some fine portraits, and is marked by smoothness and reverent feeling, together with a lack of atmosphere and a certain exaggeration of gestures indicative of character or emotion. His

most famous work is the triptych, 'Pieta,' now in Antwerp Museum. His 'Crucifixion' is in the National Gallery. See life by M. J. Friedländer, 1929.

Mattawa, *tn.* of Nipissing co., Ontario, Canada, at the confluence of the M. and Ottawa Rs. It is a centre for lumberers and trappers. Pop. 2000.

Matte, in metallurgy, an intermediate product in refining sulphide ores of copper, nickel, and lead. It contains from 30 to 40 per cent of sulphur, which is subsequently removed. Alternatively known as regulus.

Matteawan, vil. of Dutchess co., New York, U.S.A., 1 m. E. of the Hudson R.; it has a state hospital for the criminal insane. Pop. 7000.

Mattei, Tito (1841-1914), It. composer, *b.* near Naples; became prof. in the Santa Cecilia Academy, Rome, in 1858, and after leaving the Continent settled in London in 1865, and became conductor at Her Majesty's Theatre. His work includes popular operas, ballets, and pianoforte music.

Matteotti, Giacomo (1885-1924), It. Socialist politician, *b.* at Fratta Polesine, in Rovigo. Member of the It. Chamber of Deputies, he became prominent in 1921, after Giolitti had accepted Mussolini as an ally in order that the Fascist bands might intimidate the workmen of Turin and the Venetian peasantry. M. began to reorganise a Unitary Socialist party, of which he was secretary, on a constitutional and part. basis in accordance with the commonsense view of the rank-and-file Socialist trade unionists. This clear sighted action helped the country to settle down, a result abhorrent to Mussolini, who, now ultra-nationalist and a renegade from republicanism, was preparing a *coup d'état* with the monarchy and the army. Having, after the 'march on Rome' (1922), acquired control of the state machine, he proposed and carried through the Chamber an electoral 'reform,' by which the strongest party was to have two-thirds of the seats. In the elections which were held in the following year the intimidation was tremendous. Mussolini naturally obtained his majority, but there were nearly 3,000,000 voters out of over 7,500,000 who had enough courage to vote against him, and when the Chamber met M. protested against Fascist outrages, and was thereupon murdered with unblushing brutality on June 10, 1924. This crime, the worst blunder of Mussolini and his associates by reason of its unending repercussions, in which at least De Bono (*q.v.*) and Finzi (minister of the interior) were involved, brought about a crisis in Fascism, though one which was so little understood abroad that, when the Council of the League of Nations met in Rome towards the end of the year, Mussolini was able to exploit Austen Chamberlain's cordiality to the advantage of his regime. See further ITALY, History.

Matter: In philosophy, according to the scholastics following Aristotle, was classified as *materia prima* (first matter) and *materia secunda* (second matter). The former is that of which a thing is

made and is determined by the substantial form, for example, according to a commonly received opinion, first matter in man (wrongly called the body) is determined by the rational soul. First matter is the subject of all corporeal change and the principle of extension and quantity. Substantial form determines it, places it in a determinate species, gives it its specification and actualisation; and only through its substantial form can it be known. Second matter is determined by an accidental form (e.g. roundness, redness, hardness, etc.), and is therefore an already constituted body. Metaphysicians to-day define M. as one of the ultimate principles or substances, in a dualist system, of which phenomena are appearances or manifestations or, in materialistic monism and materialism, the sole substance in terms of which the universe is ultimately to be explained. In this sense M. is unknowable: it underlies the properties of all particular things in which those properties inhere or by which, regarded as impressions made on the senses, they are caused; and it is the substratum of such qualities, supposed to be necessary to explain their constant co-existence as a group. The Eng. empiricists Locke, Berkeley, and Hume minimised or denied the importance of the conception of substance itself; but Kant retained the notion of M. as signifying the permanent which is found throughout all change. Modern phenomenologists, in so far as they recognise the concept of substance, and consequently of M., at all, regard it as denoting the unknown existent upon which physical properties somehow depend. See W. C. D. Whetham, *Matter and Change*, 1924, and E. L. Watkin, *A Philosophy of Form*, 1935.

2. In physics, is the name given to that out of which all objects external to the mind are thought to be composed. The physicist is concerned with the explanation of the phenomena of nature, and the ultimate goal of his researches is an interpretation of the physical nature of M. that will be consistent with the laws of natural phenomena. The earliest theory of M. of any importance is that of Democritus and Lucrétius, who supposed that M. consists of hard atoms (Gk. *átomos*—unentable) that could neither be created nor destroyed nor altered in any way. Experimental evidence that supported such a theory, modified in some respects, was forthcoming at the beginning of the nineteenth century when Dalton's chemical researches led to the discovery of the law of multiple proportions. He discovered that in chemical combinations, elements combine in certain definite proportions by weight. If a given element really consisted of identical atoms, and if n atoms of one element always combined with m atoms of another given element, then the macroscopic result would lead to Dalton's result. This hypothesis has been very fruitful in explaining chemical phenomena, and it has had a similar success in the realm of physics. Thus the Kinetic theory of matter, by postulating the existence of atoms and groups of atoms, called molecules, has been able to account quanti-

tatively for the physical law of gases, liquids, and solids by a statistical inquiry into the motions of these molecules. The success of this theory can be appreciated by reading Sir Wm. Bragg's book, *Concerning the Nature of Things* (1927). A quasi-philosophical interpretation of the atom was forthcoming when Kelvin imagined it to be a vortex rising in the ether that permeated all space. Electrical research initiated by J. J. Thomson in the last decade of the nineteenth century carried the investigations a step further. While the atom of Dalton was the 'ultimate particle' in chemical reactions, it proved to be 'cuttable' by electrical means, for the existence of an electron, a particle carrying a negative charge of electricity, whose mass was less than that of the lightest atom, the atom of hydrogen, was established, and its mass and electrical charge determined by Millikan in 1908. Rutherford's researches in radioactivity, supported by the researches of Moseley and others, gradually established the electrical theory of M. According to this theory all M. is composed of elementary positive charges of electricity called protons, and negative charges called electrons. In 1913 Bohr deduced the result that the atom of hydrogen is an elementary solar system, with a proton for its sun and an electron as the sole planet. The quantitative success of this model, together with experimental evidence concerning the essentially similar nature of other atoms, too complex to yield a mathematical solution of their solar systems, seemed to lead to the conclusion that M. had at last been reduced to its simplest term. The problem is, however, more complicated to-day. Difficulties that were adumbrated by the theory of relativity have materialised in a spate of fresh experimental evidence. A new theory of light has arisen; it involves a new theory of M. Annihilation of M., formerly supposed to be impossible, is taking place at such a rate that the sun alone is losing something of the order of 250,000,000 tons a min. in the form of photons or light corpuscles. Radiation, as well as the 'hard particles' known as electrons and protons ten years ago, 'exhibit a dual nature.' To quote Sir James Jeans, who in *The Mysterious Universe* (1930) sums up the state of knowledge as follows: '... the tendency of modern physics is to resolve the whole material universe into waves and nothing but waves. These waves are of two kinds: bottled-up waves, which we call M., and unbottled waves, which we call radiation or light. If annihilation of M. occurs the process is merely that of unbottling imprisoned wave energy and setting it free to travel through space.' Following the work of Einstein and Eddington, theories on the nature of M. have been put forward by E. A. Milne, H. Weyl, P. Hoyle, and others. See also *ATOM AND ATOMIC THEORY*. See Sir A. S. Eddington, *Stars and Atoms*, 1927; Sir J. Jeans, *The Stars in their Courses*, 1931; and E. A. Milne, *Relativity Gravitation and World Structure*, 1940.

Matterhorn, or Mont Cervin, peak of the

Pennine Alps, in the central zone of the Middle Alps, on the borders of Valais, Switzerland, and Piedmont, Italy, 6 m. S.W. of Zermatt. Altitude 14,775 ft. Its appearance is most striking owing to its isolation and unusual steepness. The ascent by the N.E. or Zermatt ridge was first made in 1865 by Whymper, Lord Douglas, Hudson, and others, when sev. of the party lost their lives. Subsequently it was climbed by the E. ridge, the Zmutt ridge, and the N. face, and ultimately by all four ridges and faces. All routes are very difficult, especially in bad weather, but there are fixed ropes on the N.E. and E. ridges, which lessen the standard of climbing required, and reduce the risks to a minimum. See E. Whymper, *The Valley of Zermatt and the Matterhorn*, 1901, and G. Rey, *The Matterhorn*, 1917.

F.N.A.

THE MATTERHORN FROM ZERMATT

Matthay, Tobias (1858-1945). Eng. pianoforte teacher, b. in London, founded the M. school in 1900. He was a prof. of piano at the Royal Academy of Music. His system is founded on observation of the operation of both physical and psychological laws, and is described in *The Art of Touch* (1903). Among many famous pupils may be mentioned Harriet Cohen, Myra Hess, Irene Scharrer, and York Bowen.

Matthew, Basarab (d. 1654), hospodar of Wallachia. He came to the throne in 1633, and ruled with much wisdom. Among his reforms were the estab. of a printing press (1652), the codification of the law, and the trans. of the Bible into Wallachian.

Matthew of Paris, see PARIS, MATTHEW.

Matthew of Westminster, legendary fifteenth-century Benedictine monk and chronicler, to whom the *Flores historiarum* was formerly assigned. This MS. was probably compiled by various writers at St. Albans and Westminster. It was first printed by Archbishop Parker in 1567, trans. by C. Yonge in the Rolls Series, 1890.

Matthew, the Gospel according to St., first book of the N.T. The tradition

which attributes the authorship to St. M. is founded on the words of Papias that 'Matthew composed the oracles (*logia*) of the Lord in the Hebrew tongue and each interpreted them as he was able.' This cannot refer to our gospel, for it is certain that this work is an original Gk. composition, and not a trans. from the Heb. or the Aramaic. Some have therefore been led to doubt the veracity of Papias, but this is rendered unnecessary by the very probable theory as to the 'oracles of the Lord' (see LOGIA). Our gospel seems to have been composed from the two main sources: (1) St. Mark's Gospel, or the earlier form of it known as the *Ur-Markus*; (2) a source common to St. M. and St. Luke, known as Q. It is extremely difficult to secure a probable date for the first gospel. Harnack dates it from A.D. 70 to 75, except certain later additions. Previous critics had also generally placed it in the last quarter of the first century. It is almost certain that St. M. was not its author. The gospel is characterised first by the number of its quotations from the O.T., emphasising the Messianic character of Christ's work, secondly, by its arrangement of the subject-matter in groups. Thus we have a collection of discourses in chaps. v.-vii., of miracles in chaps. viii. and ix., of parables in chap. xiii. Much more attention is given to our Lord's discourses than in the Marcan narrative. See commentaries by T. Zahn, 1903; W. C. Allen, 1907; F. Maues, 1919; and article in J. Hastings's *Dictionary of the Bible*, 1898, where full bibliography is given.

Matthews, James Brander (1852-1929), Amer. man of letters, b. at New Orleans and educated at Columbia College, New York. A founder of the Amer. Copyright League, the Dunlap Society, and the Simplified Spelling Board, he became president of the Modern Language Association of America in 1910. His pub. works, comprising fiction, criticism, drama, etc., include *French Dramatists of the Nineteenth Century* (1882); *Figures of Manhattan* (1894); *Introduction to the Study of American Literature* (1896); *Aspects of Fiction* (1896, 1902); *Tales of Fantasy and Fact* (1896); *Molière, his Life and his Works* (1910); *A Book About the Theatre* (1916); *The Principles of Playmaking* (1919); and *Playwrights on Playmaking* (1923).

Matthews, Walter Robert (b. 1831), Brit. divine; educated at Wilson's College, Camberwell, and King's College, London. He was successively curate at St. Mary Abbots, Kensington, and at St. Peter, Regent Square, London; lecturer in philosophy, King's College, London, 1903-18, and in dogmatic theology, 1909-18; dean, 1918-32; vicar of Christ Church, Crouch End, London, 1916-18; canon theologian, Liverpool cathedral, 1930; chaplain to the king, 1923-31; Boyle lecturer, 1920-22; Warburton lecturer, 1938; dean of Exeter, 1932-34; an. of St. Paul's, in succession to Dr. Inge, 1934. His pub. include *Studies in Christian Philosophy* (1921; 2nd, 1928); *The Psychological Approach to Religion* (1925); *God in Christian Thought*

and Experience (1930; 6th ed., 1942); *The Adventures of Gabriel in his Search for Mr. Shaw* (1933); *Essays in Construction* (1934); *The Purpose of God* (1935); *Hope of Immortality* (1937); *Signposts to God* (1938); *Moral Issues of the War* (1940); *The Foundations of Peace* (1942); and *Strangers and Pilgrims* (1945).

Matthias Corvinus (1443-90), king of Hungary, b. at Klausenburg (Kluj), the son of John Hunyadi; elected king in 1458. He was not crowned till 1464, after a long struggle against the Turks, the Bohemians, Emperor Frederick III., and hostile factions at home. His reign was marked by a series of wars. In 1468 he conquered Bosnia, and in 1469-69 Moldavia and Wallachia, and in 1478 concluded a peace with Ladislaus of Bohemia, by which he gained Moravia, Silesia, and Lusatia. In 1485, during a war with Frederick III., he captured Vienna and made himself master of much of Austria. He was a great military tactician and a prudent but arbitrary ruler. He was a liberal patron of learning, and founded the Univ. of Budapest and a fine library.

Matthiola, genus of cruciferous herbs or shrubs which has given rise to various valuable garden plants, including the ten-week, night-scented, Brompton, queen, and wallflower-leaved stock. *M. incana* and *M. sinuata* are Brit. natives.

Matthiesson, Friedrich von (1761-1831), Ger. poet, b. in Hohendodeleben, near Magdeburg. From 1781 to 1784 he was prof. of economics at Dessau. In 1787 he pub. his poems, which were praised by Schiller and Wieland. A collected ed. of his writings was pub. in Zürich (1825-29, 8 vols.). See lives by H. Döring, 1833; W. Krebs, 1912; and A. Heers, 1913.

Mattingly, Harold (b. 1884), Eng. historian and authority on Roman coinage, b. at Sudbury, in Suffolk. From 1910 to 1918 he was assistant keeper of the dept. of coins and medals at the Brit. Museum, and from 1942 to 1948 president of the Royal Numismatic Society. Among his very numerous pub. are *Imperial Civil Service of Rome* (1909); *Coins of the Roman Empire in the British Museum* (vols. I-IV, 1923-40); with E. A. Sydenham and C. H. V. Sutherland, *Roman Imperial Coinage* (vols. I-V, 1923-49); *Roman Coins* (1928); he also ed. the *Numismatic Chronicle*.

Mattioli, Count, see under IRON MASK, THE MAN IN THE.

Matto Grosso (Cuyabá), interior state of Brazil. The Rs. Madeira, Parana-Paraguay, Araguay, Guapore, and Tapajos form its boundaries, and it is also watered by the Xingu R. The greater part is a plain, much of which is densely wooded, while there are also large swampy areas. Sev. ranges of low mts. traverse the centre, and are rich in minerals, including diamonds. The prov. is little known and scantily inhabited. Rubber is the chief export, and sugar, tobacco, coffee, and maté are also produced. Cap. Cuyabá. Area, 532,210 sq. m. Pop. (estimated) 368,200. It contains a tn. of the same name, formerly an important mining centre. Pop. 1000.

Mattoon, city of Coles co., Illinois, U.S.A., 50 m. W. of Terre Haute. It has foundries and machine shops. Pop. 15,800.

Maturin, Charles Robert (1782-1824), Irish novelist and dramatist, b. in Dublin, wrote sev. plays, one of which, a tragedy, *Bertram*, was produced by Keon at Drury Lane in 1816. He is best remembered as the author of the novels *Monlarlo* (1807) and *The Milesian Chief* (1812), both of which won praise from Scott, and especially *Melmoth the Wanderer* (1820), which was his masterpiece. See his letters (to Lady Ewan-Smith (ed. J. Brumforth, 1927) and life by N. Idman, 1921.

Maturin, cap. of the state of Monagas, Venezuela, 40 m. inland from the gulf of Paria. It has a wireless station. Pop. 7000.

Mau: 1. Tn. in the Azamgarh dist. of the United Provs., India, 55 m. N.E. of Benares. The chief manuf. is silk. Pop. 16,000. 2. Tn. in the Jhansi dist., United Provs., India, 117 m. S.W. of Cawnpore, and engaged in the manuf. of *khaddi* cloth. Pop. 25,000.

Maubeuge, tn. in the dept. of Nord, France, on the Sambre. It is strongly fortified, has an arsenal, and manufs. glass and hardware. Taken by the Gers., Aug. 1911, it was recaptured by the Allies on Nov. 9, 1918. In the Second World War it formed one end of the salient caused by the Ger. advance in May 1940, and was captured after three days' heavy fighting. Pop. 20,800.

Mauch Chunk, (co. seat of Carbon co., Pennsylvania, U.S.A., on the Lehigh R. At this spot the riv. flows through a deep ravine, and the tn., which is situated on the mt. slopes, attracts a number of visitors on account of its beauty. It is in the centre of a rich coal region. Pop. 3000.

Mauchline, tn. of Ayrshire, Scotland, on R. Ayr, 8 m. S.E. of Kilmarnock. It has noted manufs. of fancy wooden articles, and a famous horse and cattle market. Burns lived at Mosshead, 1½ m. to the N.W. Pop. 2300.

Maude, Aylmer (1858-1938), Eng. writer, educated at Christ's Hospital and the Lyceum, Moscow. He helped to arrange the emigration to Canada of thousands of Doukhobors, a Russian religious sect. In 1918 he visited Russia again, as a lecturer for the univ. committee of the Y.M.C.A. Although he wrote books on various subjects he will be remembered chiefly for his work as an interpreter of Tolstoy and as a translator of his books, a task for which he was well fitted by his knowledge of Russian and his friendship with Tolstoy. In 1908 he pub. the first vol. of his *Life of Tolstoy: the First Fifty Years*, the second vol., dealing with Tolstoy's philosophical period, appearing in 1910. He also trans. and ed. Countess S. A. Tolstaya's compilation, *The Final Struggle*, 1936.

Maude, Cyril (b. 1862), Eng. actor, b. in London, eldest son of Capt. Charles H. M., was educated at Charterhouse. He first appeared on the stage in Colorado in 1883 in *East Lynne*; and in 1884

returned to England, appearing at the Criterion Theatre, London, in 1886. He played in *The Great Divorce Case* and in the first performance of *The Second Mrs. Tanqueray* (1893). He was co-manager with Frederick Harrison at the Haymarket, London, 1896-1905, and in 1907 took over the management of the Playhouse, Northumberland Avenue. His first wife, Winifred Emery (q.v.), with whom he was long associated on the stage, d. 1924. His reminiscences were pub. in 1927.

Maude, Sir (Frederick) Stanley (1864-1917). Brit. general, b. at Gibraltar, son of Gen. Sir Frederick Francis M., V.C., G.C.B. Educated at Eton and Sandhurst. He joined the Coldstream Guards in 1884, and served in the Sudan, 1885; in the S. African war, 1899-1901. Early in the First World War he commanded the 14th Infantry Brigade, being wounded severely. Major-general in 1915. He commanded the 13th Infantry Div. in France, the Dardanelles, Egypt, and, in Aug. 1916, Mesopotamia. He was made lieutenant-general in 1917. He marched from Basra up the Hal R. to Kut, and defeated the Turks at Shurran, entering Bagdad March 11. See also under IRAQ, History, and MESOPOTAMIA, Campaigns in. See life by Sir C. E. Callwell, 1920.

Maudsley, Henry (1835-1918). Eng. physician, b. in Yorkshire, graduated as M.D. from Univ. College, London, in 1857. He was medical superintendent of Manchester Royal Lunatic Hospital, 1859-62; physician at the W. London Hospital, 1861-74; prof. of medical jurisprudence at Univ. College, London, 1869-79, and became Goulstonian lecturer at the Royal College of Physicians, 1870. He specialised in mental work and was editor of the *Journal of Mental Science* (1862-78). His numerous works include *Responsibility in Mental Disease* (1874); *Physiology of Mind* (1876); *Pathology of Mind* (1879); *Body and Will* (1883); *Natural Causes and Supernatural Seemings* (1886); *Life in Mind and Conduct* (1902); and *Heredity, Variation, and Genius* (1908).

Maugham, William Somerset (b. 1874). Eng. novelist and playwright, b. in Paris. Educated at the King's School, Canterbury, and Heidelberg Univ., he studied medicine, but in 1897 pub. his first novel, *Liza of Lambeth*, and the success of that novel and of *Mrs. Craddock* (1902) finally won him over to literature, though something of his hospital experience is reflected in the first of his masterpieces, *Of Human Bondage* (1915). With the pub. of *The Moon and Sixpence*, partly based on Gauguin's life (1919), his reputation as a novelist was assured. His success as a playwright developed at the same time, and in one period only Bernard Shaw had more plays running in London. One of his most successful plays was *Our Betters* (1923), a social satire performed in New York, 1917, and London, 1932. He has also written sev. vols. of short stories, those with a Malayan or S. Pacific background being particularly well known. His autobiography, notable for its self-revelations, *The Swimming Cup*, was pub. in 1938; and *A Writer's Notebook* in 1949.

His other plays include *Loaves and Fishes* (1911); *East of Suez* (1922); *Caesar's Wife* (1919); *The Unknown* (1920); *The Circle* (1921); and *The Sacred Flame* (1929). Other novels include *The Making of a Saint* (1898); *The Bishop's Apron* (1906); *The Painted Veil* (1925); *Ashenden* (1928); *Cakes and Ale* (1930); *Theatre* (1937); *The Razor's Edge* (1944); and *Catalina* (1948). See lives by R. A. Cordell, 1937, and R. H. Ward, 1937.

Maui, one of the Hawaiian group of is., situated about 26 m. N.W. of Hawaii. It consists of two peninsulas divided by an isthmus of sand, the E. one containing the volcano of Haleakala, over 10,000 ft. high and with a crater 20 m. in circumference. The chief tns. are Lahaina and Kahului. Area 730 sq. m. Pop. 45,300.

Maui (natives), see under MAORI.
Maule: 1. Prov. of Chile, bounded on the W. by the Pacific Ocean. Area 2172 sq. m. Stock-raising and agriculture are carried on. Cap. Cauquenes. Pop. 70,500. 2. Riv. of Chile, which flows into the Pacific Ocean near Constitucion. It is about 110 m. long.

Maumbury Rings, circular earth mounds situated 1 m. S. of Dorchester, England. They form a circle capable of holding 12,000 persons. Excavations carried out between 1908 and 1913 disclosed that the original work was an earthen circle, with an interior ditch, dating from the late Neolithic to Early Bronze Age (c. 1800 B.C.). In Rom. times the work was converted into the amphitheatre of the tn. of Durnovaria (Dorchester).

Mauna Kea, extinct volcano on the is. of Hawaii, 13,801 ft. high. It is the highest mt. of the Hawaiian Is., and is snow-clad for the greater part of the year.

Mauna Loa, active volcano of Hawaii, and the greatest in the world, erupting frequently. It lies S. of Mauna Kea, and is 13,706 ft. high.

Maundy Thursday, Thursday of Holy Week. The name is derived from *mandatum*, the first word of the service chanted at the washing of the feet of pilgrims on that day, which is taken from John xiii. 34. It was accompanied by a distribution of 'doles,' which were handed to the pilgrims in small baskets, thence called 'maunds.' The feet-washing part of the ceremony was carried out in varying degrees of faithfulness by kings, clergy, and monks until about the fifteenth or sixteenth century. James II. performed the rite personally. After this the lord high almoner was given the task, but the rite ceased about 1750. In 1838 the dole was replaced by a money payment (M. money) from the clerk of the Almonry Office. Specially minted silver coins, introduced by Charles II., are still distributed. In Rom. Catholic churches holy oils are consecrated on this day.

Maunoury, Michel Joseph (1847-1923), posthumously marshal of France; b. at Maintenon (Eure-et-Loir). He served in the war of 1870, in the artillery, and later became prof. of artillery at St. Cyr, colonel in 1897, general of div. in 1905, and military governor of Paris, 1910. On the outbreak of the First World War he took command of three divs. in the Fourth

Army under Ruffey, and defeated an attempt to turn Ruffey's left Aug. 24, 1914. In Sept., in command of Sixth Army of Paris, he engaged Kluck in the battle of the Ourcq, and forced him back. Wounded, March 1915, he again became governor of France later in the year. Retired March 1916.

Maupassant, Guy de (1850-93). Fr. novelist and poet, *b.* at the Château de Miromesnil, Seine-Inférieure; educated at Yvetot and Rouen. He entered the Ministry of Marine, and fought in the Franco-Ger. war. He early came under the influence of Flaubert, who assisted him with encouragement and advice. After about 1886 he gradually broke down in health and reason, and after attempting suicide in 1892, died in painful circumstances in Paris. As a novelist he was the last of the naturalists, and though marked by considerable limitations in thought and imagination, he was a master in the vivid and accurate reproduction of life which he himself had observed with a wonderful intensity. His style is simple, but most effective. As a writer of *contes* he began, in 1880, with a masterpiece, *Boule de Suif*, contributed to *Soirées de Médan*, a collection by Zola, Huysmans, and others. His best collections of short stories are *La Maison Tellier* (1881); *Mademoiselle Fifi* (1883); *Clair de Lune* (1883); *Miss Harriot* (1884); *Yvette* (1884); *Toine* (1886); *La Petite Roque* (1886); *Mont-Orliol* (1887); *Le Horla* (1887). His novels include *Une Vie* (1883); *Bel-Ami* (1885); *Pierre et Jean* (1888); *Fort comme la mort* (1889); and *Notre Coeur* (1890). He also wrote *Contes de la Bécausse* (1883); *Contes et Nouvelles* (1885); *Monsieur Parent*, and *Contes du jour et de la nuit* (1885); *Le Rosier de Madame Husson* (1888); and *Inutile Beauté* (1890), all collections of short stories; *Des Vers* (1880), a vol. of poems, and sev. books of travel. His complete works were ed. by L. Conard in 29 vols. (1908-10). See lives by P. Mahn, 1908; J. Holland, 1924; E. Boyd, 1926; R. V. Steward, 1926; R. Dumesnil, 1935; and S. Jackson, 1938.

Maupertuis, Pierre Louis Moreau de (1698-1759). Fr. mathematician, *b.* at St. Malo, educated in Paris, and served for some time in the army. In 1723 he was elected to the Academy of Sciences, and in 1728 his ardent support of the theories of Newton led to his becoming a fellow of the Royal Society, London. In 1736 he was the head of a party of academicians, including Clairaut and Le-monnier, who were sent to Lapland to measure a degree of long, and succeeded in exposing the error made in the previous measurement of Dominic and Cassini. He pub. *Sur la figure de la terre* in 1738. In 1740 he went to Berlin, and was made president of the Academy of Sciences. He wrote sev. treatises on geometry, arithmetic, and astronomical measurement. His theory of pessimism, described in *Essai de philosophie morale* (1749), was later developed by Schopenhauer, Hartmann, and others. See A. Le Sueur, *Maupertuis et ses correspondants*, 1897; life by P. Brunet, 1930.

Maura, Antonio (1853-1925), Sp. states-

man, *b.* at Palma, Majorca, son of a manufacturer of leather goods. Educated at a local secondary school and at the law school of Madrid Univ., he entered the Cortes in 1881 as Liberal representative of his native tn. Colonial minister under Sagasta in 1892, he seceded to the Conservatives in 1901, becoming minister of the interior, 1902. Prime Minister seven times between 1903 and 1922, his ministries were short-lived, as he was autocratic and uncompromising. He was not friendly to France or England. He disapproved of the dictatorship estab. 1923.

Maur, St., Congregation of, society of reformed Fr. Benedictines. It was estab. about 1618 at St. Maur-sur-Loire, and as the movement spread the chief house was removed to St. Germain des Prés, Paris. The order, which was famous for its literary work, was suppressed at the revolution. It included Mabillon, Bouquet, Chardon, and other learned scholars among its members.

Maurepas, Jean Frédéric Phélippeaux, Comte de (1701-81). Fr. statesman, *b.* at Versailles. At an early age he succeeded his father as secretary of state of the king's household, and in 1725 became superintendent of the Marine. In 1749 he offended Mme de Pompadour by an epigram, and was banished from court. In 1774, on the accession of Louis XVI., he was recalled and made first minister. He entirely remodelled the Marine dept., and was a liberal patron of art and science, but both Turgot and Necke were sacrificed to his ambition. His memoirs, by himself, are curious and carelessly written. They were printed at Paris in 1792.

* **'Mauretania,' The**, see CUNARD STEAMSHIP LINE.

Mauriac, Francois (*b.* 1885). Fr. novelist and poet, *b.* at Bordeaux. Like Bernanos (*q.v.*) M. is anchored to the Rom. Catholic position, and is an observer of fallen humanity. His *Désert de l'amour* (1925), *Thérèse Desqueyroux* (1929), and *Le Vieux de riptres* (1932) give an excellent picture of the Catholic bourgeoisie, of the propertyed classes in the S.W. of France. His *La Pharisienne* (1911; trans. *A Woman of the Pharisees*, by G. Hopkins, 1946) exemplifies this type. It is a concentrated study of a woman who intermeddles, with disastrous results, in the affairs of others in order to dominate them spiritually, and according to her own interpretation of what is right for them; who inevitably regrets her every 'altruistic' action as 'the cross laid upon the great-hearted in darkness and uncertainty on behalf of the spiritually mean and inferior'; and who only in the evening of her life comes to realise that 'It is not our deserts that matter, but our love.' M. is one of the most distinguished of Europe's contemporary novelists; yet outside a restricted and informed public his name was almost unknown to Eng. readers. Between 1947 and 1949, however, a great change came, though different reasons may be assigned for his popularity with different readers. What M. supplies is a moral fervour which was once a common feature of our literature, and perhaps it is

no mere coincidence that enthusiasm for his novels comes at a time which has seen the rehabilitation of George Eliot and Henry James. Perhaps his 'foreignness' also partly explains the success of his novels in this country; for they paint a world which, for most (especially non-Catholics) is more than usually strange; their setting is that of a Fr. prov. life in the most intensely personal and foreign aspect and the characters move in a closed circle of prejudice and intolerance which has no counterpart in the world we know (Gerald Hopkins). In *Thérèse* M.'s sense for situation and the density of his dialogue are worthy of a great tragic drama. An exceptional psychologist, M. is also a poet in his imaginative vision of landscape and of destiny. His other works include *Les Mains jointes* (verse, 1909) and *Adieu à l'adolescente* (poem, 1911); the novels *Le Baiser au Léprieux* (1922), *Génitrice* (1924), *Le Mystère Frontenac* (1933), and *Le Fleuve de feu* (1933); a life of Racine (1930); the dramas *Asmodé* (1937), *Les Malaises* (1943), and *Cahiers noirs*, the first vol. of which was pub. 'underground' in 1942. See biographical study, with bibliography, by E. Rideau, 1945; also D. Saurat, *Modern French Literature*, 1946, and J. Majault, *Maurice et l'art du roman*, 1946.

Maurice, Sir Frederick Barton (b. 1871), Brit. major-general, eldest son of Gen. Sir John Frederick M. Entering the army in 1892 he served in Iraq, 1897-98, and the S. African war, 1899-1900. He was director of military operations, imperial general staff, 1915-18, and major-general 1916. In May 1918 he publicly denied the accuracy of certain ministerial statements as to army matters, and was retired for this breach of discipline. For the remainder of the war period he was a military correspondent. Principal of the Working Men's College, Camden Town, 1922-23, he became prof. of military studies at London Univ., 1927. Pubs. include *Forty Days in 1911* (1919); *Robert E. Lee the Soldier* (1925); *Governments and War* (1926); *British Strategy* (1929); *History of the Scots Guards* (1934); *Life of Lord Haldane* (2 vols., 1937-38); and *Adventures of Edward Wogan* (1945).

Maurice, Frederick Denison (1805-72), Eng. divine, b. at Normanston, Suffolk, went to Cambridge Univ., and there assisted in founding the famous 'Apostles' Club.' Chaplain to Guy's Hospital, 1830-1840, in the latter year he became prof. of Eng. literature at King's College, London, and in 1845 Boyle lecturer and Warburton lecturer; but in 1853, at the request of the council, resigned both chairs after the pub. of his *Theological Essays*. He allied himself with the Christian Socialists and Charles Kingsley. In 1854 he took an active part in the foundation of the Working Men's College, of which he was appointed the first principal. The starting-point of his theology is God's redemption of man, and its centre is the reality of the Kingdom of God. His pubs. include *The Claims of the Bible and of Science* (1863) and *Moral and Metaphysical Philosophy* (1871-72). See lives by his son, 1884, and C. F. G. Masterman, 1907; also A. Vidler.

The Theology of F. D. Maurice, 1949.

Maurice of Saxony (1500-58), emperor of the Holy Rom. Empire and king of Spain. See under CHARLES V.

Maurice, Prince of Orange and Count of Nassau (1567-1625), son of William the Silent. On his father's assassination (1584) he became stadtholder of Holland and Zeeland provs., and of the seven United Provs. (1587). He showed himself a capable general, capturing Breda, Zutphen, and Nimeguen (1590-91), and expelling the Spaniards, who were compelled to acknowledge the United Provs. as a free republic, and conclude a twelve years' truce (1609). The struggle was renewed (1621), and while negotiating an alliance with England and France M. d. See G. van Prinsterer, *Maurice et Barneveldt*, 1875.

Mauricianus, Junius, Rom. jurist, fl. it seems, in the days of Antoninus Pius. He wrote *Ad Lycopos*, and his authority is four times cited in the *Digest*.

Maurier, George Louis Palmella Bussone and Sir Gerald Du, see DU MAURIER.

Maurists, see MAUR, ST., CONGREGATION OF.

Mauritania, colony of Fr. W. Africa, between Lower Senegal and Rio del Oro. Its N. limits are not strictly defined, but its area is estimated at 324,000 sq. m. Formerly a protectorate, it became a colony, under the administration of a lieutenant-governor, in Dec. 1920, represented by one member each in the National Assembly, Council of the Republic, and Assembly of the Fr. Union. Consisting mainly of sandy desert, it is the least productive of France's W. African colonies; some gum, dates, and cotton are produced, and sheep are reared. Pop. 492,600, comprising nearly 400,000 Muslims, about 92,000 other natives, and about 520 Europeans.

Mauritia, genus of tall S. Amer. palms with fan-shaped leaves.

Mauritius (formerly *Île-de-France*), is. of the Indian Ocean belonging to Great Britain, lies in lat. 19° 58' to 20° 33' S., and long. E. from Greenwich 57° 17' to 57° 46'. It is 39 m. from N. to S., and 129 m. from E. to W., and has an area of 720 sq. m. The surface is of varied formation, a great portion being volcanic, while its coast is fringed by extensive coral reefs pierced in sev. places by the estuaries of small streams. Its mts., although of no great height, are marked by the usual irregularities observed in volcanic formations. Of these the most celebrated is the Peter Pitte, situated in the rear of the tn. of Port Louis, and forming a remarkable cone, sustaining on its apex a gigantic piece of rock which has the appearance of being poised upon its summit with the nicest precision. The climate is very moist and tropical, especially at sea level, and the European residents live mostly in the hill dists., especially at Curepipe (1800 ft.). The prin. tns. are Port Louis (66,800), the cap., and Grande Port or Mahébourg, the S. port, the latter difficult of access for shipping and much encumbered with coral reefs. Port Louis has a spacious harbour. Its greatest industry is

sugar, and most of its accessible surface is covered with sugar plantations. Owing to depression in sugar prices and the competition of beet sugar the Mauritians have latterly taken up supplementary industries, such as aloes, rum, copra, coconut oil, tea, and tobacco. Apart from Hindus the people are mainly of Fr. descent, and there are also many mixed Indian and African peoples. A new constitution for M. was promulgated in 1947. The legislature consists of the governor as president, three *ex-officio* members, twelve nominated members, and nineteen elected members. The executive must include four members selected by the legislature.

M. was discovered in the year 1505 by the Portuguese commander, Don Pedro Mascarenhas. Later it was colonised by the Dutch, who named it M. after their stadtholder, Count Maurice. In 1710 the Dutch abandoned the is., which was then taken over by the Fr. India Company and named Île-de-France. About this time, the Fr. also colonised the is. of Réunion, then called Bourbon. In 1735 they sent to M. its most famous governor, Mahé de la Bourdonnais, and the is. owes its later prosperity largely to his energy and foresight. He founded Port Louis, built roads and forts, cleared forests, and introduced the sugar-cane. In 1767 the is. passed to the Fr. Crown and, in the Napoleonic wars, was used as a base against the Brit. merchantmen. Accordingly the Brit. sent out an expedition from India, which captured the is. in 1810. By the treaty of Paris the Île-de-France was ceded to Britain, and its original name M. was restored. The Fr. laws and customs, however, together with the language and Catholic religion, were not disturbed, and M. remains largely Fr. in character to this day. There are various scattered is. dependencies, including Rodrigues, with a pop. of 10,000, and the Chagos archipelago. M. has suffered much from hurricanes, notably in 1931. Pop. 428,300, including over 300,000 Hindus. See E. Hitié, *Histoire de Maurice*, 1897; A. Pilot, *L'Île de France: esquisses historiques*, 1910; J. A. Duclos, *L'Évolution Nationale Mauricienne* (Paris), 1924; R. Philogène, *The Island of Mauritius*, 1928; and W. H. Ingrams, *Short History of Mauritius*, 1931.

Maurois, André (b. 1885) (pseudonym of Émile Herzog), Fr. writer, b. at Elheuf. He became known to Eng. readers through *Les Silences du Colonel Bramble* (1918). Other works of his, many of them also on Eng. themes, are *Ni ange, ni bête* (1919); *General Bramble* (1921); *Les Discours du Docteur O'Grady* (1922); *Ariel, ou la vie de Shelley* (1923); *Bernard Quenay* (novel, 1926); *Meïpe, ou la délivrance* (1926); *Études Anglaises* (1927); *La Vie de Disraeli* (1927); *Les Derniers Jours de Pompei* (study of Bulwer Lytton and his wife, 1928); *Aspects de la biographie* (1928); *Byron* (1930); *Marshal Lyautey* (1931); *Voltaire* (1932); *Dickens* (1934); *Chateaubriand* (1938); *Tragedy in France* (1940); and *Seen Faces of Love* (1948). During the First World War he was attached to Brit. troops as liaison officer. His chief fame rests upon the biographies which are

as interesting as novels. His autobiographical *I Remember, I Remember* was pub. in 1942, and *Call No Man Happy* in 1943. See D. Saurat, *Modern French Literature*, 1946.

Maurollo, or Marullo, Francesco (1494-1575), It. mathematician, was of Gk. origin. He became a monk and taught mathematics at Messina. In that he used letters in arithmetical calculations, he may be said to have paved the way for algebra; in trigonometry he introduced secants; and in his *Treatise on Conics* he attempted to deduce the curves from the fact that they are arcs of circles in perspective. His *Cosmographia* appeared in 1543.

Maurras, Charles Marie Photius (b. 1868), Fr. royalist writer, b. at Martigues. He was literary critic for Larousse's encyclopedia, 1894-1900. In 1902 he assisted Léon Daudet in turning *L'Action française* into a daily paper; it had a profoundly stimulating effect on Fascism in Italy. In Oct. 1926 he was imprisoned for accusing a minister of favouring Communism and for inciting to disturb the peace. In 1945 he was sentenced to solitary confinement for life as a collaborator during the Ger. occupation of France. His writings include *Jean Moréas* (1891); *Trois idées politiques* (1898); *Chateaubriand, Michelet, Sainte-Beuve* (1898); *Les Amants de Venise, George Sand et Musset* (1902); *L'Avenir de l'Intelligence* (1905); *La Musique intérieure* (poems, 1925); *Au signe de Flore* (autobiography, 1933); *Dictionnaire Politique et critique* (1933-34); *Louis XIV. et la France* (1933); *Les Véniers sur la mer* (1937); *Jeanne d'Arc* (1937); *Mes idées politiques* (1937); *Louis XIV. ou l'Homme-roi* (1939); *La Seule France. Chronique des jours d'épreuve* (1941); and *De la colère à la justice* (1942). His collected writings about the First World War were pub. as *Les Conditions de la victoire* (1915-20). See A. Thibaudet, *Les Idées de Maurras*, 1920; J. Maritain, *Une Opinion sur Charles Maurras et le déclin des catholiques*, 1926; study by L. Daudet, 1928; and J. P. Cotyambo, *Charles Maurras, ou l'ennemi du peuple*, 1937.

Maury, Jean Siffrein (1746-1817). Fr. cardinal and orator, b. at Valréas, Vaucluse, was a cobbler's son. In 1771 he penned a much-admired *Éloge* on Fénelon, and in the following year his *Panegyrique de Saint Louis* met with a most cordial reception. In 1785 he was elected to the Fr. Academy. During the sittings of the National Assembly, from 1789 to 1792, he defended the Church and the ancien régime with bravery and with a lively wit which succeeded in disarming his opponents. Pope Pius VI. welcomed him on his emigration (1792), and in 1794 he became cardinal. The acceptance on his part of the archbishopric of Paris from Napoleon (1810) was the cause of subsequent disgrace and imprisonment. His *Essai sur l'éloquence de la chaire* (1777) has become a classic. See life by G. Ronet, 1892.

Maury, Matthew Fontaine (1806-73), Amer. naval officer, astronomer, and

hydrographer. In 1825 he was appointed midshipman in the U.S. Navy, and in 1836 he was made lieutenant, but being injured by an accident he was appointed to the Hydrographical Office at Washington. While there he wrote his *Physical Geography of the Seas* (1856) and his works on the ocean currents and great circle sailing. In 1855 he was made commander, and pub. sev. works. See life by his daughter, 1888.

Maurya, the name of a great dynasty which was supreme over N. India for 137 years. In 321 B.C. Chandragupta M. captured the throne of Magadha (or Behar), and estab. an empire stretching from the Arabian Sea to the bay of Bengal.

raised in 353 B.C. a splendid tomb, for centuries the glory of the Asiatic city of Halicarnassus. The remains of the colossal group, which once crowned the two colonnaded tiers, now rest in the Brit. Museum. The most ambitious mausolea are those of Augustus and Hadrian (the castle of San Angelo) at Rome; those of Frederick William III. and Queen Louise at Charlottenburg near Berlin; of Napoleon III. at Farnborough; and that of Lenin at Moscow.

Mauve, Anton (1838-88), Dutch landscape painter, b. at Zaandam, was a friend of Israels and Maris, and uncle of Vincent van Gogh. His rural pictures breathe sombre peace and are attractive for the

LENIN'S MAUSOLEUM AT MOSCOW

Dr. D. J. Dillon

The greatest of the M. kings was Asoka (q.v.), the founder's grandson: the last was Brihadratha.

Mausier Rifle and Pistol. These were invented and constructed by Wilhelm M. (1834-82) and Paul M. (1838-1914). The rifle has great accuracy and durability: it has a bolt action and a charger-loaded magazine; the locking-bugs are at the forward end of the bolt, with which the bolt-head is integral. The pistol is an automatic, holding ten rounds in the grip: there are sev. calibres, the .9 mm. being sighted to 1000 yds.

The rifle, which has both military and sporting uses, was the standard Ger. Army weapon from 1872 to 1914, and is also used by many other armies, including the Sp., Brazilian, and Turkish. The pistol was replaced in the Ger. Army by the Luger during the Second World War. It is an officer's weapon in many forces, both in Europe and in S. America.

Mausoleum, essentially a large and imposing sepulchral monument. The word is derived from Mausolus, king of Caria, to whose memory Artemisia, his wife,

great delicacy of their tonal scheme. He was a pupil of Van Os, for whom, however, he did not greatly care as an artist, and one can see the influence of Millet in his works.

Mauve (Lat. *malva*, mallow) was first patented as a dye by Sir Wm. H. Perkin in 1858. It was the first of the aniline dyes to be practically used in the arts. It is produced by the oxidation of aniline by the use of sulphuric acid and potassium dichromate, the base of the colour being *Mauveine* (C₁₆H₉NaO₄).

Mavor, Osborne Henry, see BRIDIE, JAMES.

Mavros, see MARS.

Mavrogordato, Mavrocordato, or Mavrocordatos, name of a distinguished family of Phanariot Gks.

Alexander Mavrogordato (c. 1636-1709), doctor of philosophy and medicine who was very influential at the court of Sultan Mustapha II. It was he who arranged the peace of Karlowitz (1699).

Nicholas Mavrogordato (1670-1730), Alexander's son. He was prince (hospodar) of Wallachia, and ruled the Danubian

principalities for the sultan, exciting the bitter indignation of the Rumanians by his Hellenising efforts.

Prince Alexander Marrogoriato (1791-1865), descendant of Nicholas. He defended Missolonghi during the Gk. War of Independence (1822-23). In 1832 he was chosen vice-president of the Gk. national assembly at Argos, and the following year he became first minister to King Otto. He was Gk. ambas. at Berlin, London, and Constantinople, and on two later occasions (1844 and 1855) the vicissitudes of the political situation brought him to the head of affairs.

Mawson, Sir Douglas (b. 1882), Eng. explorer and geologist. b. in Bradford, Yorkshire, and educated at Sydney Univ. He went on a geological expedition to the New Hebrides, 1903, and was appointed to the scientific staff of Shackleton's expedition, 1907-8, which determined the position of the S. magnetic pole. He organised and commanded the Australian expedition, 1911-14, to explore the Antarctic lands S. of Australia, establishing a wireless telegraphic station on Macquarie Is. He discovered and explored King George V. Land, and his assistant, Dr. Wild, discovered and explored Queen Mary Land. A full account of this expedition is contained in M.'s work, *The Home of the Blizzard* (1915). In 1929-31 he visited the Crozets, Possession Is., and Heard Is. in the *Discovery* (Capt. Scott's old ship), and carried out oceanographical studies in the Australian sector of Antarctica, this time taking a small aeroplane with him. See C. E. Laceron, *South with Mawson*, 1948.

Max, Adolphe Eugène Jean (1869-1939), famous as burgomaster of Brussels, his bp. He was educated at the Athénées of Brussels and Ixelles, and at Brussels Univ., becoming doctor of law at twenty. He joined the staff of the newspaper, *La Liberté*, with Paul Hymans. Elected prov. councillor at twenty-five, he was communal councillor, 1903, and 'échevin,' 1908. On Dec. 7, 1909, he was appointed burgomaster. His actions on the approach of the Gers., Aug. 1914, were of the wisest and best calculated to spare the lives of the inhab. by giving no excuse for violence to the invaders, whom he met outside the city; and, when the occupation had begun he was indefatigable in his efforts to prevent oppression, refusing to be placed under a Ger. governor. He strove to keep up the courage of his compatriots by issuing posters contradicting the demoralising ones pub. by the Gers., and by protesting incessantly against the violation of the citizens' rights. The notorious von Bissing stopped the distribution of food rations in order to extort an additional tax of 30,000,000 fr., whereupon M. warned all banks that the city no longer guaranteed its bonds. This time he was arrested (Sept. 26), and imprisoned first at Namur, next at Glatz, next at Celle-Schloss, Hannover, where he was the object of unfounded accusations which occasioned his sojourn in military prisons, and finally at Goslar, just before the armistice. He escaped on Nov. 13, and

arrived on the 17th at Brussels, where he had a tremendous ovation. Made minister of state four days later, he was elected to the chamber, 1919. His honours included the G.C.V.O., 1920; G.C.B.E., 1921; honorary citizenship of Edinburgh, 1924.

Maxcanu, com. in the state of Yucatan, Mexico, 36 m. S.W. of Mérida. The grotto of M. is looked upon as sacred. Pop. 10,000.

Maxence, Saint, see MAIXENT.

Maxentius, Marcus Aurelius Valerius, Rom. emperor (A.D. 306-12); put his rival, Severus, to death, and banished his father, Maximianus (q.v.), to Gaul. Constantine, son-in-law of Maximianus, slew Maximianus in 310, and in 311, when Galerius died, Constantine and Licinius leagued themselves against M. and Diocletian. Constantine defeated the armies of M. in various battles, notably at Saxa Rubra, near Rome, and so won supremacy over the old cap. and Italy. M. was drowned in the Tiber (312) while trying to escape over the Mulvian bridge (now the Ponte Melle). See H. von Schoenebeck, *Beiträge zur Religionspolitik des Maxentius und Constantin*, 1939.

Maxillaria, genus of terrestrial orchids with thick fleshy flowers, occurring mainly in central America.

Maxim, Hiram Percy (1869-1936), Amer. engineer, son of Sir Hiram Stevens M. He patented a number of inventions of electrical instruments and improvements in automobiles, his most noted invention being the M. silencer for firearms. See his *Life's Place in the Cosmos* (1933).

Maxim, Sir Hiram Stevens (1810-1916), Amer. civil, mechanical, and electrical engineer, b. at Sangersville, Maine, U.S.A. He first made experiments and improved steam engines, and invented an automatic gas engine. He then studied electricity, invented an incandescent electric lamp, and the method of using carbons in electric lighting. His great work, however, was the automatic system of firearms, and he was formerly connected with the firm of Vickers, Sons, & M. He became a naturalised Brit. subject, and was knighted in 1914. See his *My Life* (1915).

Maxim, Hudson (1853-1927), Amer. inventor of explosives; younger brother of Sir Hiram M. In 1890 he built a manufactory of dynamite and smokeless powder at M., New Jersey, a town named after him. He invented the high explosive called Maximite. During the First World War he was chairman of the ordnance and explosives committee of the naval consulting board. Pubs.: *The Science of Poetry and the Philosophy of Language* (1910); *Defenseless America* (1915); and *Dynamite Stories* (1916).

Maxima and Minima. Many mathematical problems are comprised under this head. For example, a line of given length may be made to enclose various shaped and sized figures; what is the greatest space it can be made to enclose? A number is the sum of two other numbers; of all the pairs that can be selected, which pair will show the greatest product? Many such problems were stated and solved by the anc. Gks. Euclid has many pro-

positions of this nature solved by geometrical methods. Such problems are of great practical value in the useful arts; e.g. given a certain amount of metal, what dimensions for a cylindrical cistern will provide the greatest capacity? Or again, given a log of wood, what dimensions on cutting to a rectangular beam will give the greatest strength? In each problem a maximum or minimum has to be found. The study of curves, the conditions of their formation by a moving point, has led to greater complications; there are three phases to be determined: rise, fall, and turning. A curve attains a maximum at the moment it ceases rising and commences to fall, a minimum at the moment it ceases to fall and commences to rise. Or, in algebraic language, when any value y of a function is greater than the immediately neighbouring values, both before and after, it is called a maximum value of the function; when any value y of a function is less than the immediately neighbouring values, both before and after, it is called a minimum value of the function. There may be many maxima and many minima, and a maximum value according to the definition above is not necessarily the greatest value the function may have. Considering an irregular wavy curve, each maximum or minimum is the highest or lowest point occurring in any phase, and a minimum may have a higher value than a maximum. Bernoulli in 1696 propounded and solved problems by methods which became known as 'isoperimetrico.' This was extended by Euler, and led to the invention by Lagrange of the calculus of variations. Practically speaking, the subject is now investigated by the differential calculus. Curves are considered from the point of view of gradient; the gradient is represented by the symbol $\frac{dy}{dx}$, where y is a function of x .

and at the turning points $\frac{dy}{dx} = 0$. Further differentiation distinguishes between M. and M., i.e. for a maximum $\frac{d^2y}{dx^2}$ is positive, for a minimum negative. See any book on differential calculus.

Maximianus I. (M. Aurelius Valerius Maximianus), Rom. emperor (A.D. 286–305), originally a Pannonian soldier, was made by Diocletian his colleague in the empire, but was compelled to abdicate along with the latter. When his son, Maxentius, assumed the imperial title in the following year (306), he resided some time at Rome, but being expelled from the city by Maxentius, he took refuge in Gaul with Constantine, who had married his daughter, Fausta. It is generally supposed that he was compelled by Constantine to put an end to his own life at Marselles in the year 310. See also MAXENTIUS.

Maximianus II. (Galerius Valerius Maximianus) (A.D. 305–11), Rom. emperor, the son of a shepherd. He served in the wars of Aurelian and Probus, and in 292 was made Cæsar and entrusted with the command of Illyria and Thracia. Upon

the abdication of Diocletian and Maximianus I. in 305, he became Augustus, but in 307 suffered defeat at the hands of the usurper Maxentius, and lost Italy and Africa. The rest of his life was spent in works of public utility, but his reign is notorious for his pitiless persecution of the Christians.

Maximilian I. (1459–1519), one of the most distinguished of the Ger. emperors, the son and successor of Frederick III., was b. at Neustadt, near Vienna. In his nineteenth year he married Maria, the heiress of Charles the Bold, duke of Burgundy, and was soon involved in war with Louis XI. of France, who attempted to seize some of her possessions. M., although successful in the field, was compelled, by the intrigues of Louis in the Netherlands, to betroth his daughter Margaret, then four years old, to the Dauphin, afterwards Charles VIII., and to give Artois, Flanders, and the duchy of Burgundy as her dowry. In 1486 he was elected king of the Romans. Insurrections in the Netherlands, encouraged and supported by France, again involved him in war with Louis XI. He afterwards repelled the Hungarians and the Turks. He again took up arms against France when Charles VIII. repudiated Margaret and married Anne of Bretagne, in order to acquire that great prov. A peace was, however, soon concluded at Senlis in 1493. M. receiving back the provs. which he had given with his daughter. On the death of his father in 1493 he became emperor, and he subsequently married Bianca Sforza, daughter of the duke of Milan. He sought to put a stop to Fr. conquests in Italy, and was at first successful, but ultimately he had to give up Milan to France and Verona to the Venetians. Nor was M. more successful against the Swiss, who, in 1499, won their independence from the Ger. Empire. The marriage of his son Philip with the Infanta Juana, and of his daughter Margaret with the Infant Juan of Spain, led to the subsequent union of Spain with Austria, whilst the marriage of two of his grandchildren with the son and daughter of Ladislaus, king of Hungary and Bohemia, brought both these kingdoms to the Austrian monarchy.

M. carried out some military reforms, estab. the Reichskammergericht or imperial court of justice, and set up an aulic council. Versatile and cultured, he was a patron of learning; he himself wrote works on law and hunting. See life by I. R. Seton-Watson, 1902; and J. Grünbeck, *Die Geschichte Friedrichs III. und Maximilians*, 1940.

Maximilian II. (Joseph) (1811–64), king of Bavaria, son of Louis I., b. at Munich, married in 1842 the Princess Maria Hedwig. Until 1848 he took no part in political affairs, but in that year of revolution he was suddenly called to the throne on his father's abdication. He adopted a liberal policy.

Maximilian, Ferdinand Joseph, Archduke (1832–67), son of Archduke Francis Charles of Austria and son-in-law of Leopold I., king of the Belgians, whose

daughter Charlotte he married in 1857. He was *b.* at Schönbrunn, Vienna, and was made governor of Lombardo-Venetia in 1857 by his brother, Emperor Francis Joseph, in pursuance of his policy to conciliate the It. republics, but M.'s chivalrous nature availed nothing against the implacable hatred of Italy for Austria. Fr. troops invaded Mexico and on the capture of Puebla in 1863, with the co-operation of the Mexican clerical party, proclaimed M. emperor of Mexico. Renouncing his Austrian rights, M. accepted the throne. Civil war followed, and in 1866 the Fr. troops were withdrawn. M. was captured and shot at Queretaro, probably by order of Juárez. See E. Corti, *Die Tragödie eines Kaisers*, 1933, and M. Hyde, *Mexican Empire*, 1945.

Maximinus, Caius Julius Verus (Maximinus Thrax), Rom. emperor (A.D. 235-238), was originally a Thracian shepherd. He was of gigantic size and great bodily strength. Alexander Severus gave him

A BRONZE BUST OF MAXIMINUS THRAX

the command of a new legion raised in Pannonia, at the head of which he followed Alexander in his campaign against the Gers, on the banks of the Rhine, where he induced some of his companions to murder Alexander and his mother, Mamaea (A.D. 235). He was proclaimed emperor, but his cruelty and rapacity aroused enemies against him in various parts of the empire. He was killed by his own soldiers in A.D. 238 when he was besieging Aquileia.

Maximinus, Galerius Valerius, Rom. emperor (A.D. 308-14), originally bore the name of Dala, and in early life was a shepherd. Becoming a soldier, he was raised to the rank of Caesar, and made governor of Syria and Egypt in 305. In 308 he assumed the title of Augustus, and on the death of his uncle, Galerius, in 311, suc-

ceeded to the command of the provs. of Asia, and entered into a secret alliance with Maxentius. Having invaded Thrace in 313 in the absence of Licinius, he suffered a crushing defeat near Heraclea, and was forced to flee. His death took place at Tarsus.

Maximinus of Trèves (*d. c.* 349), Fr. bishop, *b.* near Poitiers. He became bishop of Trèves in 332, and became a staunch defender of St. Athanasius and St. Paul when they were exiled by the Arian emperor. At the councils of Milan, Sardica, and Cologne he was a foremost opponent of Arianism.

Maximus, Magnus Clemens, Rom. emperor (A.D. 383-88), a native of Spain. He accompanied Theodosius on sev. of his expeditions, and remained for some years as a general in Britain. Here he was elected emperor by the troops in 383, and immediately crossed to Gaul to attack Gratian. The latter was defeated and slain, and Gaul, Spain, and Britain did homage to M. In 387 he crossed the Alps, put Valentinian to flight, and estab. himself in Milan, but was defeated by Theodosius at Sisis, on the Saône, and again at Poetovio on the Danube, being subsequently captured and put to death at Aquileia.

Maximus, Petronius Anicius, Rom. emperor (A.D. 455), was a member of the high nobility of Rome. At the age of nineteen he was admitted to the council of the Emperor Honorius, and in 420 held the office of prefectus Rome, becoming consul in 433, and again in 443. He was friendly with Valentinian III, until the emperor seduced his (M.'s) wife, after which M. murdered him in 455. M. was elected emperor immediately, and married the widowed Empress Eudoxia. She, on learning the truth of her former husband's death, secured the help of Genseric the Vandal, who sacked Rome. M. was slain.

Maximus, Rutilius, Rom. jurist, who wrote a treatise entitled *Ad Legem Falcidiam*, which was enacted 40 B.C.

Maximus, Tyrius (of Tyre), rhetorician and Platonic philosopher, lived in the latter half of the second century, during the reigns of the Antonines and of Commodus. There are extant forty-one dissertations of M. T. on various points connected with the Platonic philosophy, which are written in an easy and pleasing style, and more commendable for the expression than the matter. The following examples will give some idea of the subject of these dissertations: 'On Plato's Opinion respecting the Deity,' 'Whether we ought to return injuries done to us,' 'Whether Prayers should be addressed to the Deity,' etc. The dissertations have been trans. into Fr. by Foreny (1764) and by Douais (1802, new ed. 1910). See K. Meiser, *Studien zu Maximus Tyrios*, 1909.

Max-Müller, Friedrich, see MÜLLER.

Maxton, James (1885-1946), Scottish politician, *b.* in Glasgow, educated at Grahamston School, Barrhead, Hutcheson's Grammar School, Glasgow, and Glasgow Univ. As an undergraduate he belonged to the 'Conservative Club,' but

after having become a school teacher he embraced Socialism with all the ardour of a convert, and spent much of his spare time in speaking for the Independent Labour party, of which he was elected chairman of the Scottish divisional council. In 1914 he was appointed to the national administrative council as representative for Scotland, and during the First World War was a pacifist and conscientious objector. In 1916 he was sentenced to twelve months' imprisonment for inciting munition workers to mutiny, in a public speech. In 1926 he became chairman of the I.L.P. For twenty-four years he was M.P. for Bridge-ton, Glasgow. An uncompromising revolutionary and advocate of 'direct action' he was none the less a man of great humanity, respected by all parties, and one of the most popular members of the House of Commons. M. led the so-called 'ginger group' in the Labour party—Clydeside M.P.s anxious to 'ginger up' the Labour movement in the years following the First World War. In 1929 he left the Labour party after the secession of the I.L.P. Although M. and his friends were largely responsible for placing Ramsay MacDonald at the head of the Labour party, he was not asked to take office in either Labour administration (1924, 1928). He pub. a study of Lenin, and made contributions to the 'If I were Dictator' series.

Maxwell, Sir Herbert Eustace, seventh Baronet (1845-1937), writer and politician, b. in Edinburgh, fourth son of the sixth baronet of Monreith, was educated at Eton and Christ Church, Oxford. M.P. for Wigtownshire, 1880-1906, he was Rhind lecturer in archaeology at Edinburgh, 1893-1911; lecturer on Scottish hist. in Glasgow Univ., 1910, and president of the Society of Antiquaries of Scotland, 1900-13. In 1925 he was appointed as first president of the governing board of the Scottish National Library. He took a special interest in social legislation, and was chairman of select committees on provident insurance and friendly societies. He was a lord of the treasury (junior whip), 1886-92, and sworn of the Privy Council in 1897. Although he will be best remembered as a writer, he was over forty when he pub. his first book. Among his works are *Studies in the Topography of Galloway* (1887); *The Art of Love* (a novel, 1889); *The Letter of the Law* (a novel, 1890); *Life of the Duke of Wellington* (1900); *The Chevalier of the Splendid Crest* (1906); *The House of Douglas* (1901); an ed. of the *Crewey Papers* (1903); *British Freshwater Fishes* (1904); *Scottish Gardens* (1908); *A Century of Empire* (vol. i., 1909; vol. ii., 1910; vol. iii., 1911); *The Making of Scotland* (1911); *Early Chronicles relating to Scotland* (1912); *Edinburgh, a Historical Study* (1916); *Flowers, a garden Notebook* (1923); and *Inter Alia* (1925).

Maxwell, James Clerk (1831-79), Scottish physicist, b. at Edinburgh; educated at the Edinburgh Academy and the univs. of Edinburgh and Cambridge. At the early age of fifteen he sent to the Royal Society of Edinburgh a paper on the 'Description of Oval Curves,' and during the

next three years followed it up by 'On the Theory of Rolling Curves,' and 'On the Equilibrium of Elastic Solids.' In 1856 he became prof. of natural philosophy at Marischal College, Aberdeen, and in 1860 held the same post in King's College, London. He was a member of the Royal Societies of London and Edinburgh. On the endowment by the duke of Devonshire of Cambridge Univ. with a model laboratory of experimental physics (the Cavendish Laboratory), M. was elected unanimously as the first prof. of experimental physics in that univ. M.'s final presentation of his theory was given in the treatise on electricity and magnetism in 1873. The theory at first had few adherents, one reason being that M.'s presentation of his theory was in some features exceedingly obscure. The two definite statements about electricity made by M. were: that wherever there is electric force there is displacement, and that electricity behaves like an incompressible fluid. M.'s electromagnetic theory was that waves of light were waves of electric and magnetic force. It was not until ten years after M.'s death that any direct experimental evidence of the existence of electrical waves was obtained. He also investigated the molecular constitution of matter, the kinetic theory of gases, and geometrical optics, and wrote, *inter alia*, treatises on the dynamical theory of gases (1859), heat (1871), and matter and motion (1873). See lives by L. Campbell and W. Garnett, 1882; R. T. Glazebrook, 1896; Sir J. J. Thomson, 1931; and R. L. Smith-Rose, 1948.

Maxwell, Mrs. John, see BRADDON, MARY ELIZABETH.

Maxwell, Sir John, see HERRIES.

Maxwell, Robert, Lord (d. 1546), member of a Scottish family which settled near Kelso about 1100. He was a member of the royal council under James V., a warden of the W. marches, and a lord provost of Edinburgh. He was also an extraordinary lord of session in 1533, and one of the regents in 1536. He was taken prisoner by the Eng. at the rout of Solway Moss in 1542.

Maxwell, Lady Stirling, see NORTON CAROLINE ELIZABETH SARAH.

Maxwell, William Babington (1866-1938), Eng. author, son of John M., publisher, and his wife, Miss Braddon, authoress of *Lady Audley's Secret*. After a brief spell as an art student he turned to fiction. He pub. *The Countess of Maybury* in 1900, and produced a novel each year thereafter till 1913. Among his novels during this and his later period of activity were *The Guarded Flame* (1906); *The Devil's Garden* (outspoken on moral subjects, 1913); *The Mirror and the Lamp* (1918); *Tudor Green* (1935); *The Emotional Journey* (1936); and *Everslade* (1937)—the last three being a trilogy which appeared under the general title *Men and Women*. His autobiography, *Time Gathered*, appeared in 1938.

Maxwelltown, tn. in Kirkcudbrightshire, Scotland, on the Nith, opposite Dumfries, with which it is connected by bridges. It has dye-works, sawmills, and nurseries,

and manufs. tweed, woollens, gloves, and hosiery. An observatory, with a museum, is situated on Corbely Hill, quite near to M. Pop. 6000.

May, Philip William (1864-1903), Eng. humorous artist, *b.* in Leeds, and known as Phil May; after an adventurous career as a lad he achieved popularity with his illustrations to *The Parson and the Painter* (1891). He pub. *Annals* from 1892, and contributed sketches of low life to numerous papers. In 1896 he became a member of the staff of *Punch*. He was one of the greatest black-and-white artists, and a lineal descendant of Leech and Keene. See life by J. Thorpe, 1932.

May, Thomas (1595-1650), Eng. writer, *b.* in Sussex; graduated at Sidney Sussex College, Cambridge. He was admitted to Gray's Inn in 1615, but being prevented by defective utterance from practising the law, devoted himself to literature. He first produced a comedy entitled *The Heire* (1622), which was much praised by Thomas Carew, and followed this by another comedy and three classical tragedies, but none of these met with success. In 1627 appeared his trans. of Lucan's *Pharsalia*, which met with unstinted praise from Ben Jonson, and gained him the favour of Charles I. In 1628 he pub. a version of Virgil's *Georgics*, and the following year Martial's *Epigrams*. In 1633 he was commissioned by the king to write two narrative poems, one on *Henry II.*, the other on *Edward III.* His reputation as a prose writer rests upon his *History of the Long Parliament* (1647), which is described by Chatham as being 'a much honester and more instructive book than Clarendon's.' See A. G. Chester, *Thomas May*, 1932.

May, Sir Thomas Erskine, first Baron Farnborough (1815-86), Eng. constitutional jurist, *b.* in London. He was assistant librarian of the House of Commons in 1831, and a barrister at the Middle Temple in 1838. In 1844 he pub. *A Treatise on the Law, Privileges, Proceedings and Usage of Parliament* (10th ed., much enlarged, 1893; ed. by Sir T. L. Webster, 1921), a learned work which has been trans. into Ger., Fr., It., Sp., Jap., and Hungarian. He was examiner for private Bills and taxing-master for both Houses of Parliament, 1847-56, and clerk of the House of Commons, 1871-86. He was president of the Statute Law Revision Committee, 1866-84, a member of the Privy Council, 1885, and created Baron Farnborough in 1886. Besides the work mentioned above he pub. *The Constitutional History of England since the Accession of George III., 1760-1860* (1861-63) and *Democracy in Europe: a History* (1877).

May, fifth month of the year, and the last of spring. It was the third month in the Rom. calendar, and was called M. probably after Maia, the mother of Mercury, to whom the Romans used to sacrifice on the first day of this month. It was regarded by the Romans as an unlucky month, especially for marriages, and the superstition still survives in some parts.

Maya, or Mahamaya, mother of Gautama

Buddha. According to tradition she and her sister, Prajapati, were the prin. wives of Kshatriya, a wealthy landowner of a small state surrounding Kapilavastu, in S. Nepal. At the age of forty-five M. bore Gautama, c. 560 B.C., in a wayside grove, which was visited three centuries later by Asoka, whose commemorative pillar there was discovered in 1895.

Maya, race of Amer. Indians, the aborigines of Yucatan. The old Mayan empire fl. between the second and seventh centuries A.D. In A.D. 1000 a new empire was estab. which survived until the coming of the Spaniards in the early part of the sixteenth century. There was an organisation of city states, though without one single ruler. They were the most advanced of the Amer.-Indian races, had a written language, and have left numerous examples of MSS. and picture-writing. In religion they had much in common with the Aztecs; they were polytheistic, and worshipped a sky god, who was the creator, and gods of the moon, rain, death, etc. In their sculptures the two most frequently depicted are the rain god and the god of arts and crafts. Religious festivals were frequent: gifts of crops and animal sacrifices were made, and human sacrifices, though at first rare, became common later. The Mayans subsisted chiefly on agriculture, the prin. food being maize. They made many ornaments of gold, greenstone, jade, and copper, but they were especially skilful in architecture and in carving in stone. They erected buildings of vast size, which they decorated in a wonderful manner, and though these cannot compare with the buildings of Egypt and Greece, their massive character and lavish wealth of carvings attest a civilisation far superior to that of many civilised peoples in the old world. One of the most famous Mayan works of art is in the temple of Palenque, which contains a remarkable tablet, on which is represented a sacrificial scene. Expeditions under the aegis of the Brit. Museum have explored Brit. Honduras for Mayan remains. A site at Pusila disclosed, on excavation, a stone stele containing one of the longest and most important of known Mayan inscriptions. A form of picture-writing was used, and an arithmetical system of counting in twenties, which made possible considerable progress in mathematical and astronomical science. On the S. Stann Creek site two large plazas were found, surrounded by mounds and pyramids, which are supposed to have been the substructures of temples or altars. Numerous examples of Mayan pottery have also been found; also spear-heads, incense-burners, jadeite ear ornaments, and greenish stone axes. The Ms. of to-day, in Yucatan, have small, sturdy, agile figures, and the strange curve of the nostril and the nose, and the mouth with straight upper lip that are found represented in the early Mayan paintings. The women wear the traditional smock, called the *upil*, with embroidered flowers round hem and shoulders, and a white underskirt showing below. The love of the Ms. for pageantry, which is evident in the

old friezes, is maintained in the Christian tableaux in the churches, and in the wealth of decoration adopted from Spain. Round the churches the Mayan houses are still built like the models carved on the temple walls of Uxmal, being oval in shape and very primitive. So little have the people changed that their ancient feud against the Aztecs is not forgotten, and even to-day the Yucataní hates to be called Mexican. The Mayan language is still spoken, but it has ceased to be written (Freya Stark). See T. W. Gaun. *The Mayan Indians*, 1918; A. Joyce, *Maya and Mexican Art*, 1927; J. L. Mitchell, *The Conquest of the Maya*, 1934 (elaborates some original

Mexican Embassy

THE MAYAN TEMPLE OF PALENQUE

theories on the nature of Mayan culture); S. C. Morley, *The Ancient Maya*, 1946; and V. W. von Hagen, *Maya Explorer: John Lloyd Stephens and the Lost Cities of Central America and Yucatan*, 1917.

Maya, or **Maia**, riv. in E. Siberia. Is a trib. of the Aldan, joining it on the r. b. after a course of 600 m.

Maya, illusion (otherwise called *Aridya*, ignorance, or *Sakti*, power), in Vedanta philosophy is the fictitious energy which in conjunction with the Highest Self (Atman, Purusha) produces or constitutes the Isvara, the Lord, or cosmic soul, the first emanation of the Atman, and himself the (fictitious) cause of all that seems to exist.

Mayaguez, tn. on the coast of the is. of Porto Rico, 70 m. W.S.W. of San Juan. The chief exports are sugar, coffee, hides, and fruit, mainly oranges. In 1918 M. suffered considerably from an earthquake. Pop. 76,500.

May-Apple, see *PONOPHYLLUM*.

Maya-Quiché, collective name for all the pops. among the Amer. Indians who speak various forms of a common language, is

derived from the two most important members of the group, the Mayas of the Yucatan plains and the Quichés of the Guatemalan plateaux. They inhabited Mexico, Yucatan, Guatemala, and Honduras, and represented the most cultured inhab. of central America at the time of the Sp. conquest. Among the various nations may be mentioned the Mayas, Chols, Zends, Mamés, Lacandons, Pocomans, Cachiqlens, Quichés, Huastecs, Itzas, Pocomchis, and Zotzils.

Mayavaram, tn. in the Tanjore dist., Madras India, 174 m. S.W. of Madras. It manufs. cotton and silk goods. Pop. 30,000.

Maybole, police burgh and mrkt. tn. in Ayrshire, Scotland, 8 m. S. of Ayr, possesses an old castle. The chief industry is the manuf. of shoes. Pop. 4900.

May Day, May 1st, was formerly celebrated throughout Great Britain, and to a lesser extent in France and Germany, with festivities, which now survive only in a few rural dists. They are the direct descendants of the ant. Rom. Floralia, and of the Druidic feasts in honour of the god Bel. In Tudor England the custom seems to have been for people to go into the woods in the night, gather branches of trees and flowers, and return with them at sunrise to decorate their houses. Then there was the crowning of the M. queen, who held sway for one day over her court, consisting of morris dancers, Robin Hood, Maid Marian, Friar Tuck, Little John, and other members of the same band, as well as of the villagers and townspeople. And all who wished danced round a maypole decorated with flowers and ribbons. The maypole was generally made of birch, and was set up on April 30, except in London, where permanent maypoles stood in the streets. The M. revels were much censured by the Puritans, and in 1644 maypoles were forbidden to be erected by the Roundhead Parliament. They were, however, sanctioned at the Restoration, and in 1661 a cedar pole, 134 ft. high, was erected in the Strand. It was taken down about 1717, and used by Sir Isaac Newton as a support for the great telescope which had been presented to the Royal Society by a Fr. astronomer. The date is now observed as Labour Day (q.v.).

Mayebashi, tn. of Honshiu, Japan, 70 m. N.N.W. of Tokio. It trades chiefly in silk. Pop. 50,000.

Mayen, tn. in the Rhineland-Palatinate, Germany, 15 m. W. of Koblenz. It has cloth factories, breweries, and tanneries. Basaltic lava, used for paving stones, is quarried in the vicinity. The tn., originally a Rom. settlement, gained new importance in the Middle Ages, and by the thirteenth century possessed a tn. wall and a castle, some relics of both still remaining. Pop. 15,000.

Mayenne, see *MAINZ*.

Mayenne: 1. Dept. of W. France, formed from parts of the old prov. of Maine and Anjou. M., which is included almost entirely within the basin of the Loire, has a mild climate, but only a partially productive soil, being occupied in many dists. by extensive sandy heaths. The chief

branches of industry are the breeding of cattle and sheep and the keeping of bees, while iron mines and marble and slate quarries are worked. The linen, hemp, and paper manufs. and cider making are of some importance. Cap. Laval. Area 1986 sq. m. Pop. 256,300. 2. Tn. of the above dept. on the Loire, on the r. b. of which rises, on a steep and rocky height, the anct. fortress of the dukes of M. There are linen and calico manufs. Pop. 8200. 3. Riv. in the N.W. of France, which rises in the dept. of Orne, and debouches at Pont-de-Cé into the Loire. Length 130 m.

Mayer, Johann Tobias (1723-62), Ger. astronomer, was b. at Marbach. He taught mathematics for a living and studied gunnery in his spare time. He pub. a memoir in 1750, *On the Libration of the Moon*. In 1751 he became director of the observatory at Göttingen, and afterwards prof. of economy in that univ. His *Zodiacal Catalogue* was his next work, and in 1755 he pub. his *Lunar Tables*. These tables were printed by the Board of Longitude in the year 1767, and likewise the *Solar Tables*, by the same author, in the year 1770. To M. is also due the discovery of the principle of the repeating circle, which was afterwards so fully developed by Borda, and employed by him in the measurement of the arc of the meridian.

Mayer, Julius Robert von (1811-78), Ger. physicist, b. at Heilbronn. He studied at Tübingen, Munich, and Paris, and subsequently settled as a physician in his native tn. In 1842 he pub. *Bemerkungen über die Kräfte der unbelebten Natur* as a preliminary to *Die organische Bewegung in ihrem Zusammenhange mit dem Stoffwechsel*, which appeared three years later. Both of these deal with the conservation and transformation of energy. See E. Dühring, *Robert von Meyer, der Galilei des neunzehnten Jahrhunderts*, 1895, and H. E. Timmerding, *Robert von Meyer und die Entdeckung des Energiegesetzes*, 1925.

Mayfair, fashionable quarter of the W. of London, situated N. of Piccadilly and the Green Park. In the early eighteenth century originated a fair held, in May, in the Brook Field, near Chesterfield House, and M. takes its name from this. The Rev. Alexander Keith, who ministered in the dist. in the eighteenth century, is reputed to have solemnised about 7000 clandestine marriages.

Mayfield: 1. Vil. of Sussex, England, 11 m. from Tunbridge Wells, on the S. region railway. It was a mkt. tn. in the Middle Ages. There are slight remains of a palace belonging to the archbishops of Canterbury. 2. Tn. of Kentucky, U.S.A., co. seat of Graves co., 21 m. S. of Paducah. It has woollen and flour mills, cigar factories, and machine shops. Tobacco is the most important crop. Pop. 8600.

'Mayflower,' see under **PILGRIM FATHERS**.

Mayfly, see **Ephemera**.

Mayhem, see **MAIM**.

Mayhew, Henry (1812-87), Eng. autho., b. in London. His first production was

the weekly periodical, *Figaro in London*, which he pub. with Gilbert & Beckett in 1831, and followed this by *The Thief* (the first of the 'Rits' type of papers) in 1832. His prin. book, *London Labour and the London Poor*, appeared in 1851 (ed. by P. Quennel, 1949). His farce, *The Wandering Minstrel*, was produced in 1841. He collaborated with his brother Augustus in *The Good Genius* (1847); *The Plague of Life* (1847); and *The Image of his Father* (1851). He wrote also humorous stories and books on travel, and was one of the founders of *Punch*, of which he was co-editor with Mark Lemon.

May, Isle of, in the frith of Forth, Fife-shire, Scotland, 5½ m. S.E. of Crail. On the highest point of the is. is a lighthouse, and there are ruins of a twelfth-century priory.

Maymyo, hill station of Burma, 30 m. N.E. of Mandalay. It figured prominently in the Burmese campaigns of the Second World War. See further under **BURMA**, **SECOND WORLD WAR**, **CAMPAIGNS IV**, *Fall of Fort Dufferin*. Pop. 8000.

Maynard, tn. in Middlesex co., Massachusetts, 20 m. N.W. of Boston, on Assabet R. It has woollen manufs., cellulose products, plants, and powder mills. Pop. 6800.

Mayne, Jasper (1604-72), Eng. churchman, archdeacon of Chichester and a dramatist, baptised at Hatherleigh in Devonshire, where his family owned a small property, was educated at Westminster and at Christ Church, Oxford. He was rector of Cassington in 1639, and during the Civil war often preached before the king. At the Restoration he was made a canon of Christ Church, archdeacon of Chichester, and chaplain-in-ordinary to the king. He wrote *The City Match*, a domestic comedy (1659); *The Amorous War*, a tragi-comedy (pub. 1648); and a trans. of Lucian's *Dialogues*, begun in 1638.

Mayne Reid, Thomas, see **REID, MAYNE**.

Maynooth, tn. of co. Kildare, Ire., 15 m. W. of Dublin. Its chief interest is its Rom. Catholic college, which was estab. during the ministry of Pitt in the year 1795, by an Act of the Irish Parliament. In the year 1846 Sir Robert Peel carried a Bill for an increased and permanent endowment, no longer dependent on a vote of Parliament. An endowment of £369,000 from public funds was granted in 1871. The college is a very striking Gothic structure, and receives students destined for the priesthood and resident within the building. A new chapel was erected in 1890. Pop. 900.

Mayo, Charles Horace (1865-1939), Amer. surgeon, b. at Rochester, Minnesota. As surgeon at St. Mary's Hospital, Rochester, he had much success in operations for goitre. He pub. works on goitre and cancer. He and his brother Wm. were chief consultants for all medical services in the First World War, and in 1915 gave \$1,500,000 to establish the M. Foundation for Medical Education and Research. He was awarded the gold medal of the National Institute of Social Sciences in 1918.

Mayo, Richard Southwell Bourke, sixth Earl of, *see* BOURKE.

Mayo, William James (1861-1939), Amer. surgeon, b. at Le Sueur, Minnesota, elder brother of Charles Horace M. He organized a small hospital which became St. Mary's, famous throughout the world as the seat of the M. Clinic.

Mayo, maritime co. of the prov. of Connaught, Eire, is bounded N. and W. by the Atlantic Ocean. The coast-line of M. is about 250 m. and is much indented by bays, the chief of which are Kittala Bay, Clew Bay, Westport Bay, Newport Bay, Achill Sound, and Blacksod Bay. The surface is very irregular, the interior being part of the great plain of Ireland, bordered by two ranges of mts., separated from each other at the sea by Clew Bay. Of these ranges the highest points are Mullrea (2630 ft.), Nephin (2530 ft.), and Croagh Patrick (2370 ft.). The soil of the central plain is fertile. The rearing of cattle is general, but tillage has increased of late years. Ironstone abounds in some dists., but is not worked. An excellent marble is found in the N.W. dist. The chief towns are Castlebar, Westport, Ballina, and Ballinrobe, and the prin. rvs. are the Moy and the Overmore. Loughs Cullen, Conn, Castlebar, Corranore, and Carragh lie within the co. A valuable salmon-fishery exists in the R. Moy, and the small lake of Lough Mask is the habitation of the well-known 'gillaroo' trout. The antiquities of M. are chiefly eccles. Four round towers are still in existence, and there are at Cong the remains of a splendid abbey, which dates from the twelfth century. The celebrated 'Cross of Cong,' now in the museum of the Royal Irish Academy, was the archiepiscopal crosier of Tuam, once preserved in the abbey of that name. Area 2156 sq. m. Pop. 148,200.

Mayon, volcano in the prov. of Albay, Luzon Is., Philippine Isles. Its cone, which is perfect, rises to a height of 8274 ft., and the mt. is frequently in eruption.

Mayor. A M. was originally an overseer, or steward, or kind of bailiff, if the derivation from Norman *maior*, *mair*, be correct, and the word is really cognate with *Armoric mair*, i.e. one that looks after, tends, or guards, e.g. *mair y biswal*, a land steward. Others, however, derive the word from Lat. *major* = greater, superior; plural, ancestors, a derivation which at once invites the assumption that it always, or very early, had its present connotation of chief magistrate (*magister* through *magnus*), whereas in Eng. hist. the mayoralty is a comparatively late development of the bor. organisation. Everywhere the M., whatever his particular functions, appears to have risen to eminence, but none to so great a degree as the 'M. of the palace,' or first officer of the royal household of the Merovingian kings. Holders of this office were successively chief officer of state, minister of the palace, and king, for the last of them, Pepin, after deposing Childeric IV., founded the Carolingian dynasty (A.D. 750). The M. at the present day as the head of a municipal corporation is in a prominent and responsible position

(for term of office, qualifications, etc., *see under* BOROUGH; COUNTY SESSIONS; MUNICIPALITIES.) In times of riot or civil disorders he has power, and indeed is compelled, to call in the aid of troops, a power the exercise of which in certain circumstances may place him in a very unenviable position (*see* *Regina v. Pinney*, 1866), for technically at least he may be liable to criminal proceedings if he acts without justification and to an information for neglect if he omits to act. In other words, he must 'hit the precise line of his duty.' *See also*, for Lord Mayor, MAYOR'S COURT; LONDON, *Government*; PROVOST.

Mayor's Court, anct. court of record, held before the mayor and aldermen of the city of London at the Guildhall. Some authorities trace its origin to the anct. customary jurisdiction of the portreeve of London in the old hustings court of A.D. 675, from which the predecessor of the present M. C. became a distinct and separate tribunal in the reign of Henry III. The lord mayor and all the aldermen are the judges, but the recorder by custom sits as the sole judge, or, in his absence, the common serjeant, who in his turn, if unavoidably absent, may be represented by a barrister of seven years' standing. There is much of antiquarian interest in the M. C., both as to the names of its officials, e.g. the duties of a sheriff are carried out by the serjeant-at-mace and the deputy serjeant-at-mace, and as to the formalities of pleading. *See* L. E. Glyn and F. G. Jackson, *Jurisdiction and Practice of the Mayor's Court*, 1910.

Mayotte, *see* COMORO ISLANDS.
Mayow, John (1610-79), Eng. chemist and physiologist, was b. in London, educated at Wadham College, Oxford, and practised as a physician in Bath. He pub. *Tractatus quinque medicophysici* (1671), containing 'De sal-nitro et spiritu nitro-aereo,' which develops a theory of combustion, and important modern discoveries in pneumatic chem. *See* C. G. Jocher, *Gelehrten-Lexicon*, III., 1751; J. F. Blumenbach, *Institutiones Physiologicae*, 1786; and J. C. Roemer, *Histoire de la Chimie*, II., 1842-43, 1866-69.

Maypole, *see* MAY DAY.
Mayreau Island, *see under* ST. VINCENT.
Maysville, co. seat of Mason co., Kentucky, U.S.A., on the Ohio R., 60 m. S.E. of Cincinnati. The chief manufs. are cotton, flour, tobacco, and shoes. Pop. 6500.

Mayu: 1. Riv. of Burma, rises in the Chittagong hills, and after some 80 m. flows into the bay of Bengal N. of Akyab. 2. Hills of Burma near the Arakan coast. In 1942-44 they were the scene of fighting between Jap. and Brit. forces, since the road from Butthidaung to Maungdaw passes through them, in a series of tunnels.

Mayurbhanj, Indian state with Orissa to the S.W., Bihar to the N., and W., and Bengal to the E. The highest point of its hilly area is Meghasani, at 3824 ft. The sole important tn. is Baripada. M. has vital artistic traditions, springing as it does from an anct. Bhauja kingdom. Area 4243 sq. m. Pop. 891,000.

Mayweed (*Matricaria inodora*), annual or

biennial plant of the order Compositae. It has a branching growth, with narrow finely divided leaves and daisy-like scentless flowers with yellow centres. The stinking M. (*Athemis rotula*) has a malodorous juice which causes skin irritation when handled.

Maywood, tn. in Cook co., Illinois. U.S.A., 10 m. N. of Chicago, on the Desplaines R. It has large tin-plate works. Pop. 26,800.

Mazagan, seaport tn. of Morocco, 115 m. N. of Morocco. It is the port of Morocco, and its roadstead affords facilities for a safe anchorage. The chief exports are grain, almonds, hides, and wool. Pop. 40,300 (Europeans 2600).

Mazamet, tn. in the dept. of Tarn, France, 50 m. S.E. of Toulouse. Its chief manufs. are cloth, leather, and flannel. Pop. 15,000.

Mazanderan, prov. in the N. of Persia, lying between the Elburz Mts. and the Caspian Sea. It consists of a low coastal plain rising very rapidly to lofty mts. The rivers are all short and very swift. The climate is unhealthy and malarious in the lowlands, where the ground is somewhat swampy, but fertile. Among the chief products is wool. Silk textiles are manufactured at Chalons. Other productions are rice, cotton, sugar, and other agric. crops. The chief minerals are iron and petroleum. Barfurush (now Babul) (pop. 30,000) is the largest tn., but Sari, 20 m. to the E., is the cap. Area 10,640 sq. m. Pop. 200,000.

Mazapil, tn. of Zacatecas state, Mexico, 65 m. S.S.W. of Saltillo. Pop. 6000.

Mazarin, Jules (properly Giulio Mazarini) (1602-61), cardinal and statesman, son of Pietro Mazarini, was b. at Pescina in the Abruzzi. His father was the intendant of the household of Philip Colonna, and his mother Ortesia Buffalini was a connection of the Colonnas. Having received his elementary education at Rome from the Jesuits he passed into Spain with the Abbé (afterwards Cardinal) Girolamo Colonna, at the age of seventeen, where he attended courses of law in the univs. of Alcalá and Salamanca. But he soon abandoned jurisprudence for the military profession. From this time he began to display his talents for diplomacy. The generals of the pontiff, Conti and de Bagni, sent him successively to the Duca de Feria, general of the Spaniards, and to the Marquis de Cœuvres, afterwards Marshal d'Estrées, who commanded the Fr. troops. He then resumed the study of jurisprudence and took his doctor's degree. But the disputed succession to the duchies of Mantua and Montferrat having kindled a new war, he quitted law finally for diplomacy. The competitors were the Duc de Nevers, whose cause was espoused by the court of France, at which he resided, and the Duca de Guastalla, who was supported by the emperor, the king of Spain, and the duke of Savoy. The pope, wishing to prevent a war of which Italy was about to become the theatre, sent Cardinal Sacchetti to Turin to act in favour of the Duc de Nevers, and M. accompanied him in this mission. Sacchetti returned to Rome

unsuccessful, leaving to M. the title of internuncio with power to continue the negotiations and to effect a peace. Cardinal Richelieu entertained the highest opinion of him, and feeling that France wanted an able man in Italy, he succeeded in winning over the young diplomatist, who from this time openly showed himself favourable to the interests of France, and went to Paris at Richelieu's invitation, through whose influence he was made a cardinal (1641). On the death of his patron he succeeded to his position and influence with Louis XIII., who shortly before his death nominated M. to the council of regency, presided over by the queen-mother, Anne of Austria. After some time she made him Prime Minister and invested him with absolute authority. The first years of his ministry were signalised by the victories of the Fr. over the Spaniards at Rocroy and Lens, which produced the peace of Westphalia, and by the commencement of the civil war of the Fronde. M. was twice compelled to yield to the storm raised against him and to quit France, but at length, as much by address as by force, he secured victory in the struggle. In 1659 M. concluded the peace of the Pyrenees, which put an end to the wars between France and Spain, and cemented it by a marriage between Louis and the Infanta. He died at Vincennes on March 9. M. was but little regretted. A courtier writing at the time says: "Le roi est, on parait, le seul touché de la mort du cardinal." He had accumulated immense wealth by very doubtful or equivocal means. His fortune is said to have amounted to near 8,000,000 sterling, all acquired in a period of external war or of internal commotion. The only productions of M. which have been pub. are his letters. The whole were collected and reprinted at Amsterdam in two vols. under the title of *Négociations secrètes des Pyrenees* (1745). The Abbé Allainval afterwards arranged these letters in chronological order, and, together with fifty unpublished letters, brought them out under the title of *Lettres du Cardinal Mazarin, où l'on voit le secret de la négociation de la paix des Pyrenees* (1745, Paris, 2 vols.). See A. Haasall, *Mazarin*, 1893, and H. Coville, *Étude sur Mazarin et ses débuts avec Innocent X.*, 1914; also lives by K. Federn, 1922, and H. Tributou, 1933.

Mazarron, tn. of Spain, in the prov. of Murcia, 20 m. W. of Cartagena. There are lead, iron, and copper mines in the neighbourhood. The port of M., on the Mediterranean, is a suburb, with a coasting and fishing trade, and salt works. Pop. 18,200.

Mazepa, Ivan Stepanovich (1645-1709), hetman of the Cossacks, b. at Mazepintzi, in the Ukraine. He became a page in the service of John Casimir, king of Poland. According to popular belief a Polish nobleman, having surprised him in an intrigue with his wife, caused him to be stripped naked and bound upon his own horse, and sent the animal off, leaving M. to his fate. The horse carried him to his own distant residence, but M. fled to the Ukraine, joined the Cossacks,

and in 1687 was elected their hetman. He won the confidence of Peter the Great, who made him prince of the Ukraine, but on the curtailment of the freedom of the Cossacks by Russia, M. conceived the idea of throwing off the sovereignty of the tsar, and so entered into negotiations with Charles XII. of Sweden. These and other treasons were revealed to Peter the Great, who did not credit the informants, but afterwards, being convinced of M.'s guilt, caused a number of his accomplices to be put to death. M.'s cap., Baturin, was destroyed and his Cossacks abandoned him. M. joined Charles XII. and took part in the battle of Poltava, after which he fled, in 1709, to Bender, and there died, probably a suicide. His story has been made the subject of a poem by Byron, of a novel by Bulgacyn, and of two paintings by Horace Vernet.

Mazer, Brit. drinking-bowl, generally of maple wood, with a deep silver rim and a silver boss or print in the interior. It was formerly much used. A Scottish sixteenth-century example, the Watson M., was purchased by the Royal Scottish Museum, Edinburgh, with the assistance of the National Art Collections Fund, 1948.

Mazo de la Roche, see DE LA ROCHE.

Mazovia, dist., well covered with pine and birch, formerly included in the N. of Russian Poland. During the reign of Sigismund I. (1506-48) it lost its independence of 100 years' standing, and was incorporated with the Polish kingdom.

Paul Popper

A POLISH MAZURKA BAND

Mazurka (Polish for 'a woman of Mazovia'), sprightly Polish dance, not unlike a polka, originating in the old palatinate of Masovia, at least as far back as the sixteenth century. Chopin com-

posed many beautiful Ms., which are written usually in $\frac{3}{4}$ or $\frac{2}{4}$ time. The M. dance spread to Germany in the 1750s, thence to France, and in the first decade of the nineteenth century to England. The polka-M. differs from the M. in having an accent on the third beat of the measure, and from the polka in its triple time.

Mazzara del Vallo (anct. Mazara), city in the prov. of Trapani, Sicily, 13 m. S.E. of Marsala. The chief exports are corn and oil. Pop. 22,000.

Mazzard, or **Gean** (*Prunus avium*), species of cherry-tree, which is found throughout Britain, but is probably native only in the S. It reaches a height of over 50 ft., with a trunk 7 ft. in girth and a spreading, loosely branched crown. The bark is a dull red, peeling in broad rings and marked with transverse stripes. It has long oval leaves, sharply toothed and marked with transverse stripes. The flowers are borne in clusters. The fruits are dark red, with juice which stains. The H. is one of the parents of cultivated cherries, e.g. of the bigarons. The M. yields a fine timber, which has some resemblance to mahogany when polished and stained, and is used in cabinet-making, and also for pipes.

Mazzarino, tn. in the prov. of Caltanissetta, Sicily, 15 m. S.E. of Caltanissetta. Pop. 16,000.

Mazzini, Giuseppe (1805-72). It. patriot and republican, b. in Genoa. He studied at the univ. of his native tn. and for four years practised as an advocate. In 1827 his maiden essay in literature, *Dell'Amor Patrio di Dante*, appeared in a Liberal jour. In 1830 M. joined the secret society of the Carbonari, and six months later was betrayed and banished from Italy. The organisation of a new Liberal league, 'Young Italy,' was M.'s next work whilst staying at Marseilles. Banishment from Marseilles, in consequence of the extensive operations of the society having been revealed to the authorities, compelled M. to hide for sev. months. The first fruits of Young Italy was the revolutionary expedition of Savoy, organised by M. at Geneva, but which was defeated by the royal troops. Sentence of death, *par contumace*, was recorded against M. in the Sardinian courts for his participation in the affair, but he soon recommenced with increased vigour his revolutionary operations. A new association, entitled 'New Europe,' and based on principles of European rights and enfranchisement was inaugurated by the exertions of M. in Switzerland.

In 1837 M. quitted Switzerland for London. From then on his labours in the It. revolutionary cause were incessant. The resolute combatant of partial union and monarchical leadership at Milan, M. retired to Switzerland on the capitulation of Milan to the Austrians, to reappear in Florence on the rising of Tuscanry and finally at Rome, where he was elected triumvir and triumphant rejoicings. His tenure of supreme authority was marked by wisdom, moderation, and success. On the surrender of Rome by

M.'s advice, he quitted the city and proceeded to Lausanne via Marseilles. The conduct of France he bitterly attacked in public letters to De Tocqueville and others. He subsequently returned to London, and at his instigation risings in Milan (1853) and in Piedmont (1857) were attempted. In 1859 he combated the threatened Fr. predominance, and refused to accord faith to the Liberal programme of Louis Napoleon. The Sicilian expedition of 1860 owed as much to the organisation of M. as to the heroic command of Garibaldi (q.v.). He constantly opposed the new It. monarchy and in 1870 he was arrested at sea and imprisoned at Gaeta. He d. of pleurisy at Pisa.

M.'s contribution to the unification of Italy was, in its early stages, of great value. He unified and vitalised the struggling aspirations of the Its. by his idealism. But his solution, a republic, was not in accordance with political realities, and the future lay with the Piedmontese monarchy and its greatest statesman, Cavour (q.v.).

His best work is *Il Dovero del Uomo* (1858) (*The Duties of Man*, trans. 1862; see Everyman's Library). See *Life and Writings*, 1864-70, and *Scritti editi e inediti* (18 vols.), prepared by himself, and the eds. of A. Saffi, W. Clarke, Mouglilano, J. A. R. Marriott, and Bolton King in Everyman's Library; also his *Letters*, trans. into Eng. and ed. by Bolton King, 1929, and *Select Writings*, ed. by N. Gangula, 1945. See also lives by Bolton King, 1902; A. Reedman, 1922; and I. Silone, 1948; also Bolton King, *History of Italian Unity*, 1934.

Mazzuchelli, or Mazzucchielli, Giovanni Maria, Count of (1707-65). It. man of letters, had charge of the library which Cardinal Quirini had given to Brescia, and was a collector of books, medals, and antiquities. His ambitious hist. of It. literature entitled *Scrittori d'Italia* (1753-1763) did not advance beyond the letter B.

Mbabane, tn. of Swaziland, S. Africa, 12 m. N.W. of Brumersdorp. It became the seat of gov. in 1905. There are tin mines. White pop. 320.

McFall, Frances Elizabeth, see GRAND, SARAH.

McNeill, Ronald John, see CUSHENDON, BARON.

Mdina, anct. cap. of Malta; founded by the Romans, and remained the prin. tn. of the is. until superseded by the foundation of Valletta in 1563. M. has many Rom. remains, including those of monumental buildings, and also catacombs of various periods. The cathedral church of St. Paul was founded by the Normans in the twelfth century; it was ruined by an earthquake in 1693, and rebuilt in the baroque style. M. is a city of churches. The chief church after the cathedral is that of the Carmelites, founded 1570, but much modified in the seventeenth century. The par. of M. is a large one, embracing much of the rural area in the centre of the is. The only church to suffer damage from raids in the Second World War was the tiny chapel of Our Lady of Victory, a building dating from the fifteenth cen-

tury. Perhaps the most important monuments of M. are the series of early Maltese palaces, very small buildings of stone with their first floors lit with two-light windows of early Gothic form, and dating from the end of the fifteenth century. Among notable buildings of later times are the seventeenth-century archbishop's palace and the later Vilhena Palace. The whole place retains an atmosphere of medieval Europe to a unique degree, and fortunately the few bombs which fell within its high-bastioned walls caused little damage in the narrow streets. See also RABAT.

Mead, Richard (1673-1754), Eng. physician, b. in Stepney, London, and educated at Utrecht, Leyden, and Padua, was appointed medical adviser to George II. (1727). He held the post of physician at St. Thomas's Hospital, London, from 1703 to 1754. He wrote numerous treatises, including *Mechanical Account of Poisons* (1702), an account of snake venoms, and advocated quarantine and disinfection for plague, and inoculation for smallpox.

Mead, fermented liquor made by dissolving honey at the rate of 4 lb. to a gallon of water and boiling it with spices. On cooling 1 oz. of brewer's yeast per gallon is added, and after standing for about 8 hrs. it is poured into a barrel to ferment. When fermentation ceases a small quantity ofisinglass is added to clear the liquid. After bottling it is stored for six months or more, when it is ready for use as a dry table wine. Special licences for its sale are necessary. Sack M. and sack metheglin are varieties of M.

Meade, George Gordon (1815-72), Amer. general. He first won distinction in the Mexican war, where he attained the rank of captain of engineers, and fought in the civil war as brigadier-general of volunteers. Lincoln placed M. in chief command of the Union army in place of Hooker. In July 1863 he defeated the Confederates under Lee at Gettysburg, though his own casualties were great. When Grant was made commander-in-chief of the Union armies he retained M. as his right-hand man in all the subsequent campaigns in Virginia. See life by J. H. Pennypacker, 1901.

Meadow Grass, the genus *Poa*, and specially *P. trivialis* and *P. pratensis*; hay and pasture grasses, with flat pale-green leaves and pyramidal panicles of flowers. *P. nemoralis* is the wood M. G.

Meadow Rue (*Thalictrum flavum*), perennial herb of the order Ranunculaceae, with a creeping root-stock and tall furrowed stems. It has small yellow flowers clustered in a pyramid.

Meadow Saffron, see COLCHICUM.

Meadow Sweet, or Queen-of-the-Meadows (*Spiraea ulmaria*), tall plant (family Rosaceae), with compound cymes of fragrant, creamy-white flowers and pinnate leaves. It is common in pastures.

Meadville, city of Crawford co., Penn. sylvania, U.S.A., 33 m. S. of Erie. It manufactures machinery, rayon, and zip-fasteners, and lies in a rich farming country. Alleghany Methodist College is at M. Pop. 18,906.

Meagher, Thomas Francis (1823-67), Irish politician, b. at Waterford. He joined the Young Ireland party, and in 1848 was condemned to death for his revolutionary propaganda. The sentence was commuted to exile, and he escaped (1852) to America, where, on the outbreak of civil war (1861), he organised the Irish brigade for the Federals, and was for a time governor of Montana.

Meagre (fish), see MAIGRE.

Meal Tub Plot, fictitious plot hatched by Thomas Dangerfield (q.v.) in 1679 with the connivance of a Mrs. Cellier (who was known as 'the popish midwife,' and was almoner for the countess of Powis) when it was profitable to needy villains to concoct imaginary plots against the king and the estab. religion. From the papers found in a meal tub in Mrs. Cellier's house, it seems to have been designed to implicate the duke of Monmouth and the Catholics in a pretended plot to establish a commonwealth and overthrow Protestantism. Sir Wm. Waller searched Mrs. Cellier's house and found therein, concealed at the bottom of a meal tub, the 'little paper book, tied with red ribbons,' containing 'the model of the designed plot against the Protestants.' Dangerfield, by turning king's evidence in another trial, secured a pardon, and Mrs. Cellier was acquitted.

Meal-worm, larva of a common beetle (*Tenebrio molitor*), frequenting mills, granaries, and bakehouses. It is thin and round, about 1 in. long, and tawny in colour, with bright rusty bands. The beetle is $\frac{1}{2}$ in. long, with stout legs and eleven-jointed antennae and black and red in colour.

Mealy Bug, homopterous insect, which does considerable harm to plants in greenhouses by sucking the sap and by choking the pores of the leaves. The insects are minute and red in colour, but a covering of white mealy powder disguises them. The males have wings, but the females are wingless. The pest is destroyed, with difficulty, by spraying with insecticide; fumigation with tobacco smoke or cyanide of potassium is more effective.

Mean, in philosophy, is applied to a doctrine of Aristotelian ethics. According to Aristotle, virtue consists in finding the M. ($\tau\omicron\ \mu\epsilon\sigma\omicron\upsilon$ or $\mu\epsilon\sigma\omicron\tau\eta\varsigma$) between all extremes, because all desire tends to excess, and excess is the danger of life. According to the genuine exposition of it, this doctrine is not a mere counsel of apathy, but that of a middle course between passion and apathy. See Aristotle, *Nicomachean Ethics*, books I.-III., and Sir A. Grant, *Aristotle's Ethics*, 1877; E. Wallace, *Outlines of the Philosophy of Aristotle*, 1883; D. Stewart, *Notes*, 1892; and W. D. Ross, *Aristotle*, 1923.

Meander (Lat. *Meander*, Gk. *Μαίανδρος*), appellative use of the name of a riv. in Phrygia noted for its winding course. See MEANDER.

Mean Sea Level. There is no absolute invariable figure which may be taken as indicating M. S. L. From a world point of view it is a local convention. If the whole globe were covered with a uniformly deep ocean, and if there were no

differences of density between one part and another, the surface would form a perfect ellipsoid of revolution, that is to say, all the meridians would be exactly equal ellipses and all parallels perfect circles. But as the water surface is broken by land, and as the mean density of the substance of the land is 2.6 times as great as that of sea water, the gravitational attraction of the land must necessarily cause a heaping-up of the sea around the coasts forming what has been called the continental wave, and leaving the sea level lower in mid ocean. Hence the geoid or figure of the sea surface is not part of an ellipsoid of rotation, but is irregular.

The differences of level between different parts of the geoid, i.e. in different seas and oceans, have in the past been greatly overestimated. The inequalities of the geoid are now considered in no case to exceed 300 ft. Distortion of the ocean surface may also arise from meteorological causes. Solar radiation does not account for a difference of level of more than 20 ft. between tropical and polar seas; the range of temp. between summer and winter in the Baltic is as much as 20° F., but this only corresponds to a difference of level of 1½ in.

In the Brit. Isles the ordnance survey datum level used to be referred to a benchmark on a dock wall in the tidal riv. at Liverpool, which was supposed to represent M. S. L. as ascertained nearly 100 years ago, but was based on a fortnight's observation only.

This datum has since been considered unsatisfactory for scientifically accurate observations. Newlyn, situated on the open sea, was therefore chosen; and the Newlyn datum is the M. S. L. at that place as computed from hourly observations over a period of six years, 1915-21. The new datum is shown on all 1/2500 and 6-in. ordnance survey maps pub. since April 1929.

Means Test, in connection with applications for transitional unemployment benefit, denotes the statutory test of the applicant's means in order to arrive at the amount of assistance for which he is eligible. It was introduced in 1931. In 1932 the Labour party complained bitterly of the retention of the M. T., but the gov. retained the test in principle, though in its Bill of 1933 it proposed that the test of need should be the income of the household. This proposal found expression in the regulations made under the Unemployment Assistance Act, 1934, which provide that the amount of allowance granted shall be determined by reference to the applicant's needs, and for this purpose the resources of all members of his household are required to be known. The M. T. was replaced by the provisions of the National Insurance Act (1946) (q.v.).

Mean, **The**, in mathematics, of two or more quantities is an intermediate quantity determined by certain rules. The most common Ms. are the arithmetic M., the geometric M., and the harmonic M. The arithmetic M. is the average value of the quantities, the geometric M. is the

square root of the product of the quantities, and the harmonic M. is the arithmetic M. of reciprocals.

Mearns, Renfrewshire, see NEWTON MEARNS.

Mearns, The, see KINCARDINESHIRE.

Measham, par. and vil. of Derbyshire, England, 4 m. S.W. of Ashby-de-la-Zouch. Red bricks and terra-cotta are manufactured, and there are coal-mines in the vicinity. Pop. 2300.

Measles, acute infectious disease, characterised by reddish eruptions on the body and catarrh of the mucous membranes of the air passages, conjunctiva, etc. It is one of the commonest infectious diseases in England, occurring in scattered cases at all times, and in rapidly spreading epidemics at frequent intervals. It attacks children for the most part, and is usually disseminated by the congregation of children in school. The rate of mortality is low, but there are certain dangers arising from possible complications which render it desirable to prevent the frequent epidemics. Like smallpox, it is presumably caused by an infective virus. Canon and Pellicke have isolated a minute bacillus that appears characteristic of the early stages of the disease, but its occurrence appears to be a result rather than a cause of the conditions set up by the disease. An attack of true M. (*Rubeola* or *Morbilli*) confers immunity from subsequent attacks to the end of life. The early symptoms are so indefinite that contagion often spreads before the disease is recognised. After from seven to fourteen days' incubation, catarrh of the mucous membranes sets in. The eyes become red and watery, there is a watery discharge from the nose, a dry cough, sore throat, thirst, restlessness, and a high temp. After three or four days small dark-red spots appear on the face and neck, and the face becomes swollen; they are sometimes preceded by a rash inside the mouth ('Koplik's Spots'). The eruption extends downwards until the whole body is involved. The rash fades away in the same order as it attacked the body. The red spots become yellowish, and the skin crumbles off in a powder resembling bran. The duration of the eruption from first to last is about a week, and during that time the febrile conditions increase until the temp. is about 101° or 105° . At the height of the eruption the temp. usually falls, and convalescence proceeds rapidly. Inflammation of the air passages may persist and lead to bronchial trouble. The eyes may remain irritable, a degree of diarrhoea may persist, or the general vitality of the patient may be so affected that liability to tubercular affections is increased. There may be infection of the ears, leading to deafness. After recovery the patient should be sheltered from cold and unhygienic conditions for a lengthened period, as much of the mischief arising from M. is due to a premature neglect of the precautions proper to a state of convalescence. The actual fever stage in the mild form of the disease requires little treatment other than that associated with febrile conditions generally. Efforts should be made to

prevent the spread of the epidemic by isolating proved and suspected cases. Schools are usually shut when an epidemic threatens a neighbourhood. *German measles*, *Rubella*, or *Roseola*, is a mild infectious disease characterised by an eruption similar to that of M., but in a milder form. Febrile symptoms are not marked or are absent altogether.

Measure, in music, is an old-fashioned term for a rhythmic phrase or dance.

Measures, see WEIGHTS AND MEASURES.

Meat, term formerly applied to food, particularly solid food. It is now restricted, except for a few surviving phrases to butcher's M., or the muscular tissues of such animals as bullocks, sheep, pigs, etc. M. as an article of food owes its value to the large amount of available proteins it contains and its appeal to the appetite when well cooked. The supply of M. is now regularised by the adoption of methods of preservation by means of which the supplies of thinly populated countries are made available for the whole world, and for almost any length of time. The modes of preservation used are *heat*, as in the great canning industry of Chicago; *cold*, as in the preparation and shipment of M. from the Argentine, New Zealand, Australia, etc.; and *salling*, or impregnating with brine. The drying of M. for preservation for any length of time is now practically obsolete. M. extracts are made by processes arising from that initiated by J. von Liebig; the soluble water is removed from the M. and condensed to a small compass by evaporation *in vacuo*. The food value of M. extract depends more upon the stimulating character of the material rather than on any amount of protein it may contain. The protection of the public against unsound M. is in the hands of the medical officers and inspectors of nuisances attached to the various bor. and dist. councils. The Public Health Act, 1875, and subsequent amendments, provide for the inspection of slaughterhouses and the destruction of M. shown to be unsound. The three great cattle-raising areas of the world are Argentina, Australia, and Iowa in the U.S.A., where the cattle are 2111, 1771, and 1811 respectively to each 1000 of pop. These figures can be best realised by comparison with the United Kingdom, where there are 199 cattle to each 1000 of pop. Argentina and the other M. countries of the R. Plate, Uruguay, and Paraguay are fortunate in having the best natural feeding substances for cattle rearing, and an exceedingly mild winter that enables rearing to be carried on at low cost. The cattle fatten rapidly and, where alfalfa is used as a food, multiply rapidly.

Meath, maritime co. in the prov. of Leinster, Eire, bounded E. by the Irish Sea. The surface is mainly flat, rising towards the W., and the coast is low and sandy. The chief riv. is the Boyne, into which flows the Blackwater. Agriculture flourishes, oats being the prin. grain crop; cattle and sheep are reared in considerable numbers. There are some woollen manufs., and linen is woven by handlooms. There

are some fine old ruins at Duleek, Beehive Abbey, and Clonard, and a castle at Trim, the co. tn. Tara, the supposed site of the old Irish cap., with its palace, is in the co. Five members are returned to the Dail by M. and Westmeath. Area 904 sq. m. Pop. 66,200.

Meat Poisoning, see BOTULISM.

Meaux, tn. in the dept. of Seine-et-Marne, France, on the Marne, 26 m. E.N.E. of Paris. It possesses a twelfth-century cathedral. Dairy produce and corn are the chief products; sugar, steel, and cotton goods are manufactured. Pop. 14,200; arron. 158,900.

tion; the chief articles manufactured there are chaplets for the pious pilgrims. Respecting the hist. of M., it was known to Ptolemy already as Macoraba, and first belonged to the tribe of the Kosaites, later to the Korcish. Mohammed, who had been obliged to leave it precipitately (see HEJIRA) in 622, returned to it and conquered it in 627. M. was taken by the Wahabis (1803), but given up again to the pasha of Egypt, Mehemet Ali (1833), whose son, Ibrahim, was made Sheik El Haram (of the sacred place). On Oct. 13, 1924, the Wahabis again captured M. and in 1926 Ibn Saud was proclaimed king of

THE KAABA, MECCA

E.N.A.

Mecca (*Om Al Kora*, mother of cities), one of the oldest tns. of Arabia the cap. of the prov. of Hedjaz, and, through being the bp. of Mohammed, the central and most holy city of all Islam. It is situated 245 m. S. of Medina, and about 65 m. E. of Jiddah, the well-known port on the Red Sea, in a narrow, barren valley, surrounded by bare hills and sandy plains and watered by the brook Wadi-M-Tara-feyn. The inhab. of M. make their living chiefly by letting their houses to the pilgrims (see HADJ), who flock hither to visit the chief mosque, containing the Kaaba (q.v.). This mosque, capable of holding about 35,000 persons, is surrounded by nineteen gates surmounted by seven minarets. A great number of people are attached to the mosque in some kind of eccles. capacity, as khatibs, muftis, mueddins, etc. It is protected by three castellated buildings, and is governed by a sheriff. The trade and commerce of M. hardly deserve men-

tion; the chief articles manufactured there are chaplets for the pious pilgrims. Respecting the hist. of M., it was known to Ptolemy already as Macoraba, and first belonged to the tribe of the Kosaites, later to the Korcish. Mohammed, who had been obliged to leave it precipitately (see HEJIRA) in 622, returned to it and conquered it in 627. M. was taken by the Wahabis (1803), but given up again to the pasha of Egypt, Mehemet Ali (1833), whose son, Ibrahim, was made Sheik El Haram (of the sacred place). On Oct. 13, 1924, the Wahabis again captured M. and in 1926 Ibn Saud was proclaimed king of the Hedjaz in M., his predecessor King Ali being forced to abdicate. Later, when the Hedjaz and the Nejd were united as Saudi Arabia, the constitution of 1926 provided for a consultative Legislative Assembly at M. M. has a wireless station. The road from M. to Jeddah (45 m.) is partly metalled, and motor omnibuses ply between the two tns. A certain balm, called balm of M., is made here. Permanent pop. (estimated) 70,000, floating pop. 100,000. See C. S. Hurgon, *Mecca*, 1888; A. Wavell, *A Modern Pilgrim in Mecca*, 1912; and E. Rutter, *The Holy Cities of Arabia*, 1928.

Mecca Stones, see MOCHA STONES.

Mechain, Pierre François André (1744-1805), Fr. astronomer, b. at Laon. He worked at the Paris observatory, and besides discovering eleven new comets culminated the orbits of another twenty-four. From 1791 he was engaged in surveying the arc of the meridian between

Rodez and Barcelona. D'Alembre's *Système métrique* tells how accurately he fulfilled his task, and gives also a sympathetic picture of the man himself, a victim to despondency and the stress of hostile circumstances.

Mechanical Accounting. see CALCULATING MACHINES; ELECTRIC ACCOUNTING MACHINES.

Mechanical Differential Analyser. The differential analyser is a machine for solving differential equations, which occur frequently in scientific and engineering problems. It consists of a number of units which can be mechanically interconnected through gears and gear units in a variety of ways by rotatable shafts.

and output tables, on which the solution of the equation is delivered in the form of a graph. The solution can also be obtained in numerical form. The shaft whose rotation represents the independent variable is driven by an electric motor, and other motors drive the torque amplifiers. The running of the machine is controlled by push-buttons at convenient points.

Mechanical Engineering, branch of engineering that deals with the theory and practice of all mechanical means of transport, e.g. railway, marine, automobile, and aeroplane engineering. It also includes the theory and practice of power generation and transmission and the production

Metropolitan-Vickers Electrical Co. Ltd.

THE MECHANICAL DIFFERENTIAL ANALYSER AT MANCHESTER UNIVERSITY

Designed on a unit principle, it can solve a wide range of differential equations. The machine illustrated has eight integrator units, six input boards, one output board, and occupies a floor area of about 27 ft. by 10 ft.

The rotation of each shaft represents one of the variables in the differential equation, and the shafts can be connected together in such a way that the relation between their rotations satisfies the equation. The adaptability of the machine depends on the wide range of possibilities of these interconnections. The essential units are called integrators, which each consist of a vertical wheel resting on a rotatable horizontal disk, the distance from the centre of the disk to the point of contact with it being continuously variable. The rotation and displacement of the disk represent the variable of integration and the integrand respectively, and the rotation of the wheel represents the result of integration. In order to avoid error due to slip of the wheel on the disk, a 'torque amplifier,' with an amplification up to 10,000 to 1, is inserted between the wheel and the shaft to which it is connected. Other units are input tables, which are used for supplying to the machine information in the form of a functional relation between two variables,

of machine tools. Courses in M. E. are provided at all the univs., and at many of the technical colleges in Great Britain, from whom prospectuses may be obtained. The Institution of Mechanical Engineers was founded in 1847 by George Stephenson. See J. Horner, *Dictionary of Mechanical Engineering Terms*, 1933; C. H. Tupholme, *Modern Engineering*, 1942; and D. A. Low and B. B. Low, *A Pocket-book for Mechanical Engineers*, 1944.

Mechanical Handling, see CONVEYORS.

Mechanics, science which considers the laws involved when bodies are acted on by forces which keep them in equilibrium or which produce motion in them. M. is arbitrarily subdivided into statics (including hydrostatics) and dynamics (including aerodynamics and hydrodynamics), the former branch treating of forces in equilibrium, and the latter dealing with forces acting so as to produce motion. Not only does M. deal with the direct action of forces on bodies, but it also studies the nature and action of forces

when they act on bodies by the agency of machinery. This gives the origin of the word M., and as a matter of fact M. was in its early stages the science of making machines. A machine in M. means any contrivance in which a force applied at one point is made to raise a weight or overcome a resisting force acting at another point. All machines can be reduced down to three primary machines, viz. the lever, inclined plane, and pulley; and three secondary, derived from these, viz. the wheel and axle, wedge, and screw for the properties of each of which see the articles dealing with them. These six machines are sometimes known as the mechanical powers. An account of the application of these mechanical powers in the construction of complex machines would involve descriptions of most of the engines by which human labour is abridged or dispensed with. It will be seen, therefore, that M. is of the utmost importance in structural engineering. M. is essentially an experimental science: all its laws are based on intuitive deductions from experimental observations. This is true, for example, of the three great laws of M. enunciated by Newton. M. has its origin in the mechanical powers that were employed long before any formal principles governing their action were discovered. Archimedes (q.v.), by his investigations of the principle of the lever and the property of the centre of gravity, estab. M. as a science. After Archimedes little progress was made until the time of Stevinus (1548-1620), who investigated the principle of the inclined plane. The golden age of M. began when Galileo (q.v.) made the first inquiries into problems of motion. Aristotle had taught that the speed with which a body falls is directly proportional to its weight. Galileo proved this to be false by letting two weights fall from the top of the Leaning Tower of Pisa; he subsequently deduced the solution to the problem of falling bodies, and he re-examined the previous knowledge of M. Newton (q.v.) took up the subject after Galileo, and his contributions to it were so great that his three laws remain the fundamental laws of M. to-day. His theory of universal gravitation enabled him to account for the motions of the members of the solar system as well as the motion of bodies on the earth. Lagrange and Laplace developed the subject in the eighteenth century, and at the present time Einstein and others are examining the philosophical foundations of the subject. See also DYNAMICS; ENERGY; FORCE; HYDROKINETICS; HYDROSTATICS; KINEMATICS; KINETICS; STATICS. See Sir A. Kennedy, *Mechanics of Machinery*, 1886; J. Goodman, *Mechanics applied to Engineering*, 1899, 1926-27; C. W. MacCord, *Kinematics*, 1901; A. Sommerfeld, *Wave Mechanics*, 1929; G. P. Thomson, *Wave Mechanics of Free Electrons*, 1930; T. Barrucough and E. J. Holmyard, *Mechanics for Beginners*, 1931.

Mechanicsville, tn. of Saratoga co., New York, U.S.A., situated 17 m. N. of Albany. It manufs. bricks, shirts, and knitted goods. Pop. 7400.

Mechanicsville, Battle of, first of the

'Seven Days' Battle' of the civil war, sometimes known as the battle of Beaver Dam Creek.

Mechanisation, substitution of mechanical for manual operation in industry. The Eng. industrial revolution of the eighteenth - nineteenth centuries released new sources of energy and new materials for the production and transportation of goods, but it only mechanised the actual working process in certain simple crafts, such as spinning and weaving. Its most representative creation was, in fact, the engineer, the last, most highly skilled of all craftsmen. In the progress (or evolution) to a more complete and real M., America has led the way in the course of the last hundred years by the M. of the most complex manual skill, including that of the engineer, as well as most other crafts which had survived unchanged for centuries. The dual agencies through which this result was achieved are motion study and the production line, the former carrying the principle of division of labour to its logical or mathematical conclusion, and adapting it to the continuous flow of the production line. M. is complete when the human hand is replaced in the production line by self-acting tools, so that the workers cease to be operators and become machine-minders. This final stage has so far only been achieved in a few industries, even in the U.S.A. Hence the present stage of M. is still mainly opposed to the true interests of the worker; for his part in production is so monotonous that he loses all interest in it. M. has, indeed, been regarded as one of the fundamental causes of the split between thought and feeling which is so characteristic of the present age. See also MASS PRODUCTION in THE U.S.A. See S. Gideon, *Mechanisation takes Command*, 1949.

Mechanisation and Motorisation, Military. These terms are often used synonymously, but properly speaking mechanisation means the employment of arms which depend for their functioning entirely on mechanical means (e.g. tanks, some forms of engineer equipment, and A.A. gear), whereas motorisation means the transport and supply by motor vehicles of men, arms, and equipment which are also capable of being moved and maintained by other means.

Both are costly processes, and the mechanisation of the forces of a great power depends closely upon the peacetime industrial development (especially metallurgical) of that power. Motorisation again depends on the size and efficiency of its automobile industry. No power could afford to purchase the whole, or even a considerable part, of its mechanised and motorised equipment from abroad. Thus, though lacking specialised equipment such as tanks and anti-tank guns in 1939, the Brit. Army was at that time completely motorised, though the home forces were equipped largely with impressed civilian vehicles, while even at the height of its efficiency the first-line transport of the bulk of the Ger. Armies depended on horse

traction, in spite of the fact that the Ger. motor industry had been coerced in the years immediately before the war into adopting a standardised programme of production of vehicles (such as the *Folkswagen*) which could be immediately adapted to military use: the strategic moves of the Ger. Army, from the Russian to the W. front, were carried out by rail. By 1945 the two powers most conspicuous for mass production and mass employment of tanks were precisely those whose peacetime industries had the highest output of heavy agric. tractors, the U.S.A. and the U.S.S.R. Tanks and motorised troops played a relatively small part in the great successes of the Jap. Army, who fought their war in a style consistent with an economy whose forte was light industry and shipping. The armies of Poland, Hungary, and the Balkan states can hardly be said to have known mechanisation or motorisation up to 1939.

The experience gained by the Brit. Army in the campaigns of the First World War waged in defence of the Suez Canal, and the constant preoccupation of the imperial general staff with the security of the Middle E., would alone have been sufficient to account for the almost complete elimination of cavalry, horse artillery, and animal transport from the Brit. Army before 1938. Hippomobile armies, apart from their extreme vulnerability from the air, require enormous quantities of forage and water, in addition to the normal burden of rations and ammunition, and the supply of a great cavalry army for any length of time in arid zones, such as Mesopotamia and the Syrian and W. deserts, was an impossible task. See TANKS; ARMoured CARS; INFANTRY; ARTILLERY.

Mechelen (Fr. *Malines*), city of Belgium, 14 m. S. of Antwerp, on the R. Dyle. It has a cathedral with an unfinished steeple of 318 ft., containing a famous chime of forty-five bells. There are sev. other churches in M., some of which contain pictures by Rubens. Of these the finest is that of 'The Adoration of the Magi' in the church of St. John. There are also sev. secular buildings, giving evidence of the wealthy past of the city. The Cloth Hall was built in 1320, and the old palace of the Grand Council of the Netherlands in 1374. M. was formerly known for its lace manufs. At present there are very important furniture manufs. It produces also textiles, tapestry, and tinned vegetables. There is a large workshop of the Belgian Railway Company. The surrounding dist. is famous for the cultivation of early vegetables, of which M. is an international market. It is the see of an archbishop, primate of Belgium, and there are two convents. M. suffered much in the early stages of the First World War during the battle of Antwerp; afterwards it was famous as residence of Cardinal Mercier. During the Second World War M. was bombed sev. times, and damage was done. Pop. 60,200. See L. Godenne, *Malines jadis et aujourd'hui*, 1908, and J. Laenen, *Geschiedenis van Mechelen tot op het einde der middeleeuwen*, 1926.

Mecklin Laoc, see under LACE.

Mechnikov, Ilya, see METCHNIKOV.

Meckenen, **Mekenen**, or **Meckeln**, **Israel von** (d. 1503), engraver and goldsmith, is usually identified with the Ger. painter, Meister Israel, eighteen of whose works hang in the Pinaothek of Munich. They are religious in subject, and belong clearly to the school of Van Eyck.

Mecklenburg, prov. of Germany, formed of the two former grand duchies, M.-Schwerin and M.-Strelitz, the areas of which are respectively 5068 sq. m. and 1131 sq. m. Schwerin is watered by the Elbe and Warnow, and its surface is generally flat and well wooded. Strelitz is also flat and similar in its physical character to Schwerin, although being further from the sea its climate is less humid and less changeable. Agriculture is the chief industry of M., and stock-raising is an important pursuit. Gypsum and salt are mined in Schwerin. The title of grand duke was obtained for Schwerin and for Strelitz in 1815. Until 1907 both duchies were practically absolute monarchies, but in that year they were granted some form of constitutional government. In 1934 they were united. The chief tns. are Schwerin (54,000); Ludwigslust, Rostock (heavily damaged by the R.A.F. in 1942), with a pop. of 95,000 in 1940; Instrow; Wesmar; and Strelitz. Pop. 2,139,700.

Mees, **Ladislav** (real family name **Martonosik**), b. 1895, Hungarian poet. He completed his studies at Budapest, and became canon of a Fr. order of priests, who made him a prof. for a time, and then assigned him to a vil. par. He has written three books of poetry: *Angelus of the Dawn* (1923); *Slaves Sing* (1925); and *Consolation* (1927). He has made himself pre-eminently the poet of his own countryside, and of the poor.

Medallions, large medals struck for a particular occasion. In architecture round or oval panels and tablets, often decorated with designs or figures in relief, are called M. in reference to their shape. See under MEDALS.

Medals. Numismatists have usually given the name of medal or medallion to those coin-like pieces that have been struck or cast for particular purposes or on extraordinary occasions, in commemoration of victories, treaties, coronations, and other important events, or in honour of remarkable persons, in contradistinction to coins, which have been issued for circulation as money. The art of engraving dies is of very ant. origin (see NUMISMATICS). In some parts of the Gk. world, especially in Sicily, coins struck for currency sometimes bore what may be called commemorative types, and so served one of the purposes of M., but true M. or medallions are rare; the only examples known before the Hellenistic age come from Syracuse, Agragas, and Athens, the two latter being represented by one issue each. The later Syracusan series was definitely associated with games, a usage which recurs in Egypt under the Ptolemies.

Under the Rom. Empire the art of the

medallion was raised to a very high degree of skill and beauty of imperial portraiture. These large pieces, struck generally in bronze or silver, with some magnificent exceptions in gold, were produced at the order of successive emperors for distribution on special occasions to friends, court officials, army officers, and foreign rulers and envoys; many of them were provided with a loop for suspension.

In the early medieval period the It. term *medaglia*, first applied to large bronze Rom. coins or medallions, finally came to denote any subsequently made piece of similar bold size and elaborately finished style; and the It. Renaissance saw medallie art nobly developed by Pisano ('Pisanello') (c. 1390-1455) and Matteo de' Pasti, his younger contemporary, from both of whom the great It. school derived.

MEDAL STRUCK TO COMMEMORATE THE APPOINTMENT OF JAMES (THE FUTURE JAMES II.) AS ADMIRAL OF THE FLEET

One of the earliest pieces is a gold medal of the Council of Florence (1439). Papal M. begin with Paul II. (1464), those of earlier popes having been issued by their successors.

A second great school of medallists began in Germany in 1453, and Ger. M. came to display much originality and strength in treatment, though they were inferior to the It. in observing the limitations imposed upon the art by a circular shape. Sicilian M. appear as early as 1501; Sp. in 1503, and Dan. in 1516. Early Dutch M. (after 1566) are notable for their elaborate engravings of views, maps, and plans. Fr. M., which began in 1451 and developed under Dupré (1576-1643) and Warin (1600-72), were remarkably transformed by the reign of Louis XIV. (1643-1715), the events of which were mirrored in a long and splendid series of realistic design. The medallie hist. of the Napoleonic period, though of similar extent, is comparatively undistinguished through its addiction (with the *littérateurs*) to a false classicism.

The series of Eng. M. is one of the most perfect, though probably more notable for its representations of contemporary

events than for its artistic quality. The earliest example is a gold medal of Henry VIII. (Supremacy of the Church, 1545). Edward IV.'s reign supplies the first of a long series of coronation M. Among the best known die-engravers of Eng. M. are the Frenchman Briot, active under Charles I.; Thomas Simon, his near-contemporary and successor; the It. Benedetto Pistrucci, designer of the Waterloo medallion; and, later in the nineteenth century, Wm. Wyon, R.A. There are signs that in many countries the art of the medal is again claiming a place above that to which it sank in the late nineteenth century, and that it is vindicating its importance not only as an historical repository of national events and nationally famous figures but also as a study peculiarly welcome for the collector of objects of virtu. The work of Theodore Spicer-Simson (*q.v.*) between 1910 and 1930 attained a fine distinction.

The striking of M. for the learned societies and (since 1849) for the services forms one of the regular functions of the Royal Mint in London.

See E. Hawkins, A. W. Franks, and H. A. Grueber, *Medallie Illustrations of the History of Great Britain and Ireland*, 1885; G. Tanner, *Historical Record of Medals and Honorary Distinctions*, 1891; L. Forrer, *Biographical Dictionary of Medallists*, 1904-30; G. F. Hill, *A Guide to the Exhibition of Historical Medals in the British Museum* 1924, and *A Corpus of the Italian Renaissance Medals*, 1930; J. Babelon, *La Médaille et les médailleurs*, 1927; and H. Taprell Dorling, *Ribbons and Medals*, 1947.

Medals, First and Second World Wars (British). See under title, e.g. WAR MEDAL, BRITISH; VICTORY MEDAL; STAR, 1914: 1914-15 (First World War)—BUKHA STAR; DEFENCE MEDAL; ITALY STAR (Second World War).

Medan, tn. of N. Sumatra, situated about 10 m. from the W. coast on the R. Deli. Here is one of the high courts of justice of the Dutch E. Indies. Pop. 14,000.

Mede, or **Mead**, Joseph (1586-1638), Eng. scholar, took his M.A. degree from Christ's College, Cambridge, in 1610, and was associated with his college as fellow and reader in classics for the rest of his life. His *Clavis Apocalyptica* (1627) is a reasonable exposition of the apocalyptic prophecies.

Mede, tn. in the prov. of Pavia, Lombardy, Italy, 22 m. W.S.W. of Pavia. Pop. 6500.

Medea (Gk. Μυδία), in Gk. mythology, a famous sorceress. She was the daughter of Æetes, king of Colchis, and the wife of Jason, with whom she fell in love when he came in search of the golden fleece. She assisted him in his quest, and together with her brother, Absyrtus, embarked with him in the *Argo*, but being pursued by Æetes she murdered her brother and scattered the parts of his body into the sea, thus doling her father. At length she arrived at Iolcus with Jason, and from there they went to Corinth, where they lived happily for about ten years, until Creon, king of Thebes, betrothed his

daughter Glauce to Jason. This led him to desert M., and for his faithlessness she exacted a terrible revenge. She killed both the bride and her father by sending the maiden a poisoned robe and diadem, and murdered her two sons, Mermerus and Phereas, in her husband's sight. After this she fled from Corinth in a car drawn by dragons, the gift of her grandfather, Helios, to Athens, where she married Ægeus, by whom she had a son, Medas, who was regarded as the progenitor of the Medes. Being forced to leave Athens, she returned with her son to Colchis, and restored her father to the throne of which he had been deprived by his own son Perses. At Corinth she was deemed immortal, and was said to have become the wife of Achilles in the Elysian fields, but elsewhere she was merely regarded as an ancestress. See Euripides, *Medea*, trans. by G. Murray, 1906, and F. L. Lucas, 1924.

Medea (anc. *Lamida*), tn. of Algeria, situated 40 m. S.W. of Algiers. Pop. 17,000 (Europeans 4000).

Medellín, chief tn. of the dept. of Antioquia, Colombia. It is an episcopal see, has a univ., and is the second largest tn. of the republic. There are rich gold and silver mines in the vicinity. The inhab. are chiefly engaged in the manuf. of jewellery, porcelain, and pottery. Coffee is grown and exported; silk, cotton, wool, and chocolate are also produced. There is an air-line to Panama. Pop. 224,200.

Medes, or **Medians**, see under **MEDIA**.

Medford: 1. City of Massachusetts, U.S.A., in Middlesex co., situated on the Mystic R. and lakes, 5 m. N.N.W. of Boston. The manufs. include woollen goods, food products, machinery, and chemicals. Pop. 63,000. 2. City of Oregon, U.S.A., cap. of Jackson co., 4 m. N.E. of Jacksonville, with sugar refining and brewing industries. Pop. 11,200.

Medhurst, **Walter Henry** (1796-1857), Eng. missionary in China, b. in London, was ordained at Malacca in 1819, and after working in Penang and Batavia founded a mission in Shanghai, with which he was associated from 1842 to 1856. He issued a very accurate version of the Bible in High-Wen-II, his version being a revision of the old Chinese text. He was part author of a trans. of the N.T. into the Mandarin dialect of Nanking. He pub. also a Jap.-Eng. dictionary (1830) and a Chinese-Eng. dictionary (1842-43).

Media, in anc. times, the name of the N.W. part of Iran, corresponding to the present provs. of Azerbaijan, Gililan, Mazanderan, Irak-Ajemi, and the E. portion of Kurdistan. The Medians were in language, religion, and manners very nearly allied to the Persians. After they had shaken off the yoke of the Assyrians, their tribes, according to the common account, united about 708 B.C., chose Deloces (Kai-Kobad) for their chief, and made Ecbatana their cap. His son, Phraortes, or Arphaxand, subdued the Persians. Cyaxares (Kai-Kaous), the son of Phraortes, in alliance with Nabopolassar, king of Babylon, overthrew the Assyrian empire about 604 B.C., and vanquished the brigand hordes of Scythia. He was suc-

ceeded by his son Astyages (Asdechak), who was deposed (560 B.C.) by his own grandson, Cyrus (Kai-Khüsrü), king of Persia, and from this time the two nations are spoken of as one people. Ecbatana, the cap. of M., became the summer residence of the Persian kings. With the overthrow of the Persians by Alexander the Great after the battle of Arbela (331 B.C.) M. became part of Alexander's realm. After the death of Alexander the Great (324 B.C.) the N.W. portion (*Atropatene*) of M. became a separate kingdom, and existed till the time of Augustus, the other portion, under the name of Great M., forming a part of the Syrian monarchy. M. was on sev. occasions separated from Persia. In 152 B.C. Mithridates I. took Great M. from the Syrians and annexed it to the Parthian empire, and about 36 B.C. it had a king of its own, named Artavasdes, against whom Mark Antony made war. Under the Sassanian dynasty the whole of M. was united to Persia. It became, during the fourteenth and fifteenth centuries, the stronghold of Turkoman tribes. In early times the Medes were a warlike race, and distinguished for their skill with the bow. They were also celebrated for their horsemanship, and it was from them that the Persians adopted this and other favourite exercises. See J. von Präsek, *Geschichte der Meder und Perser*, 1906 10; H. H. Rowley, *Darius the Median*, 1935; and G. G. Cameron, *History of Early Iran*, 1936.

Medias (Hungarian *Medgyes*), tn. of Rumania in Transylvania, situated on the Great Kokel, 25 m. N.N.E. of Sibiu (Hermannstadt). Pop. 15,500.

Mediation, **Act of**, Swiss constitution. the work of Napoleon, was drawn up in 1803. Prior to the treaty of Lunéville Fr. troops had been in occupation of Switzerland; but, after that treaty, it was politic for Napoleon to evacuate his forces and help the Swiss to settle down; for in this way he would be certain of this strategically important ter. The A. of M., which was drafted with the aid of delegates from the various cantons, revived the former diet, the president formally representing the central gov., but having no executive power. There were to be nineteen cantons; the Diet was to meet in turn at the six large tns., and France was to guarantee the Swiss neutrality. This constitution came to an end in 1813.

Mediatization (Ger. *Mediatisierung*) is derived from Lat. *mediatus*, middle, and was coined to describe the process by which the title of certain (Ger. princes was subordinated to that of other sovereigns, instead of being held directly from the emperor. Many minor houses were mediatized in 1803, and again in 1815 at the congress of Vienna.

Medical Association, British, founded in 1832, now has a membership of upwards of 50,000. Its headquarters are in Tavistock Square, London, W.C.1, and there are also a considerable number of home and colonial branches. Its official organ is the *British Medical Journal*. Papers dealing with every dept. of medical science are

read at the ann. meeting of the association, which is held at different cities of the country (1949, Harrogate). Originally it was known as the Prov. Medical and Surgical Association, but since 1856 it has borne its present name. Also publishes *Archives of Disease in Childhood* (quarterly); *Journal of Neurology and Psychopathology* (continued since 1938 as *Journal of Neurology and Psychiatry*); *Abstracts of World Medicine*; *Abstracts of World Surgery*; *Obstetrics and Gynaecology*; and others.

Medical Corps, Royal Army, see MEDICAL SERVICE, ARMY.

Medical Education is special training in one or more branches of medicine, but since medicine itself is founded upon physics and chem., M. E. usually includes at least elementary instruction in these sciences. M. E. has developed very differently in different countries. Amongst the earliest records of definite surgical training are those of Hindus in about the fifth century B.C. The Hindu student practised incisions and punctures in the veins and hollow stems of plants; he banded models; and in preparation for operations on cysts and ulcers in the human body, he tapped juicy fruits. The works of Hippocrates and Galen formed the foundation of most education in clinical practice and surgery until after the Renaissance, and some 'Hippocratic principles' are incorporated in modern professional etiquette. Except in anatomy M. E. was mainly didactic until the eighteenth century, partly because of the difficulty in procuring specimens and partly because of the complete acceptance of the Gk. writings. In Edinburgh all anatomical demonstrations were shown on a single body, and operations were practised on dogs. This difficulty led to the estab. of museums of anatomical and pathological specimens. Many Brit. students completed their M. E. at Padua, Montpellier, Leyden, Berlin, or Paris.

In Great Britain Oxford, Cambridge, London, Edinburgh, and Dublin, and all prov. univs. (but not the univ. colleges), have a faculty of medicine. The student must first qualify for entrance to the univ. The medical examinations proper comprise the first M.B. in biology, physics, and chem., taken either externally or after one year's study; the second M.B. in anatomy and physiology after a further two years; the third M.B. in clinical subjects after three years spent in hospital practice. In London M. E. has long been associated with clinic l observation and demonstration, but in schools not connected with hospitals the teaching was purely didactic until the need for clinical work was fully recognised, and more facilities were afforded.

Before the latter half of the nineteenth century medical specialists were comparatively few, but with the growth of knowledge it became impossible for the general practitioner to learn how to deal adequately with all types and manifestations of diseases. Consequently some doctors and surgeons have specialised in special branches of medicine and sur-

gery, and, after education in the elements of general medicine, it is necessary for the specialist to undergo a course of training in the particular branch of medicine he wishes to follow. The Cambridge Medical School specialises in the experimental branches and the allied sciences. London affords excellent opportunities for surgery, clinical work, and the study of tropical diseases.

Since 1948 all the medical schools of London Univ. have followed the lead of the prov. univs. in admitting women on equal terms with men; in practice about one-fifth of the students are women.

The cost of a M. E. varies somewhat in the different medical schools. The fees for tuition are in the region of £50 per annum, to which must be added considerable items for examination fees, purchase of books and instruments, and expenses of maintenance. Various scholarships are, however, available.

The two important pubs. named below make various suggestions for the reform of M. E., and should be consulted by those seeking further information: one interesting proposal is a compulsory 'intern year' in a hospital appointment after the third M.B. examination, before the student shall be legally entitled to practise his profession. See *Interdepartmental Committee on Medical Schools* (the *Goodenough Report*), 1944, and *The Training of a Doctor* (Report of the Brit. Medical Association), 1948.

The first college of medicine for women was estab. in Philadelphia (1850), and in 1874 the London School of Medicine was opened, and training given in the Royal Free Hospital for Women.

Medical Jurisprudence, or Forensic Medicine, application of medical science to questions of common law. A large body of scientific facts has been built up, having for its purpose the elucidation of points, as far as medical knowledge can throw any light upon the matter, concerning the civil rights of individuals and the nature, extent, causation, etc., of personal injuries. So important has this legal aspect of medicine become, that M. J. is included as a subject of study in the training course of every medical practitioner. Among the subjects dealt with are evidences of age, personal identity, pregnancy, insanity, paternity, etc., as far as they are likely to have any bearing on the responsibility of an individual or his capacity for certain rights; and evidences of rape, abortion, death by poison, drowning, or hanging, possibility of live-birth in trials for infanticide, the identification of bloodstains, etc. See A. S. Taylor, *Elements of Medical Jurisprudence*, 1936, and *Principles and Practice of Medical Jurisprudence* (new ed.), 1928; S. A. Smith and J. Glaister, *Recent Advances in Forensic Medicine*, 1931; J. Collie, *Fraud in Medico-Legal Jurisprudence*, 1932; and H. T. F. Rhodes, *Forensic Medicine*, 1947.

Medical Practitioner, individual who practises the art of medicine; a qualified M. P. is one whose name is inscribed on the medical register of the General Medical Council in the United Kingdom. The

General Medical Council was estab. by the Medical Act of 1858 to regulate the conditions under which persons entered the medical profession, and a register was instituted to contain the names of qualified individuals. The amended Act of 1886 defined the general scope of the qualifying examination, and gave the council some measure of control over the corporate bodies licensed to grant diplomas. The general requirements do not vary to a great extent among the diploma-granting bodies of the United Kingdom. Before being enrolled on the 'student's register,' an intending practitioner has to produce one of many specified certificates relating to the subjects of general education. A period of study of five years' duration is then entered upon. In the first years of the course the student is examined in physics, chem., and elementary biology. Later on the training becomes more purely professional, and includes anatomy, physiology, *materia medica* and pharmacy, pathology, therapeutics, forensic medicine, psychiatry, radiology, obstetrics and gynecology, pediatrics, etc., together with medicine and surgery, including clinical instruction in a recognised hospital.

The right of the General Medical Council to strike a practitioner's name off the medical register, either for a criminal conviction or for infamous conduct in any professional respect, is a statutory right, but is not subject to appeal unless the members of the tribunal had no evidence on which to found their decision or have fallen short in 'natural justice.'

Any unregistered person practising as an apothecary (the modern 'apothecary' is a general M. P., by licence of the Apothecaries Company; but in popular usage the term is archaic) is liable to a penalty under the Apothecaries Act, 1815. The use by unregistered persons of any title implying registration, or that they are recognised by law, is made an offence by the Medical Act, 1858. No unregistered person can give a valid certificate required by law, or hold an appointment at a hospital, or in a ship, etc., or practise under the National Health Insurance Acts, or obtain dangerous drugs, or treat venereal disease.

Medical Practitioners in the U.S.A.—There is no federal law regarding the practice of medicine in the U.S.A., this being left to the jurisdiction of each of the self-governing states. State medical boards can insist that a would-be practitioner have a diploma from some recognised medical school. In general any graduate of a medical school anywhere can set up in practice after having estab. his credentials and, in some cases, having passed certain tests. The standard of the medical schools has been raised through the efforts of the Amer. Medical Association and the local state associations, and now, in most schools, the student must have had an academic education and must attend sessions and lectures for four years before receiving his diploma. Some of the greater medical schools, which are heavily endowed, have done their part in adding to the world's stock

of medical knowledge, while some of the Amer. surgeons are unsurpassed anywhere.

Medical Research is fundamentally concerned with the prevention and cure of disease. To this end it is essential that the symptoms and nature of the disease should be known and experiments made to determine its reaction to various methods of treatment. Consequently the methods of M. R. are observational and experimental. The earliest M. R. must have been very haphazard and mainly experimental, but the anc. civilisations and many savage tribes had herbal remedies for various affections, and the Chinese and Babylonians attempted to account for their remedies by formulating theories of disease. These theories were purely speculative, and it was not until the time of Hippocrates that the observational method was systematically employed. Arabian physicians made extensive use of this method, but Hippocrates is usually regarded as its founder. It is essential in clinical practice and leads to correct diagnosis. The experimental method was systematised by Galen, and in his investigation of the nervous system he laid the foundation of experimental physiology.

There are certain aspects of disease which cannot be investigated in the clinic. While the observational method could discover a connection between *Anopheles* and malaria (see *MALARIA*), experimental work was necessary to trace the life hist. of the malaria parasite and its phases in man and mosquito. Semmelweis (1857), as a result of clinical observations, showed that infection could be spread by living and by dead bodies; Pasteur and Koch, in the laboratory, were able to isolate infective organisms and to investigate their reactions. The development of this pioneer experimental work in bacteriology is seen in the growth of immunotherapy during recent years (see *BACTERIA*; *MEDICINE*.)

Experimental M. R. is so wide a field that it deals with subjects included in separate branches of science, such as bacteriology, parasitology, physiology, obstetrics, therapeutics, dietetics, biophysics, biochemistry, anatomy, and surgery. The rapid development of the experimental method during the present century has called forth much adverse criticism. The behaviour of organisms and of tissues in culture may be very different from their behaviour in a patient. The reactions of rats, dogs, and rabbits may be very different from the reactions of human beings. A healthy animal, infected in the laboratory with a disease, may not be affected in the same way as an unhealthy one or as an animal living a normal life. So long, however, as the research worker fully realises these and similar possibilities, they do not vitiate his results, but rather enable him to apply them with greater reserve and in a more critical manner. Obviously the best conduct of M. R. is in the co-ordination of the observational and experimental methods, and some modern research laboratories are in close connection with a hospital in which patients may be observed and, if willing,

subjected to experiment. The experimental method receives severe criticism for its use of animals such as rats and rabbits in the investigation of rickets and cancer; of various vertebrate animals in the study of the endocrine organs in physiology, and other branches of M. R. The choice of the subject of the experiment must always fall either on the human being or on a different animal, and it is doubtful whether there will ever be unanimous agreement on this vexed question. That man has undoubtedly benefited by such experiments is shown by the use of insulin in *Diabetes mellitus*, of liver for pernicious anemia, the efficacy of the antirachitic vitamin and the determination of its presence in various food substances. Man has also benefited by experiments on his fellows, as in the case of the voluntary infection of Dr. P. T. Manson with the malaria parasite to forward the research on malaria. Opponents of vivisection should bear in mind that without it substantial progress in M. R. at the present day would be impossible. Such experiments in living animals are very carefully regulated by the Home Office.

Statistics may be very useful in investigations of epidemiology, heredity, diet, and other subjects of M. R., and non-mathematical research workers on such subjects need to co-operate with skilled statisticians in order to get as complete an interpretation as possible of their results. Recent research on these lines has led to the prediction and probable course of certain epidemics (see EPIDEMIOLOGY). The statistics, however, need to be scientifically collected and to be thoroughly reliable, otherwise they may be totally obstructive instead of leading to progressive research. Much work remains to be done on the best method of obtaining reliable statistics, and the best type of statistics for especial purposes. The research worker, in addition to skilled technique, needs patience, endurance, ability to review his results critically, and readiness to discard preconceived ideas or working hypotheses when there is insufficient experimental evidence to support them. Individuals owe much to advances due to research in biophysics in connection with radio-, actino-, and electro-therapy, electro-cardiography, and improvements in auscultatory apparatus. The latest methods employed in obstetrics are due to research in biochemistry, surgery, physiology, and embryology (see articles on these topics). Considerable attention is devoted both to clinical and experimental work on cancer, its treatment and earlier diagnosis. Research is being carried out to determine whether reliable diagnosis of the disease at an early stage may be made by blood tests (see CANCER). See also NUFFIELD COLLEGE. See R. Dawson, *The History of Medicine: a Short Synopsis*, 1927; J. A. Dehnege, *Towards National Health*, 1931; D. Hiesman, *Medicine in Modern Society*, 1938; G. F. McCleary, *The March of Medicine*, 1941; G. W. Gray, *The Advancing Front of Medicine*, 1941; and M. Silverman, *Was against Disease*, 1942.

Medical Service, Army. Medical service in the Brit. Army is provided by the Royal Army Medical Corps. Before the Crimean war the service was on no permanent basis, and was carried on in a haphazard manner. There existed expert advisers to the army, officers of high rank, but there was no unified corps of officers and other ranks as we know it to-day. In the early campaigns, and through the Peninsular and Waterloo, attention in the way of non-medical comforts was provided by the wives of soldiers, who were permitted to follow their husbands on active service. Gradually regimental hospital staffs were formed, but it was not until the Crimean war that a corps of men only (no officers) was formed 'for the better care of sick and wounded,' entitled Medical Staff Corps. In 1857 it became the Army Hospital Corps. In 1884 the doctors were formed into the Medical Staff, but the final welding of officers and men did not take place until 1898, when the Royal Army Medical Corps was formed. The opening of the Herbert Hospital at Woolwich in 1861 marked an important stage in the development of the A. M. S., and other hospitals followed at Netley, Aldershot, and elsewhere. The estab. of a corps for the medical service advanced the provision of medical units for subsequent expeditions; and the members of such units often distinguished themselves, many winning the Victoria Cross. During the First World War the estab. of the A. M. S. expanded in conformity with army expansion generally and, from an estab. of 9000 other ranks in Aug. 1914, increased to 133,000 in the last year of the war. A total of 9,000,000 casualties was dealt with, 2,000,000 being on the W. front. The R.A.M.C. was, of course, assisted by the Nursing Services, Red Cross, and other similar organisations. A beautiful window in Westminster Abbey perpetuates the memory of countless acts of bravery performed by the A. M. S. The varied fronts on which fighting took place during the First World War was a test of the efficiency and organisation of the A. M. S. Every means of conveyance, modern, obsolete, and improvised, was brought into use, and all sorts of buildings were converted into hospitals. Ingenuity contributed largely to the comfort of the sick and wounded. Protection of casualties from aerial attacks was a new feature of the First World War and, in the shell-fire zone, protection was of paramount importance. The range of modern weapons brought the activities of the A. M. S. well within the danger zone. Shells blew up aid posts and dressing stations or wiped out bearer-parties, and some 6573 members of the A. M. S. were killed and many thousands were wounded. Many Amer. doctors joined the Brit. A. M. S., and were granted officers' commissions in the R.A.M.C. When the Amer. Army came to Europe they were permitted to join the Amer. Army. For a full story of the A. M. S. during the First World War see Maj.-Gen. Sir W. G. Macpherson, *Official History of the Medical Service*, 1921-24; H.M.S.O., *Regulations for Army Medical*

Services, 1932, and Organisation, Strategy, and Tactics of the Army Medical Services in War, 1937.

Army Medical Service in the Second World War.—The A. M. S. made great strides in the Second World War, as exemplified in operations performed in the battle zone. Thus in the N. Africa battle area first aid was administered on the field; then, by way of an advanced dressing station, the wounded man arrived at a casualty clearing station. This was the

From the casualty clearing station the patients were sent to a general hospital at the base, often by motor ambulance to an aerodrome, and thence by ambulance plane, often performing in 2 or 3 hrs. a journey that by any other means would take 36 hrs. General hospitals were all equipped in the same manner as the casualty clearing station, and many of them had special sections for various types of casualties. They had from forty to eighty trained sisters and

ried with its personnel in one C-47 aircraft, it has ten beds and a laboratory (background), a surgery (foreground); and a dental unit (on the right).

most advanced medical post where operations could be properly performed. A mobile electric unit supplied power for X-ray and lighting. In fact, the casualty clearing station was completely mobile, carrying tentage for operating theatres and wards. Expert surgeons and eminent doctors were employed in these advanced stations. These stations, which in N. Africa were generally about 20-30 m. behind the front lines, were expert at moving, and from positions over 100 m. away could reach their new destination by evening, and be ready to receive patients the following morning. Each station had its team of specialists: physician, surgeon, anaesthetist, X-ray specialists, and dental officer, together with eight sisters, R.A.M.C. nursing orderlies, and cooks.

many R.A.M.C. men for the other tasks necessary in a modern hospital. These hospitals were divided into two main divs., medical and surgical. The treatment of wounds in the Second World War was well in advance of that in the previous war. Plaster fixation and sulphonamide drugs enabled the surgeon at the front to prepare his patients so well that long journeys even by road and rail did no harm. No doubt it would have been ideal if all patients could have been evacuated by air, but that was not possible, though in the Burma theatre it was achieved to a very large extent.

Army Medical Service of the U.S.A.—The normal or peacetime strength of the medical corps of the U.S. Army is about 6400 officers and men. There are small

hospitals connected with every army garrison, but there are also large general hospitals at Hot Springs, Arkansas, Denver, Colorado, the presidio of San Francisco, a general army medical centre, including Walter Reed Hospital in Washington, D.C., and at El Paso, Texas. In the colonial possession the army has hospitals at Manila in the Philippines (lost to the Jap. in 1942), and at Honolulu in the Hawaiian Is. There is also an aviation hospital at San Antonio, Texas. Here has been developed a complete airborne emergency hospital, carried in one plane. The 100-bed field unit can be carried in nine aircraft.

During the First World War there were, at the front or at the base hospitals, more than 20,000 medical officers, and ten times that number of other ranks. It is estimated that there were something like 20,000 nurses attending a total of over 350,000 beds.

During the Second World War there were at the front or at the base hospitals more than 14,000 medical officers and six times that number of other ranks. It is estimated that there were more than 10,000 nurses attending a total of over 120,000 beds.

Medical Societies. Numerous societies of widely different medical denominations exist throughout the Brit. Isles, more than ninety in England, five in Wales, sixteen in Scotland, and three in Ireland. The Ministry of Health may be accounted one of these, with its gov. lymph estab., and its many pubs. appearing from time to time. The Brit. Medical Association (founded 1832) is the greatest society, with headquarters in Tavistock Square, W.C.1, and its weekly pub. of the *British Medical Journal*; its branches are found throughout Britain and the colonies. The ann. meeting is of great interest and value to the medical profession; in 1949 it was held at Harrogate (see MEDICAL ASSOCIATION, BRITISH). The Royal Society of Medicine, 1 Wimpole Street, W.1, has meetings throughout the winter, and publishes its *Proceedings* annually at five guineas; its private library consists of 140,000 vols. The Medical Society of London (founded in 1773), 11 Chandos Street, W.1, meets twice monthly during the winter, with lectures and discussions, and publishes *Transactions* at 15s. The Lister Institute of Preventive Medicine, the Medical Research Council, Research Defence Society, Ophthalmological Society, and Royal Sanitary Institute (to which the Parkes Museum belongs) are representative of the various interests of the societies.

Medici, name of an illustrious Florentine family. Cosimo de' M. (1389-1464), called 'pater patriae' by his grateful fellow citizens, was the son of Giovanni (c. 1360-1429), who is justly regarded as the founder of that greatness which afterwards distinguished his posterity. In 1433 Cosimo was obliged to leave his native Florence and to seek refuge in Venice as the result of one of those sudden revolutions which are inseparably associated with the hist. of the It. medieval

republics. The following year, however, he was recalled, and until his death directed the fortunes of Florence, saving her from the ravages of war by his prudent alliances and skilful foreign policy, and using his enormous riches for the generous and enlightened patronage of art and literature. He instituted an academy for the study of Platonic philosophy, collected a number of priceless classical and oriental MSS., which formed a splendid nucleus to the Laurentian library, gathered about his court some of the foremost painters, sculptors, and scholars of the day, and won

DEATH MASK OF LORENZO THE
MAGNIFICENT

golden opinions for his munificence and generous charities. The name M. adorned none more illustrious than Cosimo, unless it was his grandson, Lorenzo the Magnificent (1449-92). Lorenzo also was the victim of the endless family feuds, and narrowly escaped assassination at the hands of the influential and jealous Pazzi. He was perhaps even more lavish in his patronage of learning than his grandfather. The academy which he founded for the study of the antique was largely responsible for the rapid dissemination over Europe of Gk. and Lat. literature, as well as for the pre-eminence of Florence in the field of Renaissance culture. It was he who seized at once on the vital importance of printing, and it was he who procured, through John Lascaris, 200 MSS. from the monastery of Mt. Athos, which were destined to embellish the Laurentian library already referred to. This unique collection, together with the equally unique

collection of anct. sculptures and vases, etc., was broken up and in part destroyed when the Fr. sacked the city, which was under the rule of Piero (1471-1503), the incompetent son of Lorenzo. The astute politician Giulio (1478-1534), who rose to be Clement VII., was an illegitimate son of Giuliano, Lorenzo's ill-fated brother. A second son of Lorenzo, Giovanni (1475-1521), succeeded to the papal chair as Leo X. Lorenzo II. (1492-1519), grandson of Lorenzo the Magnificent, exhibited all the incontinence and infirmity of will which mark a degenerate race, whilst the viciousness of his character was further emphasised in his natural son, Alessandro (1510-37), who governed Florence as duke from 1530, the year of her tragic surrender to the emperor Charles V. Cosimo I. (1519-74), who was created grand-duke of Tuscany in 1570, and Ferdinand I. (1549-1609), were descended from Lorenzo (1395-1440), a younger brother of the great Cosimo. The male line of the M. became extinct with Giovan Gastone (1671-1737), the seventh grand-duke. See CATHERINE DE' MEDICI and MARIE DE' MEDICI for the alliance of this house with the royalty of France. See Janet Ross, *Lives of the Early Medici*, 1910; C. Booth, *Cosimo I., Duke of Florence*, 1921; G. Maguire, *The Women of the Medici*, 1927; H. Acton, *The Last Medici*, 1931; D. G. Loth, *Lorenzo the Magnificent*, 1930; and C. Stange, *Lorenzo il Magnifico*, 1940.

Medici, Alessandro de', see LEO (popes), Leo XI.

Medici, Catherine de', see CATHERINE DE' MEDICI.

Medici Chapel, one of the monumental works on which Michelangelo was employed in the years 1520-34, and intended to be the burial-place and monument of the M. in their family church of San Lorenzo, in Florence. It was not built by Michelangelo, but the commission for its decoration and the monuments in it was given to him by the M. popes, Leo X. and Clement VII. For various reasons it was never completed, the execution of the commission being interrupted by the demands of earlier commissions, straitened papal finances, and the conflict between the papacy and the Florentines in which Michelangelo himself was deeply involved as engineer of the fortifications of Florence. The architectural decoration of the chapel, the four allegorical figures of Dawn and Evening, Night and Day, on the two sepulchres, and the seated figures of the dukes Lorenzo and Giuliano above them, are almost complete; but of the still more elaborate double sepulchre on the entrance wall only the group of the Virgin and Child, which was to have occupied the centre, was completed. The whole leaves an overwhelming impression and, although unfinished, it illustrates Michelangelo's power, in his prime, of achieving a unity which resolves discords and conflicts. In his interpretation of the art of Michelangelo, as exemplified in this monument, Dr. Charles de Tolnay sees not merely a sepulchral chamber, in itself a novelty, but also a microcosm of the

universe. See C. de Tolnay, *Michelangelo: the Medici Chapel*, 1949.

Medici, Giovanni de', see LEO (popes), Leo X.

Medici, Marie de', see MARIE DE' MEDICI.

Medicina, tn. of Emilia, Italy, in the prov. of Bologna, 15 m. S.E. of the tn. of that name. Pop. 14,000.

Medicinal Herbs. In medieval times few plants were without their supposed medicinal value, but the progress of medicine has limited them to a very small number. With a special state dept.'s aid, considerable attention is devoted to the culture of M. H. in the U.S.A., but in Britain, where in the E. cos. a century ago their culture was an important industry, they are little grown now and considerable importations are received from India and other countries. Some plants, such as foxglove, hemlock, belladonna, peppermint, valerian, and henbane, can be grown in Britain better than elsewhere. Foxglove and hemlock need to have their juice expressed immediately after cutting.

Medicine, science of the treatment of disease; any substance administered with the object of curing a diseased condition. The term is used sometimes to indicate that branch of the healing art which deals with internal administrations as opposed to surgery or operative treatment. In its widest sense, however, M. includes all varieties of curative treatment, as well as discussion of the causation of disease, and kindred subjects. According to modern conceptions, the study of M. involves first of all the study of anatomy, or the structure and form of the body, and physiology, or the study of function. Medical practitioners are called upon to deal with diseased conditions, hence pathology becomes part of the general subject. The treatment of diseased conditions is studied under the name of therapeutics, which, as far as it is concerned with drugs, involves a study of pharmacology. Operative treatment of surgery has sev. subdivisions of which dentistry is an important example. Sev. branches of medical practice have been dealt with separately, of which obstetrics, or midwifery, is of overwhelming importance; it is closely allied to gynecology, or diseases of women. A special aspect of the application of medical knowledge is indicated in the term medical jurisprudence (*q.v.*).

The development and classification of medical science have proceeded by gradual steps from very early times. Among the more primitive peoples medical practice was an adjunct of the sacerdotal function, and relied more upon the influence of the deity than upon any intrinsic efficacy in the methods adopted. Even the priests of Aesculapius, the Gk. god of healing, relied upon purely religious exercises to effect a cure. The medical school of Chnidus was estab. between 700 and 600 B.C. and was mainly concerned with the description of symptoms as symptoms, dissociated from the patient. In this respect it differed from the Coan school, founded later by Hippocrates. The rise of purely rational curative methods is

associated with the name of the Gk. physician Hippocrates (c. 460 B.C.), who was an outstanding member of a profession which had already taken a distinct place in Hellenic life. The great feature of the work of Hippocrates is the recognition of disease as the result of natural causes, and he and his followers bequeathed to the medical world the principles of minute observation of symptoms and the consideration of these in relation to the patient and environment. These principles have grown into the method of clinical M. The general theory of the Hippocratic school postulated four humours in the human body. These were blood, phlegm, yellow bile, and black bile, and an improper proportion of the constituents was understood to be the cause of disease. Careful observation was necessary to diagnose the state of the body with regard to these elementary humours, and patient application of the available means of cure was combined with assiduous observation of their effects. When the victories of Alexander had disseminated Grecian knowledge throughout the known world, a school of physicians sprang up at Alexandria which founded what has been called the empirical school. The members of this school observed effects instead of inquiring after causes, and built up a body of clinical experience which appears to have led to considerable success in practice. Rome produced the school of 'methodics,' which assigned all morbid conditions to the too great constriction or too great relaxation of the pores separating the atoms of the body. The general treatment, therefore, involved increasing or decreasing the amount of constriction to the required extent by the use of drugs and by carefully adjusted dieting. All the medical knowledge of the ancients was co-ordinated and the results recorded by Galen, who lived in Rome in the second century A.D. The study of his works was pursued in the monastic establs. of the Middle Ages, but the search after a universal principle militated against the development of medical knowledge on scientific lines. The revival of learning helped to clear away some of the mists of superstition which had been superposed on the work of Galen. Good trans. were made by Linacre and others, and the study of anatomy, botany, and pharmacology proceeded apace. Scientific method, much as it helped forward the branches of knowledge which were ultimately to cause great developments in medical theory, did not, however, have an immediately great effect on medical practice. Success was more likely to attend the efforts of the empiricists who constantly sprang up, and overlaid with superstition as their theories were, nevertheless their knowledge of drugs and their skill in manipulation served them and their patients far better than somewhat dangerous dogma. In 1628 Wm. Harvey pub. his discovery of the circulation of the blood, but it was some time before the importance of this phenomenon was adequately recognised. Progress became constant though gradual, until the appreciation of the truths of

biology as demonstrated by Darwin led to the development of theories with far-reaching effects. In Germany Schölein commenced a new era by his discovery of a parasite as the cause of the skin disease called favus. Bacteriological research led, in the hands of Pasteur and others, to the conceptions of toxins produced in the blood by bacteria and to the anti-toxin evolved as a result of the intoxication.

On the work of Pasteur and his contemporaries, Koch and Klebs, the modern treatment of infectious diseases is based. Pasteur did pioneer work in vaccination and inoculation; Koch worked out the life-history of certain infective organisms, showing their relation to disease. Klebs discovered bacteria causing typhoid fever and diphtheria, and showed that some bacteria could be removed from a medium by filtration. He thus began the important work on filterable and non-filterable viruses. The results obtained by these three pioneers gave a stimulus to research on bacteriology and parasitology, and numerous infective bacteria and other parasites have been described since the middle of the nineteenth century. As a result, most infectious diseases, even those of epidemic character, are comparatively well under control. (See BACTERIA; EPIDEMIOLOGY.)

Pasteur's results helped to direct Lister's quest for a preventive of wound infections, and surgery, general healing, and hospital sanitation were inestimably advanced by the introduction of antiseptics (see LISTER). Tropical M., which became of interest as a result of exploration and colonisation, benefited by the impetus given to the study of bacteriology and parasitology. The first organised attempt to study tropical M. was made in 1764 by the Indian Medical Service of the Brit. Army. Sir Patrick Manson started the school of tropical M. in Hong Kong, 1866, and the London school in 1893. Subsequently similar schools have been opened in many busy ports, and much has been done to prevent, alleviate, and cure diseases caused by bacteria and by plants and animals parasitic on human beings in tropical countries.

During the nineteenth century considerable progress was made in public hygiene, particularly in connection with water supplies, sanitation, and the improvement of conditions in factories (see HYGIENE). The introduction by Ehrlich of salvarsan in 1910 for the treatment of syphilis paved the way for the discovery of prontosil, which was followed in turn by the mann. of still more efficient bactericides such as sulphanilamide and sulphapyridine; these have proved of great value in the treatment of pneumonia, puerperal fever, gonorrhoea, and other diseases. The discovery of penicillin by Fleming in 1928, and its use on a large scale during and subsequent to the Second World War, are described in the article PENICILLIN. Streptomycin is helping in the battle against tuberculosis, and other anti-bacterial extracts from fungi, as for instance chloramycetin and aureomycin, are also being investigated. The First

World War stimulated research in most branches of M. New methods of surgery were necessitated by the large numbers of cases needing immediate attention, and quick methods of blood transfusion were introduced (see BLOOD TRANSFUSION). Important advances were made in physiotherapy, leading to the more extensive use of massage, diathermy, electrotherapy, and radiotherapy (see sections on these subjects). Inoculation against influenza, cholera, typhoid, and para-typhoid fevers and other infectious and epidemic diseases was in general use in the army, and military hygiene was vastly improved. New antiseptics were introduced, and special investigations were made of diseases such as trench fever, gas gangrene, and shell shock, peculiar to warfare. Psychological methods of treatment became increasingly used by doctors, and the field of psychology has widened considerably. Shortage of food supplies led to extensive research on diet and nutrition, and this research was helped to a great extent by the discovery of Sir Frederick Gowland Hopkins, in 1906, that in addition to protein, carbohydrates, and fat, 'accessory food factors' are necessary for the maintenance of life. This led to the discovery of the vitamins (see HOPKINS, SIR F. GOWLAND; VITAMINS). The Second World War led, amongst other improvements in M., to the large-scale production and use of penicillin (q.v.) as an antibacterial agent. Other noteworthy advances during the twentieth century are mainly of social importance, and tend by preventive measures to raise the national standard of health. The institution of medical inspection of school children, the estab. of dental clinics, of welfare centres, where advice may be obtained relating to pre- and post-natal care of the child, have done much to improve the health of school children, and to reduce infant mortality. The mortality of mothers during childbirth has also been reduced by improvements in obstetric surgery, and Kronig and Gauss (1916) introduced the administration of morphine-scopolamine as an anaesthetic to induce 'twilight sleep' (see OBSTETRICS).

Arising out of the estab. by Mendel of heredity as a quantitative science, various methods of improving the race have been suggested (see EUGENICS; HEREDITY; MENDEL), while M. is also concerned with methods of contraception and their effect on the individual.

Endocrinology has developed into a specialised branch of M., a branch tending to connect it more closely with biochem. The effects of abnormal functioning of the ductless glands are seen in *Diabetes mellitus*, associated with the failure of the pancreas to secrete insulin; cretinism and Graves' disease, associated respectively with too little or too much secretion of the thyroid gland; Addison's disease, with the suprarenal bodies, and acromegaly, with the pituitary gland. Much experimental work remains to be done in connection with the endocrine system. Cortisone (compound E), recently extracted from the cortex of the

suprarenal bodies, is now being used in the treatment of rheumatoid arthritis (see BIO-CHEMISTRY).

The modern tendency in M. is to do far more experimental work. Mathematics is frequently employed to help to elucidate the results, and has enabled epidemiologists to predict the course of an epidemic, and hence to be prepared to combat it. The study of heredity and of certain physiological processes is also facilitated by the application of mathematics.

Principle, *Romance of Medical Science*, 1949; Sir J. Conybeare, *Textbook of Medicine*, 1949; and W. R. Feasby, *Medical Manual*, 1949.

Medicine, Forensic, see MEDICAL JURISPRUDENCE.

Medicine Hat ('the town that was born lucky'—Kipling), city of Alberta, Canada, 180 m. E.S.E. of Calgary, with wood-working factories, iron, steel, chemical, and cement works. Important strikes of natural gas have been made in the dist. It is one of the greatest flour-milling centres in the world. Pop. 10,000.

Medicine Man, see WITCH-DOCTOR.

Medicine, Patent, see PATENT MEDICINE.

Medick, the genus *Medicago*, perennial leguminous herb, growing to a height of 2 ft. in England, chiefly on waste land and gravelly or sandy soil, and also found in Europe generally. W. Asiatic countries and N. Africa. Brit. species include *M. falcata* or purple M., and *M. lupulina* or black M. *M. lupulina*, the Hop-trefoil, sometimes called Shamrock and in Norfolk Non-such, is occasionally cultivated with other clovers. It is a trailing biennial with yellow flowers and smooth kidney-shaped pods. *M. sativa*, with blue or violet flowers, and also known as lucerne, is a Mediterranean plant, largely cultivated as a green fodder plant. See also ALFALFA.

Medina, tn., 32 m. N.E. of Buffalo in Orleans co., New York, U.S.A., with electric power stations and manuf. of furniture and iron goods. Pop. 5800.

Medina, or **Madina** (Arabic for 'city'), or **Medinat Rasul Allah** ('city of the apostle of God'), sacred city of Hejaz, 253 m. N. of Mecca in W. Arabia. Besides the fort and the tn. proper, which is fenced with a rampart of massive stone masonry, there are suburbs, where the peasants mostly dwell.

The inhab. are agriculturists, who profit by the natural fertility of the volcanic soil and grow dates, peaches, apricots, and grapes. Next to Mecca M. is the most sacred resort of the Muslim pilgrims, for its spacious and impressive mosque contains the tomb of the prophet. The Hejaz railway reaches to M., though in 1925 the S. branch was destroyed during the Wahabi siege of M. Hist. and gossip (says the distinguished authority, St. John Philby) have long since combined to create in the mind of the traveller expectations of splendour which are doomed to disappointment and he is not prepared 'either for the charm of Medina or for its insignificance.' The approach over the sombre barrier of the lava field dividing the city area from the 'Aqlq valley is uninspiring and only the mosque and tomb of the prophet of Islam, with its dull-green dome and shapely minarets, 'suggests anything else save the bare bones of a departed glory.' 'The rest, at first sight, seems but ruin—the great oasis but a struggling belt of palms of considerable length but little density or grandeur; the city walls broken or disfigured by additions and reparations; and the city itself as an out-worn garment far too large for the body within.' '... closer acquaintance would disclose unsuspected charms without anything that may be called beautiful except the mosque itself' (H. St. J. B. Philby, *A Pilgrim in Arabia*, 1942). M. comprises the city, the camp, and annexe. All this area is surrounded by an outer wall, forming a rough oval a mile long from E. to W. and half a mile from N. to S. The core of M. is the city, walled all about, and occupying half the E. sector of the enclosed area. Its central feature, close to the E. extremity, is naturally the prophet's mosque, which, though much enlarged in the intervening period, covers the ground actually occupied by Mahomet and his family on their first arrival in A.D. 622. At the S.W. extremity of the annexe or Anbariya quarter, which is in ruins, is the railway station and workshops. The railway line from this point skirts the W. boundary wall on its northward route. On the S., inside and outside the rather dilapidated wall, are rambling gardens and palm groves, and a small insignificant hamlet called Misr. The main street of M. leads eastwards past a group of mansions on the left forming the residence of the Wahabi governor and his family and suite. The Manukha or camp area is surrounded by the houses and hostels which have grown up to shelter the visitors from the weather. On the other side of the camping place is a broad street called Ainliya, a new commercial thoroughfare leading into the Haram area. In the mosque is the famous library of Shaikh al Islam 'Arif Hikmat, the repository of hundreds of rare MSS. Outside the walls of the city there is a deep fringe of palm-groves encircling the old city from the Quba Gate on the S. side to the Damascus Gate on the N. The dates of M. are famous all over the Muslim E., both for their essential qualities and their pious associations. Pop. 30,000. See Sir R. F.

Burton, *Personal Narrative of a Pilgrimage to Al-Medinah and Mecca*, 1855, and E. Rutter, *The Holy Cities of Arabia*, 1928.

Medina del Campo, tn. of Spain in the prov. of Leon, 26 m. S.S.W. of Valladolid. There is a fine old castle. Once an important city of over 50,000 inhab., the pop. has dwindled to about 6000.

Medina Sidonia, tn. in the prov. of Cadiz, Spain, 20 m. S.E. of Cadiz. The tn. stands on a hill, and contains the old residence of the dukes of M. S. Pop. 13,000.

Medinet-el-Fayûm, city of Egypt, cap. of Fayum prov., situated on the Bahr Yusuf. It is an important trade centre of a rich agric. dist. The tn. stands close to the site of the anc. city of Crocodilopolis (Arsinoë), where the Egyptians worshipped the sacred crocodiles kept in Lake Moeris. Hawara, with its labyrinth, is to the S.E. Pop. 43,000.

Meditation. Spiritual teachers of all religions recognise three stages in the soul's progress towards perfection, the purgative, illuminative, and unitive ways. M. is the preliminary and indispensable exercise in the second of these 'ways.' It has been described by Ruysbroek as 'a concentration of all the interior and exterior forces in the unity of the spirit and in the bonds of love' (*L'Ornement des noces spirituelles*, il. 4), and by Boehme as 'the cessation of individual activity.' It is important to note that M. is not a mere indulgence of a natural disposition to reverie; it involves a deliberate act of attention, a deliberate act whereby all discordant images are expelled from the conscious mind, and all the scattered interests of self are recollected. Hence it is clear that M. must not be confused with mystical contemplation, wherein infused knowledge takes the place of ratiocination. M. requires the assistance of the imagination; and indeed no less a person than St. Teresa of Avila tells us that she was fourteen years practising M. before she was able to dispense with the use of a book. The most important guide to M. is the *Spiritual Exercises* of St. Ignatius of Loyola, upon which the Society of Jesus founds its whole spiritual teaching. The usual subjects of M. as practised in the Christian Church are the lives and sayings of Christ and the saints, and the cardinal dogmas of faith. This fact immediately distinguishes Christian M. from the *dhyana* of the Buddhists and *dikhr* of the Sufis, in which is taught concentration upon a single thought, and which may be regarded rather as prolonged acts of mental discipline rather than as stages towards moral perfection. See, besides the works of St. Teresa and St. John of the Cross, S. F. Poulain, *Grâces d'oraison*, 1906, and F. von Hügel, *The Mystical Element of Religion*, 1908.

Mediterranean Fever, see MALTA FEVER.
Mediterranean Sea (anc. Mare Internum), great i. and sea, bounded on the N. by Europe, on the E. by Asia, and on the S. by Africa, and communicating with the Atlantic by the Strait of Gibraltar, with the Black Sea by the Dardanelles, sea of Marmora, and Bosphorus, and with

the Red Sea by the Suez Canal. It has an area of about 1,008,000 sq. m., including its chief subdivisions, the Tyrrhonian, Ionian, Adriatic, and Aegean Seas, and its extreme length is 2300 m., with a breadth varying from 86 to 600 m. It has a drainage area of about 3,000,000 sq. m., the prin. rivs. being the Ebro, Rhone, Po, Arno, Tiber, and Nile. Italy, Sicily, and the shallows of the Adventure Bank, stretching from Sicily to Cape Bon on the African coast, divide the sea into an E. and a W. basin, of which the former has an extreme depth of 2187 fathoms and the latter of 2406 fathoms, while the mean depth of the whole area has been estimated at 780 fathoms. The rivs. bring but a small supply of water compared with the size of the sea, and owing to this and the great amount of evaporation in such a lat. there is a constant inflow from the Atlantic, and the water is saltier than in the great oceans. Its temp., too, at equal depths near the surface is on an average sev. degrees (Fahrenheit) higher than that of the Atlantic. At depths of less than 100 fathoms the water varies in temp. according to season and depth, but at great depths there is an almost constant and uniform temp. of about 55° F. In some places, under particular conditions, the tide rises as much as 5 ft., but taking the sea all over it may be said to be nearly tideless. The climate is warm and equable, the mean daily temp. being above 50° F. for at least eight months in the year, but the M. peninsulas have a marked deficiency of rain, the middle of summer being remarkable for its drought. Among local winds are the *sirocco*, a violent, dry, hot, parching, and dust-laden southerly wind, prevalent chiefly in Malta and Sicily, but occasionally as far N. as Rome; the *leveche*, a similar wind experienced on the S.E. of Spain; the *solano*, a moist E. wind visiting the same regions; the *mistral* and *bara*, cold, dry, northerly winds, the former of which prevails from the mouth of the Ebro to Genoa, especially round Marseilles, the latter along the coast of Dalmatia, and the *estesian* winds, which blow in the E. parts of the sea, chiefly in late summer and autumn. The prin. is. are Sicily, which divides the M. into an E. and W. portion, Cyprus, Crete, Malta, and the Ionian is. In the E., Sardinia, Corsica, and the Balearic Is. in the W. The most important gulfs are Taranto in Italy, Lepanto in Greece, Syrtis and Cabes in Barbary, in the E. portion; and Valencia in Spain, Lyons in France, Genoa in Italy, and Tunis in Africa, in the W. The M. is frequently subject to earthquakes, and Vesuvius, Stromboli, and Etna are among the most famous of its active volcanoes. The scenery of its shores is varied, mt. ranges and high table-lands predominating. The fauna of the M. is similar in character to that of the neighbouring parts of the Atlantic Ocean, but a marked feature is the scarcity of life in the deeper parts. Fish are abundant, especially tunny, anchovies, pilchards, and mackerel, and the finest coral, sponge, and ambergris are procured. Since the opening of the Suez

Canal, the pearl oyster and various other molluscs have come in from the Red Sea.

The M. is 'the Great Sea of the Hebs.,' but the Phenicians were the first great agents in promoting the communion of peoples, and their flag waved in every part of the waters of the 'Internal Sea.' After them came the Gks., who did much for trade, and even when Carthage had been destroyed and the Romans were all powerful, they still possessed the largest share of the commerce of the M., for the Romans despised all trade. In the Middle Ages the Venetians monopolised its commerce.

From the eighteenth century Great Britain exercised the main influence by the possession of Gibraltar and Malta, an influence which was contested by Italy during the Italo-Ethiopian war (1935-36). During the Sp. civil war tension in the M. became acute when the Sp. insurgents claimed the right to blockade Sp. ports. In the Second World War Great Britain and France controlled the M. up to the summer of 1940; but the whole position was changed by the collapse of France and the entry of Italy on the side of Germany. The position would have been still further compromised by the Vichy Gov., but for the prompt action of Mr. Churchill in securing the immobilisation of the Fr. fleet at Alexandria and the destruction of other units at Oran (July 1940). The balance of power in the M. swung in favour of Britain with the victory of Taranto when half the It. battle fleet was torpedoed by Brit. aircraft (Nov. 1940). This action confined the It. fleet to harbour besides virtually severing contact between Italy and Libya, and the complete opening of the M. to Brit. convoys to Libya seemed to be in sight at the end of the year. But early in 1941 the arrival of Ger. air squadrons in the airfields of Sicily destroyed this prospect, besides endangering Brit. naval operations, though these were by no means stopped, as was shown by the bombardment of Genoa and the naval victory off Cape Matapan (g.r.) (March 1941). But with the combined Ger. and It. air bombardments of Malta and the check on Brit. military operations in Egypt and Libya, Britain for a time lost the command of the M., and her supply ships had to make the 12,000-m. route round the Cape. The turning-point came with the victory of El Alamein (Oct. 1942), the landing of Amer. and Brit. forces in N. Africa (Nov. 1942), and the allied capture of Bizerta and Tunis for these events, besides liberating Malta, foreshadowed the immediate invasion of Italy. After the war other factors entered into the adjustment of the balance of power: Russia at one time sought to secure a voice in Tripoli, but so far this demand has not been followed up; again the question of the continuance or otherwise of the Brit. mandate in Palestine and the future relations of Britain with Egypt, which came before the United Nations in the autumn of 1947, might have seemed to suggest a reorientation of Brit. policy; but these and similar factors, such as Amer. influence in Greece in support of Brit. policy in that country against the Communist attempts to secure control, are

at present imponderables. *See also* NAVAL OPERATIONS IN SECOND WORLD WAR; AFRICA, NORTH, CAMPAIGNS IN (SECOND WORLD WAR). *See* E. C. Sempie, *Geography of the Mediterranean Regions*, 1931; E. Muspratt, *Greek Seas*, 1933; J. Holland Rose, *The Mediterranean in the Ancient World*, 1934; C. A. Petrie, *Lords of the Inland Sea*, 1937; F. Saxl and R. Wittkower, *British Art and the Mediterranean*, 1948; A. Siegfried, *The Mediterranean*, 1948; and H. Newman, *Mediterranean Background*, 1949.

Mediumship, *see* PSYCHICAL RESEARCH.
Medjidie, name of an Ottoman order, instituted in 1852 by the Sultan Abd-ul-Medjid, as a recognition of both civil and military distinction. It is a silver sun with the crescent and star interspersed between its rays.

Medlar, fruit of the M.-tree (*Espilus germanica*). It is about 1 in. in diameter and hard fleshed when fit to gather, but after storing for a few weeks the flesh softens or bleets. The flavour is peculiar, but is relished by many. The tree is much branched and of dwarf habit, and is usually planted for its large white flowers and generally decorative appearance.

Medmenham, vil. of Buckinghamshire, England, 3 m. S.W. of Marlow, famous for its abbey, which was founded by Cistercian monks in the beginning of the thirteenth century. Lord le Despencer founded a mock order of Franciscans here in 1755, commonly known as the 'Hell Fire Club' (*see also* DARTWOOD, SIR FRANCIS). The vil. is prettily situated near the banks of the Thames. Pop. 500.

Médoc, dist. of France, bounded on one side by the Gironde; famous for its claret, red Bordeaux, Maryaux, Pauillac, and other wines.

Medomsley, tn. in the co. of Durham, England, situated about 1 m. E.S.E. of Elcheater. It is engaged in coal-mining. Pop. 7000.

Medtner, Nikolai Raslovich (b. 1880), Russian composer, b. in Moscow. He studied the pianoforte under Safonov at the Moscow Conservatoire, gained there the Rubinstein prize, and toured Europe as a pianist in 1901-2, becoming prof. at the conservatoire for a year on his return, but then retiring to devote himself to composition. After the revolution he taught at a school in Moscow and in 1922 went on another tour in the W., but found himself unable to return. He settled in Paris for a time and later in London. M.'s instrumental music displays a rich harmonic invention, but his many songs, impeccable in taste, are his most important work, demanding the highest skill in singer and pianist. For the text he has relied largely upon Russian and Ger. poets, including Goethe, Heine, Pushkin, and others.

Medulla oblongata, *see* BRAIN.

Medullary Rays, term used in vegetable physiology, referring to radiating cellular bands which connect the pith with the cortex.

Medusa, *see* GORGONS.

Meduse, *see* JELLY-FISH.

Medway, riv. of England. Its source is

in Sussex, and it flows through Kent to Rochester, from which tn. it forms an estuary, joining the R. Thames at Sheerness. The marshland between the M. and the Thames is known as the Hundred of Hoo. The other tns. on its banks are Tonbridge, Maidstone (to which tn. it is navigable), and Chatham.

Medwig-ston, *see* MAIDSTONE.

Mee, Arthur (1875-1943), Brit. editor and author, b. at Stapleford, near Nottingham. In 1906 he produced the *Harmsworth Self-Educator*, and various other works followed, notably *The Children's Encyclopedia*, which he ed. from 1908 to 1933; *The Harmsworth History of the World* (1907); and *The Harmsworth Popular Science* (1912). He also founded and ed. the *Children's Newspaper*. In many productions he was associated with Sir John Hammerton (q.v.). He wrote *Joseph Chamberlain* (1900); *Arthur Mee's Golden Year* (1922); *The Children's Shakespeare* (1926); *The Rainbow Books* (1939); and *The King's England*, a survey of Eng. tns. and vils. (from 1938). *See* Sir J. Hammerton, *Child of Wonder*, 1947.

Meeanee, *see* MIANI.

Meergerer, Han van (d. 1917), Dutch artist, *see* FORGERY, *Forgery in Art*, or *Faking*.

Meenen, *see* MENIN.

Meerane, tn. in Saxony, Germany, situated about 9 m. N. of Zwickau. It is an industrial centre, and manufs. woollen goods and cloths, which it exports. Pop. 24,000.

Meer, Jan van der, name of two Dutch painters of Haarlem, who were father (1628-91) and son (1656-1705). Both painted landscapes with cattle. The father excelled also in sea-pieces and battle scenes, whilst the son, who had studied under Nicolas Berchem, and who was besides a charming etcher, was famous, above all, for his studies of sheep.

Meer, Jan van der (1632-75), *see* VERMEER, JAN VAN.

Meerkat, or *Suricate* (*Suricata tetradactyla*), mammal, with soft and long grey fur, which is found in Cape Prov., and belonging to the civet family. A third of its length (14 in.) is occupied by the tail. The M. feeds on succulent bulbs, is sociable, and partial to sun baths. The Madagascar cat and the *Cynictis penicillata* are also termed Ms.

Meerschau, $(\text{Si}_2\text{O}_11(\text{H}_2\text{O})_2 \cdot \text{Mg}_2)\text{H}_2\text{O}$, white or yellowish amorphous mineral, composed of hydrous silicate of magnesia. When dry it floats on water. Hardness, 2 to 2.5. It decomposes in hydrochloric acid with gelatinisation, and gives off water when heated. It occurs in beds and in irregular masses in alluvial deposits at Lamos and Negropont, in Asia Minor, Morocco, and in Spain, where it is used as a building stone. It is used for making pipes and pipe bowls, being admirably adapted by reason of its lightness and porosity. It is first soaked in tallow and in wax, and then polished.

Meerssen, com. of Holland in the prov. of Limburg, 4 m. N.E. of Maastricht. Pop. 6000.

Meerut, cap. of the dist. and div. of M.,

United Provs., India, situated 40 m. N.E. of Delhi. To the N. of the city is a cantonment, and it is the site of a military station. M. was the place at which the Indian Mutiny first broke out in 1857. Pop. (1941) 169,300; (div.) 6,700,000; (dist.) 1,896,000.

Megæra, see under EUMENIDES.

Megalith Culture (Gk. *μεγας*, great; *λίθος*, stone) is named from a development of Neolithic times characterised by the building of menhirs, alignments, tombs, and standing circles of large stones. Since the middle of the nineteenth century the term M. has come to mean either a large stone used in the construction or the construction itself as a whole. The M. tomb was essentially derived from the rock-out tombs of the W. region of the Mediterranean, and the fashion spread along the Atlantic seaboard of Europe, through Spain, France, and the Low Countries as far W. as the Baltic. The Ms. postulate a most powerful religious practice based on the ritual significance of fertility and directed to the worship of the earth mother. M. C. included mixed farming, rearing of stock, and the development of potting and weaving of cloth. When it impinged upon the older food-gathering civilisations, its economic effects were profound and indeed little short of revolutionary. In this the use of polished stone played an important part. There are sev. varieties and many notable examples of Ms. in Britain, and recent controlled excavations in the Orkneys, Caithness, the Cotswolds, Wales, and at Avebury and Stonehenge have added much to our knowledge of the M. C. The dolmen, a roofed burial chamber of stones, is found in the W. regions of England, in Scotland, and in Wales, but many are merely the chambers of long barrows from which the earth or stone envelope has been denuded; Kit's Coty in Kent and the Devil's Den near Marlborough are well-known examples. The long barrows vary in their architectural features; the chambers in the last stages were inserted in the side of the mound and the site of the former functional entrance occupied by a ritual false doorway. Well-known examples in Great Britain are Belas Knap and Rodmarton, Gloucestershire; Wayland's Smithy, Berkshire; and Carn Barn, Arran, and there are many others. Some of the standing-stone circles are later than the Neolithic period. Of the circles Stonehenge, Avebury, and Arbor Low, Derbyshire, are notable examples. See O. G. S. Crawford, *The Long Barrows of the Cotswolds*, 1925; M. C. Burkitt, *Our Early Ancestors* (ed. 1929); and J. and C. Hawkes, *Prehistoric Britain*, 1943. Maps: Ordnance Survey Megalithic Survey, *Neolithic Wessex, The Trent Basin, and South Wales*. **Megalopolis**, most recent but the most important of the cities of Arcadia, was founded on the advice of Epaminondas after the battle of Leuctra (371 B.C.), and was formed out of the inhab. of thirty-eight vills. It was situated in the dist. *Menalia*, near the frontiers of Messenia, on the R. Helisson, which flowed through

the city. It became afterwards one of the chief cities of the Achaean league. Philopomen and the historian Polybius were natives of M.

Megalosaurus, extinct reptile, a sub-order of the dinosaurs. Fossil remains, chiefly fragmentary, occur in Jurassic and cretaceous deposits in Europe, Asia, and N. America. It was a large carnivorous reptile, from 15 to 20 ft. long, with formidable teeth, powerful hinder quarters, and a long thick tail.

Megaphone (from Gk. *μεγας*, great, and *φωνη*, sound), instrument, invented by Edison, for facilitating the conveyance of sound for a distance of some miles. It consists of two large and tapering funnels.

Megapodidae, see MOUND BIRDS.

Megara, cap. of Megaris (q.v.), a small dist. in Greece, between the Corinthian and Saronic Gulfs. In ant. times M. formed one of the four divs. of Attica; but it was conquered by the Dorians, and was for a time subject to Corinth. It finally asserted its independence and rapidly became a wealthy and powerful city. After the Persian wars M. was for some time at war with Corinth, and was thus led to form an alliance with Athens, and to receive an Athenian garrison into the city (461); but the oligarchical party having got the upper hand, the Athenians were expelled (441). M. is celebrated in the hist. of philosophy as the seat of a philosophical school, usually called the Megarian, which was founded (about 400 B.C.) by Euclid, a native of the city. It was also known for its white shell marble and for a white clay, of which pottery was made. See E. L. Hightberger, *The History and Civilization of Ancient Megara*, 1927.

Megaris, small mountainous region of Hellas, or Greece Proper, bounded by Attica, Corinth, and the sea. It formed the N.E. part of the isthmus of Corinth. Cap. Megara (q.v.).

Megasthenes, Gk. writer who lived in the third century B.C. He was sent by Seleucus Nicator as ambas. to the Indian King Sandrocottus, and spent some time at his court in Magadha in the valley of the Ganges. While he held that position he compiled an historical and geographical work about India, entitled *τα Ἰνδικά*. This book, which is written in the Attic dialect, is the chief treatise on that subject left us by the ancients, and on it are incorporated the records of both Diodorus and Arrian.

Megatherium (Gk. 'great beast'), gigantic extinct herbivorous quadruped (18 ft. long, 8 ft. high), of the order Edentata, and, with *Mylodon*, *Megalonyx*, etc., forming the family Megatheriidae. It was a kind of giant sloth. Its skeleton was found in the Argentine in 1789, in the S. Amer. pampas deposits of the Pleistocene period. The structure of the lower jaw indicates that it had a prehensile tongue similar to that of the giraffe.

Megerie, Ulrich, see ABRAHAM A SANCTA CLARA.

Meghna, estuary of the Ganges and the Brahmaputra, enters the sea by four mouths. Navigation is somewhat impeded by a strong tidal bore.

Megiddo (modern Tell el-Mutesellim), old

fortified city of Palestine, commanding the best pass from the Mediterranean to the valley of Esdraelon and on N. to Galilee and Damascus. It was always a point of great strategic importance; the great Pharaoh Thothmes III. (middle fifteenth century B.C.) defeated here the Canaanites, and the Judean King Josiah (2 Kings, xxiii. 29 f.) was defeated and mortally wounded by Necho (609 B.C.); finally, in 1918, Allenby defeated here a Turkish Army.

A Ger. expedition excavated this site in 1903-5, but it found little of exceptional interest. Large-scale systematic excavations, however, of the Oriental Institute of the Univ. of Chicago (1925-39), with

with hydraulic lime-plaster. Each unit of stabling consisted of a central passage (c. 10 ft. wide), flanked by two rows of stone pillars, which served simultaneously as tie-posts and as supporters for the roof. Beyond were two aisles for the horses (each 10 ft. wide), each unit accommodating over thirty horses. See J. Finegan, *Light from the Ancient Past* (3rd ed.), 1947; F. Thieberger, *King Solomon*, 1947; and W. F. Albright, *The Archaeology of Palestine*, 1949.

Megrim, see MIGRAINE.

Megrim, temporary loss of voluntary power and movement in horses. The symptoms frequently occur when a horse is going up-hill with a stiff load and tight

MEGIDDO: THE EXCAVATION OF SOLOMON'S

E.N.A.

resources which dwarfed all preceding excavations (nearly \$1,000,000 was spent) produced extremely interesting results. The debris of occupation reaches about 70 ft. of depth, the lowest level of occupation going back to the beginning of the fourth millennium B.C. or earlier. The most interesting results so far are the extensive stables (discovered in 1928) of the Israelite kings, which were first built in the time of Solomon (970-931 B.C.), and the astonishing hoard (found in 1937) of more than 200 carved and incised ivories from the twelfth century B.C. The M. stables covered a considerable portion of the site, and, according to the easily recognisable lay-out, provided room for 450 to 480 horses and 150 to 160 chariots. The stables were exceedingly well built; the architects who reconstructed a model of the stables on the basis of the remaining ruins, were struck by the aesthetic and practical nature of the design. The stables and the adjacent courtyard were paved

collar, following congestion of the blood vessels in the brain: the horse falls down and its pulse is very small. General attention to the animal's condition, the provision of a more comfortable collar, and less heavy loads check its recurrence.

Mehadia, nrkt. tn. of Banat, Rumania, 15 m. N. of Orsova. It was on this site that the Rom. tn. of Ad Mediam was built, and the Hercules baths known in Rom. times are near here. Pop. 2500.

Mehallet-el-Kebir (anc. Cynopolis), cap. of the prov. of Gharbiye, lower Egypt, situated 45 m. S.W. of Damietta. Pop. 48,000.

Mehemet Ali, or Mohammed (1769-1849), pasha of Egypt, b. at Cavalla, Rumelia, where he at first kept a shop, but soon gave up trading for the profession of arms. He helped to suppress a rebellion in Crete. Later, in Egypt, at the head of a corps of Albanians, he co-operated with the Brit. in driving out the Fr. from that country, and afterwards, having made an

alliance with the Mamelukes against the Turkish sultan's regent, Khosrow, became viceroy of the Mamelukes. Mainly through bribery he was made pasha of Cairo by the sultan in 1806, and then, turning against his former allies, the Mamelukes, tried to exterminate them, and did indeed cause large numbers of them to be assassinated, thereby securing undisputed sway over upper Egypt. He now sought to suppress the fanatic Wahabis in a war which lasted for sev. years, during which his son, Ismail Pasha, conquered Dongola, Kordofan, Sennar, and other provs. Another son, Ibrahim, he sent in command of a large fleet to Morea to co-operate with the Turks against the Gks. in their struggle for independence; but his fleet was completely destroyed at Navarino (q.v.) (1827). The sultan, however, in return for his aid against the Gks., surrendered Crete to M. in 1830, and was promptly met with a demand for the cession of Syria. This having been rejected, M. invaded and conquered that prov., and, after inflicting a crushing defeat on the Turks at the battle of Konieh, marched on Constantinople, but was baffled by the intervention of the European powers. He succeeded, however, in acquiring Syria and Adana under a treaty signed at Kutais. In 1839 the Sultan Mahmoud II. sought to regain Syria, but, being heavily defeated by M., appealed to the European powers for assistance. The outcome of European aid was that M. was defeated near Beirut, and Alexandria being blockaded, M. gave up their claim on Syria, but secured for his family recognition as hereditary pashas of Egypt. In 1848 he resigned in favour of his son Ibrahim, who was soon afterwards succeeded by Abbas, M.'s grandson. In the closing years of his life M. lost his reason. M. was unquestionably a great soldier, and a most able ruler, albeit owing much to intrigue and assassination. He not only succeeded in organising his army on European models, but in peace gave a great impetus to agriculture and commerce, besides founding medical and military schools, reforms the more remarkable in view of his lack of education. See H. Dodwell, *The Founder of Modern Egypt: a Study of Muhammad Ali*, 1931.

Mehlis, see ZELLA-MEHLIS.

Mehoffer, Józef (b. 1869), Polish painter. b. at Ropczyce. His stained-glass work, especially that at Fribourg in Switzerland, is noted for its fresh and lively colouring, and he has had much influence on the revival of the art. See J. Berthier, *Les Vitraux de Mehoffer à Fribourg*, 1918.

Mehomia, or Razlog, Bulgarian tn. of Macedonia, situated 55 m. S.E. of Sofia. Pop. 8000.

Mehta, Sir Firozshah Mehrvānji (1845-1915), leader of the moderate Congress party in W. India; b. at Bombay, son of a Parsi merchant. He was the first Indian to be called to the Eng. Bar (Lincoln's Inn, 1868). From 1872 he sat on the Bombay corporation. A member of the supreme legislature for three triennial terms, he was one of the founders of the National Congress, becoming its president in 1890. E.C.I.E., 1904.

Méhul, Etienne Henri (1763-1817), Fr. composer, b. at Glivet, Ardennes, and studied musical composition under Gluck. The production of his first opera, *Cora*, was delayed, but meanwhile he made a sensation with his comic opera, *Euphrosine et le soldat* (1790). The *Cora* met with no success, but M. soon reached the front rank with his *Sratonice*. He will be best remembered for his sacred opera *Joseph in Egypt* (1807). His other operas include *Adrien*, *Phrosine et Melidore*, and *L'Irato*, and he also composed numerous symphonies. He died of consumption, leaving a great deal of musical scores behind him, much of it notable for its dramatic power and effective orchestration. See life by R. Brancour, 1912.

Mehun, tn. in the dept. of Cher, France, situated on the Meuse, 8 m. N.W. of Bourges. Pop. 5100.

Meiderich, Ger. tn. incorporated with Duisberg (q.v.).

Meier-Graefe, Julius (1867-1935), Ger. art historian, b. at Reschitz, Rumania. He wrote on the development of modern art and studies of Cézanne (1910), Van Gogh (1910), Delacroix (1913), Courbet (1921), Dostoevsky (1926), Renoir (1929); and Corot (1930). He was editor of *L'Art décoratif* from 1896 to 1900.

Meighen, Arthur (b. 1874), Canadian Conservative statesman, b. at Anderson Post Office, Perth co., Ontario, son of Joseph M. Educated at St. Mary's Collegiate Institute and Toronto Univ., he taught in a school and later engaged in business. Called to the Bar in 1903, he practised at Portage la Prairie, for which place he was first elected to the House of Commons, 1908. Solicitor-general 1913; secretary of state and afterwards minister of interior 1917; he attended the imperial conference of 1918. He was Prime Minister and privy councillor in 1920. His party was defeated in 1921, and he lost his seat, but was elected for Grenville co. in 1922, and re-elected for Portage la Prairie in 1925. Prime Minister in 1926, he became minister without portfolio 1932-35, and leader of the gov. in the Senate 1932-35. Early in 1942 he accepted the leadership of the Conservative party, and demanded conscription for overseas service, a total war effort by Canada, and a national gov. In the by-election in March, however, he was defeated for the S. York div. of Ontario.

Meijo Tenno, see MITSUHIRO.

Meiktila, div., dist., and tn. of Burma. The div. consists chiefly of a level plain, and large numbers of cattle are reared. The chief products are rice, cotton, millet, and sesamum. The tn. of M. stands on a lake. Area of div. 10,854 sq. m.; of dist. 2183 sq. m. Pop. of div. 1,200,000; of dist. 344,000; of tn. 8000. See also BURMA, SECOND WORLD WAR, CAMPAIGNS IN, *Battle for the Burma Oilfields*.

Mellhan, Gabriel Senao de, see SENAO DE MEILHAN.

Meiningen, tn. of Thuringia, Germany, situated on the r. b. of the Werra, 43 m. N.W. of Coburg. Some of the tn. is old, the Elisabethenburg being one of the buildings of interest. Pop. 22,100.

'Mein Kampf' ('My Struggle'), title of a two-vol. work written by Adolf Hitler (q.v.), setting forth his political programme. The first vol. was written in the fortress of Landsberg am Lech, Bavaria, where he was undergoing a term of imprisonment after his abortive *putsch* of 1923. The second vol. was written in the years 1925-27 after he had reconstructed his party.

If European statesmen had accepted a literal interpretation of this very frank self-disclosure the Second World War might have been averted. Expressed concisely Hitler's thesis in this work is that his countrymen should be prepared to endure any hardship and strain every nerve and muscle to fight a great war. Gers. were told that they were the great Nordic people, that it was their duty to increase their pop., and that, when they had once again, by the sword, become a world power, they must remorselessly seek *Lebensraum* by annexing ter. all round. Crude as is the composition of the work, it reveals a powerful brain, proceeding philosophically and with unquestionable logic. If the Ger. people were discouraged and downhearted from their defeat in 1918, they must be reinvigorated with a new outlook, a new *Weltanschauung* or 'manner of regarding the world'. This new spirit or way of looking at life and the purpose of national policy is supplied in the book. It is founded not only on the assumed superiority of the Ger. race, but, also negatively, on contempt for Jews, Socialists, and parl. institutions. Rid Germany of the influences due to each and all of these, and the way was open to the next step, the rearmament of Germany, and the piecemeal absorption or destruction of all the surrounding nations. Hitler had learned much from his adversaries, notably the Viennese Socialists. It was from them that he learned the methods of terrorisation and gangsterism which he himself afterwards adopted and, with ruthless cynicism, brought to perfection. He traded on his acquired knowledge of mass psychology and openly avers that the 'masses would sooner be dominated than supplanted' and that, however barefaced the intimidation practised upon their minds, they would be as little conscious of the outrage upon their human liberty as of the fallacies underlying the whole doctrine (see 181st Ger. ed., p. 44). An essential part of the technique in these methods was that of a barrage of lies and calumnies levelled at any selected adversary, e.g. Dr. Schuschnigg of Austria and Dr. Beneš of Czechoslovakia. Actually these doctrines of racial superiority and the need for *Lebensraum* were not invented by Hitler. They were essentially personal or local fanaticisms, particularly the anti-Semitic teaching, converted into mainstays in the pursuit of power-politics.

Such teaching was bound to prevail among Gers. in a way which would be impossible with the democracies, because, in the latter, it is the nation or political unit that supplies the unifying bond, whereas the Gers. have only with difficulty

thought of themselves in any other way than as a race. And this racial pride further explains why the post-war settlement of Versailles, especially on the E. border of Germany, so bitterly rankled in Ger. minds as an unmerited violation of their natural rights. These doctrines supplying the ground plan of his thesis, it remains to ask how Gers. were to become a world power needing a large ter. The answer is the simple one: the sword must win what the plough must till. Not only of the treaty limitations on her arms and armed forces, but of every restraining bond forged by the Versailles Treaty, Germany must as soon as possible ruthlessly rid herself. The actual sequence in the steps taken by Hitler subsequently, rearmament, remilitarisation of the Rhineland, annexation of Austria, subjugation of Czechoslovakia, and conquest of Poland, conformed to a rigidly logical development. Sooner or later must come the decisive war, and he was ready to embark on it in Sept. 1938, when he compassed the humiliation of Czechoslovakia. The catastrophe of a European war was averted by the Munich 'appeasement' fiasco of that year; but the curious thing is that any European statesman could have believed that the absorption of the betrayed Czechoslovak nation could have satisfied Hitler. The legitimate inference is that if they had read *M. K.*, they regarded it as no more than the vapouring of a madman. Yet repeatedly in the thesis recur exhortations to annex ter. as the foremost task of a foreign policy and the first duty of the Ger. National Socialist party. Annexations are described as a moral duty for those who need to expand, and no argument must be heeded which assumes that annexation involves an infringement of human rights. This brief survey of *M. K.* may be concluded with a reference to Hitler's doctrine that the more any one yields to you the more you should exact from him, and in this connection we may quote the familiar passage on domination: 'A clever conqueror will always, if possible, impose his demands on the conquered by instalments. For a people that makes a voluntary surrender saps its own character, and with such a people you can calculate that none of these oppressions in detail will supply quite enough reason for it to resort once more to arms.'

Meissen, Heinrich von, see HEINRICH.

Meissen, tn. of Saxony, Germany, on the L. of the Elbe, 14 m. W.N.W. of Dresden, built partly on two heights, the Atraberg and the Schlossberg. The latter is crowned by a thirteenth-century cathedral and the Albrechtsburg, where Dresden china was manufactured from 1710 to 1863, after Böttger discovered the art of making porcelain known in Fr. as 'Vieux Saxe'. The porcelain factory is now in the Triebisch valley. The tn. is also noted for manufs. of machinery, turbines, and cables, and has textile factories and breweries. M. was founded about 928 by Henry the Fowler, and till the thirteenth century was the seat of margraves, becoming merged in the kingdom of Saxony

about 1423. Cölln-an-der-Elbe was incorporated with M. in 1901. Pop. 47,800. See O. E. Schmidt, *Das tausendjährige Meissen*, 1928; H. Giesau, *Die Meissener Bildwerke*, 1936; and H. Kuas, *Der Dom zu Meissen*, 1939.

Meissonnier, Jean Louis Ernest (1815-91), Fr. painter, b. at Lyons, was a pupil of J. Potier and L. Cogniet at Paris. His most characteristic work depicts civil and military life of the seventeenth and eighteenth centuries, or scenes of 'society' life, painted on small panels, and remarkable for finish and detail. The influence of the Flem. figure-painters is evident in these. M. was elected to the Académie (1861), and was president of the Great National Exhibition (1883). Among his works may be mentioned 'Les Joueurs d'échecs' (1836); 'La Rixe' (1854); 'Cuirassiers of 1805' (1871); 'La Lecture chez Diderot' (1859); 'A Game of Piquet' (1845); 'Arrival of the Guests.' The Wallace Collection (Hertford House, London) has good examples of his 'miniatures in oils,' including 'Soldiers Gambling' and 'A Charge of Cavalry.' See works by J. Claretie, 1881; J. Mollet, 1882; J. Laurens, 1892; G. Larroumet, 1893; M. O. Greard, 1897; and E. Fromentin, 1901; also A. Alexandre, *Histoire de la peinture militaire en France*, 1891.

Meistersingers (master-singers), name given to the Ger. lyric poets of the fourteenth, fifteenth, and sixteenth centuries, who banded themselves into guilds for the revival of the national minstrelsy. Many schools for M. were formed in all parts of Germany, especially the S., perhaps the most famous being that of Nuremberg whilst under Hans Sachs. Each guild was divided into various classes, from beginners or *Schüler* up to *Meisters* or poets, who could invent a new melody in addition to fitting new words to old tunes. Meetings were held weekly in the tn. hall or the church, and there were special competitions and festivals at Easter, Whitsuntide, and Christmas. The members of the guild regarded poetry and music too much in the light of *crafts*, in which excellence was attained by following certain rules, to produce any very great achievements, but their general effect was good rather than bad. After the sixteenth century the M. gradually died out. Wagner's opera has immortalised their tradition. See W. Nagel, *Studien zur Geschichte des Meistersangs*, 1909.

Mejerda River, see BAGRADAS.

Mekenon, Israel von, see MEKENEN.

Mekla, tn. of Algeria, situated 85 m. S.W. of Biskra. Pop. 10,000.

Meklong, seaport of Siam, on the gulf of Siam, 44 m. S.W. of Bangkok. Salt is exported. Pop. 16,000.

Meknés, Mekinez, or Mequinez, tn. of Fr. Morocco, situated 35 m. W. by S. of Fez, on a mt. slope. It is the summer residence of the sultan and the site of the Mulai Ismael mosque. Its chief manufs. are earthenware and leather. Pop. 159,800 (Europeans 23,600).

Mekong, Mekhong, or Cambodia, River, chief riv. of the Siam Peninsula, Indo-China, about 2800 m. long. Its exact

source is unknown, but it rises in Tibet, where it is known as the Lan-tsang-kiang, its head stream probably being the Chien-tso-kiang, parallel to the upper Yangtze-kiang. It flows through the Chinese prov. of Yunnan, the Shan country, Laos, and Cambodia, entering the China Sea by numerous mouths in Cochlu-China. It forms a boundary between Siam and Indo-China. There are rapids below Chienhong and at Kratie and other parts. The branch from the Tonle Sap (Great Lake, Bienhoa) joins the main riv. at Pnompenh.

Mela, Pomponius, Rom. writer on geography, b. at Tingentera in Spain, probably contemporary with the Emperor Claudius. M.'s work is entitled *De Situ Orbis*. It is divided into three books, and contains a very brief description of the various parts of the world. The best eds. of M. are by Gronovius (Leyden), 1685, frequently reprinted; by Tschucke, 1807; and the Bipont, 1809. M. has been trans. into Eng. by A. Golding, 1585 and 1590, and by E. von Philipp, 1912; into It. by Forcarchi, 1557; and into Fr. by Frélin, 1804. See D. Detlefsen, *Quellen und Forschungen zur alten Geschichte und Geographie*, 1908.

Mélaka, see MALACCA.

Melampus (Μελαμπος), legendary son of Amythaon and brother of Bias. He is said to have estab. the worship of Dionysus in Greece, and to have been the first to practise the medical art. He was also regarded by the ancients as being the first mortal endowed with prophetic powers.

Melancholia, form of insanity (q.v.). The patient becomes morbidly introspective and suffers from insane delusions, and becomes suicidal. Recovery from M. can be more complete than from any other form of insanity. Fresh air, good diet, and careful exercise and attention to the bodily functions are essential features in the treatment. A condition in which depression and excitement occur, alternately or otherwise, is called manic-depressive psychosis. See S. Freud, *Monrning and Melancholia*, in vol. iv. of *Collected Papers*, 1921-25.

Melanchthon, Philip (1497-1560). Luther's fellow worker in the Reformation, b. at Bretten, Baden. His name was originally Schwarzerl. It was because the celebrated Gk. scholar, John Reuchlin, a relation, had trans. his own Teutonic surname into the Gk. formation Capnio, on the supposition of its connection with *Rauch* (smoke), that the young Schwarzerl (a compound, meaning in Eng. 'black earth') received the more melodious (Grecised) appellation of M., by which alone he is now known. He was educated at Heidelberg. In 1512 he went to Tübingen, where he became student and teacher, till on his relative Reuchlin's recommendation he was appointed prof. of Gk. at Wittenberg (1518), and it was here he became acquainted with Luther.

In 1521 he pub. his *Loci communes rerum theologicarum*, the first great Protestant work on dogmatic theology, which passed through fifty eds. during his life. In 1530 he made a most important con-

tribution to the cause of Protestantism in the Augsburg Confession (q.v.). His consent, conditionally given, to the introduction of the Augsburg Interim (q.v.) (c. 1547) led to painful controversies. He died at Wittenberg, leaving two sons and two daughters by his wife, the daughter of a burgo-master of that town, whom he had married in 1520. Among his most notable works are *Summa doctrinae Lutheri* (1524); *Libellus visitatorius* (1527); and *Examen ordinandorum* (1552). His numerous works, consisting of theological treatises, commentaries on sev. of the Gk. and Lat. classics, Lat. poems, and some historical and philosophical writings, were pub. in a collected form in 5 vols. at Basle in

PHILIP MELANCHTHON

After an engraving by Albrecht Durer, 1526.

1511, and in 4 vols. at Wittenberg in 1564, again in 1580, and again in 1601. The most complete ed. of his works is that by C. G. Bretschneider in his *Corpus reformatorum* (28 vols., 1831-60; supplements ed. by O. Cleinen, 1910 ff.). See also Peucer's ed. of his works (1562-1564). M.'s life was written by his friend Camerarius (q.v.), 1566. See also lives by B. Saunders, 1897; G. Wilson, 1897; G. Ellinger, 1902; and H. Engelland, 1931; also F. Hildebrandt, *Melancthon, Alien or Ally*, 1940.

Melanesia (Gk. *melas*, black, and *nēsos*, is., from the colour of the inhab. of the is.), name given to a large group of is. of W.-central Oceania, between Micronesia (q.v.) in the N. and Polynesia (q.v.) in the S., inhabited mainly by people of Papuan origin. The term M. embraces all the is. from the Bismarck Archipelago in the N.W. to the Fiji Is. in the S.E., and includes part of New Guinea, Santa Cruz, Banks Is., New Hebrides, D'Entrecasteaux, New Caledonia, Loyalty, and Admiralty Is. The is. are either of volcanic or coral formation, abounding in reefs and lagoons, with luxuriant vegetation.

The inhab. are treacherous and ferocious, cannibalism is probably still practised, and they are ethnically affiliated to the Papuans of New Guinea. They are short in stature, with frizzly hair and negroid features, denoting the intrusion of a Polynesian element into the aboriginal stock. They tie their hair into small bunches with fibre, causing it to stick out all round the head. Their protruding jaws and thick lips give them a hideous appearance. They speak an anct. form of the Malayo-Polynesian language, and their religion is animism combined with spirit worship. The is. are devoid of the larger carnivora, but rats, opossums, bats, mosquitoes, and reptiles abound. As M. stretches from 145° E. and 1° S. in a S.E. direction to the Tropic of Capricorn at 180° E., the is. vary in their flora and fauna to a very great extent, as also do their manners and customs. The inhab. of some of the is. are proving amenable to European civilisation, and under good gov. and treatment are showing many signs of improvement.

Anthropologically the different is. groups present many features that would appear to be common to Melanesian society generally, but in some cases there are marked divergencies. In the Banks Is. a noteworthy custom is that of initiation into the *sukue*, a complicated organisation which may be compared to a man's club. A div. of the *sukue* is the *tamale* or ghost societies which meet in the bush. In most vils. in these is. there is a building called the *gamal*, which is the eating and sleeping house of the members of the *sukue* as well as their general meeting-place in the vil. The process of initiation into the various ranks of the *sukue* is an important element in the social life of the Banks Islanders. Each of the *tamale* societies is entered by a ceremony of initiation which varies greatly in complexity and duration for the different societies. Most of the *tamale* societies possess objects, worn as hats or as masks, or carried in the hand, and these often bear the shape of the animal or other object from which the society takes its name. The object of the *tamale* is partly disguise, and partly to produce fear among the uninitiated, and to enhance the mystery of the societies. A study of the *sukue* and *tamale* societies is necessary to an understanding of their bearing on the general life of the people of the Banks Is., and especially on the determination of social rank and importance, the distribution of wealth and the protection of property. Though there are many points of similarity between the cultures of the Banks and Torres Is., notably in connection with relationship, the social organisation of the two groups of is. differs considerably. The main social divs. of both groups, however, are exogamous. In the New Hebrides the social structure is that frequently met with in Melanesian is., namely that of the dual exogamous organisation with matrilineal descent. Both sexual communism and communism in property were once practised in M. It is probable that the two kinds of communism were closely associated. Secret

organisations, however, sprang up, which introduced the very widespread custom of taboo, an important feature of which was the protection of individual property.

Perhaps the most instructive is. for Melanesian sociology is New Guinea, the largest of all the M. is. The inhab. of this is. present extraordinary differences in physical characteristics and culture, and the contrast between the relatively tall, dark-skinned, frizzly-haired natives of Torres Strait, the Fly R., and the neighbouring parts of New Guinea on the one hand, and the smaller lighter-coloured peoples of that part of the coast-line stretching from the E. of Cape Possession to the archipelagos of the E. extremity, is so striking that the two peoples must be recognised as racially distinct (Seligmann). Hence the term Papuan is really unsuitable to denote the inhab. of the whole of New Guinea, and it is better to follow Prof. Seligmann, who uses the term 'Papuanian' to denote all the inhab. of New Guinea and its archipelagos, and limits the term 'Papuan' to the geographically more W. Papuanians, a congeries of frizzly-haired and often mop-headed peoples, whose skin colour is some shade of brownish black. The E. Papuanian, or the generally smaller, lighter-coloured, frizzly-haired races of the E. peninsula of New Guinea and its archipelagos may be called Papuo-Melanesians (or Massim). Many of these latter speak languages with a common Melanesian grammar. These languages are divisible into groups, the constituent languages of each containing many common words, all akin to the stock language of Oceania. But the vocabulary of the Papuan languages shows a number of evidently unrelated stock languages, and their grammar has no Melanesian characteristics. The inhab. of the N. is. of the Massim, like the inhab. of the Louisiades, are skilled in the craft of building the *waga*, large sea-going canoes, that figure so prominently in the life of the dist. It is in these is. too that the decorative art, characteristic of the whole of the Massim dist., has attained its peak in the carving of ornaments for the bows of the *waga*, and in the decorative patterns of the trobriand lime gourds. The most characteristic cultural feature of the Massim is the existence of a peculiar form of totemism with matrilineal descent. The members of each clan have as totems a series of associated animals belonging to different classes of the organic kingdom. Exogamy is strictly observed. Totem birds, snakes, and fishes are commonly represented upon houses and canoes' bows and upon lime spatulas, and indeed on most of the wooden utensils and ornaments of the Massim. For further details of the various groups of is. in M., see the separate articles PAPUA; NEW GUINEA, etc. See R. H. Codrington, *The Melanesians*, 1891; C. G. Seligmann, *The Melanesians of British New Guinea*, 1910; W. H. R. Rivers, *The History of Melanesian Society* (2 vols.), 1914 (a survey of kinship and marriage); and S. H. Ray, *Comparative Studies in the Melanesian Languages*, 1926.

Melanians, family of fresh-water snails, abounding in most tropical and sub-tropical countries and numbering about 1000 species. The shells are spiral and turreted, and are mostly of dark colours.

Melanorrhoea, genus of tall evergreen trees (order Anacardiaceae). *M. utilita* is the varnish tree of Burma. The varnish is obtained as a thick, white juice on tapping the tree, which turns black on exposure to the air; it has anthelmintic properties. The wood is tough and very valuable.

Melantherite, see COPPERAS.

Melanthaceae, natural order of bulbous, tuberous, or fibrous rooted plants, with white, green, or purple flowers, commonest in temperate countries.

Melba, Nellie (Mrs. Helen Porter Armstrong, *nee* Mitchell), Dame (1861-1931), Australian soprano, b. at Burnley, near Melbourne, of Scottish birth, daughter of David Mitchell of Forfarshire, who had settled in Australia. Her first public appearance was on May 17, 1884, in Melbourne, and, the following year, she regarded herself fortunate in being soprano at St. Francis's Rom. Catholic Church in Melbourne. Gradually, however, she began to recognise her own capabilities, and persuaded her father to go with her to London in order that she might take lessons (1886). Sullivan rejected her for the Savoy Opera Company, Randegger would not receive her as a pupil; and Carl Rosa did not keep a promised appointment open for her. She then went to Paris, where she became the pupil of the celebrated Mme Marchesi. Soon she appeared in one of Marchesi's matinées as 'Mme Melba,' the name being derived from Melbourne. Her début in opera was at the Théâtre de la Monnaie, Brussels, 1887, as Gilda in *Rigoletto*. Her success was immediate, and was enhanced by her handsome face and figure. Later she appeared in *La Traviata*, *Lucia*, Delibes's *Lakmé*, Thomas's *Hamlet*, and at Covent Garden Theatre (May 24, 1888) as Lucia in *Lucia di Lammermoor*, though the critics were not enthusiastic over her voice. In 1889 she returned to Paris to continue her study with Marchesi, and from 1889, after her first appearance at the Paris Opera House, her record was one of constantly growing popularity. She toured Europe and America with equal success. During the First World War she raised over £100,000 for the soldiers, and was made D.B.E. In 1924 she made her farewell to the Australian operatic stage, taking the part of Mimi in *La Bohème*, and her farewell, in London, at Covent Garden, in the parts of Mimi, Desdemona, and Juliet. M. was a coloratura singer, pure and simple; she had a voice of great range and of perfect purity, and of absolutely even quality, yet left many unmoved by a certain coldness or nonhuman quality. She made one or two attempts at the bigger things, such as Elsa in *Lohengrin* and Elizabeth in *Tannhäuser*, but her success was less in proportion as the music and dramatic force increased in profundity of meaning; and, after taking the part of Brynhilde in *Siegfried*, in 1896,

with no success, she abandoned any further idea of being a Wagnerian singer. She married Charles Armstrong, son of a Queensland squatter, 1882. She was the first person to broadcast in a musical programme, from Marconi's station at Chelmsford (June 15, 1920). She wrote an autobiography, *Melodies and Memories* (1925). See lives by Agnes G. Murphy, 1909, and P. Colson, 1932.

Melbourne, William Lamb, second Viscount (1779-1848), Eng. statesman, b. in London. His univ. education he received first at Cambridge, and at Glasgow. He entered the House of Commons for Leominster in 1805, and joined the Whig opposition, under the leadership of C. J. Fox. He accepted the chief secretaryship of Ireland in Canning's Gov., and this partial alienation from the Whigs was increased when he not only took office under Lord Goderich, but remained for a short time in the gov. of the duke of Wellington. In 1828 he was transferred to the Upper House. In 1830 he was home secretary in the gov. of Earl Grey. In 1831 Earl Grey retired, and William IV. sent for M., who became Prime Minister. On the accession of Queen Victoria in 1837 it became the duty of M. to instruct the young sovereign in her various duties to fit her to perform her part as the constitutional monarch. In 1841 his gov. was succeeded by that of Sir Robert Peel. See Lord D. Cecil, *The Young Melbourne*, 1948, and D. B. Wyndham Lewis, *Four Favourites*, 1948.

Melbourne, mkt. tn. of Derbyshire, England, 7 m. from Derby on the London Midland Region railway. It is a market-gardening centre, and has boot and thread manufs. Pop. 4000.

Melbourne, cap. of Victoria, Australia, founded in 1835, in the reign of William IV., and named after Lord Melbourne, the then Prime Minister of England, lies on the Yarra Yarra, at the head of an extensive sheet of water called Hobson's Bay, 24 m. from the anchorage. It is the second most populous city in Australia and the fifth city of the Brit. Commonwealth; the area of metropolitan M. is 2124 sq. m. It is prettily situated overlooking the bay, with wide streets, modern, regularly planned, and richly endowed with parklands. Victoria's magnificent Shrine of Remembrance, erected in 1933, of Grecian classical architecture, is situated on the summit of a low hill off St. Kilda Road, and is a landmark which may be distinguished from almost any part of the city and many miles S. as Port Phillip Bay, which is contiguous to Hobson's Bay, is entered. The city was designed by Robert Russell, a pupil of John Nash, the designer of much of the old-time Regent Street, London. The city council has recently adopted a zoning scheme for tn. planning in preparation for the future development of the city. Its building regulations preclude skyscrapers, but what it lacks in height is compensated for by grace and variety of architectural design. The architectural beauty of its many impressive buildings is outstanding.

The first settlement was founded in

1835 by John Batman, a sheep farmer of Tasmania, who, with John Pascoe Fawcner, purchased 700,000 ac. from natives, and began to farm on ground that is now covered by the city of M. Batman's purchase was, however, repudiated by Governor Bourke as a trespass on crown lands, but eventually reasonable conditions were imposed on the settlers. Batman, in fact, founded a free city, and it was kept free. The name of the founder has been preserved in remembrance in Batman Avenue, on the N. bank of the Yarra, and Batman ward of the city. M. was created a city by letters patent of

Australian News and Information Bureau

MELBOURNE: COLLINS STREET AND FLINDERS STREET RAILWAY STATION

Queen Victoria dated June 25, 1847, and issued when M. was made the see of a bishop of the Church of England. Development was greatly accelerated by the discovery of gold at Ballarat and Bendigo in the early fifties. The main thoroughfare is Collins Street, the home of Australian finance, and the chief shopping streets are Bourke Street, Swanston Street, Elizabeth Street, and the 'Block' in Collins Street, where are the clubs and cafés.

More than one-fourth of M.'s total area of 7740 ac. is occupied by gardens and public parks. Within a few minutes' walk of the crowded business thoroughfares are the Botanic, Alexandra, and Queen Victoria Gardens in the S., Royal Park and the Exhibition Gardens in the N., the Treasury and Fitzroy Gardens in the E., and the Flagstaff Gardens in the W. The splendid botanic gardens, occupying

130 ac., and containing 10,000 species and plants, representing 2000 genera, owe much to the direction of Baron von Muller, who estab. relations with similar institutions all over the world, and founded a national herbarium, which is now the most complete extant collection of Australian dried plants. The later extensions of Wm. Robert Guilfoyle, curator, and the deepening of the Yarra, have contributed further to the development of the gardens. Thirteen ac. are occupied by lakes. The lly lake is a mass of colour during Nov. and Dec., and Middle Lake is a sanctuary to which hundreds of birds return at the opening of the duck-shooting season. 'The Separation Tree,' an old red-gum, stands in the gardens. It was a well-developed tree when the first white settlers arrived in Victoria, and the citizens of M. gathered round it on July 1, 1851, to celebrate the separation of the colony from New S. Wales.

Among the industries are engineering, brewing, tanning, printing, flour-milling, bacon curing, and brickmaking, while cheese, pottery, cigars, clothing, woollen goods, and leather are manufs.

There are many striking buildings in the city. With its tall spires rising against the background of commercial M., St. Paul's (Church of England) Cathedral, dominating the city, casts its shadow over the city's busiest intersection. It is built to a Gothic cruciform plan. The foundation-stone was laid by the governor, the marquis of Normandy, in 1880, but the cathedral was not opened for worship until eleven years later. The central spire, which rises to a height of 314 ft., was erected in 1931, and the completed cathedral was blessed by the archbishop of M. on April 30, 1933. Sandstone from the Barrabool Hills near Geelong, and limestone from Warrn Ponds, were the main materials used in its construction. Some of the interior granite columns were imported from England, but most of them were of Australian granite. St. Patrick's (Rom. Catholic) Cathedral is erected on an area of land on E. Hill granted by the gov. to the Rom. Catholic Church in 1849. The present cathedral, the third building on the site, was designed by W. W. Wardell, an eminent architect who had studied under Pugin, one of the most notable Gothic revivalists. St. Patrick's Cathedral, in early Gothic style, is cruciform in plan, and consists of a nave with side aisles, transepts, and a sanctuary surrounded by seven chapels. The eye of the visitor who enters the cathedral from the W. front is led to the chancel and the distant surrounding chevet chapel, the lofty arcading between the nave and aisles and the moulded columns of bluestone. Some of the entrances are richly adorned with carving and with deep recesses of columns and arch moulds. The dignity of the building externally is enhanced by its triple spires, the central spire rising to a height of 340 ft., and the carving and grouping at the E. end. An Act of the Imperial Parliament passed in the year 1850 decreed 'that the district of Port

Phillip should be separated from the colony of New South Wales, and should be named and designed as the colony of Victoria,' having a separate Legislative Council. But not until 1855, when the daily discoveries of gold and the rapid progress of the state were exalting public ideas, was a start made on the erection of Houses of Parliament. On Nov. 25, 1856, the first session of the first Parliament of Victoria was inaugurated. The present Parliament House was built during the great boom in the eighties on a site in front of the former House. Visitors to M.'s art gallery are met on every side with the words 'Purchased in the terms of the Felton Bequest.' In this sentence is written much of the hist. of the M. gallery. After his arrival in Australia in 1852, when twenty-one years of age, Alfred Felton estab. himself as a druggist and general merchant. His business prospered and he amassed a fortune. Unmarried and without relatives in Australia, he employed his constantly increasing wealth mainly on charitable and artistic objects, and bequeathed his estate of £378,000 for these purposes when he d. in 1904.

The M. mint is a branch of the Brit. royal mint, and was estab. by order of the council on Aug. 10, 1869, and opened on Jan. 12, 1872, to meet the problems created by the large discoveries of gold in Australia, and to reduce as far as possible its export. To-day the mint does not produce gold coins, but any one can sell gold there, and, if necessary, have it melted down and the fine gold extracted and weighed in his presence. Since the closing down of the Sydney mint in 1926 the royal M. mint has become the mint of the Commonwealth and the sole contractor for the production of Commonwealth coinage. Some of the original minting machinery is preserved within the building.

The univ. of M. was founded in 1854, and has an enrolment of between 8000 and 9000 students. It owes its origin largely to Hugh Culling Eardley Childers, a graduate of Trinity College, Cambridge, who was appointed inspector of schools in 1851 when only twenty-three years of age. One of his first efforts was to move for the estab. of a univ., and he recommended that £10,000 be provided for the purpose. In 1853 100 ac. of the present site were granted by the Crown, and the foundation-stone of the univ. was laid by the governor the following year. Wilson Hall, the prin. assembly hall, is the architectural gem of the univ. One of its outstanding features is the great S. window. A permanent conservatorium of music arose in 1910, when Dame (then Madam) Nellie Melba laid the foundation-stone of Melba Hall, towards the cost of which she was a substantial contributor.

M. has a large shipping trade; its port, called Port M. (considered to be one of the safest in the world), is 2½ m. away, but vessels of considerable size can ascend the Yarra Yarra to the heart of the city. There are wet and dry docks and safe anchorage for large vessels. Electric traction superseded cable tramways in

1925, and the suburban railways have also been electrified. The latter, like all Australian railways, are administered by a state dept.

Airport development projects on a large scale to provide for all unpredictable demands of civil flying have been launched in Australia where domestic airlines are booming month by month, and the chief airports are becoming increasingly important as international junctions. M.'s airport at Essendon (second in importance only to Sydney, the empire, and trans-Pacific terminal) is being further extended. Buildings will eventually extend over 100 ac., each airline company or operating unit occupying its own building. The landing area is capable of docking twenty-four aircraft simultaneously. Pop. of M. (1835) 177; (1946) 1,226,900.

Melchett, Sir Alfred Moritz Mond, first Viscount (1868-1931), b. at Farnworth, son of the famous chemist, Dr. Ludwig Mond. He became eventually chairman or director of a large number of industrial companies such as Brunner Mond & Company, the Imperial Chemical Industries, and the Mond Nickel Company. He became a Liberal M.P. in 1906, and was associated with that party until 1926, when he joined the Conservative party. Two years later he was created a peer, having been created a baronet in 1910. His son, Henry Ludwig Mond, second Viscount M. (1899-1919), was educated at Winchester and Cambridge Univ. After active service in the First World War he became a director of the Imperial Chemical Industries, the Mond Nickel Company, and other business concerns of which his father was the head. In 1923-24 he represented the Isle of Ely as a Liberal in the House of Commons, but in 1929 was elected as a Conservative member for one of the Liverpool divs. In 1932 he pub. *Modern Money*, in which he declared that the existing monetary system was unsound and unworkable, and had led to the unemployment of millions of people. He proposed the formation of a supreme economic council, and advocated payment of the Brit. war debt to America by the transfer of possessions in the W. Atlantic and the Pacific.

Melchites, name given to Christians in Syria and other parts of the E., who, acknowledging the authority of the pope, and the doctrine of the Church of Rome, use the Orthodox E. rite. They are chiefly to be found in Aleppo and Damascus. Their patriarch resides at Damascus.

Melchizedek, Canaanite priest, king of Salem in the time of Abraham (see Gen. xiv. 18). Called 'Priest of the Most High God' ('El-'Eliyon'). Abraham acknowledged his priesthood by his offerings. The identity of Salem with Jerusalem has been generally admitted. A sect of Gnostics asserted M. to be an earlier incarnation of the Second Person of the Trinity, superior to Jesus Christ. The parallel drawn in Heb. vii. between Jesus and M. has caused the view to appear frequently among Christians that M. was an incarnation of Deity. See V. Burch, *The Epistle to the Hebrews*, 1936.

Melcombe, Baron, see DODINGTON GEORGE BUBB.

Melcombe Regis, see WEYMOUTH.

Meleager, son of the Calydonian king Ceneus, took part in the Argonautic expedition, and was the leader of the heroes who slew the boar which laid waste the fields of Calydon. His life depended on the burning down of a brand that was blazing on the hearth at the time of his birth, but which Althea, his mother, snatched from the flames. He killed his uncles in a quarrel over the hide of the Calydonian boar, and his mother. To be avenged on him for slaying her brothers, threw the brand back into the fire, whereupon M., as the Fates had foretold, expired.

Meleda, see MLEJET.

Meleda, is. in the Adriatic Sea, lying off the coast of Dalmatia. It is 23 m. by 4 m. of volcanic formation, and has been identified as the anc. Melita. Pop. 1500.

Melegnano (formerly Marignano), tn. in the prov. of Milan, Italy, 10 m. S.E. of Milan. It was the scene of the battle of Marignano in 1515, when the Fr. defeated the Swiss. Silk and linen are manufactured. Pop. 7000.

Melek, see MOLECH.

Melenoze, tn. in Hungary, 50 m. S.W. of Temesvár. Pop. 9000.

Meléndez Valdés, Juan (1754-1817), Sp. poet, b. at Ribera del Fresno (Badajoz), was a friend of Jovellanos, and for many years prof. of law at Salamanca. He was a pastoral and lyric poet, and was influenced by the ideas of the Fr. philosophical school. He collaborated with the Fr. invaders of his country, and was accordingly exiled in 1813. He d. at Montpellier. His poems include the eclogue *Ballio* (1780); odes *To the Arts* (1781); *To the Presence of God*; elegies *Parting* and *The Likeness*. His *Poesias* appeared in 1785.

Melenik, see MELNIK.

Meletianism, schism in the Church at Alexandria from the fourth to the middle of the fifth centuries. It arose out of a dispute between Meletius, bishop of Lycopolis in Egypt, and Peter, bishop of Alexandria; but the true grounds of the quarrel are obscure. There is evidence to show that Meletius's offence was the conferring of holy orders outside his own diocese (see M. J. Routh, *Reliquiae sacre*, iv., 1814-18). St. Athanasius, however, does not refer to any irregularity of ordination. He states that Meletius was condemned c. 305, having sacrificed to idols and calumniated the bishops of Alexandria. According to Epiphanius the real cause of dispute was the treatment of *lapsi*, i.e. those who in face of persecution had denied the Christian faith and afterwards repented. Meletius is said to have refused them absolution like the Novatians in Rome, and the Donatists in Africa, although the other Egyptian bishops followed the more lenient course. M. was considered by the Council of Nicea; Meletius was forbidden to ordain any more, and those who had received orders from him were to rank below the clergy ordained by Bishop Peter and his

successors. See A. P. Stanley, *Lectures on the History of the Eastern Church*, 1884, and C. J. Hefele, *A History of the Christian Councils* (trans.), 1894.

Melfi, tn. and episcopal see of Potenza Prov., Italy, at the foot of Mt. Vulture, 34 m. S. of Foggia. It was founded about 304, becoming the cap. of Apulia, under Norman dukes (1044). Its Norman cathedral was ruined by earthquake in 1851, though later rebuilt. Olives, vines, and grain are cultivated. Pop. 15,000.

Melford, Long, par. in the co. of Suffolk, England, situated 3 m. N. of Sudbury. Pop. 12,700.

Melfort, Loch, sea-loch of Argyllshire, Scotland. 11 m. S. of Oban.

Melianthus, or **Honey Flower**, genus of evergreen shrubs of the order Sapindaceæ, with graceful pinnate leaves and clusters of racemes of fragrant flowers which in some species yield great abundance of honey.

Meli, Giovanni (c. 1740-1815), Sicilian poet, b. at Palermo. He practised medicine, and was prof. of chem. at Palermo Univ. (1787). His 'canzonette,' odes, and epigrams are mostly in the Sicilian dialect. His pastorals, like *Ecloghe Pescatorie*, are exquisite specimens of their kind. In virtue of his *Favole morali* he may be called a Sicilian La Fontaine. The *Parnaso siciliano* contains his 'Poésie' (1874). A complete ed. appeared 1814, a posthumous one with an *Ode to Nelson* (1830), and a revised ed. by A. Alfano in 1908.

Melilla, or **Milla** (anct. *Rusadir*), seaport garrison tn. on the N. coast of Sp. Morocco, with large cisterns and magazines. The harbour was opened (1902) as a port of commerce. Near by are lead and iron mines. Pop. (with garrison) about 77,200. See MOROCCO.

Melilli, tn. in the prov. of Syracuse, Sicily, 14 m. N.W. of Syracuse. Pop. 7000.

Melilotus, genus of leguminous plants with trifoliate leaves, and small yellow or white flowers. *M. alba*, white melilot, or Bokhara clover, is grown as a fodder crop, but has a bitter taste and rapidly becomes hard and woody.

Méline, Félix Jules (1838-1925), Fr. statesman and economist, b. at Remiremont, became member of the National Assembly 1872. He was under-secretary of state for the dept. of justice in 1879, and became a member of the General Tariff Commission in 1881. In 1883 he was made minister of agriculture in Ferry's first ministry. In 1888 M. was made president of the chamber. On the death of Jules Ferry he became president of the general council of the Vosges. In 1893 he took over the editorship of *La République française*, which he retained till 1896. Becoming Premier in April 1896 he held office till June 1898. He was a strong anti-Breyfusard. Became senator for Vosges, 1903. He pub. *Le Retour à la terre et la surproduction industrielle* (1905). During the First World War he became minister of agriculture under Briand, holding office till Dec. 1916. In 1920 he was elected president of the newly created General Commission

of Agriculture. See G. Lachapelle, *Le Ministère Agricole*, 1928.

Melinite: 1. Yellow clayey material, looking like yellow ochre. It has a sp. gr. of 2.24, is lamellar in structure, shining in streak, and is found at Amberg, in Bavaria. 2. The Fr. army name for picric acid (*q.v.*), a high explosive commonly called lyddite in England and shimosite in Japan. It consists essentially of a mixture of trinitrotoluene and trinitrophenol (picric acid), the compound being less dangerous to handle and having a lower melting point than its constituents.

Meliotism, see under OPTIMISM.

Meliphagidæ, see HONEY-EATERS.

Melissic Acid, fatty acid which occurs in beeswax and carnauba wax. It is prepared by heating melissyl alcohol with caustic potash, and forms a crystalline solid soluble in water.

Melissus of Samos (fl. c. 440 B.C.), (Gk. philosopher of the Eleatic school. Against Heraclitus, Anaxagoras, and Empedocles M. taught the unity and immutability of being which could be apprehended by the mind alone. He modified the doctrine of his predecessor Parmenides of Elea by showing that reality is infinite and eternal, though he tended to make eternity an endless duration rather than that which is of its essence timeless. See R. Adamson, *The Development of Greek Philosophy*, 1908; T. Gomperz, *Greek Thinkers*, 1912; and J. Burnet, *Early Greek Philosophy*, 1920.

Melita: 1. Anct. name of Malta (*q.v.*). 2. Anct. name of Meleida (*q.v.*).

Melito, or **Meliton**, Saint, eccles. writer of the second century A.D., the champion of Catholic orthodoxy. He seems to have been bishop of Sardis under Marcus Aurelius, and apparently took part in the paschal, Marcellite, and Montanist controversies. Only fragments of his works are extant, including the *Εκλογαί*. See Eusebius, *Historia Ecclesiastica*, iv., 1672; J. Otto, *Corpus Apologetarum*, ix., 1842-1872; and C. Bonner, 'The Homily on the Passion by Melito,' in *Studies and Documents*, 1940.

Melito, seaport in the prov. of Reggio, S. Italy, 15 m. S.S.E. of the tn. of Reggio. Pop. 6000.

Melitopol, tn. in the Zaporozhe Region of the Ukrainian S.S.R., 125 m. S. of Dnepropetrovsk, near the shore of the sea of Azov. It is a centre of silk production, and also manufs. various kinds of agric. machinery. Pop. 75,700.

Melittis, or **Bastard Palm**, handsome Brit. perennial of the order Labiatæ with long ovate leaves and conspicuous flowers, creamy white and blotched or spotted with pink or purple. It occurs, rarely, in woods in the S.W.

Melk, tn. of Lower Austria, on granite rocks 180 ft. above the Danube. It has a Benedictine abbey founded in 1089. Pop. 2900.

Melksham, mrkt. tn. of Wiltshire, England, on the Avon, 8 m. S. by W. of Chippenham. Manufs. include cordage, coco-nut fibre, indiarubber goods, and woollens. Flourmilling is also carried on. There are saline baths near. Pop. 4000.

Mellan, Claude (c. 1598-1688), Fr. draughtsman and engraver, a pupil of Gaultier at Paris, of Vouet and Villamena at Rome. He early made engravings from the marbles of the Gustinian collection. His best works include 'St. Peter Nolascus'; 'Rebokah,' after Tintoretto; 'The Sudarium of St. Veronica' (1649) (portrait of Christ as imprinted on her handkerchief); and a portrait of Urban VIII. (1631).

Melleray, Mount, Trappist monastery in Co. Waterford, Eire. It originated in 1830, when a band of Trappist monks, expelled from France, arrived penniless and built themselves a shelter on Mt. M. The hundred monks there are vowed to lifelong silence, having wearied of the world and its ways. They keep open house without restriction or inquiry into the faith or religious beliefs of their visitors and no payment is expected. They live on a frugal diet and drink only water. They are famous for having cured many dipsomaniacs who come to M. for the 'cure.' The hospitality of the monks is as famous as is their reputation for piety and industry.

Mellifont Abbey, first Cistercian foundation in Ireland, founded in 1142 by St. Malachy (1094-1148), 4 m. N.W. of Drogheda, in Co. Louth. It surrendered to Henry VIII.'s commissioners in 1539. Now in ruins, its remains were excavated in 1884-85. See K. F. B., *Mellifont Abbey*, 1886.

Mellite, hydrated salt of alumina and metallic acid found in brown coal deposits. M. occurs in octahedrons with octahedral cleavage, or in granular nodules. Hardness 2-2.5; colour, honey-yellow; sp. gr. 1.65. It dissolves in nitric acid and is decomposed by boiling water.

Mellitus, Saint (d. 624), Rom. Benedictine abbot, was sent by Gregory the Great to England in 601 at the head of a group of missionary monks to carry on the work of St. Augustine (q.v.). The first bishop of London, he was exiled for refusing communion to the apostate sons of King Sigebert, but in 619 was recalled to Kent and became archbishop of Canterbury.

Mellon, Andrew William (1855-1937), Amer. banker and politician, b. at Pittsburgh, Pennsylvania. He was educated in what is now the Univ. of Pittsburgh, and then entered the banking house which belonged to his family. Industrial development conduced to the prosperity of his chain of banks and he also became the largest producer of aluminium in the U.S.A., and so became one of the three or four wealthiest men in the world. In 1921 he was appointed secretary of the treasury, and later came to London as Amer. ambas. He presented to America an art collection estimated to be worth £10,000,000. In 1911 he founded the M. Institute at Pittsburgh, the world's largest institute for scientific research; the building was dedicated in 1937. He came to Europe in July 1931 to conduct negotiations arising out of the Hoover (q.v.) proposal for postponement of payment of war debts.. He wrote *Taxation, the*

People's Business (1924). See life by P. H. Love, 1929.

Melmoth, William (1666-1743), Eng. lawyer, and anonymous author of *The Great Importance of a Religious Life* (1711). He commented on the immoralities of the stage, in the form of letters to Defoe.

Melmoth, William (1710-99), Eng. littérateur and eloquent prose writer, son of above. He wrote *Fitzosborne's Letters* (1742), trans. Pliny's *Letters* (1747), and some of Cicero's works (1753-77). His *Memoirs of a Late Eminent Advocate* (1796) deals with his father's life. See J. Nichol, *Literary Anecdotes*, II., iii., 1812.

Melnik, or Melenik: 1. Tn. of Bulgaria, 65 m. N.N.E. of Salonika. Pop. 5000. 2. Tn. of Bohemia, Czechoslovakia, on the Elbe, 18 m. N. by E. of Prague, noted for wine and apricots. Pop. 5000.

Melo, or Villa de Cerro Largo, tn. of Uruguay, cap. of Cerro Largo dept. on the Tacuari. 200 m. N.N.W. of Monte Video. It is the seat of a suffragan bishopric. Coal, granite, and metal ores are mined. The surrounding dist. is agric. Pop. 12,000.

Melocactus, typical genus of the family Melocactideae, succulent plants found in the W. Indies and elsewhere in tropical America. It has a conical, ribbed, and globose stem and melon-like rosy tubular flowers and is also called melon-thistle. The best known species is *M. communis*, or Turk's Cap or Pope's Head cactus--the head bearing the flower is red and like a Turkish fez in form.

Melodion, see CONCERTINA.

Melodonomum, see MELUN.

Melodrama, originally a musical drama, or a drama interspersed with vocal or instrumental music. Now it is generally a non-operative play of a semi-tragic or serious character, characterised by rapid action, sensational situations, and violently expressed emotions, with marked contrast between hero and villain. The two earliest plays of this type in the Eng. language are *Deaf and Dumb* (1801), by Thomas Holcroft (adapted from the Fr. *melodrame* by Bouilly), and *A Tale of Mystery* (1802). The elements of M. had, however, existed long before this time, and were present in some of the Elizabethan tragedies as well as in late eighteenth-century romantic drama. More modern examples are Henry Irving's productions of *The Lyons Mail* and *The Bells*, and among famous Victorian Ms. were *Sweeney Todd, the Demon Barber of Fleet Street* and *Maria Marten, or the Murder in the Red Barn*.

Melody, succession of musical sounds so arranged as to have a pleasing effect on the ear. It differs from harmony in being the production of only one voice or instrument, whereas harmony is the result of the blending of different voices or sounds. In the list of music unaccompanied M. was the only music until comparatively modern times, when harmony was introduced; but whereas harmony is not essential to musical art M. is. Rhythm is a most important element in M. whether it be the free rhythm of plain-song

or the equal-measured rhythm of music of the classical period or that of the most modern composers. Much subtle elaboration of M. is to be found (*e.g.*) in Beethoven's sonata subjects. His Ms. are often clearly harmonic in their structure and, similarly, in Bach's music harmony is a basis of M. M., like music in general, may be said to be either of the class which stresses beauty of pattern or that which is more concerned with depth of expression. M. most abounds in contrapuntal music and, particularly, the fugue. See P. Scholes, *Oxford Companion to Music* ('Melody'), 1941.

Meloïdæ, see CANTHARIDÆ.

Melon, fruit of *Cucumis melo* (order Cucurbitaceæ), valuable tropical plant which has been cultivated for many centuries. In Britain it is almost invariably grown in pits or hot-houses. The colour of the flesh may be green, scarlet, or white. The size of the fruit, generally globular, that of a giant gourd. See also WATER varies from that of an olive to MELON.

Meloria (anct. Manaria), small is. in the Mediterranean, 4 m. from Leghorn harbour. The Genoese here defeated the Pisans at sea (1284).

THE VENUS DE MILO

Melos, is. in the Ægean Sea, belonging to Greece, one of the Cyclades group. It is about 14 m. long and 8 m. broad, and covers an area of 64 sq. m. It is of volcanic formation, and has sev. mt. peaks over 1000 ft. high, Mt. Prophet Elias rising to 2548 ft. The is. was first colonised by the Phœnicians, and was taken by the Athenians in 416 B.C. In 1537 it was seized by the Turks. M. is rich in sulphur, gypsum, manganese ore, salt, lead, and zinc. The famous statue, the Venus of Milo, now in the Louvre, Paris, was discovered near Kastro, the cap., by a

peasant in 1820. Early pottery and paintings were discovered in the prehistoric settlements at Phylakopi; much damage was done here during the Second World War. See Evans, Hogarth, and others, *Excavations at Phylakopi*, 1904.

Melos, or Milo, tn. of New York, U.S.A., in Yates co., lying between the lakes of Kenka and Seneca. Pop. about 5000.

Melpomene, in Gk. mythology, the muse of tragedy. She is generally represented fully draped, with a calm expression, holding a bearded, open-mouthed mask.

Melrose (Celtic *mao ros*, bare moor): 1. Police burgh and mrl. tn. of Roxburghshire, Scotland, on the Tweed, at the foot of the triple Eildon Hills, 37 m. S.E. of Edinburgh. The famous Cistercian abbey was founded (c. 1136) by David I., and is celebrated by Scott as 'Kennaquhair.' Partly destroyed by Edward II. (1322) and Richard II. (1385), it was wrecked during Lord Hereford's expedition (1545) and by the Reformer. The Decorated and Perpendicular styles prevail, and its beautiful traceried windows are famous. It contains, *inter alia*, the tomb of Alexander II., the heart of Robert the Bruce, and the reputed tomb of the wizard, Michael Scott (1175-1231). Abbotstord, residence of Scott, is about 3 m. distant. Old M., 2½ m. E., is the site of a still more anct. Columban monastery, estab. about 640 by St. Aidan, and deserted by 1075. There is an old Border peel (fort) at Darnick. Pop. 2000. See *Chronica de Mailros*, 731-1275 (1684 and 1835, Bannatyne Club). 2. City of Middlesex co., Massachusetts, U.S.A., 7 m. N.W. of Boston, of which it is a suburb. It contains Middlesex Fells, a state reservation, and Spot Pond, a large reservoir. Manufs. include boots, rubber shoes, silver, and leather goods. Pop. 25,300.

Meltham, par. and tn. of the W. Riding, Yorkshire, England, 5 m. S.W. of Huddersfield. There are cotton, thread, and woollen mills, and tractors are manufactured. Pop. 5000.

Melting, change of physical state when a solid is converted into a liquid by the application of heat. This change takes place at a definite point in the case of pure substances which do not decompose chemically under the action of heat. The presence of impurities depresses the M.-point and this furnishes a method of determining the purity of a substance and an important method of determining molecular weights. As an illustration of the fact that the presence of impurity lowers the M.-point, it may be noted that salt is used to remove ice from pavements. In the case of the determination of molecular weights, it is found that the freezing-point of a dilute solution of a given substance is depressed below that of the pure solvent by an amount proportional to its concentrations, *i.e.* the mass of dissolved substance per 100 gm. of the solvent. Freezing mixtures also depend on the fact that the presence of impurity depresses the M.-point. Some solid substances contract in volume when melted, while others expand.

This can be shown more clearly by considering the reverse operation, i.e. solidification; thus a substance which contracts on M. will expand on solidifying. Taking water as an instance we find that when water freezes its volume increases. This explains the bursting of pipes in winter, and also the fact that ice floats in water, since, because of this expansion, volume for volume, it is lighter. On the other hand, solid paraffin wax sinks in liquid wax, showing that liquid paraffin wax contracts on solidification.

Increase of pressure has little effect on the M.-point, unless the increase be large. Then it tends to depress or elevate the M.-point according to the substance. This increase of pressure lowers the M.-point of ice. The making of a snowball illustrates this point. The snow is pressed together, causing some of the snow to melt, and when the pressure is removed this melted snow freezes again, forming the ball into a compact mass. M. is employed commercially to separate bodies of different M.-points, and to take copies of objects as illustrated in an iron foundry. In the latter case bodies which expand on cooling are used so that every corner of the mould may be filled.

Melting-point.—The determination of the M.-point of a substance is very important in the methods of organic chem., and affords a ready method for the detection of the presence of a substance. Many methods are employed to determine the M.-point, the most common of all being to draw a glass tube out to a very fine tube and seal one end. Very small pieces of the substance are introduced into the tube, which is then tied to the bulb of a mercury thermometer. Both are immersed in a bath of water or some other liquid, which is heated until the substance melts. The substance may then be allowed to cool and the temp. at which solidification commences can be obtained. The substance is again melted, and the M.-point read off on the thermometer. Three or four readings may be taken in this manner, the M.-point being the mean of the readings. Some M.-points are (°C.) mercury, 38.9; tin, 232; zinc, 419; brass, 900; steel, 1400; tungsten, 3380. See also METALLURGY (METALLURGICAL FURNACES).

Melton, par. and vil. of Suffolk, England, on the Deben, 9 m. E.N.E. of Ipswich, with machine works. Pop. 2000.

Melton Mowbray, mkt. tn. of Leicestershire, England, on the Eye, near its confluence with the Wreake. 15 m. N.E. of Leicester, in normal times noted for pork-pies and Stilton cheese. There are iron-ore quarries, and smelting and blasting furnaces. It is also noted as a hunting centre (Quorn, Belvoir, and Cottesmore hounds). The tn. estate of M. M., an independent body founded 400 years ago, still owns the market tolls and the corn exchange. The cattle market is leased by them to the urb. dist. council. Similarly its anct. educational functions are now vested in the co. council, to whom it leases the land on which stands the tn.'s technical college.

Apart from that, the tn. estate maintains to-day two parks, a sports ground, and other recreational amenities. Its income is £5000 a year. The estate is vested in twelve feoffees, elected for life or so long as they reside in the par., and is managed by two tn. wardens, elected annually. Pop. 12,000.

Melton, West, par. and vil. of the W. Riding, Yorkshire, England, 5 m. N. of Rotherham. Pop. 4000.

Melun (anct. *Melodunum*), cap. of Seine-et-Marne dept., France, on the Seine, 28 m. S.E. of Paris. It has mediæval churches, a Renaissance tn. hall, and a ruined palace. M. was captured by Henry V. of England in 1420, but the inhab., with the aid of Joan of Arc, recovered it in 1430. Manus. include linens, cottons, woollens, pottery, and leather. M. suffered some damage from bombing in the Second World War, and in the 1944 advance of the Allies into France, Amer. tanks swept around the S.E. of Paris to M. on Aug. 20, driving the Gers. back across the Seine. When the allied troops had reached the Seine at M. above, and at Mantes Gassicourt below, the cap., the position of the Ger. garrison in Paris became untenable. Pop. 17,500.

Melun et de Vaux, Vicomte de, see FOUQUET, NICHOLAS.

Melusina, or *Mélusine*, in Fr. folklore, a water fairy, half woman and half fish; the daughter of Elinas, king of Albania. She married Count Raymond on the condition that he would never seek her on Saturdays, when she was accustomed to shut herself up alone. When they were married she built him a castle called Lusignan Castle. Raymond broke his promise, and did visit her on a Saturday, so she changed into a serpent and escaped from the castle by a window. Since her escape she was supposed to have visited the castle, uttering cries a little time before the death of the lords of Lusignan. Hence the expression 'Cris de mélusine,' which is still heard in some provs. in France. Jean d'Arras made this legend the subject of one of his stories in 1581. There is an Eng. prose version, *Melusine*, of the lat. prose story of Jean d'Arras. See J. Dunlop, *History of Fiction*, 1888, and S. Baring Gould, *Curious Myths of the Middle Ages*, 1897.

Melville, Melvill, or Melvino, Andrew (1545-1622). Scottish scholar and reformer, b. at Baldovie, Angus. After leaving St. Andrews with a high reputation for learning, he set out for the Continent (1564), becoming regent of St. Marceon College at Poitiers (1566). Leaving for Geneva owing to political troubles (1568), through Beza's influence he was appointed prof. of humanity at Geneva Academy (1568-74). On returning to Scotland, he became principal of Glasgow Univ. (1574-1580), and rendered the highest services to Scottish education. He was principal of St. Mary's College, St. Andrews (1580-1607). A staunch and fearless champion of Presbyterianism, he was one of the foremost in urging about the fall of episcopacy in Scotland, and helped to draft the *Second Book of Discipline* (c. 1581). His extreme and outspoken views

frequently brought him into disfavour. He was forced to flee to England (1584-85), but then returned and was made rector of St. Andrews (1590-97). Summoned with other ministers to London (1606) to confer with James I., he was imprisoned in the Tower till 1611. James refused his petition to return to Scotland, and he accepted the chair of biblical theology at Sedan. See lives by T. McCrie, 1819, and J. Morison, 1899; also A. Gardner, *History of England, 1603-16*, i., 1863, and A. Lang, *History of Scotland*, 1902.

Melville, George John Whyte, see WHYTE-MELVILLE.

Melville, Henry Dundas, first Viscount, see DUNDAS, HENRY.

Melville, Herman (1819-91), Amer. author, b. in New York city of a family of Scottish descent. At seventeen he embarked as a seaman on a whaler, deserting his ship when it reached the Marquesas Is. in the S. Seas, and being for months a captive among the cannibal tribes of Nukuhiva. He made his escape, joined another whaler, and deserted it when it reached the Tahitians. He eventually joined a regular Amer. man-of-war, and after serving his term of enlistment returned to Boston in 1844. In 1846 he pub. his first book, *Typee*, a wonderful picture of life among the cannibals of the Marquesas. *Moo*, in 1847, likewise dealt with life in the Polynesian Is. In them he attacked the Amer. missionaries, advising them to christianise Christianity before seeking to evangelise savages in whom he found many splendid traits. In 1850 he pub. *White Jacket*, which embodied his experiences on an Amer. man-of-war, and it was largely due to his unsparing pen that corporal punishment was abolished in the Amer. Navy. In 1851 appeared his greatest book, *Moby Dick*. This is a true prose epic of the sea: a story of the hunting of whales and of the thousand inroads of the seas. M. pub. many other books after this, but nothing comparable with those mentioned. See lives and studies by R. Weaver, 1921; W. Braswell, 1936; and R. Anderson, 1939; also W. E. Sedgwick, *Herman Melville: the Tragedy of a Mind*, 1945.

Melville, James (1556-1614), Scottish reformer, b. near Montrose, a nephew of Andrew, whose fortunes he shared to a large extent, becoming under him tutor in Glasgow Univ. (c. 1575) and prof. of oriental languages at St. Andrews (1580). From 1586 he took an active part in Church controversy, and was moderator of the General Assembly (1589). Summoned to London with his uncle (1606) on the latter's imprisonment, he was forbidden to return N. beyond Newcastle-on-Tyne. His *Diary, 1556-1601* was printed by the Bannatyne Club (1829) and by the Wodrow Society (1842).

Melville, or Melvil, Sir James, of Halhill, Fifeshire (c. 1535-1615), Scottish soldier, historical writer, and diplomatist. He was page and, later, privy councillor to Mary Queen of Scots, and accomplished various missions for her. His *Memoirs of My own Life*, first pub. by G. Scott (1683), were ed. by Thompson (Banna-

tyne Club, 1827-33). See J. A. Froude, *History of England*, viii., 1856-70, and Chambers's *Biographical Dictionary of Eminent Scotsmen*.

Melville: 1. Is. off the coast of N. Australia, separated by Clarence Strait from the mainland. It is 70 m. long and 30 m. broad, and was discovered by King. 2. Largest of the Parry Is. in the N. Polar Sea, Arctic America, separated (W.) by Fitzwilliam Strait from Prince Patrick Is., by M. Sound (S. and S.E.) from Victoria Land and Prince of Wales Land. It was discovered and named by Parry (1819-20). Length 200 m., breadth 130 m. 3. Peninsula in N. Canada, bounded W. by Boothia Gulf, N. by Fury and Hecla Strait (separating it from Baffin Land), E. by Fox Channel. Length 250 m., average breadth 100 m. 4. Sound, 250 m. long by 200 m. broad, communicating with the Arctic Ocean and Baffin Bay, S.E. of M. Is.

Melvins, Andrew, see MELVILLE.

Melykut (deep well), com. and tn. of Bacs-Bodrog Prov., Hungary, 17 m. from Maria Theresopol. Pop. 8000.

Melyris, genus of metallic-coloured beetles, with long narrow bodies; native of Cape Prov.

Melzi, Francesco de' (c. 1491-1568), It. amateur painter, of a noble Milanese family, friend and pupil of Leonardo da Vinci. The 'Vertumnus and Pomone' at Berlin is often ascribed to him. To him is due the preservation of Leonardo's writings, which, with other belongings, were bequeathed to him.

Membrane, in anatomy, indicates the textures of the animal body which, arranged as laminae, cover organs, line the interiors of cavities, and take part in the formation of the walls of canals and tubes. For mucous M. see DIGESTION and EPITHELIUM; for deciduous Ms. which enclose the fetus see PLACENTA. See also SEROUS MEMBRANES.

Memel: 1. (Lithuanian *Klaipėda*), seaport tn. (founded 1252) of the Lithuanian S.S.R. on the Kurisches Haff, 72 m. N.N.E. of Königsberg. It has a well-fortified harbour and is a centre of the Baltic lumber trade. Before the Second World War it had iron foundries, shipbuilding yards, and breweries, and manufs. of machinery, chemicals, etc. It was captured by the Russians in 1915 and evacuated in the same year. After the First World War it was renamed *Klaipėda*. Pop. 50,000. 2. M. Ter., before the First World War was an area of 1000 sq. m. with a pop. of 150,000 on the N.E. border of Germany. Together with the port of M. it was separated from Germany by the treaty of Versailles and assigned to Lithuania. When the National-Socialist party secured the ascendancy in Germany agitation for reunion of the ter. with Germany became a major political issue. In 1935 the pro-Nazi party in the M. Diet at length became the largest party in that assembly and secession from Lithuania was thenceforth their chief object. The Lithuanian Gov. sought to prevent secession by making large concessions to the ter. Memellanders, but in vain, and, in

the elections at the end of 1938, the pro-Nazi party secured nearly 90 per cent of the total votes. After the seizure of Czechoslovakia (March 1939) the Ger. Gov. sent an ultimatum to Lithuania demanding the surrender of the M. Ter. Lithuania was powerless to resist and the ter. was reincorporated in the Reich, a free zone being secured for Lithuania in the port of M. In the Second World War M. and ter. were taken by Russia, together with the rest of Lithuania. 3. Riv. in Russia and Germany, called in the former country the Niemem (Nyeman). Rising in Minsk Region, it flows W. to Grodno and enters the Kurisches Haff by the Russ and Gilge mouths. Near Grodno a canal connects it with the Bober and Vistula.

Memelland, or **Memel Territory**, see **under MEMEL**.

Memline, **Memling**, or **Hemling**, **Hans** (c. 1430-94), Flem. painter. His works were well known in his own time. He painted a 'Virgin and Child' for Sir J. Daine, and his 'Last Judgment' and the shrine (1480) containing the relics of St. Ursula in the museum of the hospital of Bruges were very famous. M.'s colouring is beautiful, and his figures are very fine; of all the Flem. masters of the fifteenth century, only the brothers Van Eyck are superior to him (see also **FLEMISH ART**). See W. H. J. Weale, *Hans Memling*, 1901.

Memmi, **Lippo**, di **Filippuccio** (d. 1356). It. painter, brother-in-law of Simone di Martino, with whom he often worked. Most of his work was done between 1332 and 1351. The fresco over the door of the convent of the Servites at Siena and a small Madonna acquired for the Berlin Museum are the finest of the works attributed to him.

'**Memmi**', **Simone**, **Simone Martini**, or **Simon of Siena** (c. 1283-1344). It. painter, pupil of Duccio. He was a friend of Petrarch, and painted portraits of Laura and Petrarch, while the poet dedicated two sonnets to him. He shared the 'Gothic' ideals of the Pisani, his influence on the Sienese school of painting being evident for the two following centuries. The frescoes in the church of Santa Maria Novella at Florence, 'The Annunciation' in the Uffizi, and the triptych in Antwerp Gallery are his work.

Memmingen, tn. of Bavaria, Germany, 33 m. S.S.E. of Ulm. It trades principally in cheese and hops, and manufs. woollen and cotton fabrics and soap. Pop. 16,300.

Memnon, in Gk. legend, son of Eos (dawn) and Tithonus. He fought for his uncle, Priam of Troy, against the Gks., but after heroic exploits was slain by Achilles. Also represented as an oriental hero, he is not definitely called king of Ethiopia or Egypt till the later part of the fifth century B.C. M. has been identified with Amenhotep (Amenophis III.), in whose honour colossal statues were erected near Thebes. One of these was supposed to give forth musical sounds at dawn when touched by the sun's rays. See Quintus Smyrnaeus, *Posthomerica*, ii.; G. Rawlinson on *Herod.*, iii., 254; J. Jacobs, *Über die Götter des Memnon*, 1830; R. Curzon in *Edinburgh Review*, 1886; and

Sir J. Gardner Wilkinson, *Topography of Thebes*, 1843.

Memoirs, form of literature common to all nations in all periods. They may be described as a narrative of events happening or purporting to happen in the lifetime of the author, and relating to his entire life or to some portion of hist. with which he has been intimately connected or for which he has had access to particular sources of information. M. include not only such productions as bear that title, but also such as are styled confessions, reminiscences, souvenirs, diaries, and the like. They differ from hist. in that they do not purport to cover all of even the significant events of a period, and frequently ignore a strict chronological order. Among the earliest examples of M. we may class the *Anabasis* and *Memorabilia* of Xenophon, Julius Caesar's *Commentaries*, the Gospels and the Acts of the Apostles, and the *Confessions* of St. Augustine. Fr. literature is especially wealthy in M., probably because, as Chateaubriand remarks in his *Génie du Christianisme*, their form and the scope which they afford to the author's personal pride and prejudices are peculiarly suited to the Fr. temperament. M. are found covering the whole of Fr. hist. and every facet of Fr. life from those of Froissart and Joinville to the *Confessions* of Rousseau and, later, F. R. de Chateaubriand's celebrated *Mémoires d'outre tombe* (1848) and F. P. Guizot's *Mémoires pour servir à l'histoire de mon temps* (1858-67). One cannot say that elsewhere in Europe M. have a proportionate value as historical sources, though mention must be made of the immortal diaries of Samuel Pepys and John Evelyn, and of Goethe's M. M. are especially adapted to reveal in great detail the social and cultural life of short periods of hist. and among recent Eng. works of this kind are Oliver Gogarty's *As I Was Going down Sackville Street* (1937), *Tumbling in the Hay* (1939), and Sir Ronald Storr's *Orientalisms* (1943). See also **BIOGRAPHY**.

Memorial Day, see **DECORATION DAY**.

Memory is the name given to the capacity for remembering, that is, for reviving or utilising past perceptions, activities, or other experiences. A little reflection convinces us that these activities of remembering are of many different kinds. Thus a man picturing in his own mind a past perception is said to be remembering it, or when he is giving an account in words of the activities of the past day. When we see that a dog avoids a place where he has been hurt, we attribute this to his M. of his past experience though we know nothing of his thought but only observe that his past experience is affecting his present behaviour. Recognition is also regarded as evidence of M., as when we recognise the face of an acquaintance, although we could neither have pictured his face to ourselves nor have described it. M. thus stands for no single kind of mental activity, but is a name given to a number of different types of mental process which have in common the practical end of

co-ordinating present behaviour with past experience. A particularly important distinction is that between habit or mechanical M., found most purely in the activity of learning dates or tables by heart, and logical memory, which is the much more important activity of learning material in such a way that its meaning is understood and can be reproduced in our own words. Mechanical learning has some place in the early stages of education but it is out of place in later school activities such as hist., science, mathematics, where what is required is not literal reproduction but understanding. Neglect of this distinction led to the trivialities of the associationist psychology in which learning by heart was regarded as the typical process of M. and the processes of thought were regarded as due to the linking together of ideas by the laws of association (*q.r.*). These laws are no doubt of importance in the relatively unimportant field of habit M. They explain, however, only that part of M. which is the formation of mental habits. Logical M. requires more complex conceptions of the organisation of experiences into units in accordance with the principles of Gestalt psychology. We can remember a mathematical principle when we see it as a whole, organised in relation to the rest of our knowledge. The essential step towards remembering is insight or understanding, not the linking together of ideas by association. There is no experimental evidence in support of the common notion that different individuals differ in the effectiveness of their M. as a whole or that children have better Ms. than adults. Different individuals certainly differ in particular directions of M. ability. For example, some can perform what appear miraculous feats of mechanical remembering through the possession of a particularly stable and accurate form of mental imagery known as eidetic imagery. Children generally do better than adults at tasks involving merely mechanical M., but adults of not too advanced age are generally better at tasks requiring logical remembering. At a great age inability to remember new things may be the result of general loss of efficiency of the senile brain. Amongst adults of young to middle age the differences in capacity for logical remembering are almost entirely due to differences in general intelligence (*q.r.*). There is no reason for believing that M. can be improved by exercise, although remembering can be improved by the use of improved methods of learning or by the use of mnemonics (*q.r.*). The most common cause of forgetting is obsolescence or fading through lapse of time and the incidence of new experiences. Freud has also drawn attention to a kind of forgetting which is important in the causation of mental disorder, the active banishment of unpleasant Ms. from the mind which he calls repression. It has been argued that this form of forgetting is found to some extent amongst normal people as well as amongst those suffering from neurotic disorders. See H. Ebbinghaus, *Über das Gedächtniss*, 1885; H. Bergson

Matter and Memory (trans.), 1911; H. J. Watt, *The Economy and Training of Memory*, 1909; S. Freud, *Psychopathology of Everyday Life* (trans.), 1911; T. H. Pear, *Remembering and Forgetting*, 1922; F. C. Bartlett, *Remembering*, 1932; and C. A. Mace, *Psychology of Study*, 1932.

Memphis: 1. Anct. city of Lower Egypt on the Nile, its ruins standing 12 m. S. of Cairo. It was said to have been built by Menes, the first historical king of Egypt, and became the first cap. of the entire kingdom of Egypt. It grew to great importance under Apophis or Pepy (c. 1700 B.C.), who built the pyramid 'Men-nofer' near by. Among its numerous anct. buildings were temples of Ptah or Hehpestos, of Isis (sixth century B.C.), of Serapis, and of Ra. The pyramids and statues of Rameses II. remain, and the ruins of Saqqara close by. The Noph of the O.T. (Is. xix. 13; Jer. li. 16) is probably M. The city declined rapidly after the Arab conquest. The modern vil. of Mit-Rahinéh (Mitraneh) in Giza Prov. marks the site. See Sir W. Smith, *Dictionary of Greek and Roman Geography*, 1854-57; B. Poole, *Cities of Egypt*, 1882; J. Quibell, *Excavations at Saqqara*, 1908-1909; C. M. Firth and B. G. Gunn, *Excavations at Saqqara: Teli Pyramid Cemeteries*, 1926; and J. Capart, *Memphis*, 1930. 2. Co. seat of Shelby co., Tennessee, U.S.A., on the Mississippi, 15 m. from S.W. corner of the state. It is a port of entry, and the most important tn. on the riv. between St. Louis and New Orleans. It has many fine buildings, and is a great cotton market. Other products are lumber, oil, grain, groceries, confectionery, machinery, and shoes. An iron railway bridge (completed 1892) spans the riv. The surrounding area is subject to floods, and the U.S. Army flood control is organised from M. Pop. 293,000.

Mena, Juan de (c. 1411-56). Sp. poet, b. at Cordova, was Lat. secretary and historiographer to his patron, John II. of Castile. He joined the Italianate school of Santillana (*q.r.*), and Dante's influence is evident in the idylls though not in the form of his poems. His chief work, *El Laberinto de Fortuna* or *Las Trezientas*, a didactic allegory, first appeared in 1496. (See Foulché-Delbos's ed., 1904.) Nunez (1532) and Sanchez (1804) produced eds. of his works. See V. F. Romero, *Epicedio*, 1602; G. Ticknor, *History of Spanish Literature*, 1849.

Menado, or **Manado**, residency and tn. in the Is. of Celebes, Dutch E. Indies. The tn. is a free port, with a large trade to Batavia and China, and one of the most beautiful of the Dutch E. Indies. Pop. (residency) 1,139,200; (tn.) 7500.

Menæ, or **Menæmon**, see **MINEO**.

Ménage, Gilles (1613-92), Fr. scholar and writer, b. at Angers. For some time he lived in the household of Cardinal de Retz, but soon quarrelled with his patron, and founded a salon known as the Mercuriales, which, although gaining him European fame, also made him many enemies, amongst others, Molière and Boileau. His publs. include *Origines de la langue française* (1650); *Dictionnaire*

etymologique (1650 and 1670), etc. See life by Baret, 1859, also *Menagiana* (a collection of his oral opinions) pub. in 1693 and subsequently enlarged by La Monnoye (1715).

Menagerie, small collection of wild animals kept in close captivity for display. Kings of early times used to bring back wild animals for gladiatorial shows and exhibition. Private collections later became common, and until the early nineteenth century such a one was maintained at the Tower of London. It is described by Pepys. From these collections developed the great zoological gardens, the travelling Ms. of Bostock and Wombwell (1864), and the present-day circuses of performing beasts.

Alexis; he had Theophrastus for his teacher, and Epicurus for a friend. M. was a handsome, light-hearted, and elegant Gk. He was drowned while swimming in the harbour of the Piræus. M. wrote more than 100 comedies, which were in high repute among his countrymen, at least after his death; but we possess mere fragments of them (*Comicorum Atticorum Fragmenta*, ed. by Kock, 1830-88). We know something of their character, however, from the imitations of them by Terence and Plautus. Pleasant and refined wit, clear, sententious reflection, and a vein of real earnestness at times are the qualities most apparent in them. Some fragments of his work were found in Egypt in the twentieth century.

RAILWAY BRIDGE, MENAI STRAIT

British Railways

Menai Bridge, tn. in Anglesey, N. Wales, on M. Strait, 2 m. S.W. of Bangor. Pop. 2000.

Menai Strait, channel separating Anglesey from Caernarvonshire, N. Wales. Its maximum length is 13 m., and breadth 2 m., and it is famous for the suspension and tubular bridges crossing it. The former, constructed by Telford (1819-25), is 1710 ft. long. The latter, constructed by Robert Stephenson in 1850, is 1380 ft. long, and is known as the Britannia Bridge. A scheme is on foot to utilise the tidal energy of the strait by means of three dams.

Menaldumadeel, tn. of Friesland prov., Netherlands, 65 m. N.E. of Amsterdam. Pop. 12,000.

Menam, riv. of Siam, rising in the Shan Mts., near the Burmese frontier, and flowing mainly in a southerly direction for a course of about 900 m., finally falling into the gulf of Siam. It is navigable for small boats to Ching-Mai, 75 m. above Mutka, and for riv. steamers to Paknam, but its mouth is obstructed by sandbanks. Its chief trib. is the Meiping.

Menander (b. 342 B.C.), the most celebrated Gk. poet of the New Comedy. b. at Athens. His uncle was the comic poet

See J. A. F. Meineke, *Fragmenta Comicorum Græcorum*, 1841, and *Selections*, ed. by W. G. Waddell, 1927. A text and trans. of all existing fragments is pub. in the Loeb Library.

Menander, Arrius, Rom. jurist of the second century A.D. fl. under Severus and his son Caracalla (193-217). The *Digest* contains six excerpts from M.'s work. *Militaria*, and Æm. Macer quotes M. See Ulpian, *Ad Edictum*.

Menant, Joachim (1820-99), Fr. Assyriologist. b. at Cherbourg. His studies on the cuneiform inscriptions are renowned, and with Oppert he introduced the study of Assyriology into France, delivering lectures at the Sorbonne (1869). His works include *Recueil d'alphabets des écritures cunéiformes* (1860); *Le Syllabaire assyrien* (1869-73); and *Ninive et Babylone* (1887); and various Assyrian textbooks and grammars.

Menasha, banking city of Winnebago co., Wisconsin, U.S.A., on Winnebago Lake, 14 m. N.N.E. of Oshkosh. Pop. 10,400.

Menasseh, Ben Joseph Ben Israel, see MANASSEH (BEN JOSEPH).

Menavia, see MAN, ISLE OF.

Mencius (Latinised form of Mang-tze,

Meng-tseu, or Meng-tai (c. 372-c. 289 B.C.), Chinese sage, b. in Shantung, ranking next to Confucius as a moral teacher, author of one of the 'Four Books' which constitute the Chinese Scriptures. He was brought up by his mother, who is venerated in China as the pattern of all mothers. When about forty he travelled with his disciples to the various princely courts then existing in China, preaching and teaching. His dialogues and exhortations concerning practical conduct, both public and private, were pub. by his disciples as the *Book of Meng-tseu*. See also CHINA, *Chinese Literature*. See S. Julien, *Lat. trans.*, 1824-29; J. Collie (Eng.), 1828; J. Legge, *Chinese Classics*, II., 1862, 1875; E. Faber, *The Mind of Mencius*, 1882; and H. Giles, *History of Chinese Literature*, 1901.

Mencken, Henry Louis, Amer. critic, b. at Baltimore, Maryland, 1880. He began work on Baltimore newspapers, and then joined the staff of the magazine *Smart Set* as its literary critic. For some years he was joint editor of this pub. with George Jean Nathan. Together with Nathan he founded the *American Mercury* in 1924. M. has gained a wide reputation in the U.S.A. as a critic for the sophisticated. He has championed many an able native or foreign author. Most of his best essays have been reproduced in book form in a series under the general title of *Prejudices* (1919 ff.). In *Americana* (1925) his purpose is to show up the average man from the small towns. Other pub. include criticisms of G. B. Shaw's plays, the philosophy of Nietzsche, and the works of Ibsen, Brioux, and other playwrights. Some later works include *The American Language* (1919) and two *Supplements* (1945, 1948); *Happy Days, 1880-1892* (1910); *Newspaper Days* (1941); *Heavenly Days* (1943); and the autobiographical, *The Days of H. L. Mencken* (1947). Part-author of *A New Dictionary of Quotations* (1941). See B. De Casseres, *Mencken and Shaw*, 1939.

Ménde, cap. of dept. of Lozère, France, 63 m. N.W. of Nîmes, on the l. b. of the Lot. It has a fourteenth-century cathedral, built by Urban V. Pop. 6100.

Mendel, Johann Gregor (1822-84), Austrian biologist, b. at Heinzendorf of peasant stock. Having taken a degree at the univ. of Vienna he joined the Augustinian order at Brunn (Brno), where he taught natural physics in the monastery school and eventually became abbot. It was here too that M. made those observations upon which was based his famous theory propounded in 1866 and known to-day as Mendelism (q.v.).

Mendelism, biological theory of heredity first propounded by the Abbé J. G. Mendel (q.v.). At Mendel's death his immensely valuable contribution to the science of heredity had received no recognition; and it was principally owing to the trans. of his monograph by Prof. Wm. Bateson in 1902 that its scientific possibilities were realised and developed. Mendel was evidently well informed in many branches of contemporary biology. In his little garden he spent

much time cultivating the edible and the sweet pea, and kept exact records of various features of about 10,000 plants which he had grown. The possibility grew upon him that there must be some natural law of inheritance. He found that where the parents showed a marked difference in special characters, e.g. tallness and dwarfness, the hybrid offspring in the first generation was always tall. This propensity, as Darwin and others had called it, he termed a dominant characteristic and the other recessive. In the next generation, produced either by self-fertilisation or by breeding hybrid with hybrid, he found that a form resulted in which the dominant characteristic occurred pure, while there was also one in which the recessive character was pure. These two occurred approximately as two in four, the other two, though exhibiting the dominant character, having the recessive one latent, as evidently was the case with the first filial generation (see HEREDITY, Fig. 2). That is to say, breeders have only to ascertain which characters that they wish to preserve are dominant and which recessive to be able to fix them permanently. Naturally, the breeding operations are hardly ever so simple, as other characters may assert themselves and may have to be bred out. But where formerly breeders were compelled to work almost in the dark, Mendel's law gives them at any rate a sense of direction, and there can be no doubt that the law ranks among the greatest of scientific discoveries.

Mendel's success in obtaining results enabling him to formulate laws of heredity was due to his recognition of the necessity for quantitative experiments with very large numbers of plants, and for experiments with easily recognisable characteristics. After dealing with single pairs of characteristics such as tallness and dwarfness, yellow seeds and green seeds, round peas and wrinkled peas, he formulated his 'first law,' or the 'law of the purity of the gametes,' which states that any gamete, i.e. reproductive cell, male or female, can carry the determinant (gene) of only one of a pair of alternative characteristics (see HEREDITY). Mendel next experimented with the inheritance of two pairs of characteristics, crossing, for example, a tall yellow-seeded plant with a dwarf green-seeded one. As a result, he discovered his second law, the law of free assortment. According to this, characteristics were assorted independently, and thus tallness or dwarfness might be associated with either green or yellow seeds. The result in the F_2 (second filial generation) would be tall yellow, dwarf yellow, tall green, dwarf green, in the ratio 9 : 3 : 3 : 1. More recent workers found numerous exceptions to this second law, and have proved the transmission of certain characteristics in groups, such 'linked' characteristics rarely being separable. In the pea there are seven such groups (corresponding to seven pairs of chromosomes) and Mendel unwittingly selected for experiment characteristics of different groups, so arriving at the conclusion that free assortment always

occurred. We now know that this is possible only when the characteristics concerned are in different groups (i.e. when their respective 'genes' are situated in different pairs of chromosomes). Examples of 'sex linkage' are known, as described in HEREDITY. In Mendel's material the characteristics under observation were definitely dominant or recessive, but dominance is not essential to Mendelian inheritance. Red flowers of the Jap. 'four o'clock' (*Mirabilis jalapa*) crossed with white ones, produce pink-flowered plants. These, intercrossed, yield plants with red, pink, and white flowers in the Mendelian ratio 1 : 2 : 1. Other disturbances of the Mendelian ratio are caused by lethal factors inhibiting the development of characteristics, and by the interchange, or 'crossing over,' of determinants of different groups (see HEREDITY). Knowledge of Mendelian inheritance has been of great economic importance in both plant and animal breeding. Animals immune to certain forms of disease, birds with increased egg-laying capacity, good milk cows, wheats immune to rusts, grain with good food reserves, are amongst the results due to selective breeding according to Mendelian laws. See R. C. Punnett, *Mendelism*, 1905; J. Wilson, *A Manual of Mendelism*, 1929; E. Baur, *Human Heredity*, 1931; G. C. Hurst, *Heredity and Ascent of Man*, 1935; and C. E. Walker, *Evolution and Heredity*, 1936.

Mendeléev, Dmitri Ivanovich (1834-1907), Russian chemist. b. at Tobolsk in Siberia, was educated at St. Petersburg, and was a pupil of Wurtz in Paris. After lecturing at Simferopol, Odessa, and St. Petersburg, he became prof. of chem. at the univ. there (1866-1890). His contributions to chemical philosophy and physical chem. were especially valuable. M. discovered and enunciated the periodic law of the atomic weights (1869), which was partly foreshadowed by others but brought to its highest perfection by him (see ATOMIC THEORY). His prediction of new elements such as eka-boron, eka-silicon, and dvi-manganese was subsequently realised in the discovery of scandium, germanium, and rhodium respectively. He made a careful study of the chemical properties of petroleum in the mines of Pennsylvania and Caucasus, and performed valuable work on the subject of the liquefaction of gases (1834). In 1893 he became director of the Bureau of Weights. His chief work is *The Principles of Chemistry* (1868-70; Eng. trans. 1892). See T. E. Thorpe, *Essays in Historical Chemistry*, 1911.

Mendelssohn, Moses (1729-86), Ger. philanthropist and eclectic philosopher of Jewish descent, grandfather of the musician, was b. at Dessau on the Elbe. He endured great poverty in early life, and was largely self-educated. In 1750 he entered the service of I. Bernhard, a wealthy silk merchant, becoming his book-keeper, and finally his partner. He worked as a critic for Nicolai's (q.v.) *Bibliothek* which he helped to found. In 1754 he was introduced to Lessing, whose inti-

mato friend he became, collaborating with him in the satire *Pope ein Metaphysiker* (1755). He also wrote for Lessing and Nicolai's *Briefe, die neueste Literatur betreffend*. Lessing pub. M.'s *Philosophische Gespräche* anonymously (1755), and made M. the hero of his *Nathan*. From about 1767 M. turned his attention to the moral and political elevation of his race, becoming the foremost champion of Jewish emancipation in the eighteenth century. He made a Ger. trans. of the Pentateuch and other parts of the Bible (1783), pub. a Ger. version of Manasseh ben Israel's *Vindiciae judæorum*, and wrote *Jerusalem* (1783, Eng. trans. 1838, 1852), a plea for freedom of conscience and a demand for the total separation of Church and State. Other works were *Über die Evidenz in den metaphysischen Wissenschaften* (1764, Berlin Academy prize); *Phædon* (in support of immortality of the soul, 1767; Eng. trans. 1789); *Morgenstunden*, in refutation of Pantheism and Spinozism and in defence of Lessing (1785-1786). See G. B. Mendelssohn's ed. of his *Werke*, 1843-45; and M. Brasch's ed., 1880; lives by M. Sannels, 1825; M. Schwab, 1868; M. Keyserling, 1887; and F. Bamberger, 1929. See also G. Kannegiesser, *Moses Mendelssohn*, 1868; S. Hensel, *Die Familie Mendelssohn* (Eng. trans.), 1881; I. H. Ritter, *Mendelssohn und Lessing* (2nd ed.), 1886; J. E. Erdmann, *History of Philosophy*, 1889, 1921; L. Goldstein, *Mendelssohn und die deutsche Ashtatik*, 1900; H. Höffding, *History of Modern Philosophy*, 1924.

Mendelssohn-Bartholdy, Jakob Ludwig Felix (1809-47), Ger. composer, b. in Hamburg, grandson of Moses M., the philosopher. He was baptised and educated as a Christian, his father adding the surname Bartholdy to the family name. His youth was spent in the refined surroundings of a family that enjoyed the advantages of very considerable wealth, culture, and brilliant social connections. With good looks, charm, and undoubted genius, success came to M. from the very beginning of his career; and from his grandfather he inherited his great capacity for work and the vitality that runs through much of his music, the violin concerto, for instance, like a flame.

He benefited by the tuition and advice of Berger, Zelter, Weber, Cherubini, and Moscheles, and by the time he was twenty had already produced his famous octet, three piano quartets, two sonatas, two symphonies, and the *Midsummer Night's Dream* overture, besides a host of songs, an opera and many short pieces. The next few years were passed in visiting London, Munich, Vienna, and Rome, and in incidental tours in Scotland, Italy, and Switzerland (1828-31); he met with an eager welcome everywhere, and achieved a wide fame as pianist, composer, and conductor. *The Hebrides (Fingal's Cave)* overture was composed in 1830 (revised 1832). In 1837 he became conductor of the celebrated Leipzig Gewandhaus Orchestra, and two years later married Cécile Jeanrenaud at Frankfurt. The same year saw the production of his 42nd

Psalm, and the next year his splendid violin concerto was written, and *Lobgesang* in 1840. He had already conducted sev. of the Cologne and Düsseldorf festivals, and on his Eng. tour in 1846 he produced his *Elijah*, still one of the world's favourite oratorios, at Birmingham.

Everything seemed bright in the horoscope of M.'s future days. He was happily married with five children, and money was coming in for his work, apart from his private income. But the rift in the lute was his health. He hastened from place to place, conducting, giving organ recitals, playing at benefit concerts for less fortunate musicians. A series of concerts for the Philharmonic Society in London, where he introduced one of the *Leonora*

MENDELSSOHN

overtures, strained him beyond endurance. His unalloyed success in fact followed him to the grave. He returned home only to fall ill and die before his fortieth year. A special train took the coffin to Berlin, and a torchlight procession bore him to the burying-place. There were services and memorial performances throughout Germany. In London *Elijah* was given in a hall hung with mourning. But then a reaction set in. M.'s sentimentality, excessive facility, and superficial effects for a time overshadowed his genius, the genius of a composer of lofty ideals, who achieved a consummate artistry in every form of music except opera, and who had an immense influence on his age. The pendulum has swung fairly in these days. His violin concerto, considered perfect of its kind, is continually played. *Elijah*, if too dramatic for the concert stage and not dramatic enough for the theatre, is often given, sometimes in costume. The *Dream*, with its vitality, is ever young. Of the symphonies, the *Scotch* and the *Italian* remain

to be often enjoyed by simple audiences; and the benediction of what is popularly called 'Mendelssohn's Wedding March' is familiar enough.

M.'s music, if not always great, is invariably charming, and much adverse criticism is attributable to the fact that his inferior works (e.g. songs and piano solos), are best known, whilst his finest efforts (e.g. chamber-music) are somewhat neglected. As a technician M. was first-rate. His *Dream* music, in particular, is admirably scored, with the instruments playing in a light individual way that was then quite novel. His command of form was equal if not superior to that of both Schumann and Schubert. His success and his failure lay in one and the same fact, that he did nothing new, save in details. He was no innovator, no philosopher; but his contribution to the delight of music is unquestioned. See lives by E. Wolff, 1906; I. Moscheles (Eng. trans.), 1873; S. Straton, 1901, 1934; W. Dahms, 1919; and *Letters*, ed. by G. Selden-Goth, 1916. See also R. B. Gitch, *Mendelssohn and his Friends in Kensington*, 1931, and J. Petitpierre, *The Romance of the Mendelssohns*, 1948.

Menden, tn. of Westphalia, Germany, 16 m. E.S.E. of Dortmund. The chief manufs. are articles of tin and sheet-brass. Pop. 12,000.

Mendès, Catulle (1841-1909), Fr. poet, novelist, and playwright, b. at Bordeaux, was one of the group of 'Parnassians.' He founded *La Revue Fantaisiste* (about 1859), his *Roman d'une nuit* (for which he was fined and imprisoned) appearing in it (1861). His poems include *Philomèle* (1863); *Poésies* (1870, 1885, 1892); *Hespérus* (1872); *La Grive des vignes* (1895). He wrote plays, novels, and criticisms also, such as *Justice* (1877); *L'aguer* (1886); *Méphistophéla* (1890); *L'Art au théâtre* (1896-1900); *Fiammette* (1898); *Le Mouvement poétique français de 1867 à 1900* (1903); *Arlène, Galigny* (1906); and *La Maison de la vieille* (1894). See study by A. Bertrand, 1908; and M. Sourian, *Histoire de Parnasse*, 1929.

Mendicancy. In law M. is synonymous with begging. Begging *per se* is no more illegal than betting; what the law punishes is not so much begging as the habit of M., or begging in a certain way, or in a public place. In classical times beggars would seem almost to have formed a legally recognised class of persons enjoying, as it were, a stereotyped place in the social system. Many Lat. writers, for example, record the daily congregations of beggars in the porches of the houses of the wealthy, and give to the modern mind the impression that the larger the number the greater the credit to the particular plutocrat favoured with the attentions of these strange 'clients.' Juvenal, too, in *Satires* iv. and v., speaks of the crowds of mendicants who, without interference by the law, habitually took their stand on bridges, or frequented the road leading to Aricia or other suburban arteries, invariably bearing with them their *legetes* or sleeping mats. Under the Vagrancy Act, 1824, the law punishes, as a rogue and

vagabond, any one who (1) *habitually* goes about as a collector of alms, or (2) endeavours, by fraudulent pretences, to procure charitable contributions. Obtaining money by sending a lying begging letter is punishable under the Larceny Act, 1861. Standing in public streets in order to beg alms is also punishable under the Vagrancy Act. See also MALINGERING. See F. Gray, *The Tramp*, 1931.

Mendicant Orders (Lat. *mendicare*, to beg), certain religious associations of friars that sprang up in the Church in the early thirteenth century, the Dominicans, Carmelites, and Franciscans being among the most noted. They practised the strictest self-denial and self-humiliation, owned no land or personal wealth, and subsisted mainly upon alms. Particulars about the M. O. will be found in the article on MONASTICISM and under the various orders. See also DOMINIC, ST.; CAPUCHINS; CARMELITES; FRANCISCANS; FRIAR. See E. Gebhart, *Italie mystique*, 1899, and Fr. Culbert in *The Friars and how they came to England*, 1903.

Mendip Hills, range in Somersetshire, England, extending from near Wells and Shepton Mallet towards the Bristol Channel, in the direction of Weston-super-Mare, for a distance of about 18 m. The highest point is Blackdown, 1067 ft., and the range includes the Cheddar Cliffs. The hills are mainly composed of carboniferous limestone, with eruptive rocks at intervals. Zinc ore and lead are mined.

Mendoza, Diego Hurtado de, see HURTADO DE MENDOZA, DIEGO.

Mendoza, Inigo López de, Marquis of Santillana, see SANTILLANA, INIGO LOPEZ DE MENDOZA, MARQUIS DE.

Mendoza, Pedro González de (1428-95), son of Inigo López, surnamed Grand Cardinal of Spain. He attained eminence under Henry IV. of Castile, by whose influence he was made a cardinal, and subsequently exercised equal influence over Isabella, whose right to the succession he espoused. He was successively bishop of Calahorra and Sigüenza (1473), chancellor of Castile and Leon, archbishop of Seville and Toledo (1481), and was sometimes called the third king of Spain. His influence was exerted in favour of the Jews, and of the projects of Columbus. He took a vigorous part in the prosecution of the wars against the Moors. The college of Santa Cruz at Valladolid was founded by him. On his death-bed he named as his successor Cardinal Ximenez. See Wm. H. Prescott, *History of Ferdinand and Isabella*, 1838.

Mendoza: 1. Prov. of W. Argentina, covering an area of 57,445 sq. m. The Andes form its W. boundary, and the Cordillera chain covers a good part of the ter. It has a dry climate. Minerals, such as gold and copper, abound, and copper and silver are extracted in large quantities. Uranium was discovered in 1947 at Las Heras. Marble, gypsum, and rock crystal are also mined, and there are petroleum deposits. The chief source of wealth is agriculture, the prin. products consisting of wheat, maize, wine, tobacco, and vegetables. Irrigation has turned

this arid prov. into one of wealth and prosperity. Pop. 590,600. 2. City of Argentina and cap. of above prov., 632 m. W.N.W. of Buenos Aires, with an elevation of 2320 ft. In 1861 all its prin. buildings were destroyed by an earthquake and now most of them are only one storey high. The climate is hot and dry. The chief exports are raisins and wine. In 1910 a tunnel through the Andes was completed, and M. is now the centre of a trans-continental route from Buenos Aires to Valparaiso. Pop. 103,900.

Menedemus (c. 350-c. 276 B.C.), Gk. philosopher of Eretria, which gave its name to his school. Having been in turn a tent-maker and a soldier, he is said to have met Phædo. He abandoned the military life, and became a student of Phædo, whose academy he subsequently transferred to Eretria. Having taken an active part in the affairs of his city, he fell into disfavour through his intrigues with Antigonus Gonatas, at whose court he is supposed to have died of grief.

Menelaus, in Gk. mythology, was the son of Atreus or Plisthenes, and younger brother of Agamemnon. He was king of Lacedæmon and husband of Helen, of whom Paris robbed him, together with his treasures. He organised an expedition for her recovery, and with Agamemnon was one of the heroes of the Trojan war. On his voyage home he was shipwrecked off Cape Malea, and, after eight years spent among the people of the E., finally landed at Pharos. Here the god Proteus revealed to him the reason of his detention, and prophesied that as husband of the daughter of Zeus he would enter the Elysian plains alive. Having sacrificed to the gods, he resumed his journey and arrived at Sparta on the very day on which Orestes was holding the funeral feast over Ægisthus and Clytemnestra. He spent the rest of his life quietly with Helen, by whom he was the father of Hermione and Megapenthes, the former of whom married Neoptolemus, son of Achilles.

Menelik, or Menelek, II. (c. 1812-1913), emperor of Abyssinia, was the son of Hacli Melloth, king of Shoa. In 1856 he was obliged to wed Batana, the daughter of Theodore, the reigning emperor, and ten years later he became king of Shoa. On the assassination of Theodore in 1889 he declared himself emperor. Having inflicted an ignominious defeat on the Its. at Adowa in 1896, he was able to replace the objectionable treaty of Uchali (1889) by the peace of Addis-Ababa (1896), whereby his independence was fully recognised. Under his intelligent direction Abyssinia rapidly assimilated W. civilisation.

Menemen, tn. of Asia Minor on the Gediz-chal, 14 m. N. by W. of Smyrna. Pop. 12,000; about half are Moham-medans.

Menéndez y Pelayo, Marcelino (1856-1912), Sp. writer and critic, b. at Santander, studied at Madrid, and after a brilliant academic career became prof. at the age of twenty-two. His orthodoxy and ultramontanism are revealed in his popular essays *La Ciencia española* (1878)

and in his *Historia de los heterodoxos españoles* (1880-86), whilst his *Calderón y su teatro* (1881) and his *Historia de las ideas estéticas en España* (1883-91, 1903-1912) are true monuments of literary criticism. He has issued the standard ed. of Lope de Vega (1890-1902). His complete works were pub. in 13 vols., 1911-1924 and 1940 ff. See lives by A. Bonilla, 1914; M. Artigas, 1927, 1939 (with bibliography); and A. Sandoval, 1944.

Menes (Μηνις), according to the traditions of the Egyptians, was the first king of Egypt. The name, signifying conductor, has been found on inscriptions, but no contemporary monuments of him were known until his grave was discovered by de Morgan at Negadr in Upper Egypt in 1897. Herodotus ascribes to him the building of Memphis, and Diodorus says that he introduced the worship of the gods and the practice of sacrifices into Egypt.

Menfi, tn. of Sicily in the prov. of Girgenti, 32 m. E.S.E. of Marsala. Pop. 12,000.

Menger, Karl (1840-1921), Austrian economist; prof. at Vienna, 1873-1903. Rejecting the historical method in economics, showing always an uncompromising preference for speculation and *a priori* theory, he is remembered particularly as a co-founder of the school of 'marginal utility' (the utility or importance to the buyer of the least important or 'marginal' part of his current consumption of any commodity), in opposition to the conventional explanations of values in form of costs without relation to the choices and preferences of consumers.

Meng-ka, see **BANKA**.

Mengo, dist. of Uganda. It contains the prin. residence of the *kabaka* (or king) of Uganda, and the seat of the native gov. of Baganda (or Buganda), as well as the headquarters of the prov. administration (Kampala). It is therefore regarded as the central dist. of the Buganda Prov. (see also **KAMPALA**). The pop. (1931 census) was 362,666 (natives 356,781; Indians 4512; Europeans 786; and Goans 475). Area 9376 sq. m. (land and swamp 5781; open water 3595 sq. m.). There is elephant hunting in the dist., and the bush-pig is found in thousands in the swamp and dense cover in the vicinity of cultivation. The M. Church Council was organised by the pioneer missionary A. Mackay in 1885, and evolved with the native Anglican Church of Uganda (constituted 1909). The M. hospital was founded in 1897. It adjoins the cathedral precincts at Namiirembe (dedicated Sept. 13, 1919). The cathedral is an imposing red-brick structure, which was built at a cost of £28,000. It is the fourth cathedral on the site. The first, built of palm poles and grass, was blown down in a storm (1894). The second, of similar construction, was dismantled as unsafe (1901). The third, of burnt brick and grass roof, was destroyed by lightning (1910).

Mengs, Anton Raphael (1728-79), Bohemian painter, b. at Aussig. He was appointed court painter in Dresden, but was allowed to return to Rome to continue his studies. He soon earned a great

reputation by his original compositions, among them a 'Holy Family,' the Virgin of which was painted from a beautiful peasant girl whom he afterwards married. His 'Apollo and the Muses,' in the Villa Albani, Rome, made him still more celebrated. He executed various paintings for Charles III. of Spain, decorating the royal palaces of Spain, and the 'Apotheosis of Trajan,' at Madrid, is considered his masterpiece. See K. Gers-tenberg, *Winckelmann und Anton Raphael Mengs*, 1929.

Mengtsze, former treaty port in the S.E. of Yunnan, China, opened to trade with Tongking in 1886. Zinc, lead, tin, opium, and tea are exported. Pop. 193,000.

Menguaid, see **MAIDSTONE**.

Menhaden, **Hardhead**, or **Moss-banker** (*Brevortia tyrannus*), important fish allied to the shads, common on the Atlantic coast of N. America. It is employed as a bait, but is chiefly valuable for its rich oil and for the manurial value of the residue.

Menhirs (Breton, *men*, stone; *hir*, long) are single, tall, upright standing stones, often known simply as monoliths. Some are of natural origin (Buck Stone, Staunton); many mark the sites of prehistoric burials; while others are boundary marks, meeting-places, or sacred sites. They are of various ages, are distributed geographically in Europe, Asia, and Africa, and in general give no indication whatever of their purpose. The menhir is the simplest form of megalithic monument, and a great number in the Brit. Isles probably belong to the late Neolithic or Early Bronze Age, and certainly to a megalithic culture. The M. at Carnac in Brittany (Early Bronze Age) are especially well known; one is about 30 ft. high. In the Morbihan are pieces of a menhir which was nearly 70 ft. high. Occasionally M. bear rough engravings of conventional human and animal forms; some are of obvious phallic significance.

Ménier, Émile Justin (1826-81), Fr. manufacturer and political economist, b. in Paris. He gave up the drug factory he had inherited from his father in 1864, and purchased cocoa plantations in Nicaragua and beet-fields in France, whereby he was able to manuf. chocolate on an immense scale. He pub. sev. treatises on economics, and served the Republican cause in Parliament (1876-81). Anticosti Is. in the St. Lawrence, Canada, was purchased by his son, and utilised as a game preserve.

Ménière's Disease, condition of middle age, in which vertigo, headache, deafness, and *tinnitus* (i.e. ringing in the ears) are associated in sudden attacks, due to hæmorrhage into the internal ear or labyrinth. Other symptoms include vomiting and a staggering gait. While the vertigo may pass away or, at least, become reduced, permanent deafness may result. Though the disease was first described fifty years ago, there is as yet no satisfactory treatment, though relief may be obtained by bromide, phenol barbitone, and the salicylates.

Menin (Flem. *Meenen*), city in the prov. of W. Flanders, Belgium, 7 m. S.W. by W. of Courtrai. It is situated on the

R. Lys, close to the Fr. border. It is engaged in agriculture and manufs. of tobacco, chicory, and soap. There are also weaving mills, bleach-works, and iron foundries. Pop. 22,000.

Menin Gate, a handsome memorial to the 56,000 men of the Brit. armies who died or were killed in the Ypres salient during the First World War. The memorial was unveiled by F.-M. Lord Plumer on Sunday, July 24, 1927, in the presence of an enormous assembly of Brit., Belgian, and Fr. representatives, including the king of the Belgians. In appearance it resembles a Rom. triumphal arch. The architect was Sir Reginald Blomfield, R.A., and the sculptor Mr. (later Sir Wm.) Reid Dick, R.A. During the First World War the Menin Road was a constant target for Ger. artillery and the old M. G. was soon reduced to ruins. Lord Plumer commanded the armies in this area, known as 'the most dangerous corner in Europe.' It is doubtful if any one spot in all the theatres of war became more widely known than the M. G. Almost every regiment of the Brit. Empire had, at some time during the war, marched through this place. The Ger. Army attacked in great masses down the Menin Road in 1914, and from the old M. G. the 'old contemptible' Brit. Army emerged to stem the flood of hostile invasion, in which task it was nearly annihilated.

On May 27, 1940, the day before the surrender of King Leopold. Ger. military cyclists passed through the M. G. in advance of tanks and motorised infantry.

Meningitis, inflammation of the membranes of the brain or spinal cord. Tubercular cerebral M., or acute hydrocephalus, is always associated with a tuberculous hist. It usually attacks children under ten years of age, but is occasionally found to affect adults. The early symptoms are very indefinite. There is disturbed appetite and digestion; the patient is restless, but easily fatigued. Severe headaches and vomiting mark the more definite stage of the disease, and the patient gradually passes from an excitable state to a depressed condition. Light, which in the first stage is painful, becomes tolerable again. Squinting almost invariably appears in the eyes, and there may be drooping of the eyelid or even blindness. The pulse becomes slow, the patient sinks into a drowsy and almost insensible condition. Towards the end there may be a recurrence of the more excitable state, and the child may appear to be improving. The disease is almost invariably fatal, though treatment with streptomycin has recently given some promising results.

Cerebro-spinal fever, or epidemic cerebro-spinal M., is also known as spotted fever. It is an infectious disease, produced by *Diplococcus intracellularis* (Weichselbaum), now known as *Meningococcus intracellularis*, and since 1905 has caused considerable mortality in Europe and America. Its onset is sudden; the patient has severe headache, and is seized with rigors and vomiting. Mus-

cular spasms ensue; there is general hyperæsthesia and feverish conditions. About the fourth day rashes appear of varying form and colour. The death-rate a few years ago was 70 per cent, but the adoption of Flexner's serum treatment caused a marked diminution, bringing the mortality down to 20 per cent or even lower. Serum treatment has now been completely replaced by sulphonamides, which are more efficacious even than penicillin, and recovery is the rule. The spread of M. is apparently due to the dissemination of bacteria from the nose and pharynx of healthy people who rarely contract the disease but may act as carriers. In this way the bacteria eventually reach susceptible subjects.

The exact causes of epidemic M. are not fully known, but the bacteria become much more virulent in favourable conditions. Gordon recognised four types of meningococcus, associated with differences in the form of M., and during the First World War he and his colleagues introduced four separate types of sera for use in appropriate cases, as well as a polyvalent serum combating all four types of the disease. M. may, however, be due to other organisms associated with the presence of inflammation, particularly in connection with pneumonia and influenza, and the use of sulphonamides has rendered grouping unnecessary. See D. Brinton, *Cerebrospinal Fever*, 1941.

Meningocele, protrusion of the meninges through their bony covering. The meninges are the membranes covering the brain and spinal cord, and if there be any defect in the skull or vertebral column, the meninges may protrude, forming a cyst filled with cerebro-spinal fluid.

Meninsky, Bernard (b. 1891), Eng. painter, b. in Russia. He studied at the Slade School, London, and also in Liverpool and Paris. He has exhibited at various international exhibitions. The Tate Gallery has his 'Portrait of a Boy' and the Dublin Art Gallery his 'Mother and Child.' He was one of the Brit. official artists in the First World War. He is now teacher of drawing and painting at the Central School of Arts and Crafts and at Westminster School.

Menippus, of Gadara, Carle-Syria, fl. in the early third century B.C. Cynic and satirist, he undoubtedly exerted a paramount influence on many subsequent writers, yet his books have all perished, and his style may only be gleaned from the *Menippean Satires* of M. Terentius Varro, avowedly his imitator.

Menken, Adah Isaacs (1835-68), Amer. actress and poetess, b. in New Orleans, daughter of a Sp. Jew. Her original name is variously given as Adelaide McCord and Dolores Adios Fuertes. In 1856 she married John Isaacs M., a Jew, and changed her name Adios to Adah. She is said to have been married at least four times, one of her husbands being R. H. Newell ('Orpheus C. Kerr'), while another was Hecnan ('the Benicia Boy'). Her first appearance was in 1848 as a dancer in her native city; but her star turn was in 1864 in London as Mazeppa,

to the success of which her handsome physique largely contributed. Also acted in Paris in *Les Pirules de la Savane*. Among her friends were Gautier, Dumas the elder, Dickens, to whom she dedicated her *Infelicia* (1868), Charles Reade, and Swinburne, whose poem *Dolores* (1864) was inspired by her. She died in Paris, a professed Jewess.

Mennonites, Protestant sect, who date their origin from a congregation which formed itself in Zürich in 1525. They refuse to bear arms or to take oaths. They acknowledge only the authority of the Bible, postpone baptism until after a confession of faith, and dislike all forms of church hierarchies. Their principles were adopted and preached by the devout and enlightened Menno Simons (1492-1559), whose name is preserved in their title. It was he who rebuked the Westphalian Anabaptists for their fanatical excesses, which were responsible for the carnage and other horrors in Münster (1534), and it was largely due to his influence that the sect spread to Germany and Holland. For many years the M. were the victims of persecution. In 1786 sev. colonies of Ger. M. found an asylum in S. Russia, where Catherine II. allowed them to practise their religion undisturbed. To-day the sect numbers some 250,000 members, a third of these being in the U.S.A. Dutch refugees founded a Mennonite community at Germantown in Pennsylvania as early as 1683, and since 1871 there have been large Mennonite settlements in Kansas and Minnesota. See J. H. Ottius, *Annales Anabaptistici*, 1872; C. H. van der Smitten, *Kursgefasse Geschichte der Mennoniten*, 1895; J. S. Hartzler and D. Kauffman, *Mennonite Church History*, 1905; C. Crahn, *Menno Simons*, 1936; and the *Mennonite Quarterly Review*.

Menologies, see HAGIOLOGY.

Menominee (so called from a now almost extinct Algonquin tribe of Indians), city of Michigan, U.S.A., the seat of M. co., one of the greatest lumber shipping ports in the U.S.A. There is extensive cheese manuf. in the dist., and M. is also a fishing centre. Pop. 10,000.

Menominee, Algonquin tribe of Indians who dwell in an assigned ter. near Green Bay, Wisconsin. Except in language, they are not unlike the Ojibwa. Their estimated number is about 1400.

Menomonie, city of Wisconsin, U.S.A., co. seat of Dunn co., on the Red Cedar R. 60 m. S.E. of St. Paul, Minnesota. It is an agric. centre; timber production was once important but has declined with the clearing of the pine forests. The Stout Institute trains teachers for vocational schools. Pop. 16,000.

Menopome (*Menopoma* or *Cryptobranchus alleghaniensis*), Mud Devil, or Hellbender, voracious four-legged tailed amphibian found in some of the rivs. of N. America. It is slate-coloured and about 2 ft. long, and the body is short and thick, and the head large, flat, and broad, with wide, fleshy lips. The neck has a single gill cleft on either side.

Menorca, see MINORCA.

Menorrhagia, see under MENSTRUATION.

Mensa, one of Lacaille's S. constellations so named by him in 1752 after the Mons Mensæ (Table Mt.) at the Cape of Good Hope. It lies between Dorado and the S. pole, and contains no star of a brighter magnitude than 5.3.

Menshevik (Russian *men'shinstvo*), minority wing of the Russian Social Democratic party, formed in 1903. It differed from the Bolshevik or majority wing only on matters of party organisation, but later the two wings became mutually antagonised on tactics and aims. While the Bolsheviks (*q.v.*) were Marxists, the M. were 'reformist' in the continental sense and held that the socialisation of Russia should be gradually effected in co-operation with other radical groups and through economic reforms and the education of the masses. In the Provisional Gov. of 1917 of Prince Lvov, they had equal representation with the Socialist Revolutionaries. The Bolsheviks, who were then, and always had been despite their name, in the minority, were not represented. Later, the Bolsheviks repudiated political democracy altogether and organised themselves openly against the other two groups, eventually replacing the Provisional Gov. See further under BOLSHEVISM, and RUSSIA.

Menshikov, Alexander Danilovich (c. 1663-1729), Russian statesman and field-marshal, b. at Moscow. He began life by selling meat pies in the streets of Moscow, and had François Lefort, the tsar's favourite, to thank for his introduction to Peter the Great, with whom he had thoroughly ingratiated himself by 1699. As a soldier he distinguished himself at the siege of Azov (1696) and the battles of Kulitsch and Poltava (1706, 1709). As a civil administrator he executed Peter's reforms with remarkable promptitude and success, and on his death assumed the reins of government during the brief rule of Catherine and the minority of Peter II. Ousted from power by the Dolgorukis, he was banished and d. an exile in Siberia.

Menshikov, Alexander Sergeievich (1789-1869), Russian general and admiral, was the great-grandson of Alexander Danilovich M. He served Alexander in the Napoleonic campaigns of 1812-15, and in 1828 captured Anapa from the Turks. Created admiral in 1834, he improved very considerably the standard of efficiency in the navy. During the Crimean war (1854-56) he commanded the Russian forces at Alma, Inkerman, and around Sebastopol. Recalled on the breakdown of his health, he became a leader of the reactionary party in the Council of the Empire.

Menshiyeh, El, or Minshag, El, tn. with archaeological remains, 11 m. N.N.W. of Girgeh, on the l. b. of the Nile in Upper Egypt. Pop. 8000.

Menstruation (Lat. *menstruus*, monthly, from *mensis*), also known as Catamenia, discharge of blood, usually from four to six oz., which issues every twenty-eight days from the uterus of a woman, so long as she is capable of 'procreation'. M.

begins at the age of puberty, which among Teutonic races varies from fourteen to sixteen, and is a sign of the change from childhood to womanhood. The flow ceases between the ages of forty-five and fifty-two, this being a climacteric period popularly referred to as 'the change of life.' M. lasts as a rule from three to four days, and often occurs more or less frequently than once a month; during pregnancy and lactation it stops entirely, and its cessation, therefore, is an early indication of conception. M. comprises the discharge of the uterine lining, or endometrium, which has become thickened and vascular in preparation for the reception of a fertilised egg; it is thus part of the menstrual (catrour) cycle.

The menstrual process is often accompanied by disorders, which are broadly classified as amenorrhoea, dysmenorrhoea, menorrhagia, and metrorrhagia. (1) Amenorrhoea implies absence or deficiency of catamenia. This may arise from such a physiological cause as pregnancy; from constitutional causes such as anaemia, malnutrition, emotional disturbance, malaria, and other febrile disorders, such diseases as phthisis, or diseases of the stomach or nervous system; or from local causes such as the absence, malformation, or disease of the ovaries or uterus, or of both. Surgery will sometimes remove local causes, whilst anaemia and other constitutional causes may often be remedied by better nutrition, healthier surroundings, change of air or mental occupation. (2) In dysmenorrhoea, M. is attended by pain; with some women this is always so, whilst there are others to whom it brings no appreciable discomfort. The pelvis is the seat of the pain, but it is felt also in the groins, thighs, and sacrum. Other symptoms are headache and backache, and general lassitude. The various kinds of dysmenorrhoea are described as (a) ovarian; (b) congestive, or inflammatory; (c) obstructive, or mechanical; (d) membranous; and (e) neuralgic or spasmodic. Hot baths, rest in bed, drugs like phenacetin, hyosyamus, and ammonium acetate, and especially purgatives and aperients administered a few days before catamenia is expected, may be recommended in certain cases. (3) Menorrhagia is flooding, or excessive flow. Frequent causes are subinvolution of the uterus, fibroid tumour, polypus, cancer, and ulceration of the cervix, etc. (4) Metrorrhagia is escape of blood from the uterus, independent of M.; it is occasioned by disease of the uterus, or its appendages, and should be regarded as a serious sign.

Mensuration, section of geometry which investigates lengths, areas, and volumes. The lengths of ordinary straight lines are measured by mechanical means, but the measurement of irregular lines forms a part of the integral calculus termed rectification. *The areas of plane figures*, such as the square, rectangle, etc., may be tabulated as follows: square = (side)²; rectangle = length \times breadth; parallelogram = base \times height; trapezium = $\frac{1}{2}(a + b)$, where a and b are the lengths of the parallel sides, and h is the perpen-

dicular distance between them. Various formulae are true for the triangle: (1) half the base multiplied by the height, or (2)

$$\sqrt{s(s-a)(s-b)(s-c)},$$

where s = half the sum of the sides a , b , and c . For quadrilaterals, and the various types of polygons, it is usual to divide them up into triangles, find the area of each triangle, and sum up the results. The area of the circle = πr^2 , where $\pi = 3.141 \dots$ and r = radius. The area of a sector of a circle = $\pi r^2 \theta$, where θ is the angle subtended by the arc at the centre. That of the ellipse = πab , where a and b are the semi-axes. Various other formulae for the triangle and polygons are known in terms of trigonometrical notation. The areas of the less familiar areas are determined by calculation by means of the integral calculus.

With regard to solids, the volumes and surface areas of the most common are as follows: *Volumes*.—Prism = area of base \times height. Cone = $\frac{1}{3}$ area of base \times height. Pyramid = $\frac{1}{3}$ area of base \times height. Cylinder = area of base \times height. Sphere = $\frac{4}{3}\pi a^3$, where a = radius of the sphere. *Surface areas*.—Prism, cone, pyramid, and cylinder = area of ends + area of sides. The surface area of the sphere = $4\pi a^2$, where a = radius. Various mechanical rules have been formulated for the areas, e.g. Simpson's rule. Pappus's theorem expresses the fact that the volume of a solid of revolution is equal to the area of the generating figure multiplied by the circumference of the circle through which its centre of gravity moves, and the surface area of a solid of revolution is equal to the perimeter of the generating figure multiplied by the distance through which the centre of gravity travels. Amongst the mechanical appliances, the planimeter may be mentioned as an instrument for the measurement of the area of an irregular plane surface.

Mental Deficiency Acts. The Mental Deficiency Act of 1913 (amended by the Mental Deficiency and Lunacy (Amendment) Act, 1915, and the Mental Deficiency Act, 1927) legislates for the care of idiots, imbeciles, feeble-minded persons, and moral imbeciles in institutions under the control of a Board of Commissioners. These institutions may receive mental defectives (a) on the request of a parent or others responsible for such persons, (b) on the issue of an order from the court made at the instance of any relative or friend or by an officer of the local authority. Under the Act transfers from institutions for mental defectives to lunatic asylums may take place and from the latter to the former. Children of seven years and upwards may be certified and instructed in special schools. Under the Medical Treatment Act, 1930, opportunity is afforded of treatment without certification of those suffering from mental illness. Any volunteer for treatment who makes a written application for the purpose may be received as a voluntary patient in an institution or a nursing home or place approved by the Court of Protection or into the charge of an approved

person without a reception order. Young people under sixteen may become voluntary patients provided their parents or guardians make a written application which should be accompanied by a recommendation from a doctor. Patients may leave those homes or institutions where they have been voluntarily domiciled upon giving seventy-two hours' notice of an intention so to do. Notice of the reception, departure, or death of a voluntary patient must be sent to the Court of Protection. If a voluntary patient becomes incapable of expressing willingness or unwillingness to receive treatment, such patient may not be detained for more than twenty-eight days, unless steps have been taken to deal with him as of unsound mind. Commissioners have power to visit voluntary patients, and if they deem them unfit to be treated as such, may order their discharge or take steps to deal with them as persons of unsound mind. See also INSANITY.

Mental Tests. Modern psychologists use tests of intelligence, of educational attainments, of aptitudes (mechanical, musical, etc.), of the senses, and of personality and interests in studying children and adults. Such abilities or qualities are usually judged, in daily life, from casual observations of a person's behaviour when confronted with intellectual, mechanical, or other tasks. But a scientifically constructed test shows the following characteristics: (1) The problems or tasks are carefully chosen and graded and have usually been proved to measure the quality in question. (2) They often include a wide range of problems in order to cover the ground systematically and to allow scope for those who are highest and lowest in the quality. (3) They are given in a standard manner, often with a time limit, and should only be applied by testers who are trained both to get the co-operation of the people tested and to follow the exact procedure and interpret the results correctly. (4) Accurate records are made of the responses. Problems are set in such a way that there is only one correct answer to each; hence the marking is objective and unaffected by the tester's personal judgement. (5) Scores may be based on numbers of correct responses or the time taken, etc., and these are evaluated by comparison with the *norms* or standards of performance for children of the same age, or for groups of similar adults. For example, a dull child of ten years may only do as well on an intelligence or an arithmetic test as an average eight-year-old. He is then said to have a mental age or arithmetic age of eight, and his *Intelligence Quotient* or I.Q. is $8/10 \times 100 = 80$. The average I.Q. is 100; very bright children range from about 130 to 180, feeble-minded ones from about 70 down to less than 20. Adult test results are more often expressed by *percentiles*. Thus an army recruit would be regarded as high in mechanical ability if his score was better than that of 90 per cent of recruits.

The earliest tests, devised by nineteenth-century physiologists and psychologists,

including Fechner, Galtou, Helmholtz, McK. Cattell, and others, were mostly for measuring the senses, for example, colour vision, auditory acuity and sense of pitch, and touch. Quickness of response or *reaction time* to light and sound, as measured by electrically operated chronometers, was found to differ widely in different individuals. Sir Francis Galton conceived the idea of measuring higher mental abilities, and studied different types of mental imagery. But the first intelligence tests were Ebbinghaus's completion test (1897) and Binet and Simon's scale (1905). The latter consisted of groups of short tasks appropriate for children of different ages. It has been trans., revised, and expanded in many countries, for example by Burt in England. The best-known versions are the Stanford-Binet (1916) and the Ternan-Merrill scales. These are generally regarded as giving the most reliable measurement of a child's intelligence, e.g. before certification for a special school. Wechsler's *Bellevue* scale (1939) is more suitable among adults, and scales based mainly on play material such as the Merrill-Palmer are used with pre-school children. For deaf or other verbally handicapped children, practical or *performance tests* are available. These mostly involve fitting pictures or coloured blocks together, or putting shapes into holes.

Tests for measuring scholastic attainments in reading, spelling, arithmetic, handwriting, etc., were prepared by Thorndike and other Amer. psychologists early in this century. Valuable series of educational tests, which are especially useful in studying and coaching backward children, have been pub. by Sir Cyril Burt (*Mental and Scholastic Tests*, 1921) and F. J. Schonell (*Backwardness in the Basic Subjects*, 1942). This type of standardised examination was soon extended to the measurement of intelligence, and group tests consisting of series of printed problems were devised for Amer. recruits in 1917. Nearly 2,000,000 men took the army alpha (verbal) or army beta (non-verbal) tests. Many hundreds of tests along the same lines have been pub. since in Britain and America for measuring the intelligence or attainments of primary and secondary school pupils, ordinary adults, and univ. students. Tests of intelligence, Eng., and arithmetic are prepared yearly by Moray House, Edinburgh, and are used by many education authorities for selecting children at eleven years for grammar schools. Since 1942 all recruits to the navy, army, and R.A.F. have taken intelligence, educational, and other group tests, and the results have been shown to be highly relevant in allocation to specialist training, in selecting officers, etc. Though group tests are quicker and easier to give and score than individual ones, they vary considerably in merit, and are often less trustworthy.

Testing of occupational aptitudes has been fostered in Britain by the Industrial Health Research Board and the National Institute of Industrial Psychology. Mech-

anical tests based on pieces of apparatus or pictures and diagrams, and clerical tests, play a useful part in advising school-leavers about suitable vocations and in classifying recruits. In selecting workers for a particular job more specialised tests are constructed after a careful analysis of the job requirements. Interests in different types of work can be measured by questionnaire tests, but personal qualities such as leadership, dependability, and emotional stability are much more difficult to measure than abilities. They can be assessed only very inaccurately by questionnaires or in the ordinary interview. Ratings or judgments by acquaintances, and the extended practical exercises developed by the War Office and civil service selection boards, are of some value. So-called *projection tests*, where the person reveals his qualities indirectly through his responses to ink-blot, pictures, or verbal stimuli (free association), are often used by trained psychologists. See also under *PSYCHOLOGY*.

See Sir F. Galton, *Inquiries into Human Faculty and its Development*, 1883; M. S. Viteles, *Industrial Psychology*, 1932; O. Buros, *Mental Measurements Year Book*, 1933-36, 1938, 1940, 1948; R. B. Cattell, *A Guide to Mental Testing*, 1936; L. M. Terman and M. A. Merrill, *Measuring Intelligence*, 1937; P. E. Vernon, *The Measurement of Abilities*, 1940; J. E. Bell, *Projective Techniques*, 1947; H. J. Kysenck, *Dimensions of Personality*, 1947; P. E. Vernon and J. B. Parry, *Personnel Selection in the British Forces*, 1949.

Mentana, vil. 12 m. N.E. of Rome, Italy, where in 1867 the Fr. and papal forces defeated Garibaldi. Pop. 3500.

Menteith, Lake of, loch and dist. of Perthshire, Scotland, in the S.W. of the co. The loch is about 1½ m. long, with a breadth of 1 m., and contains three small picturesque is. The dist. extends from the Teith to the Forth, and formerly was an independent stewardry. The caridom of M. is long extinct.

Mentha, name applied to a genus of labiate plants, otherwise known as the mints; also to the volatile oil contained by the different species. The more important species are *M. viridis*, or spearmint, which is used for culinary purposes, and contains an oil used as an aromatic stimulant; *M. piperita*, or peppermint, used to relieve nausea, flatulency, and pains in the stomach and intestines; and *M. sylvestris*, or horse mint, an uncultivated variety, used for the same purposes as spearmint and peppermint.

Menthol ($C_{10}H_{18}O$), alcohol derivative of menthone, one of the constituents of oil of peppermint. It also occurs in a free state in peppermint, and is mainly responsible for the characteristic odour of the plant. M. crystallises in prisms which melt at 43° and boil at 212° C. It is reduced by hydriodic acid to hexahydrocymene. The M. of pharmacy is commonly derived from *Mentha arvensis purpurescens*, a Jap. variety of mint. In this form it usually contains other ingredients, and is made up as a soft

crystalline solid resembling camphor. In fact, it is often known as mint camphor. It volatilises readily on being rubbed on the skin, but has a stimulating effect if evaporation is prevented. It is used as an anodyne in neuralgia and in many irritating affections of the skin.

Menthu, in Egyptian mythology, lord of Thebes and of the sky—a personification of solar heat and figured as guiding the boat of the sun and striking down Apepi, the lord of the powers of darkness or personification of evil. M. was worshipped at Karnak, Hermonthis, and other Theban cities, his cult being associated with that of Ita, the sun-god. He was renowned also as a god of war. The bull was sacred to him, and Bakha, the sacred bull of Hermonthis, was supposed to be an incarnation of M., who is sometimes represented with a bull's head, though more usually with the head or double-head of a hawk surmounted by a solar disk.

Mentmore, vil. in Buckinghamshire, England, 4 m. from Leighton Buzzard. Here is the seat of the earl of Rosebery, once the property of the Rothschild family.

Mentone (Fr. Menton), favourite winter and health resort, 143 m. by rail E.N.E. of Nice, on the Mediterranean shore, in the dept. of Alpes Maritimes, France. A rugged headland divides its bay into two portions. There are really two settlements, that of the hotels and visitors, which hugs the water's edge, and the native quarters straggling up the mt. side. The mean ann. temp. is 61° F. The vegetation is almost tropical, and millions of lemons are grown each year.

In the Second World War allied forces landed near M. on Sept. 8, 1944, prior to a northward advance. Pop. 13,800.

Mentor, figures in Gk. legend and especially in Homer as the son of Alcimus, the trusted friend of Odysseus and the wise preceptor of Odysseus's son, Telemachus. It was he who had charge of Odysseus's home in Ithaca whilst the latter was abroad. From the part he plays in Fénelon's *Telemachus* his name has become synonymous with 'trustworthy counsellor.'

Mentz, see MAINZ.

Mentzelia, genus of half-hardy annuals or perennials (family Loasaceae) with large white, yellow, or orange flowers. Sev. species are hardy in sunny borders.

Menui, tn. 35 m. N.N.W. of Cairo, situated in the Nile delta at the junction of two branches in lower Egypt. It is an important market for agric. produce. Pop. 30,000.

Menufia, or **Menufiyeh**, *mudiria* or prov., 607 sq. m. in area, in the Nile delta. Lower Egypt. It stretches from the fork of the main arms along the Rosetta branch. Pop. 1,159,700.

Menuhin, Yehudi (b. 1916), Amer. violinist of Jewish descent. He began his musical studies at the age of four under Sigmund Anker and Louis Persinger in San Francisco, and later was a pupil of Georges Enesco at Paris. At the age of eleven, having already made numerous public appearances, he performed the

astonishing feat of playing the Beethoven concerto with the New York Symphony Orchestra under Fritz Busch. He made his Berlin and London debuts in 1929, and has since then played in all the principal cities of the world. M. is regarded as among the greatest exponents of his art.

Menyanthes, see **BUCK-BEAN**.

Menzel, Adolph Friedrich Erdmann von (1815-1905), Ger. painter and engraver. b. at Breslau. He lost both his parents before he was eight, and had later to support his family. Having illustrated Goethe's *Kunstlers Erdenwallen* and other works with pen-and-ink drawings, he revived the art of wood engraving, and made a name by his illustrations of Kugler's *Geschichte Friedrichs des Grossen*, and of the actual works of Frederick the Great (1843-49). He owed his mastery of oils purely to his own endeavours. 'The Forge', 'The Ball Supper', and 'The Market Place at Verona' are three of his best pictures. See J. Meier-Graefe, *Der junge Menzel*, 1906; and lives by J. von Kurenberg, 1935, and E. Waldmann, 1941.

Menzies, Robert Gordon (b. 1894), Australian statesman and lawyer, b. at Jeparit, Australia, son of James M., member of the legislative assembly, Victoria. Educated at state schools, Grangeville College, Ballarat, Wesley College, Melbourne, and Melbourne Univ., he was called to the Bar, 1918, and entered the Victorian Parliament in 1928. Attorney-general, minister of railways, and deputy premier of Victoria, 1932-34, and attorney-general of Australia, 1935-39, M. was elected leader of the United Australia party in April 1939, being Prime Minister and member of the advisory war council, 1939-41. That he stands for the unity and solidarity of the empire was shown by his decision in 1940 to send the Second Australian Imperial Force overseas, a decision over which he crossed swords with Curtin (q.v.), the leader of the Labour party. Throughout his tenure of office there was marked want of political stability in Australia, although all parties were agreed on the country's general war policy. M. tried to form a 'national' or composite gov. with the Country party, but the leader of that party, Dr. Earle Page, could not agree on the terms on which his party should join, and resigned. Labour, on the other hand, refused to join any coalition, and M. had no option but to resign when Curtin rejected his proposal to form an all-party gov. M. became Prime Minister of Australia in Dec. 1949 after the defeat of the Labour Gov.

Menzies, (n.) in the gold-mining dist. of W. Australia. It lies S. of Lake Ballard, and is connected by rail with Malcolm, Albany, and Perth. Pop. 1000.

Menzini, Benedetto (1646-1704), It. poet, b. at Florence, entered the priesthood, becoming prof. of eloquence at the archigymnasium of Rome. He enjoyed the patronage of Christina of Sweden, and was in some measure inspired by Francesco Redi. His original verse, which includes twelve pungent satires (1728), some mediocre odes, and a few dainty anacronisms, is more readable to-day than

his somewhat antiquated essay in criticism entitled *Art of Poetry*.

Mepacrin, see under **CINOHONA BARK ALKALOIDS**.

Mephistopheles is the evil spirit in the Faust legend, by whom Faust is persuaded to sign away his soul. M. receives very different treatment at the hands of Marlowe and Goethe in their versions of the Faust legend. Both, however, identify him with Lucifer (q.v.), the fallen archangel, with the medieval devil, and also with the humorous kobold of Ger. folklore.

Meppel, tn. in Drenthe, Holland, 17 m. by rail N. by E. of Zwolle. It communicates with the Zuyder Zee via the Meppeler Dfep. Pop. 12,100.

Mequinez, see **MEKNES**.

Merano (Ger. *Meran*), tn. and health resort, picturesquely situated 1050 ft. up at the base of the Kitchelberg, on the Passer R., 16 m. N.W. of Bolzano, in the It. Tyrol. Pop. 10,000.

Merbeck, John, see **MARBECK**.

Mercantile Law. There is no part of the Eng. law which is specifically called M. L. except in text-books, although the phrase is occasionally to be found in the title of a statute, e.g. the Mercantile Law Amendment Act, 1856 (as to which see **LIMITATIONS, STATUTES OF**). The reason for this is that Eng. M. L., built largely upon the customs of merchants, in theory forms merely a part of the common law (q.v.), and that such codification as can be said to exist has been comparatively recent and confined to special topics, e.g. the Bills of Exchange Act, Merchant Shipping Acts, Sale of Goods Act, etc. For the sources of M. L., its rise and development in England, see under **LAW MERCHANT**. Other subjects bearing on M. L. are Agency, Sale of Goods, Partnership (q.v.), Negotiable Instruments (q.v.), and Bill of Exchange, Life Assurance, Fire, Marine, and Accident Insurance (see also **INSURANCE**), Common and other Carriers, Contracts of Suretyship (see **GUARANTEE**), Shipping (see **MERCHANT SHIPPING ACTS**), Bankruptcy (q.v.), Lien (q.v.), Mortgage (q.v.), Pawn (see **PAWNBROKER**), and occasionally Joint Stock Companies (see under **COMPANY AND COMPANY LAW**).

Mercantile Marine. From A.S. days the merchant seamen of Britain have made a vital contribution to national defence and commercial prosperity. The naval tradition has been for centuries a crucial factor in the life of the nation, though it developed slowly and irregularly. As far as seamen were concerned there was no contract lasting longer than a ship's commission and no security of re-employment until the middle of last century. But seamen congregated in the dockyard tns. and they lived by and manned the navy. It was only during the reign of Henry V. that the Eng. navy, as distinct from the merchant service, was estab., and it was only in that of Henry VIII. that the king estab. dockyards at Woolwich, Deptford, and Portsmouth, appointed a Board of Admiralty, placed the naval service on a distinct footing, and estab. Trinity House to encourage navigation. The dockyard tns. were estab. to control

the Channel approaches and to defend the mouth of the Thames. They were important military fortresses before the king developed his power upon the sea. The dockyards and the royal ships were, however, only one element of the king's marine forces; for over all vessels he possessed that indirect remote control which medieval theory gave, and for centuries certain tons could be called upon to furnish their due quota of ships in times of stress. Hence there was always the closest contact between the royal and merchant navies. The navigators of royal ships came from merchant vessels and returned to them. The principle of the Royal Naval Reserve, 'in itself a Victorian creation designed to utilise the merchant service officers and men in time of war, is deep-rooted in all naval theory' (D. Mathew, *The Naval Heritage*, 1944). There is hardly an industry in the country that does not rely upon the merchant navy, and hardly a person whose prosperity and general well-being is not bound up in this vast and complicated organisation. It is a vital life-line without which this is, kingdom could not maintain its position in the van of world powers—without which, indeed, the people of the is. could not live (Sir Archibald Hurd, ed. *Britain's Merchant Navy*, 1943). The M. M. in Great Britain is controlled by the Ministry of Transport, which administers the laws and regulations dealing with it. On Tower Hill, London, there is a memorial to the 12,649 officers and men of the merchant service and fishing fleets who lost their lives in the First World War. For the work of the M. M. in the Second World War see under NAVAL OPERATIONS IN SECOND WORLD WAR. The training of a navigating officer usually takes place either partly in a recognised training ship or nautical training college, or by apprenticeship wholly at sea. In the former case training may begin at fourteen years of age, and continues until sixteen or seventeen. Evidence of a satisfactory standard of education is required on entry, and after a minimum period of two years' training a certificate is granted which exempts from one of the four years required for a second mate's certificate. The fees for this course vary, but range from £100 to £160 a year. In the case of apprenticeship, the apprentice continues his general education until he is sixteen, and he then applies to be an apprentice, either to the ship he has selected or to the Shipping Federation. No written examination is required. Some physical defects, especially defective eyesight, will disqualify a boy when he comes to take the second mate's certificate. The Ministry of Transport issues a model form of indenture for apprenticeship; and particulars of the examinations necessary for Ministry certificates during and after apprenticeship may be obtained from the Ministry of Transport Regulations (Examinations of Masters and Mates). Other details, such as rates of pay and prospects, are issued by the general secretary of the National Maritime Board. Most officers continue at sea for the whole of their pro-

fessional life, but there are some shore appointments with salaries ranging up to £1500 a year.

Officers and men of the M. M. made great sacrifices to duty in the Second as in the First World War. They displayed incomparable bravery in the face of U-boat and bomber attacks, and the story of the Brit. convoys to Russia and Malta and elsewhere is one of the war's true epics.

Merchant Navy Losses in the Second World War.—Brit. merchant ships (excluding fishing vessels) lost by enemy action during the Second World War

Ministry of Transport

BRITISH MERCHANT NAVY BADGE

totalled 2426, with a gross tonnage of 11,331,933. Of these 1332 (7,595,045 gross tonnage) were destroyed by U-boats; 296 (816,255 gross tonnage) by mines; 209 (969,087 gross tonnage) by surface craft; 383 (1,575,230 gross tonnage) by aircraft; and 206 (375,716 gross tonnage) by other or unknown causes. The heaviest losses were in 1941, when 717 ships (2,924,056 gross tonnage) were sunk: 291 by U-boats, 172 by aircraft, 76 by mines, 70 by surface craft, and 108 by other or unknown causes. Total losses in other years of the war were: 1939, 96 ships (419,015 gross tonnage); 1940, 548 ships (2,435,667 gross tonnage); 1942, 646 ships (3,459,923 gross tonnage); 1943, 273 ships (1,514,221 gross tonnage); 1944, 103 ships (489,040 gross tonnage); 1945, 43 ships (190,011 gross tonnage). In addition 136 fishing vessels of 24,325 tons were lost, the highest total, 55, being destroyed in 1911. The prin. differences in merchant ship losses caused by U-boats in the First and Second World Wars were in the rate of loss and in the average size of ships sunk. In the First World War losses averaged nearly 95 ships a month compared with 41 a month in the Second. The average tonnage sunk a month in both wars was approximately the same at 215,000 gross tons, the average size of ships sunk between 1939 and 1945 being 250 gross tons, as against 2300 gross tons in 1914-18. The difference in the rates of loss is the more remarkable as in the

Second World War U-boats had a far greater operational range, and from the outset were able to use bases and facilities which placed them in a favourable position. Besides this, from June 1940 Germany had Italy as a partner in Europe, who had more than 100 U-boats, and until Dec. 1941 Britain faced the onslaught alone. In 1911-18 Germany had the naval forces of practically the whole world against her, yet her U-boats sank merchant ships at more than double the monthly rate of 1939-45. One of the

main reasons for the lower rate was the use of the convoy system from the very beginning of the war. In the Second World War allied forces destroyed an average of $11\frac{1}{2}$ boats a month; in the First World War the losses of Ger. submarines were estimated at $3\frac{1}{2}$ a month.

The casualties amongst personnel of Brit. and Brit.-requisitioned ships, from 1939 to the end of the war were: deaths, 30,189; missing, 5261; wounded, 4402; internees, 5556; total, 45,411. See H. St. G. Saunders, *Valiant Voyaging*, 1948.

Statistics.—The following is an analysis showing the changes which have taken place since 1901 in the distribution of steam and motor tonnage between the prin. countries of the world.

Country	1901	1914	1929	1939	1948
Great Britain and Ireland	50.2	41.6	30.2	26.1	22.4
United States (sea)	4.2	4.5	16.6	13.0	33.5
Japan	2.2	3.8	6.3	8.2	1.3
Norway	3.4	4.3	4.9	7.1	5.3
Germany	10.1	11.3	6.1	6.5	0.5
Italy	2.7	3.1	4.8	5.0	2.6
France	4.4	4.2	5.0	4.3	3.5
Holland	2.1	3.2	4.4	4.3	3.4

The figures for Great Britain and Ireland in 1948 do not include Eire. The above table has been compiled by Lloyd's Register of Shipping from the entries in *Lloyd's Register Book*, which includes records of all sea-going merchant ships of 100 tons and upwards.

The following is an account of the net tonnage of vessels with cargo (including their repeated voyages) that entered or cleared in Brit. ports during the twelve months ended Dec. 31, 1948, compared with the corresponding period of twelve months ended Dec. 31, 1938, distinguishing (a) nationality of vessels and (b) trading areas.

(a) Nationality	Entered		Cleared	
	1938	1948	1938	1948

Mercantile System, or Commercial System, policy of estimating the wealth of a country by the amount of gold and silver it contained, and, inferentially, of placing artificial restraints on commerce to prevent money (see CURRENCY and MONEY) from going out of the country. Towards the end of the eighteenth century, when the policy obtained in England, heavy duties were put on the importation of Fr. wines and silks and other commodities, and generally importation was discouraged, while everything was done by bounties and otherwise to foster exports. Adam Smith, in countering the M. S., as it was officially expounded in Thomas Mun's book, *England's Treasure by Foreign Trade*, the title of which at that time had become a fundamental maxim in the political economy of all commercial countries (see book iv. of the *Wealth of Nations*), shows how deeply rooted was this theory of Eng. statesmen, by reference to the theory of its then foremost philosopher, Locke, that the great object of a nation's political economy ought to be the multiplication of the precious metals as 'the most solid and substantial part of its movable wealth.' From Adam Smith we learn that there

were some six prin. means by which the M. S. proposed to increase the aggregate amount of gold and silver in any country by turning the balance of trade in its favour. Two were restraints upon importation, and they were imposed either by high duties or by absolute prohibition: (1) Restraints upon the importation of such foreign goods for home consumption as could be produced at home. The Navigation Act, primarily aimed against the Dutch, was an especially gratuitous barrier to the economical supply of fish from a people who were not only the prin. fishers in Europe, but by reason of their proximity could supply England at a low cost of transportation. But even Adam Smith had to concede that the Navigation Act was eminently favourable to the development of Eng. shipping, whatever its effect on foreign commerce. (2) Restraints upon the importation of goods of almost all kinds from those particular countries with which the balance of trade was supposed to be disadvantageous. Adam Smith's lengthy arguments against this restraint may be summed up in his position that the balance of produce and consumption may be constantly in favour of a nation, though the balance of trade

(an expression used to denote the supposed loss from foreign trade through the amount of gold and silver exported, as measured by that part of the imports which had to be paid for in gold and silver) is against it, by reason of the fact that though its circulating coin may be fast going out of the country or replaced by paper money, its *real wealth*, the exchangeable value of the ann. produce of its lands and labour, may all the while be increasing in much greater proportion than its debts. Exportation was encouraged (a) by drawbacks (see CUSTOMS DUTIES) in favour of (1) home manufs. subject to duties on exportation, and (2) foreign dutiable goods imported for immediate re-exportation; (b) by bounties to foster new or developing manufs., such as were supposed to be especially meritorious; (c) by commercial treaties; (d) by the estab. of colonies in distant countries from the supposed advantage of compelling them to buy Eng. commodities in exchange for their own. The only exceptions to the M. S. were those required by the system itself. The materials and instruments of production were the subjects of a converse policy, designed to enable manufacturers to obtain the requisites of manuf. as cheaply as possible so as to sell cheaper and export more largely.

From a wider view the M. S., in that it aimed to expand Brit. shipping and production, may be regarded as the economic concomitant of nationalism. The reaction against a system which tried to restrict colonies to the provision of raw materials and the absorption of Brit. manufs. was one element in the Amer. revolt. The question of a favourable balance of trade has again risen to great prominence since the end of the Second World War, especially in regard to the excess of imports from over exports to America. See further under CURRENCY AND MONEY; IMPORTS AND EXPORTS; and PROTECTION. See A. W. Small, *The Cameralists*, 1909; A. E. Monroe, *Monetary Theory before Adam Smith*, 1923; B. Horrocks, *A Short History of Mercantilism*, 1925; J. Morini-Comby, *Mercantilisme et protectionnisme*, 1930; and J. Viner, *Studies in the Theory of International Trade*, 1937.

Mercaptans, substituted alcohols, commonly methyl or ethyl, the oxygen in the hydroxyl group being replaced by sulphur, e.g. C_2H_5SH , methyl M.

Mercator, Gerhard (whose real name was **Gerhard Kremer**) (1512-94), mathematician, b. in Rupelmonde in E. Flanders, but of Ger. extraction. He was early fascinated by geography, and, after enjoying the patronage of the Emperor Charles V., became in 1559 cosmographer to the duke of Jülich and Cleves. He originated the device of projecting the meridians on maps as equidistant parallel lines, and later, as parallel straight lines at right angles to the meridians. His pub. works are *Nova et aucta orbis terræ descriptio ad usum navigantium* (1578) and *Atlas sive cosmographice* (1594).

Mercator, Nicholas (whose real name was

Nicholas Kauffmann) (1640-87), Dan. mathematician. It was he who discovered an arithmetical means of determining the area of spaces between the hyperbola and its asymptote, and who availed himself of this discovery to draw up logarithmic tables.

Mercator's Projection, see under MAPS and PROJECTION.

Merced: 1. Co. seat of M. co., California, U.S.A., 110 m. S.E. of San Francisco. It has a large trade in all kinds of fruit and other products, a lumber mill, and fruit packing and canning plant. Pop. 10,100. 2. Riv. of California, U.S.A., a trib. of the San Joaquin, having a length of 160 m. It traverses the Yosemite valley, and has two falls, 600 and 350 ft. respectively.

Mercedes: 1. Tn. of Argentina, 61 m. by rail W. of Buenos Aires. It has steam mills, soap factories, etc. Pop. 30,700. 2. Cap. and health resort of the prov. of Soriano, Uruguay, on the Rio Negro, 20 m. E.S.E. of Fray Bentos. Pop. 33,000.

Mercenaries (Lat. *mercenarius*, from *merces*, gain) are soldiers who offer their services for money to the army of any country which is willing to employ them. Greece found it necessary to use M. (*pel-tasts*) in the fifth century B.C., though for a long time the citizen hoplites remained the flower of the army. The famous Ten Thousand was composed of M., whom captains of reputation had collected at the bidding of the younger Cyrus. In Norman times M. were employed by the king, and the bulk of a medieval army often consisted of professional soldiers who were paid by a scutage tax levied on the peasantry. In addition to the mercenary cavalry, Brabagon pikemen and lt. crossbowmen were employed as M. The Swiss, by such victories as those of Granson, Morat, Nancy, etc., showed themselves the finest soldiers in Europe, and devoted themselves for a long time to professional soldiering, particularly in the employ of France. The *Landsknechts*, who fought generally in imperial armies, were a fine type of mercenary, and contributed more to the modern army in customs, etc., than even the Swiss. Throughout the eighteenth century Hessian regiments were employed for temporary purposes by the Brit. Gov. (e.g. the King's Ger. Legion was enrolled in 1794), and Gers., Swiss, and lts. were enrolled during the Crimean war. The employment of mercenary soldiers led to such things as the 'right of sack,' etc., and also to such developments as the *condottieri* (q.v.), and the present state of public opinion concerning war would preclude any such system. See ARMY, FOREIGN LEGION, and the different countries named.

Mercer, John (1791-1866), Eng. industrialist and 'father' of textile chem. B. at Blackburn, Lancashire, he began work at the age of nine as a bobbin winder at the Oakenshaw print works. With the most meagre education M. invented a new method of textile printing and reorganised the Oakenshaw works. In 1844 he investigated the action of caustic soda on cotton, and his discoveries were

the foundation of Lowe's invention of mercerised cotton. This discovery that cellulose is soluble in a solution of copper oxide in ammonia later made possible the Bemberg process of manufacturing rayon. In 1850 M. was elected to a fellowship of the Royal Society.

Mercerised Cotton, fabric resembling silk in appearance, obtained from ordinary cotton by the action of strong caustic alkalis. The process of mercerisation was patented by John Mercer in 1850. Hanks of cotton yarn are stretched between revolving rollers and passed through vats of caustic soda maintained at constant temp. and density, and warm and cold water, and afterwards dried. The cellulose fibres of the cotton thereby become semi-translucent, tensile, and untwist to a cylindrical form. Cellulose hydrate probably results from the action of water on a cellulose-caustic soda compound first produced. *See* ARTIFICIAL SILK.

Mercerised Lisle, yarn processed exactly as Lisle (q.v.) except that the cotton is chemically treated. While under tension in a solution of caustic soda, the fibres are stretched, and, swelling out, they regain their original tubular shape, this enabling the light to be reflected more readily, resulting in an appearance of lustre. This process is called mercerising after its inventor, John Mercer. M. L. is largely used for reinforcing the heels and toes of stockings so as to give extra strength at these points of wear. This yarn is also used in the manuf. of fine-gauge sheer stockings, called chiffon-lises. *See* A. W. Eley, *Stockings*, 1946.

Mercers, dealers in small wares, retailing silks, velvets, and other rich fabrics. In the Middle Ages M. generally tended to leave the homelier cloths to the drapers. A London M. Guild existed in 1172. The M. Company is the premier livery company of London, being first chartered in 1393; the hall in Ironmonger Lane, off Cheapside, and the adjacent chapel are on the site of a hospital commemorating the bp. of Thomas à Becket. The company governs St. Paul's School, Hammersmith, and the M. School, Holborn. The corporate income of the company is £53,000; trust income, £58,000; membership, 200.

Merchandise Marks. By the Merchandise Marks Act, 1887, there is an implied warranty on sale of marked goods, that the mark is a genuine trade mark and not falsely applied, and, in the case of goods to which a trade description (*see* below) has been applied, that the description is not a false one within the meaning of the Act. But the seller is not liable to an action for damages if at the time of sale or contract he delivered a signed denial of any such warranty and the buyer accepted the document.

The offences relating to trade marks specified in the Act of 1887 bear a close resemblance to forgery. The Act makes it a criminal offence, *inter alia*: (1) To forge a trade mark, (2) falsely to apply to goods any mark so nearly resembling a trade mark as to be calculated to deceive, (3) to make a die for the purpose of forging a trade mark, and (4) to apply a false

trade description to goods. A trade description means any statement direct or indirect as to (i) the number, quantity, measure, or weight; (ii) the place of manuf. or production; (iii) the material of which goods are composed; or (iv) any patent, privilege, or copyright. The accused will escape conviction only if he can prove that he acted without intent to defraud. It is also an offence under the Act to have in one's possession for sale any manufactured goods to which any forged trade mark or false trade description is applied, unless the possessor can satisfy the court that he took all reasonable precautions, had no reason to suspect the genuineness of the mark or description, and that he afforded the prosecutor all the information in his power as to the source whence he obtained the goods in question. In all cases the offending goods must be forfeited. No prosecution under the Act is allowed after three years from the commission of the offence or after one year from its discovery. *See also* under TRADE MARKS.

Merchant Adventurers' Company was founded in 1296 by the duke of Brabant. In England it did not begin its activities until the reign of Edward III., and it was not incorporated till 1553. Sebastian Cabot (1476-1557) was governor, and it was under his auspices that Chancellor reached Moscow via the White Sea and thus opened up a trade route between this country and Russia. In 1564 a monopoly of trade with Germany and the Netherlands was acquired, and under James I. its yearly commerce with the Dutch and Gers. amounted to £1,000,000. The M. A. became known as the Hamburg Company when Hamburg became their chief port of traffic. The company was dissolved in 1808. *See* W. K. Longebach, *The Merchant Adventurers of England, their Laws and Ordinances*, 1902, and G. Unwin, *The Guilds and Companies of London*, 1908.

Merchant Shipping Acts. The law on merchant shipping is mainly to be found in the Merchant Shipping Acts, 1894-1937, the first of which is practically exhaustive of the subject (except in so far as more customary law is concerned). The term 'the M. S. A.' may be said to include also the Maritime Conventions Act, 1911, the Pilotage Act, 1913, the Merchant Shipping (Wireless Telegraphy) Act, 1919, the Fees (Increase) Act, 1923, and the Merchant Shipping (Safety and Load Line Conventions) Act, 1932. By the Merchant Shipping (Equivalent of Provisions) Act, 1925, power is given to exempt in certain circumstances foreign ships and Brit. ships registered outside the United Kingdom from certain provisions of the M. S. A. where there are equally effective provisions in the law of the foreign country or place of registration applying to these ships and provided the ships are proved to have complied with such corresponding provisions. None but Brit. subjects can own any share in a Brit. ship, and all but the smallest fishing or coastwise trading vessels must be

registered under the Act or they will not be recognised as Brit. There is no corresponding limitation on alien ownership in the case of any other class of property, for even land in the Brit. Isles may be owned to any extent by foreigners. The main provisions of the Merchant Shipping Act, 1894, as amended or supplemented by later Acts, are as follows:

Part I. Registry.—No ship will be a 'Brit. ship' unless owned by (a) natural-born Brit. subjects, (b) naturalised Brit. subjects, (c) corporate bodies subject to Brit. law and having their prin. place of business in the Brit. dominions. Persons who are (1) both natural-born Brit. subjects and citizens of a foreign state, or (2) naturalised Brit. subjects, will not be qualified to own a Brit. ship until they take the Oath of Allegiance to the king of Great Britain, and, further, unless during ownership they either reside in the dominions or are partners of a firm carrying on business in the dominions. All Brit. ships, except riv. or coastwise ships not exceeding 15 tons burden, and certain smaller Canadian fishing boats, must be registered at some port in the Brit. dominions. Before registry a ship's tonnage and build, together with such other particulars descriptive of her identity as may be required by the Board of Trade, must be certified by a surveyor; and her name (which can never be changed without the previous written consent of the Board of Trade), the name of her port of registry, her official number, and a scale of feet denoting her draught must be conspicuously marked on the parts indicated by the Act. The certificate of registry may be used only for the lawful navigation of the ship, and cannot be taken by any person in the exercise of any lien, mortgage, charge, or other right or interest over the ship. The registration provisions of the prin. Act apply also to lighters and barges, subject to the Merchant Shipping Act, 1921; but under that Act vessels used exclusively in non-tidal waters (other than harbours) are exempt from the provisions of the prin. Act. The mode of transfer of a registered ship or share therein, when disposed of to a person qualified to own a Brit. ship, must be by 'bill of sale' in a prescribed form, containing such a description as will be sufficient to identify the ship to the satisfaction of the registrar. Transmission of ownership on death, marriage, or bankruptcy must always be authenticated in the manner provided, but transmission to an unqualified person necessitates a prompt sale by order of the court, the proceeds, after deduction of expenses, to be paid to the person entitled on transmission. A valid transfer may be made to a person not qualified to be a Brit. owner, but the ship at once loses her Brit. character and her certificate of registry must be given up, and if she be kept on the register subsequent to such transfer she will be subject to forfeiture. The following are registrars for the purpose of the Act of 1894: at any port in the United Kingdom or Isle of Man, the chief officer of customs; in Guernsey and Jersey, the chief officers

of customs and the governor; in Malta and Gibraltar, the governor; at Calcutta, Madras, and Bombay, the port officer; at any other port in any Brit. possession, the chief officer of customs, or, if none, the governor or his deputy *ad hoc*. A Brit. ship is bound to carry certain papers, and those generally carried are (1) The certificate of registry, (2) the agreement with the seamen (*see below*), (3) the charter parties and the bills of lading (if a merchantman), (4) the bill of health, (5) invoices containing particulars of cargo, (6) official log (*see below*). These papers must be shown to any naval commissioned officer, officer of the Board of Trade, chief officer of customs, mercantile marine office superintendent, Brit. consular officer, or registrar-general of seamen who may require to see them. It is a felony to forge, or in any way to assist in the forgery or fraudulent alteration of a register book, ship-builder's or surveyor's certificate, or certificate of registry, declaration, bill of sale, instrument of mortgage, or certificate of sale or mortgage, and a false declaration is a misdemeanour which renders the offender liable not only to imprisonment but to the forfeiture of his share in the ship. There are also other provisions in this part of the Act and that of 1906 to safeguard the national character of Brit. shipping and to protect the Brit. flag against imposition. The assumption of the Brit. flag on board a ship owned wholly or in part by disqualified persons (save to avoid capture by an enemy) involves forfeiture.

Part II. Masters and Seamen.—This part of the Act regulates the grant of certificates of competency to masters, engineers, and other officers of ships. The Merchant Shipping (Certificates) Act, 1914, contains provisions for the holding of examinations under the Board of Trade and deals fully with the engagement, discharge, wages, property, health, protection, and discipline of seamen. No one may engage or supply a seaman or apprentice without a licence to do so from the Board of Trade. The employment of children and young persons on board ship is regulated by the Employment of Women, Young Persons and Children Act, 1920. Provision is also made by the Merchant Shipping (International Labour Conventions) Act, 1925, for the medical examination of young persons employed on ships. Children under fourteen years of age may be employed only on ships on which members of the same family are also employed, but the prohibition does not apply to training ships or to school ships. As regards aliens, it is provided by the Aliens Restriction Act, 1919, that no alien may act as master, chief officer, or chief engineer of a Brit. ship, or as skipper or second hand of a fishing boat; but an exception is made in the case of those aliens who acted in such capacity during the First and Second World Wars, and who were certified by the Admiralty to have performed good and faithful service. The master of every ship (except in the case of ships of less than 80 tons burden) must enter into and sign an agreement with the

crew containing these particulars: (a) The nature and, as far as practicable, the duration of the intended voyage or engagement and the parts of the world, if any, to which the engagement or voyage is not to extend; (b) the number and description of the crew, specifying how many are engaged as sailors; (c) the time at which each seaman is to be on board or begin work; (d) the capacity in which each seaman is to serve; (e) the amount of wages; (f) scale of provisions; and (g) regulations as to conduct on board, including fines or other lawful punishment for misconduct. Running agreements, i.e. those extending over two or more voyages, may not go beyond the next following June 30 or Dec. 31, or the first arrival of the ship at her destination in the United Kingdom after that date, or the discharge of cargo upon that arrival. Agreements with lascars or any natives of India are also subject to special provisions mainly designed to ensure their return to India. Generally speaking, a seaman must have served four years before the mast to be entitled to the rating of A.B. Before paying off a seaman the master must deliver a true account of the wages due. A seaman has a right to wages up to the termination of his agreement whatever may happen to the ship, and an inalienable right of lien over the ship for their payment, but wages will not accrue during his refusal to work, imprisonment, or illness by his own default. Ordinarily the service of the seaman, under his agreement, terminated on account of wreck or loss of the ship, but, by the Merchant Shipping (International Conventions) Act, 1925, the right to wages continues during employment up to a maximum period of two months. There are also stringent provisions relative to the mode of dealing with the effects of seamen who may die on board ship. Severe fines may be inflicted on masters inexcusably leaving foreign seamen in distress in the United Kingdom. The Act of 1906 provides for the mode of dealing with wages and effects of seamen left behind out of the Brit. Isles, and for the repatriation of distressed seamen, and seamen left on land abroad without their consent or through discharge consequent on change of ownership of the ship at a foreign port. Shipowners are bound to supply medicines, medical stores, and anti-scorbutics (against scurvy) for use on board the ship. The Act of 1906 requires the master to furnish every member of the crew with provisions in accordance with the scale laid down in the first schedule to the Act. Masters are required to keep official log-books which may be kept distinct from or united with the ordinary ship's log; but in any case the official log must contain certain specified entries, mainly relating to illnesses, deaths, wages, and statements of the conduct of the members of the crew.

Part III. Passenger and Emigrant Ships.—The expression 'emigrant ship' includes only ships carrying (a) more than fifty steerage passengers, or (b) in the case of sailing vessels, more than one statute adult (person of twelve years or more) to

33 tons of the ship's tonnage, or (c) in the case of steamships, one statute adult to 20 tons. The Act of 1906 makes some important amendments to this part of the Act of 1894. A ship may not carry passengers, whether cabin or steerage, on more than one deck below the water-line, under a penalty not exceeding £500. The Act of 1894 prohibits shipowners and masters of passenger steamers, under pain of fine, from carrying passengers in excess of the number allowed by the passenger steamer's certificate. The maximum number of steerage passengers is regulated by Statutory Rules and Orders, 1917, which also regulate the berth accommodation for women passengers. There are also copious provisions relating to the general equipment of passenger steamers with compasses, hose, and safety appliances; the maintenance of order on passenger steamers; the survey of emigrant ships before proceeding outwards; the supply of provisions and water, and the carrying of an adequate medical staff on emigrant ships; the prohibition of the carriage of explosives or other dangerous goods; the delivery by the master to the customs officer at the port of clearance of a duly signed duplicate of the list of passengers, both cabin and steerage; and the forfeiture or release of a ship on payment of extremely heavy penalties for proceeding to sea without the master having obtained a certificate for clearance. Under the Merchant Shipping (Wireless Telegraphy) Act, 1919, every seagoing British ship, being a 'passenger steamer' or a ship of 1600 gross tonnage or upwards, must be provided with a wireless telegraphic installation, and must maintain a wireless telegraph service which shall at least be sufficient to comply with the rules under the Act and also must be provided with one or more certified operators and watchers. Unless these telegraphic requirements are complied with, the Board of Trade will not grant a certificate of safety.

Part IV. is concerned with fishing boats and trawlers. Fishing boats must be registered, lettered, and numbered. Registered fishing boats, whether used for profit or not, must be provided with life-buoys or with a boat rendered buoyant. Contravention of this provision renders the owner liable to a fine of £100 and to the skipper £50. Penalties are provided for offences by seamen serving in fishing boats, such as desertion, continued breach of duty, smuggling, etc. The skipper must keep a record of occurrences such as death, injury, etc., of a member of his crew while at sea and every casualty to his boat. Boys (under sixteen) must be properly apprenticed or have agreements drawn up in prescribed manner, and an indenture of apprenticeship with a boy under thirteen is void.

Part V. Safety.—This part of the Act empowers the Board of Trade (strictly the Crown by order in council (q.v.)) on the advice of the Board of Trade to make regulations for the prevention of collisions at sea. These regulations contain stringent provisions as to lights, fog signals, and

steering and sailing rules. The Board of Trade is also empowered to make rules as to the life-saving appliances to be carried on board ship. There are also important provisions as to recording a ship's draught of water, and the marking of the load line (*q.v.*). The Merchant Shipping Act of 1906 applies the Brit. load-line provisions to foreign ships, while they are within any port in the United Kingdom (but without prejudice to the power of the Crown, under the Act of 1894, to apply those provisions to the ships of any foreign country, if the gov. of that country so desire). But the Act of 1906 allows the Board of Trade to make exceptions in the case of steamships that are not carrying cargo, and the board has excepted various classes of coasting steamers. The Act of 1906 lays down the conditions under which heavy timber goods may be carried as deck cargo. There are also analogous provisions as to loading 'light wood goods' on deck. Specified precautions must also be taken to prevent grain cargo from shifting. Sending 'unseaworthy' ships to sea renders the master and any person party thereto liable to a prosecution, the only defence to which is that such unseaworthy state was in the circumstances reasonable and justifiable. Unsafe ships, *i.e.* ships which by reason of the defective condition of the hull, equipments, or machinery, or by reason of overloading or improper loading are unfit to go to sea without serious danger to life, may be detained by Board of Trade officials for survey, and, if necessary, will not be released until made seaworthy. Costs incidental to survey and detention are recoverable from the owners as salvage. Shortly after the *Titanic* disaster an international conference was held in London to consider what steps could be taken by maritime states to make their laws governing safety of life at sea more effective. A convention was signed in 1914, but the occurrence of war postponed the operation of the Act passed in that year. In 1929 a second conference was held and a new convention signed abrogating the earlier one. The Merchant Shipping (Safety and Load-line Conventions) Act, 1932, gives effect to this convention, and also to yet another convention signed in 1930. This Act, which amends the Merchant Shipping Acts, 1894-1928, contains comprehensive provisions dealing with the construction of passenger vessels, life-saving appliances, radiotelegraphy, and safety of navigation. Provisions as to the submergence of load lines and life-saving appliances of fishing boats is made by the Merchant Shipping Act of 1937. Provision is made by the Act of 1932 for the issue by the Board of Trade of 'general safety certificates' in respect of passenger steamers which comply with all the construction regulations, rules for life-saving appliances, wireless telegraphy rules, etc. Under the regulations boats, lifeboats, life-rafts, and buoyant apparatus must be marked so as to show the dimensions, number of persons authorised to be carried, manning of boats and lifeboats,

and qualifications of lifeboat men, practising of boat drills, and methods and appliances for preventing, detecting, and extinguishing fires. There are special provisions in the Oil in Navigable Waters Act, 1922, dealing with the danger of fire arising out of the discharge of oil into navigable waters. The Act of 1932 provides that the master of a Brit. ship must render assistance on receiving a wireless distress call, unless he is unable or, in the special circumstances, he considers it unreasonable or unnecessary to do so.

Part VI. relates to inquiries and investigations as to shipping casualties, and the constitution of courts of survey and naval courts on the high seas and abroad.

Part VII. empowers a shipowner to land and warehouse cargo where the consignee fails to take delivery, and, by giving notice to the wharfingers, to retain control in the exercise of his lien for freight (*see LIEN*). If the lien is not discharged by production to the wharfinger of a receipt for the amount of the shipowner's freight and charges, and by payment on deposit by the owner of the goods of the amount claimed, the wharfinger may sell at the end of ninety days and apply the proceeds to the payment of customs and excise duties, expenses of sale, warehouse charges, freight and other shipowner's charges (in that order), the balance (if any) to be paid to the owner of the goods. By the Carriage of Goods by Sea Act, 1924 (which was passed as a result of the international conference on maritime law held at Brussels in 1922), the freedom of shipowners to contract out of disabilities was curtailed in the interests of consignees and endorsees (of bills of lading) who were not parties to the contract between shipowner and carrier.

Part VIII., as amended by the Merchant Shipping (Liability of Shipowners and Others) Act, 1900, and the Merchant Shipping Act of 1906, limits the liability of a shipowner, Brit. or foreign, for loss of life or personal injury, or for loss or damage to goods, by reason of the improper navigation of his ship, or through any other cause not due to his actual fault or privity (whether in respect of persons and goods carried on his ship or on another ship with which his ship may have collided), to an aggregate amount not exceeding £15 per ton of the ship's tonnage for loss of life or personal injury, and £8 per ton for loss or damage to vessel's goods and merchandise. The shipowner is no longer exempted from liability for loss or damage or personal injury, by reason only of compulsory pilotage (*Pilotage Act, 1913*).

Part IX. deals with the powers and duties of receivers of wreck, the right of the Crown (*q.v.*) to unclaimed wreck, and the removal of wrecks by harbour authorities; regulates the trade of a marine store dealer; and regulates the procedure in salvage, providing for the mode of its apportionment among different claimants. Where salvage services are rendered by any ship belonging to H.M.'s Gov., and that ship is one which is specially equipped with salvage plant, or is a tug,

the Admiralty is entitled to claim for such services (Merchant Shipping (Salvage) Act, 1916).

Part X. deals with the powers of the Board of Trade as to pilotage dists. and authorities, but is replaced by the Pilotage Act, 1913, as being inconsistent, chaotic, and in conflict with the general law. The object of the above Act is that eventually the pilotage law for a dist. will be that Act, with the local order and by-laws made under it and confirmed by the Board of Trade. Pilotage is compulsory

service must be approved and licensed by the pilotage authority of the dist., and every pilot boat must bear certain distinguishing characteristics. Penalties are provided for pilots endangering ship, life, or limb, or for various offences in relation to their calling, such as lending their licences or selling intoxicating liquors. Under the Pilotage Authorities (Limitation of Liability) Act, 1936, the liability of a pilotage authority for loss or damage is limited to the amount of £100, multiplied by the number of pilots holding

Fox Photos Ltd.

MERCHANT TAYLORS' SCHOOL, SANDY LODGE, NORTHWOOD

on (a) every ship navigating for the purpose of entering or leaving or making use of any port in a dist. in which pilotage is compulsory, and (b) every ship carrying passengers while navigating for the purpose in any pilotage dist., whether or not pilotage is compulsory. There are exemptions, e.g. in the case of tugs, dredgers, sludge vessels, barges, and similar craft. The owner or master of a vessel navigating under circumstances in which pilotage is compulsory will be answerable for any loss or damage caused by the vessel or by any fault of the navigation of the vessel in the same manner as he would if pilotage were not compulsory. Penalties are provided against masters knowingly employing unlicensed pilots without taking reasonable steps to obtain a licensed pilot or accepting the offer of a licensed pilot to pilot the ship. All vessels regularly employed in the pilotage

licences for the dist. of the pilotage authority.

Part XI. regulates the powers of light-house authorities throughout the Brit. dominions.

Part XII. specifies the sources and application of the Mercantile Marine Fund.

Part XIII. regulates legal proceedings under the Act.

Part XIV. relates to a variety of miscellaneous subjects, *inter alia* the appointment of surveyors by the Board of Trade; the powers of the board for enforcing compliance with the Act; and the appointment of inspectors to report on accidents.

The functions of the Board of Trade in regard to the Mercantile Marine were (1939) transferred to the Ministry of Shipping, later to the Ministry of War Transport, and finally to the Ministry of Transport.

See R. Temperly, *The Merchant Shipping Acts* (4th ed.), 1932.

Merchants, Statutes of, see ACTON BURNELL, STATUTE OF.

Merchant Taylors' School: 1. A public day school for boys, located since 1933 at Northwood, Middlesex, a splendid new school having been erected there. It was founded in 1561 by Sir Thomas White and by the company of M. T. of whom the governing body is still composed. The old school buildings were destroyed by the Great Fire (1666) and were reconstructed in 1667; the next house was erected in 1873-74 on the site of Charterhouse School, which latter was transferred to Godalming, the M. T. S. coming from Suffolk Lane. The school has three sides, classical, modern and special, the last providing tuition in higher mathematics and science, and in biology for the univs. The school is recognised as a 'school of science' by the Conjoint Board of the Royal Colleges of Physicians and Surgeons. The classical side also gives tuition in Heb. up to scholarship standard. Presentations to the school are in the hands of the governors, the members of the court of the M. T. Company; without such nomination a very limited number of boys may be admitted on the recommendation of the headmaster. There are numerous entrance and valuable leaving scholarships and exhibitions. M. T. S. differs from St. Paul's, Rugby, and other great public schools in its constitution; not being divided into scholars and commons; and there is no endowment. There is limited accommodation for boarders. Edmund Spenser was a scholar at M. T. S., as were also Robert Clive, Lancelot Andrews, bishop of Winchester, and Juxon, bishop of London. A register of the school, covering the years 1561 to 1931, and ed. with biographical notes by E. P. Hart, was pub. in 1936. 2. At Great Crosby, Liverpool, was from 1618 until 1910 controlled by the M. T. Company. There is now joint control by the univs., the old boys' association, and local bor. councils. There are about 500 pupils, mostly day boys.

Merchweiler, tn. in the Rhineland, Germany, 33 m. S.S.E. of Trèves. Pop. 5000.

Mercia, central kingdom of England in the days of the A.-S. The name refers to the march or borderland beyond which dwelt the hostile Welshmen. In the seventh century it extended from the Humber to the Thames, with the exception of E. Anglia. There were independent sovereigns of M. at least from 615 to 874, when the Danes overran the E. portion. The greatest kings were Penda (626-55) and Offa (755-94). See F. M. Stenton, *Anglo-Saxon England*, 1943.

Mercis, Marius Jean Antonin (1845-1916), Fr. sculptor and painter, b. at Toulouse. He became famous when he exhibited his patriotic work in bronze entitled 'Gloria Victis'. He also executed in marble a beautiful statue for the tomb of Mme Charles Ferry, 'William Tell' in Lausanne. 'Thiers' in St. Germain-en-

Laye, and a group called 'Justice' in the *hôtel de Ville*, Paris.

Mercier, Désiré Joseph (1831-1926), Belgian cardinal, b. at Braine-l'Alleud, Brabant, son of Paul Léon M., amateur artist, of an old bourgeois family. Educated at Malines, college of St. Rombaud, Petit Séminaire, and Grand Séminaire, he was ordained priest in 1874, when at Louvain Univ. In 1877 he was recalled to teach at Malines, and in 1882 attached to the faculty of theology at Louvain. After visiting Leo XIII. at Rome, he was placed at the head of an institute of Thomistic philosophy, endowed by that pope. He wrote some text-books in this connection, and became a leader of the modern revival of Thomistic philosophy in Europe. In Feb. 1906 he succeeded Cardinal Goossens as archbishop of Malines and primate of Belgium. Made cardinal 1907, he was received by George V. in London, Sept. 1914, and then returned to his invaded country, where during the years of occupation he watched over his flock, enjoining loyalty to the Belgian Gov. only, and provoking the wrath of the Ger. authorities, who ineffectually tried to prevent his visiting Rome, Jan. 1916. In the autumn of 1919 he made a tour of the U.S.A. and Canada. He attended the conclaves for the papal election in 1914 and 1922. He pub. an *Appeal to all Christian People* which led to the 'Malines conversations' with representatives of the Anglican Church, 1923-24. See lives by A. Lavieille, 1926; C. Verwoort, 1928; and J. A. Gade, 1934.

'Mercure de France': 1. Estab. in 1672 as the *Mercurie Galant*, in 1714 it was renamed the *M. de F.* It was a most enterprising paper, and besides containing state and court news, statistics, satires, reviews, and fashions, it opened its columns to some of the best contemporary Fr. poets of the Symbolist school. It ceased pub. in 1799, was revived a few years later, but finally disappeared in 1825. 2. Fr. literary jour. founded in 1890 under the direction of Alfred Valette. Under the influence of R. de Gourmont it became the rallying point of the Symbolists and the centre of the new verse. It existed until June 1940, and appeared again in June 1946. 3. Fr. publishing house of Paris, noted for its eds. of Nietzsche (trans. by H. Albert) and the works of André Gide, Paul Claudel, Georges Duhamel, and G. Apollinaire.

Mercuric Chloride, see CORROSIVE SUB-LIMATE.

Mercurius, or **Mercury**, was the Rom. god of commerce, his name being derived from *merc*, merchandise. A temple near the Circus Maximus was dedicated to him, and his festival was celebrated on May 25 by the mercuriales, who were members of a college regulating the corn trade. Mercury was identified with the Gk. Hermes as early as 495 B.C. But the fetiales (q.v.) did not recognise the identity, and in place of the caduceus or wand carried by Hermes, as the messenger-god, they used a sacred branch as the emblem of peace. A 21-in. bronze figure of M. of the second

century has been recovered from the great temple, at a depth of 300 ft., at Colchester.

Mercury, planet nearest the sun, is the smallest of the major planets, having a diameter of about 3000 m., i.e. three-eighths that of the earth. It is three times the bulk of the moon; its mean distance from the sun is 36,000,000 m. (or 0.4 of the earth's mean distance); and it takes 87.969 days to revolve round the sun. Owing to lack of distinct surface marking it has never been definitely settled how long M. takes to rotate on its axis. For long it was thought that it did this in about 24 hrs., but the opinion of Schiaparelli, backed by Lowell, is that M. rotates so slowly that the same face is always presented to the sun. The orbit of M. is of considerable eccentricity, so much so that it receives less than half the amount of heat from the sun during its aphelion passage than it does at perihelion, the mean of heat and light being seven times more than that received by the earth per unit area. The orbit is also inclined to the plane of the ecliptic 7° , and its maximum angular distance from the sun is 28° . This means that the planet is visible at the most for only about 2 hrs. before or after sunset. The apparent diameter of M. is from $4.5''$ to $13''$ and at times it shines with a greater brilliancy than the star Arcturus, but because of its closeness to the sun it is rarely seen.

M. has been known from the most ancient times, but it was naturally not till the invention of the telescope that its transit across the sun's face was observed first by Gassendi, on Nov. 7, 1631. These transits appear on an average once in six years.

Mercury, or **Quicksilver**. Symbol Hg; atomic number 80; atomic weight 200.61. A metal, a liquid at ordinary temps. It occurs to a small extent in an uncombined state as small globules, but its chief ore is *cinnabar*, HgS , mercuric sulphide. The metal is obtained from the ore by roasting it, when the sulphur is oxidised to sulphur dioxide, and the M. is set free from combination. During this reaction the M. becomes vaporised. The vapour is passed through a series of cooling chambers where it is condensed. The mines occur in a very few places; chief amongst them may be mentioned Almaden, Istria, and California. The metal possesses some remarkable properties, in that at ordinary temps. it is a bright silvery liquid. At -38.9°C . it assumes a solid form, which is crystalline, ductile, malleable, and very soft. It boils at 357°C . giving off a colourless vapour. Owing to this large range of temp. between the limits of which it assumes the liquid state, M. is commonly used in thermometers, but its usefulness is restricted in the lower direction, since it freezes so easily. At 0°C . its density is 13.595 gm. per c.c., and its coefficient of expansion is 0.000182 between 0°C . and 100°C . It is a good conductor of heat and electricity. It dissolves certain metals to form *amalgams*. These amalgams are used for sev. practical purposes; zinc amalgam is used to cover the zinc plates of batteries

owing to the fact that it is very slowly acted upon by dilute sulphuric acid; tin amalgam is used for the construction of mirrors; and gold and other amalgams are used by dentists for filling teeth. These amalgams can also be made by the electrolysis of salt solutions, using a M. cathode, and by attacking a solution of a salt with sodium amalgam. The so-called ammonium amalgam (q.v.) is of special interest. M. is employed very largely in scientific work for the construction of thermometers, barometers, vacuum pumps, and on the large scale for the extraction of gold and silver (q.v.). For scientific work it must be clean and must not foul the surface of the containing vessel. Dirty M. can be cleaned by filtering through muslin (or filter paper with a small hole punctured at the apex) to remove suspended dirt and then allowed to fall slowly down a burette filled with dilute nitric acid to remove other impurities. M. forms two independent series of salts—the mercurous and mercuric. Mercuric oxide, a reddish crystalline powder, is obtained by heating M. in contact with the air. This oxide is decomposed at a higher temp. into its constituent elements. In this connection the work of Priestley and Lavoisier should be recalled (see AIR; OXYGEN).

The mercuric salts are obtained from this oxide by dissolving it in the various acids. Mercuric chloride (corrosive sublimate) is prepared by heating together a mixture of mercuric sulphate and common salt. It is a violent poison the best antidote being the white of an egg. It is largely used as an antiseptic. Mercuric sulphide is obtained by rubbing vigorously together M. and sulphur. When sublimed it assumes a red crystalline form known commercially as the pigment *vermilion*. *Calomel*, or mercurous chloride, is the most important of the mercurous salts. It is generally prepared by heating a mixture of mercuric chloride and M. The mercurous chloride sublimes as a white fibrous cake. It is insoluble in water, and is tasteless. M. is used largely in medicine, in the form of chlorides or iodides. M. compounds, especially if they are soluble, are very poisonous, and even as medicinal preparations should not be persisted in for long periods.

Mercuric fulminate is made by adding a solution of mercuric oxide in nitric acid to 90 per cent alcohol, warmed to about 54°C . After a brisk action white crystals of the fulminate appear, and after washing free from any acid they are spread out and vacuum dried at a moderate temp. (This should not exceed about 35°C . since at higher temps. there is the possibility of deterioration.) Mercuric fulminate is used as a detonator (see EXPLOSIVES) since it is very susceptible to shock, under the influence of which it decomposes with explosive violence.

Mercury's Wand, see DIVINING ROD.

Meroy, **Sisters of**, see SISTERSHOODS.

Mer de Glace, comparatively low-lying and accessible glacier near Chamoniix, running northwards from Mont Blanc (q.v.) between the magnificent precipices

of the Chamonix Aiguilles on one side and the Drus and the Verte on the other. It is the subject of a painting by Turner.

Mere, Maori weapon made of stone, flat and spatulate, and with a short handle.

Méré, Paul Louis Courier de, see COURRIER.

Meredith, George (1828-1909), Eng. novelist and poet, b. Feb. 12 at 73 High Street, Portsmouth, was descended from a family that had been for sev. generations tailors at Portsmouth. His grandfather, Melchizedek M., would appear to be the original of Mel in *Eran Harrington*. M. was educated in his native tn., and afterwards, from the age of fourteen, at the Moravian School at Neuwerk, near Koblenz, being greatly influenced in religious matters by his teachers. In 1844 he came to London, and was articled to a solicitor, but he soon drifted into authorship, and wrote poems which appeared in *Household Words* and *Chambers's Journal*. He married Mrs. Nicolls, the widowed daughter of Thomas Love Peacock, in 1849; she was nine years older than he, and they separated some years later. In 1861 Mrs. M. d., and in 1864 M. married Marie Vulliamy, with whom he lived happily for twenty years. His *Faith on Trial* reflects his grief at her death in 1885. From 1868 he lived at Flint Cottage, Box Hill, where he d. In 1905 he received the Order of Merit. Like Thomas Hardy, M. began as poet, and continued as poet in the intervals of writing novels. He pub. his first vol. of Poems in 1851, with a dedication to Thomas Love Peacock. As a poet M. began with easily intelligible lyrics, such as *Love in a Valley*. This reflects the lyrical mood of the early scenes of the novel *The Ordeal of Richard Feverel*; the complex analysis of mood, so marked in the other novels, also has a poetic counterpart in *Modern Love* (1862). His

Shagpat, a appeared *na* (1857) *Inc.* *The Ordeal of Richard Feverel* (1859), a delicate romance, yet without sentimentalism, was acclaimed by rev. critics, but it was not a financial success, and M. perforce had to turn to journalism for a living. He also worked as reviewer, publisher's reader, and, at John Morley's invitation, editor of the *Fortnightly* for a time. *Eran Harrington* (1861) was more remunerative, and it is certainly one of the most amusing of his novels. *Sandra Belloni* (1864) and the sequel *Vittoria* (1866) did nothing to secure him public recognition; but *Rhoda Fleming* (1865) was more widely read, though it is a painful, if a beautiful, story. *The Adventures of Harry Richmond* (1871), which had been serialised in the *Cornhill Magazine*, improved his position, and this, with *The Egoist* (1879) and *Diana of the Crossways* (1885), are among his best books. Other novels are *Beauchamp's Career* (1876); *The Tragic Comedians* (1880); *One of our Conquerors* (1891); *Lord Ormont and his Amina* (1894); and *The Amazing Marriage* (1895). Also in 1895 he republished his short stories in a vol. entitled *The Tale of Chloe*. The

Essay on Comedy (1897) is his one contribution to the literature of criticism. His definition of comedy, 'the singular scene of charity issuing of disdain under the stroke of honourable laughter,' is not so much the comedy of dramatic art as that to be found in the tales of Chaucer. M. insisted that in drama a truly comic figure should be presented without contempt, like his own pompous Sir Willoughby Patterne in *The Egoist*, and in this sense Barrie's *Twelve Pound Look* is M.'s ideal comedy, yet it does not possess the rapier thrusts of wit M. demanded.

GEORGE MEREDITH

M. wrote many poems, and collected them at various times under the titles of *Modern Love* and *Poems of the English Roadside* (1862); *Poems and Lyrics of the Joy of Earth* (1883); *Ballads and Poems of Tragic Life* (1887); *A Reading of Earth* (1888), etc. M.'s philosophy of life, implicit in the novels, takes on a fuller expression in his later poetry than in any of his prose works. These metaphysical poems, such as *Poems and Lyrics of the Joy of Earth*, seek in their hard tortuous language to reconcile morality with the lessons of biology. Bestiality and sentimentalism are for ever cramping man in his uphill striving after the normal life or life of 'common sense.' Both the poems and the novels express M.'s belief that comedy could reveal man's frailties, but the poems, though difficult to read, express this faith more openly. Even in the middle years of Victorianism, M. revealed an anti-Victorian tendency; for in 1869 we find him saying in one of his letters: 'Isn't there a scent of damned hypocrisy in all this hisping and vowelled purity of the *Idylls*?' (of Tennyson). Like Browning M. was an optimist, but, unlike Browning or Tennyson, he was an agnostic and did not accept without reservation the immortality of the soul. Yet despite his agnosticism and his conception of Nature as utterly pitiless to the individual,

he was a convinced optimist, and while rejecting unreasoned or delusive hopes for the future of the individual ego he saw the individual life as living on in the larger life of the future of the race. M. regarded life as a tragic-comedy, and his humour is reflective, even mournful in character, but he is too profound a humorist ever to indulge in cynicism, though there is much irony in his writing.

No other Eng. writer perhaps is his equal in the skillful manipulation of language and the power to give such subtle pleasure to the reader. Though generally recognised by competent critics as one of the greatest, if not the greatest, novelists of his day, M. was never widely read. It may almost be said that he had to wait for nearly thirty years before securing true recognition, and then soon lost it again; yet he was quickly acclaimed by those who were judges of literature, Swinburne, George Eliot, and Charles Kingsley. He was the novelist of the man of letters rather than of the general public. He has been well, if unkindly, summed up by Oscar Wilde: 'His style is chaos illumined by flashes of lightning. As a writer he has mastered everything but language.' The obscurity of his style used at one time to be hailed by the 'intellectuals' as his great merit, but it is now generally accepted that he is great, not because of, but in spite of, his style. Metaphor, symbolism, and a fondness for ellipsis partly explain the obscurity of his style, as well too as profundity of thought and punctilious avoidance of the commonplace, and an almost wilful abstention from all explanation or interpretation. Of his genius there can never be any question. He saw life clearly, he had wit in abundance, and a power of understanding and describing women that is at once the joy and despair of his brother novelists. His poetry was full of true appreciation of nature, and he could write poetry not only in verse but also in prose as in 'Diversion on a Penny Whistle' in *Richard Feverel*. Like all great writers, he had full confidence in his powers and attained easily to heights that few of his contemporaries would have dared to attempt. As Stevenson happily put it: to provide the author of *The Egoist*, God had first to create a gentleman and then give him genius.

M.'s *Letters*, ed. by his son, were pub. in 1912, and the *Poems*, ed. by G. M. Trevelyan in the same year. See lives by Seccombe; Ellis; Lady Butler, 1919; J. B. Priestley, 1926; A. H. Able, 1933; M. E. Mackay, 1937; and S. Sassoon, 1948. See also B. Albers-Arndt, *Die englische Gesellschaft im Spiegel der Romane von George Meredith*, 1931, and C. B. Petter, *Meredith and his German Critics*, 1939.

Meredith, Owen, see LYTON, EDWARD ROBERT BULWER.

Merebake, tn. in the prov. of E. Flanders, Belgium, 5 m. S. of Ghent, engaged in agriculture, floriculture, and manufs. of earthenware and bricks. Pop. 9600.

Merendera, genus of hardy bulbs allied to the genus *Colchicum* (q.v.).

Merewether, vil. forming a suburb of

Newcastle in Northumberland co., New S. Wales. Pop. 1500.

Merezhkovski, Dmitri Sergeievich (1865-1941), Russian author, b. in St. Petersburg, where he was educated. His first pub. was a vol. of verse, 1888; *The Causes of Decadence in Modern Russian Literature* (1893) was an essay of considerable fame. Then he produced a trilogy of historical novels entitled *Christ and Antichrist* (1901-5), about Julian the Apostate, Leonardo da Vinci, and Peter the Great. Other pub.: *The Death of the Gods* (1901); *December the Fourteenth* (1920); *The Birth of the Gods* (1926); *Akhmaton, King of Egypt* (1927); *The Life of Napoleon* (1929); *Napoleon, a Study* (1929); *Michael Angelo and other Sketches* (1930); and *The Romance of Leonardo da Vinci* (1931). Also *Paul I.* (1908) and *Tsarevich Alexis* (1921) (plays).

Merganser (*Mergus*), genus of sea ducks characterised by a very long slender beak. *M. merganser*, sometimes called the goosander or jacksaw, is a handsome Brit. bird. The male's plumage is variegated with black, greenish-black, pink and white. The red-breasted M. (*M. serrator*) breeds in the N. of Britain; the drake has a crested glossy green head, white neck, red breast, and black upper surface with white margins. *M. australis* is a rare species found only in the Auckland Is.

Mergui, dist. and seaport of Lower Burma. Forests of teak, etc., cover almost all the 9789 sq. m. of the dist. which lies in the Tenasserim div. The tn. is a pearling station, and exports rice, timber, rattans, dried fish, etc. Pop. of dist. about 181,000.

Mergui Archipelago, group of hilly is. off the Tenasserim coast in the bay of Bengal. The native Selangs barter catoutchouc, edible birds' nests, and béche-de-mor for rice and spirits.

Merian, Matthew (1621-87), portrait painter and engraver; did not renounce his own profession when in 1650 he inherited his father's book and print business. He painted an equestrian picture of the Emperor Leopold I.

Merida: 1. (Anct. Augusta Emerita, the cap. of Lusitania), tn. 32 m. E. of Badajoz, on the Guadiana, in Badajoz, Spain, with numerous Rom. remains. Pop. 14,600. 2. Univ. city, 336 m. S.W. by W. of Caracas, and the cap. of a state of the same name, in Venezuela. The religious and academic centre of Venezuela, it has an archbishop. The univ. of Los Andes has 470 students. M. grows cocon, wheat, and coffee, and manufs. cottons and woollens. Pop. of state, 193,000; of tn. 10,500. 3. Cap. of Yucatan, Mexico, 23 m. S. of its port, Progreso, on the gulf of Mexico. The fourth city in size of Mexico, it is situated in flat agric. country, almost entirely devoted to henequen (sisal fibre). Founded by the Spaniards in 1542, it has a beautiful cathedral, large hospital, massive buildings, and well-paved streets. Besides the sisal industry, there are manufs. of soap, chocolate, and hemp. Its chief exports are sisal, chicle, hides, and agric. produce. Pop. 99,000.

Meriden, tn., manufacturing plated ware and cutlery, etc., 18 m. N.N.E. of New Haven, Connecticut, U.S.A. Near by is Hubbard Park, a reservation of 900 ac. Pop. 39,400.

Meridian (from Lat. *meridies*, noon), both a terrestrial and a celestial great circle. The terrestrial M. of any given place is the line running through that place and through both the N. and S. poles. Each terrestrial has a corresponding celestial M., which passes through the N. and S. celestial poles, and also through the zenith and nadir of any place on that terrestrial M. When the sun passes the M. of Greenwich, it is not only apparent noon at Greenwich, but also at all places situated on the same half of that M.

Meridian, co. seat of Landerdale co., Mississippi, U.S.A., 89 m. from Jackson. It is an important cotton trade and industrial centre, with lumber mills. Pop. 35,400.

Meridian, Magnetic, see under Dip.

Mérignac, com. of Gironde in the arron. of Bordeaux, France. Pop. 21,400.

Mérimée, Prosper (1803-70), Fr. man of letters, b. in Paris, was the son of an artist. When his education was completed he entered the civil service, where his work was so well esteemed that by his thirtieth year he had been appointed inspector-general of historical monuments. He was a great favourite of the Emperor Napoleon III. and of the Empress Eugénie, and in 1853 he was made a senator under the empire. He began his literary career with some dramatic pieces professing to be from the Sp. of an imaginary Clara Gazul (*Théâtre de Clara Gazul*, 1825), and followed this with a collection of pretended Illyrian folk-songs, signed with an anagram of the previous name, 'La Guzla.' Up to that time his work was romantic in subject and form, but he subsequently turned to the writing of the stories on which his enduring fame depends. Though still romantic in their predilection for strange and less civilised countries and the interest revealed in foreign literature (he travelled much in Spain and was fond of writing on Sp. themes), they are essentially realistic in their local background and atmosphere and in the truth of their historic archaeological and artistic descriptions. In his chief works he stands midway between Stendhal, whose influence he acknowledges, and Balzac, though as an artist he is superior to both.

His character is a fascination to the student of biography. A casual acquaintance would have found it hard to believe that his outward cynicism was only a mask for that warmth of feeling and capacity for deep and devoted attachment which prompted him to write his intimate and charming *Lettres à une inconnue* (pub. posthumously, 1873). Many, moreover, have

blame to the Florentine scholars of the Renaissance: his love of dwelling on the tragic, grim, and eerie elements in life is emphasised in his powerful short stories, *La Vénus d'Ile* and *Lokis*, and in his vivid romance, *La Jacquerie*; and his fund of Rabelaisian humour is conspicuous in

his letters to Panizzi. He recalled the Florentines in the diversity of his interests, a diversity which enabled him to write so valuable an archaeological essay as *Description des peintures de Saint-Savin*, such lists, as the *Chronique de Charles IX.* (1829) and the *Histoire de Don Pédre I.* (1848), a literary *supercherie* like *La Guzla* (1827), and *nouvelles* like the Corsican tale *Colomba* (1840). His chief writings, besides those already mentioned, are *Mateo Falcone* (1829); *L'Enlèvement de la redoute* (1829); and *Carmen* (1846), which inspired the libretto of Bizet's opera. Other works: *La Famille de Carrajal* (1828); *La vision de Charles XI*

PROSPER MÉRIMÉE

(1830); *La Double Méprise* (anon. 1833); *Les Âmes du purgatoire* (1834); *Notes d'un voyage dans le midi de France* (1835); *Notes d'un voyage dans l'ouest de France* (1836); *Notes d'un voyage en Auvergne* (1838); *Notes d'un voyage en Corse* (1840); *Études sur l'histoire romaine* (1844); *Mélanges historiques et littéraires* (1855); *Henri Beyle* (Stendhal) (1864); and *Les Cosaques d'Autrefort* (1865). See G. H. Johnstone, *Prosper Mérimée, a Mask and a Face*, 1927; also lives by A. Filon, 1894, and P. Trahard, 1925, 1929, and 1930.

Merionethshire, maritime co. of N. Wales, bounded on the W. by Cardigan Bay. The co. is mountainous, the chief peaks being Arran Mawddwy (2972 ft.) and Cader Idris (2949 ft.). The most beautiful valleys are those of the Dovey (Dyff) and the Mawddoch. The R. Dee (Dyfrdwy) drains Bala Lake (5 m.), the largest in Wales, and flows towards Corwen, receiving sev. tribs. on the way, and there are over fifty lakes among the mts. and sev. waterfalls. Slate is quarried at Ffestiniog, and near Dolgelly, the co. tn.; gold is found, while lead, copper, and manganese have been worked. Agriculture does not flourish, except here and there in the valleys; the small hardy Welsh ponies are bred. Woollen stockings

and flannels are manufactured. Barmouth, Dolgelly, and Harlech are much visited by tourists. The area is 819 sq. m. Pop. 45,100.

Meristem, generating tissue, that part of a plant where growth is active. It consists of cells of nearly uniform size capable of dividing to form new cells. These enlarge and after certain modifications form the permanent tissue.

Merit, Order of, Brit. order instituted in 1902, limited in number to twenty-four men and women of eminent distinction. It confers no precedence or knighthood. Membership is either military or civil, the badge of the former having crossed swords, and the latter oak-leaves. Membership is designated by the suffix O.M., which follows the first class of the Order of the Bath and precedes the letters designating membership of the inferior classes of the Bath and all classes of the remaining Orders of Knighthood. An Indian O. of M. was instituted in 1837 for native officers and men, and there are similarly named orders in sev. foreign countries. See under ORDERS OF KNIGHTHOOD.

Meritorious Service Medal, instituted in 1845 for the Brit. Army and extended to the Royal Marines in 1849. In the army it was originally granted to specially selected sergeants, but during the First World War all warrant officers, N.C.O.s, and men were eligible as a reward for gallant conduct in the performance of military duty. It is now restricted to warrant officers and N.C.O.s above the rank of corporal. In the Royal Marines similar restrictions are applied. The grant carries with it an annuity not exceeding £20. The ribbon is crimson with white edges. The effigy of the reigning sovereign is on the obverse of the medal and 'For Meritorious Service' is engraved on the reverse.

Merivale, Charles (1808-93), Eng. historian, son of John Herman M. (d. 1844), b. in London, and educated at Harrow, Halesbury, and Cambridge. He rowed in the first inter-univ. boat-race (1829), and became rector of Lawford, Essex (1848-69); Hulsean lecturer (1861); Boyle lecturer (1864-65); chaplain to the Speaker (1863-69); and dean of Ely from 1869. Among his works are *A History of the Romans under the Empire* (1850-62); *Conversion of the Roman Empire* (1864); *Homer's Iliad in English Rhymed Verse* (1869); *The Roman Triumvirates* (1876); *The Heathen World and St. Paul* (1877); and his *Four Lectures on Some Epochs of Early Church History* (1879). See J. A. Merivale (editor), *Autobiography and Letters*, 1898.

Merka, or **Markah**, seaport of the former It. Somaliland, E. Africa, 45 m. S.W. of Magadoxo. Pop. (Arab and Somali) 4200.

Merksem, tn. of Belgium and suburb of Antwerp, 3 m. to the N., on the Albert Canal. It is engaged in manufs. of margarine, oil, chemicals, bottles, lead, zinc, textiles, chicory, sugar, and leather. Pop. 29,100.

Merle d'Aubigné, see AUBIGNÉ, JEAN HENRI MERLE D'.

Merlin, wizard who worked many wonders at King Arthur's court. He sprang from the intercourse of a Welsh maiden with a demon, but was saved from evil by baptism, although, throughout life, he retained his father's gift, the power of magic and divination. It was he who had the care of the infant Arthur and later disclosed to him his royal parentage. Tennyson tells of the wisdom of M. in his *Idylls of the King*, but Geoffrey of Monmouth in his *Vita Merlini* was the first to throw light on his shadowy existence.

Merlin, or *Fulco esalon*, small Brit. falcon found breeding in the N. of England and Scotland. It is essentially a falcon of the rocks and moors. On the moors the nest is generally built on a slope among the heather, and in other localities on the ledge of a rock, and in it three to five bluish-white eggs, blotched with brown markings, are laid. Adult males are blue-grey on the head, back, and wing coverts; the under parts are rufous; the tail is bluish-grey with dark bands and white tips; the legs are yellow and feathered a third of the way down. The young when first hatched are covered with a soft white down. When fully fledged they resemble the female, which is more uniform brown. It is an easy bird to tame and is readily trained to fly at larks in the autumn, while a female M. will take plover and pigeons.

Merlino Cascajo, see FOLENGO, TROFILO. **Mermaids and Mermen** (*mere*, lake; *mægd*, maid), in folklore a class of semi-human beings, whose true home is in riv. or sea. They were supposed to be capable of living on land and of entering into social relationships with ordinary mortals, and the typical mermaid is represented as a woman of exceeding beauty down to the waist, the figure ending in a fish's tail and body with scales and fins. Mermaid legends exist in nearly all countries and have given rise to beautiful tales and poems, such as J. d'Arras's *Chronique de la Princesse Mélusine*, and Matthew Arnold's *Forsoaken Merman*. The connection of these beings with mortals generally brought disaster in its train. The Phœnician Dagon and the Chaldeo-Babylonian Oannes or Hea (fish-gods) were usually represented as half fish, half human. See J. L. Grimm, *Deutsche Mythologie*, 1835; R. Hunt, *Popular Romances of the West of England*, 1865; S. Baring-Gould, *Curious Myths of the Middle Ages*, 1866-68; T. Keightley, *The Fairy Mythology*, 1878; P. Sébillot, 'Contes des Marins' in his work *Contes populaires de la Haute-Bretagne*, 1880-82; M. Yarsley, *The Folklore of Fairy Tales*, 1924; Evelyn Smith, *Myths and Legends of Many Lands*, 1930; and Jean Lang, *Book of Myths*, 1934.

Mermaid's Purse, purse-shaped egg case of the skates and dog-fish.

Mermaid Tavern. This tavern, mentioned in *Expenses of Sir J. Inward* (1464), stood in Cheapside, with side entrances in Friday Street and Bread Street, and was destroyed by the Great Fire of London. Raleigh is the reputed founder of the famous Mermaid Club (c. 1603). See Gifford, *s.v.* of Ben Jonson.

Probably Jonson, Beaumont, Fletcher, Donne, Shakespeare, Carew, Cotton, and Selden were members of this club, which was noted for its Canary wine and the sparkling wit of its frequenters. It is sometimes called the Friday Street or Broad Street Club.

Merodach-Baladan, or **Marduk**, II. (c. 722-709 B.C.), king of Babylon. Under this powerful prince the Babylonians, aided by the Elamite court, reasserted their independence. There was a long struggle with Sargon, king of Assyria, who finally captured and destroyed Babylon (710). On Sargon's assassination, his successor Sennacherib drove M. from the Babylonian throne (705). See 2 Kings, xx, 6.

Merōë, **Isle of**, wide tract of S. (upper) Nubia, anct. Ethiopia, almost surrounded by the Nile's branches, the Astabus (Bahr-el-Azrek, Blue Nile) and the Astaboras (Atbara). The ruins of anct. M., later cap. of Ethiopia, and rival cap. of the earlier Napata, are supposed to be on the Nile's E. bank, near Shendi, 3 m. from Kabushia. The modern Merowë is not to be confused with M. The Merottic period in the Sudan is that during which M. was the cap., and it was contemporary with the Ptolemaic age in Egypt. The Merottic remains are more widely distributed than those of any other period. At the acme of the Merottic dynasty its rule extended from Sennar to Shellal. The prin. site is that of M. itself and the city and pyramids of Begrawiya, 3 m. N. of Kabushia. The city was partly excavated by Prof. Garstang, who uncovered the great temple of Amon. E. of the city are the remains of the 'temple of the Sun,' founded about 600 B.C. Most of the remains, however, belong to the second or third century A.D. Reisner excavated the pyramids in 1920-23. There are ruins of temples at Nagua and at Musawwarat, and other distinctive remains of the period are reservoirs (*hafirs*), rock pictures and carvings, and decorated pottery. The Merottic kingdom was probably split up into petty kingdoms before A.D. 350, when the dynasty was finally ended by the invasion of the king of Axum who devastated Ethiopia. The region now forms part of the Sudan. See also **MEROWË**. See J. Garstang and F. L. Griffith, *Meroc: First Season's Excavations, 1909-10*, 1911, and J. A. de C. Hamilton (editor), *The Anglo-Egyptian Sudan from Within*, 1935.

Merom, **Waters of** (Huleh, Baheiret el-), lake of Palestine, mentioned in the O.T., most northerly of the series traversed by the Jordan. It is the Lake Semechonitis of Josephus, nearly triangular in shape, 4½ m. long by 3½ m. broad. See Josephus, *Antiquities*, V. v. 1.

Meropides, see **BER-EATER**.

Merovingians, or **Merwings**, name of the first dynasty of Frankish kings in Gaul, who ruled after the fall of the Rom. Empire. The name is taken from Merwig or Merovech, king of the Salian (W.) Franks, who united a few tribes under his sway (A.D. 448-57). His grandson, Clovis (481-511), extended the power of the

dynasty, which flourished until 639, and finally gave place to the Carolingians about 751. See F. J. de Pétigny, *Études sur . . . l'époque mérovingienne*, 1851, and F. Lot, *La Fin du monde antique et le début du moyen âge*, 1927.

Merowë, dist. in the Dongola Prov. of the Anglo-Egyptian Sudan, on the site of Napata, the anct. cap. of Ethiopia. It is the headquarters of the old Dongola Prov., and is famous for its fruit gardens. The M. dist. lies between the third and fourth cataracts of the Nile, and the inhab. depend entirely on the riv. for their livelihood. In the S. parts are considerable numbers of nomads, with herds of camels, sheep, and cattle. Most of the monuments of the Ethiopian period are grouped in the vicinity of M., and there is a museum at M. of Ethiopian statues and other remains. On the outskirts of the modern tn. are the ruins of a temple built by King Tirhaka. The cemeteries of the anct. tn. were excavated in 1913. Fighting against the Dervishes took place near M. in 1896. Good crops of Amer. cotton, wheat, maize, and durra are grown in the dist.

Merriam, **John Campbell** (b. 1869), Amer. paleontologist, b. at Hopkinton, Iowa. He taught paleontology at the Univ. of California, and was head of the Carnegie Institute at Washington, D.C. He has written many vols. on prehistoric animals, and is one of the recognised authorities so far as Amer. species are concerned. His *Published Papers and Addresses* appeared in 1938.

Merrick, **Leonard** (1864-1939), Eng. author, b. at Hampstead and educated at Brighton College. Especially noteworthy are his short stories representative of Bohemian life in Paris. His books include *Cynthia* (1897); *One Man's View* (1897); *Conrad in Quest of his Youth* (1903); *The House of Lynch* (1907); *A Chair on the Boulevard* (1908); *The Position of Peggy Harper* (1911); *The Quaint Companions* (1918); *While Paris Laughed* (1918); *When Lore flies out of the Window* (1902); and *The Man who understood Women and other Stories* (1908). He had the very rare distinction of a collected ed. of his works, with introductions by some of the most eminent contemporary authors, including Barrie, Chesterton, Wells, Granville Barker, W. D. Howells, Neil Munro, Pinero, Maurice Hewlett, W. J. Locke, and J. K. Prothero. This ed. was pub. in 1918.

Merrill, **Stuart** (1863-1915), one of the two Amers. who have won celebrity as Fr. poets, was b. at Hampstead, Long Island, New York. His infancy was passed in Paris, where he studied at the Lycée Condorcet, returning to the U.S.A. to study law at Columbia Univ., a study which he soon abandoned in order to devote himself to literature. While still in the U.S.A. he pub. his famous *Pastels in Prose* (1890), consisting of trans. from some thirteen Fr. writers then only known as names in America. Returning definitely and finally to France in 1890 he became well known as a master of the intricacies of Fr. poetry. In 1897 he pub.

a collection of his poems up to that date, and followed this with sev. other vols.

Merrill, co. seat of Lincoln co., Wisconsin, U.S.A., on the Wisconsin, 92 m. from the head of Green Bay. There are tanneries and lumber and sash mills. Pop. 8700.

Merrimac, see HAMPTON ROADS, BATTLE OF.

Merrimack, or **Merrimac**, riv. of S. New Hampshire, U.S.A., rising in the White Mts., flowing S. and E.N.E. through N. of Massachusetts to the Atlantic. Its many falls and rapids supply water-power for cotton-spinning, etc. It passes Concord, Manchester, Lowell, Newburyport, and other large tns., and is navigable to Haverhill. Length 180 m.

Merriman, **Henry Seton** (1862-1903), pen-name of **Hugh Stowell Scott**, Eng. novelist. For some time an underwriter at Lloyd's, he adopted a literary career (1889), winning success with his Russian story *The Sowers* (1896). Among his best known works are *In Kedar's Tents* (1897); *Roden's Corner* (1898); *The Isle of Unrest* (1899); *The Velvet Glove* (1901); *The Vultures* (1902); *Barlusch of the Guard* (1903); and *The Last Hope* (1904).

Merry Andrew, jester, buffoon, or quack-doctor's assistant at fairs. **Thomas Hearne** (1678-1735) derives the name from **Andrew Borde** (b. 1549), physician to Henry VIII., who combined immense learning with marked eccentricity. Andrew, however, is a common name in old plays for a manservant, as *Abigail* is for a waiting-woman.

Merschheid, see OHLIGS.

Merse, or **March**, strictly a fertile dist. of S.E. Berwickshire, Scotland, the name being, however, commonly applied to the whole co. Formerly it denoted all the country between the Cheviots and Lammermuir Hills.

Mersea, well-wooded is. of Essex, England, between the Colne and Blackwater estuaries, protected by a sea-wall. It is some 5 m. long and 2 wide. A causeway connects it with the mainland. It is noted for oysters. Pop. 2000.

Merseburg, tn. of Saxony, Germany, on the Saale, 9 m. S. of Halle. Its noted cathedral dates from the eleventh century. It was once a favourite royal Ger. residence, and contains a Gothic castle (fifteenth century). The bishopric of M. existed from 968 down to the Reformation. Manufs. include machinery, leather, etc. Pop. 40,000.

Mers-el-Kebir (Sp. *mazalquivir*, great port), fortified seaport of Algeria, N.W. coast, 5 m. N.W. of Oran, taken by the Fr. (1830). Pop. 5,700.

Mersenne, **Marin** (1588-1648). Fr. philosopher, theologian, and mathematician, studied at the college of La Flèche, where he met Descartes, whose views, as expounded in the *Méditations*, he championed throughout his life. Entering the Minim order of friars in 1611 he taught philosophy at the convent at Nevers. His chief works are the *Quæstiones celeberrimæ in Genesim* (1623; a commentary on chap. vi. of Gen., and an attack on atheism); a philosophical and

theological refutation of the Deists (1624); miscellaneous dissertations on theology, physics, and mathematics (1634), wherein M. discusses the possibility of flying, the velocity of light, etc.; *Les Mécaniques de Galilée* (1634); and *L'Harmonie universelle* (1636).

Mersey, **John Charles Bigham**, first Baron (1840-1929). Eng. judge, b. at Liverpool. Educated at Liverpool Institute, and also in Berlin and Paris, he was called to the Bar in 1870, and became judge of the king's bench div. of the high court, 1897-1909, and president of the probate, divorce, and admiralty div. of the same court, 1909-10. He sat in Parliament as a Conservative 1895-97, and was president of the Railway and Canal Commission, 1904-8. He was president in 1912 of the commission appointed to inquire into the circumstances attending the loss of the S.S. *Titanic*.

Mersey, riv. rising in N. Derbyshire, England, formed by the confluence of the Etherow and Goyt in Derbyshire, flows W. between Cheshire and Lancashire, passing Stockport and Warrington, out into Liverpool Channel or harbour, an arm of the Irish Sea. Its length is about 70 m., and the estuary is 16 m. long. Chief trib., the Irwell from Manchester. In spite of sandbanks the riv. is second only to the Thames in commercial importance. Near Irlam on the estuary it is joined by the Manchester Ship Canal. Beneath it is the M. tunnel, for road traffic between Liverpool and Birkenhead, opened in 1934. The railway tunnel was opened in 1886. See J. E. Allison, *The Mersey Estuary*, 1949.

Mersina (Isol), seaport in Asiatic Turkey, in the vilayet of the same name, 36 m. S.W. of Adana, with which it is connected by rail. It has an extensive trade, and exports wool, cotton, fruit, cereals, and timber. Pop. (vilayet) 280,100, (tn.) 30,200.

Merthyr Tydvil, or **Tydvil**, co. and parl. bor. and mrkt. tn. of Glamorganshire, S. Wales, on the Taff, 24 m. N.N.W. of Cardiff. It is the centre of the iron and steel industry of S. Wales, with large collieries adjacent. The eccles. par. of Dowlais forms part of the bor. (see DOWLAIS). Brewing and flannel weaving are minor industries. M. T., with Aberdare (pop. 49,000), which forms part of the parl. bor., returns two members to the House of Commons. It was made a co. bor. in 1907. Pop. 61,800.

Merton, **Walter de** (d. 1277), in all probability b. at M., Surrey. In 1261 he was made lord chancellor, and founded M., the first of our Eng. colleges at Oxford (1264-74), when he became bishop of Rochester, and retained that see till his death three years later. See HOBHOUSE, *Walter de Merton*, 1859.

Merton, vil. in Surrey and suburb of London, 8 m. S.W. of Westminster, forming with Morden a bor. constituency. It was associated with Nelson, who is commemorated by a hospital. Pop., with Morden, 67,600.

Merton College, Oxford, founded in 1264 by Walter de M. (q.v.), is the oldest

college in Oxford. The original endowment was the income from the founder's house and estate at Malden, Surrey, which went to the support of the Oxford scholars. The buildings are among the oldest and most interesting in Oxford. The choir of the church dates from 1294; the small treasury (? 1310) is among the earlier parts of the college; the large chapel was once used as a par. church, and contains some fine stained glass. The fourteenth-century library is the most ant. extant medieval library in England. The old city wall partly encloses the college and the garden. There are some well-designed new buildings. St. Alban Hall, once a separate foundation, was incorporated

blackbirds, thrushes, dippers (*Cinclus*), orioles (*Oriolus*), pittas (*Pitta*), rock-thrushes (*Petrocincla*), and other dentrostral genera. Vigors places this family between the Laniidae or shrikes, and the Sylviidae or warblers.

Merulius, genus of fungi. *M. lacrymans* is the destructive fungus which causes dry rot of timber. It can be avoided by assuming adequate ventilation.

Merv, or **Meru**, tn. and oasis of the Turkmen S.S.R., situated on the caravan road between Meshed and Bokhara, in the valley of the Murghab, about 300 m. S.E. of Khiva. The tn. is on the Transcaspian railway. Over 1470 sq. m. of the oasis are under cultivation, yielding plentiful

Valentine & Sons Ltd., Dundee

MERTON COLLEGE

In the foreground is Merton Fells.

with M. in 1882. The warden is its head, and its scholars are known as 'postmasters.' Past members include Wycliffe, Bodley, Carew, Antony Wood, Richard Steele, Harvey, Hartley Coleridge, Sir Max Beerbohm, and T. S. Eliot. See hist. of the college by B. W. Henderson, and J. H. White; P. S. Allen and H. W. Garrod, *Merton Muniments*, 1928; and F. M. Powicke, *The Medieval Books of Merton College*, 1931.

Méru: 1. Tu. in the dept. of Olse, France, 15 m. S. of Beauvais, and 25 m. N.N.W. of Paris. Manufs. include toys, chess pieces and boards, etc. Pop. 5000. 2. Mt. in Masailand, E. Africa, lying 40 m. W.S.W. of Kilimanjaro. It has an altitude of about 15,500 ft. and a surface crater.

Meru, in Hindu mythology, a fabulous mt., the abode of Vishnu. It is the most sacred of all mythical mts., is supposed to stand at the centre of the world, and to be 80,000 leagues high.

Meru, Turkmenistan, see **MERV**.

Merulidae, family of birds embracing the

crops of millet, rice, wheat, barley, and cotton. The majority of the inhab. are Tekké Turkomans, but many Armenian merchants have taken up their abode in the modern city. The old tn. was originally founded by Alexander the Great, but, having been destroyed, it was rebuilt by Antiochus I., and received the name of Antiochia Margiana. The captive soldiers of Crassus were settled here by Ordes. In after times it was one of the four imperial cities of Khorasan, and many of the Persian monarchs made it their cap., but in 1786 it was taken and sacked by the Uzbeks, a blow from the effects of which it has never recovered. The surrounding country, which bears the name of Muroochak, is celebrated for its fruits, but the climate is very hot and dry. The ruins of the old tn. lie 18 m. N.E. of the present Russian city, which is important owing to its strategic position. The country became Russian in 1883. Pop. of oasis 253,000; of tn. 30,600.

Merville, tn. in the dept. of Nord

France, at the junction of the Bourre Canal with the Lys, 8 m. S. of Hazebrouck and 20 m. W. of Lille. It is a well-built tn., and has important manufs. of damask, linen, and embroideries; there are also salt refineries, breweries, and brick works. Pop. 5000.

Merxem, see MERKSEM.

Méryon, Charles (1821-68), Fr. etcher, b. at Paris. His works include 'Le Pont du Change,' 'Abside de Notre Dame,' 'La Vieille Morgue,' and 'Stryge.' See monograph by Burty, 1879.

Merzifun, see MARSIVAN.

Merzig, tn. in the Rhineland Palatinate, Germany, 22 m. S. of Trier, has an anct. church and tn. hall. Manufs. include woollens and terra-cotta. Pop. 10,000.

Messabi Mountains, range in St. Louis co., Minnesota, U.S.A., and one of the largest iron-producing dists. of the world, with an ann. output of about 12,000,000 tons.

Messague, tn. in the prov. of Lecce, Italy, 12 m. S.W. of Brindisi. There are exports of olive oil, fruit, wine, etc. Pop. 12,000.

Messana, tn. in Gujarat, Bombay Prov., India, 40 m. N. by W. of Ahmadabad. Pop. 12,000.

Meesdag, Hendrik Wilhelm (1831-1905), Dutch marine painter, b. at Gröningen. He was a banker till 1867, when he took up art and studied under Alma Tadema and Roelofs at The Hague. He set himself to convey the idea of immensity and boundless space in the sky and sea, representing water-masses and motions most successfully. His pictures include: 'Fishing Boats at Scheveningen,' 'Morning on the Scheldt,' 'In Peril,' and numerous views of the North Sea. They are to be seen at the Luxembourg, Paris, and in The Hague museums.

Mesembryanthemum, or **Fig Marigold**, genus of succulent plants with thick fleshy leaves and brilliant flowers. Some species are half-hardy in dry sunny positions. *M. crystallinum*, or ice plant, is a trailing annual bearing white flowers in summer and frosted leaves and stems. A number of species of herbaceous and shrubby habits are grown in the greenhouse.

Meseritz, tn. in Poznan, Poland, 42 m. E. by S. of Kistritz. Pop. 6000.

Mesheid, or **Mesheed**, cap. of the prov. of Khorassan, N.E. Persia, 195 m. N.W. of Herat, Afghanistan. It is a walled city, situated in a fertile plain, and is famous for the magnificent mausoleum of the Imam Riza, visited annually by Shiite pilgrims. Its isolated position has allowed it to remain a centre of reaction against the progressive policy of the shah. But a branch of the Transiranian railway has been planned to link up M. with other centres, and it has a wireless station. Fruit is canned there. There is a court of appeal, an Amer. hospital, and a military secondary school. Manufs. include silks, velvets, carpets, shawls, worked metals, etc. A staging point on the supply route from India to Russia, M. was occupied by Russian forces from 1941 to 1946. Heavy fighting took place in the post-war Persian revolt. Pop. about 176,000.

Mesheid Ali, or **Nejef**, walled tn. of Iraq, near Bagdad. It contains the tomb of Ali, and is a place of Shiite pilgrimage.

Mesitylene (1:3:5, or symmetrical, trimethyl benzene, $C_6H_3(CH_3)_3$), an aromatic hydrocarbon found in small quantities in coal tar. It is best prepared by distilling acetone with sulphuric acid. M. is a colourless, mobile, pleasant-smelling liquid boiling at 164.5° C. Treated with concentrated nitric acid it yields mono- and dinitromesitylene, but with dilute nitric acid it yields acids by the successive oxidation of the methyl groups.

Mesmer, Franz, or **Friedrich-Anton** (1733-1815), founder of animal magnetism (q.v.), or mesmerism (see HYPNOTISM); graduated M.D. at Vienna in 1766. About 1772 he began, along with Father Hell, to investigate the curative powers of the magnet, and was led to adopt the opinion that there exists a power similar to magnetism which exercises an extraordinary influence on the human body. He pub. an account of his discovery in 1775. In 1778 he went to Paris, where his auto-suggestive system obtained the support of members of the medical profession; but he refused two offers, one of an ann. pension of 30,000 livres and the other of 340,000 livres, to reveal his secret, and this induced the gov. to appoint a commission, whose report was unfavourable. He then fell into disrepute, retired to Meersburg, and spent the rest of his life in obscurity. His historic *Mémoire sur la découverte du magnétisme animal*, otherwise called 'The Dissertation,' appeared in 1779. In it M. refers to his paper, *Disputation de Planetarum Influentia* ('Concerning the Influence of the Planets'), which he publicly read on May 27, 1766, and for which the faculty of Vienna Univ. awarded him his doctor's diploma. This paper, the title of which was later extended by the additional words in *corpus humanum* ('on the human body'), contains the germ of his famous Twenty-seven Propositions (also recorded in the Dissertation) relating to animal magnetism. Present-day spiritualism, in so far as it is based on the evidence of mediums, owes some debt to M., and equally so does the Church of Christ Scientist. How far M. himself was indebted to the iconoclast Paracelsus (1493-1541) and to van Helmont (1577-1644), raises interesting speculation. See on this Gilbert Frankau's introductory monograph to the first Eng. trans. of the *Mémoire*, 1948. See also life by A. J. Kerner 1856, and study by Graham, 1890.

Mesmerism, see HYPNOTISM.

Mesne (middle, intermediate): *M. profits*, in law, the profits received by a tenant in possession during the period for which he has wrongfully kept the lessor out of possession. In actions for the recovery of land by a landlord against a tenant whose term has expired, or has been duly determined by a notice to quit, or against persons claiming possession under such tenant, a claim for M. profits may, by the rules of the supreme court, be joined on a specially endorsed writ under Order XIV., together with the

liquidated claim for possession, the merit of the procedure under this order being that it is both summary and speedy, and the defendant, unless he has some sort of defence, will only get leave to defend the action at all on terms, as, for example, by giving security.

M. process, in law, that part of the proceedings in a suit which intervenes between the original process or writ and the final issue, and which issues pending the suit on some collateral matter. It is sometimes used to denote the whole process which issues prior to actual execution.

M. lord, in the feudal system, a lord who held land of a superior lord, but who granted away a part of it to another person; he was thus tenant to the superior, but lord or superior to his own grantee.

Mesolithic, see STONE AGE.

Mesolonghi, see MISSOLOGHI.

Mesons, or **Mesotrons**. Observations dating from the early years of the present century showed that the earth's atmosphere is continuously bombarded from outside it by a stream of radiation with a quite exceptional power to penetrate through considerable thicknesses of matter. This is called the cosmic radiation (*q.v.*). In recent years it has become apparent that the primary radiation that impinges on the upper atmosphere consists chiefly of protons, or nuclei of hydrogen atoms, travelling at enormous velocities, but accompanied also by nuclei of other types, in approximately the same proportions as the different chemical elements occur in the universe.

Atomic nuclei are positively charged, extremely minute structures, built up of protons and neutrons (see **ATOM**). In consequence of their like charges they repel one another as they approach, and, unless their speeds are very high, collisions between them do not cause disruption of their structures. If, however, their speeds are as great as those of the particles emitted from radioactive materials, or produced artificially in such machines as the cyclotron (*q.v.*), collisions between nuclei may be violent enough to cause changes that transmute nuclei of one type into those of another element. The speeds of the protons in cosmic rays, however, are much higher than any yet produced in the laboratory or by radioactive material, and as their collisions with other nuclei are correspondingly more violent, they produce changes of an entirely different type. Little is yet known of the structure of nuclei, and of the forces that hold them together, and it is because such knowledge can at present only be obtained by the study of these violent collisions that the investigation of the cosmic rays is so important.

When the stream of protons passes into the earth's atmosphere their impacts with nuclei of atoms of the air causes the more or less complete disruption of the latter, and in these collisions particles called *M.* are released. As their name implies, these are particles whose mass is intermediate between that of the proton and that of the electron; their masses are, in fact, 286 times that of the latter, and

they carry a charge that may be positive or negative. The *M.* produced in this way are called π *M.* (*Gk.* ρ for 'primary') and they were first identified in 1947 through the changes they produce in photographic plates while passing through the photographic emulsion. They are very short-lived, and on average exist for only about one hundred-millionth of a second. When brought to rest by collisions with other matter, the negatively charged π *M.* are drawn into atomic nuclei, where the energy corresponding to their mass is imparted to the components of the nuclei, and causes them to explode. The positively charged π *M.*, on the other hand, disintegrate spontaneously, forming a neutral particle that is shot off at high speed, together with a high-speed meson of a different type, called a μ meson. This has a mass 216 times that of the electron, and after a life-time of about two millionths of a second, it is further transformed into two neutral particles and an electron, which are shot out at high speeds.

M., although discovered earlier (1938) than μ *M.*, are thus their lineal descendants.

The cosmic rays, then, consist of streams of particles—atomic nuclei, *M.*, and electrons—together with electromagnetic radiation (similar in nature to X-rays) produced by the impact of electrons with the matter in their path. Its constitution, however, changes continually as it passes downwards through the atmosphere, both because certain of its components are more readily stopped by air than are others, and also because some of its components change to other forms during its passage. The means by which the atomic nuclei that impinge on the upper atmosphere acquire their enormous velocities is at present obscure. *M.* have been liberated from the atomic nucleus by means of a 4000-ton cyclotron. See P. M. S. Blackett, *Cosmic Rays*, 1936; R. A. Millikan, *Cosmic Rays and Mesotrons*, 1939; and J. G. Wilson, *About Cosmic Rays*, 1948.

Mesopotamia (*Gk.* *Μεσοποταμία*, from *μέσος*, middle, *ποταμός*, river), land between the two rivers, i.e. the Euphrates on the W. and the Tigris on the E. The dist. to which the name has been applied prior to the delimitation of the modern kingdom of Iraq, is rather loosely defined; with some it refers to the whole riv. country which stretches eastward from N. Syria to the mountainous tract of country dividing Persia (Iran) from the steppes and plains at the head of the Persian Gulf. With others it includes the whole of the country once ruled by the Babylonian and Assyrian empires. Strictly it may be confined to the dist. of the former Turkish dominions in Asia which was known as *El-Jezireh* (Syriac *Gazirha*, is.) from Samosata (modern *Samail*) on the Euphrates to where that riv. approaches the Tigris above Bagdad at the point of the great wall, the so-called Median wall, built, like the Chinese wall, as a protection against the nomad tribes of the N. For the physical features, gov., commerce, etc., see **IRAQ**.

History.—A letter of an Egyptian

Lieutenant of Thothmes I. of Egypt speaks of *Naharin* in the late sixteenth century B.C., thus giving the earliest Semitic name of a dist. somewhere on the Euphrates or beyond. This name occurs again as the place whence came a wife for Isaac (Gen. xxiv. 10). Haran (Carrhae) is closely connected with the early hist. of Abraham. This hist., however, goes far back beyond these dates. We know from inscriptions that an early Babylonian king, Zugal-zaggisi, spread his kingdom through M. as far as the Mediterranean. How the Semitic invasions of the third millennium reached Babylonia is not certain. It is possible that one wave came down from the N. through M. and caused the earliest building of the so-called Median wall.

E.N.A.

A TIGRIS LANDSCAPE

The N. Babylonian king, Sargon of Akkad (Agade), somewhere during the third millennium reduced M. in his relations with the W., and must have brought much cultivation and trade intercourse to the country. About this time, too, we hear of the Amurru (Amorites) of N. Syria.

It seems that in face of this immigration Khammurabi, or Hammurabi, the author of the great Babylonian code of laws, occupied M., and was suzerain in Asshur (Assyria), which now becomes prominent. Later the Amorites, evidently from N. Syria, gave way before a N., probably Hittite, movement. About 1780 B.C. the Babylonians were invaded by the Kassites from Elam, the mountainous dist. on the E. border, and lost their W. and N. dominions, allowing also the rise of Assyria, whose chief city was at Calah (Nimrud), on the E. border of M. Another state also comes into prominence, that of Mitanni, whose power extended to Assyria. It acted as a buffer state between Egypt and Assyria, lying as it did across the

N.W. parts of M. and barring the way to the road through Palestine to Egypt. Through the long epoch of the rise of the Assyrian empire, with its periods of unquestioned supremacy, decline, and recovery, M. was at the mercy of the warring powers, its kings asserting their independence at times, such as on the defeat of Tiglath-pileser I. about 1107 B.C. in Babylonia, and yielding again when Shalmaneser II., 853 B.C., shattered the confederacy of the N. Syrian and Israelite princes. Colonies of Assyrians were then settled in M. In 729 B.C. Tiglath-pileser III. of Assyria was acknowledged supreme from Babylonia to the Mediterranean. Under his rule, his dominions were strictly organised, and a strong central gov. was estab. He broke the Hittite power in N. M. and in Armenia. The powerful empire of Esar-haddon, 689, crumbled before the irruption of the Medes who sacked Nineveh in 606. For the fall of the Median empire and the rise of Cyrus, see PERSIA. The estab. of the Seleucid kingdoms after the death of Alexander the Great brought many Gk. settlements. Islam and the founding of the caliphate of Bagdad brought a new culture, and the later period that of the Ottoman Turks and the incorporation of M. in the Turkish empire, to which it belonged up to the time of the First World War. See also ASSYRIA; BABYLONIA. For the modern hist. see IRAQ. For archaeology see ASSYRIA; BABYLONIA; U.R.

First World War Campaigns in Mesopotamia.—The strategical importance of Iraq (M.) to the central powers during the First World War was that it offered an all-land route to India, via Persia and Afghanistan, so as to obviate the menace of the Brit. fleet. Its political importance lay in the influence the occupying nation had with the inhab., coupled with the control of the oil wells. Great Britain having declared war on Turkey on Nov. 5, 1914, the 16th Indian Infantry Brigade, under Brig.-Gen. Delamain, landed at the mouth of the Shatt-el-Arab on the 8th. A few days later Gen. Barrett, commanding the 6th Indian Div., arrived with the remainder of his command and moved on Basra, the key to M., which he took on Nov. 22, after defeating a combined Turkish and Arab force. The rapidity and decisiveness of the Brit. action impressed the inhab., and Brit. prestige was considerably raised. A further advance was made to Qurna, which fell on Dec. 9.

Gen. Sir John Nixon assumed command on April 8, 1915. During that month the 12th Indian Div. arrived; the Turks also had been reinforced. Gen. Barrett had placed two infantry brigades and one cavalry brigade at Shaliba to cover Basra from an attack on his left. The Turks attacked the post on April 12, 13, and 14 with great fury, but were defeated despite their superior numbers. Gen. Nixon decided to follow up this victory, and ordered Gen. Townshend to move on Amara. Townshend accordingly advanced on May 31, 1915. His force was conveyed in native boats known as 'hellums' pro-

tected by a naval flotilla of gun-boats. Gen. Gorrings was protecting the right flank with a force of all arms. Townshend entered Amara on June 3, without firing a shot, and captured four officers and 800 men. The next advance was on the Euphrates, where Gorrings captured Nasiriyeh on July 25. Nixon now planned to take Kut to deprive the enemy of an advanced base against him. His project was approved, and Townshend was ordered to carry it out, which he did during Sept., entering Kut on the 30th, driving the enemy before him. The Turks went direct to Ctesiphon (q.v.) and occupied a prepared position. The next objective was Bagdad. News of Ger. reinforcements, under Gen. von der Goltz, for the Turks reached Nixon and he ordered Townshend to advance on Bagdad to outstrip the enemy's reinforcements. On Nov. 22 Townshend met the enemy at Ctesiphon, but their reinforcements had arrived, and he was outnumbered, and after suffering heavy casualties, withdrew to Kut again. The Turks followed him and besieged Kut, which fell to them on April 29, 1916, and Townshend and 2700 Brit. and 6500 Indian troops were taken prisoners (see also KUT AL AMARA).

Gen. Sir Stanley Maude assumed command of the Mesopotamian expeditionary force in Aug. 1916, and at once organised a fresh forward move, which commenced on Dec. 10. His plan was to surprise the enemy by moving at night and to push forward on the r. b. of the Tigris to capture the line of the R. Hal. This was completely successful, and Maude pushed on up the Tigris until he captured Bagdad on March 11, 1917. He d. on Nov. 18 in the same house in which Gen. von der Goltz had d. a year previously. He was succeeded by Gen. Marshall, who had been commanding the 3rd Corps. In Jan. 1918 the 'Dunster force' (see under Dunster-ville) set out from Bagdad. In Sept. Gen. Marshall moved forward, co-operating with Gen. Allenby in Palestine, and his force was in sight of Mosul when the armistice was declared. See E. Candler, *The Long Road to Bagdad*, 1919; K. Roosevelt, *War in the Garden of Eden*, 1920; Maj.-Gen. Sir C. V. F. Townshend, *My Campaign in Mesopotamia*, 1920; F. J. Moberly, 'The Campaign in Mesopotamia' in *Official History of the Great War*, 1923-1927; Vice-Adm. W. Nunn, *Tigris Gunboats*, 1932; and Maj. R. Evans, *A Brief Outline of the Campaigns in Mesopotamia*, 1914-18, 1935.

Mesozoa, group of lowly animal organisms intermediate between the Protozoa or unicellular organisms, and the Metazoa, or those of many-celled structures. The best-known types are the family Dicyemidae, which are ciliated thread-like organisms found parasitic in the kidneys of cuttlefish.

Mesozoic, subdivision of geological time, between the Palaeozoic and the Cainozoic; it includes the Triassic, Jurassic, and Cretaceous systems, which cover much of England, France, N. Germany, the Alps, and the W. states of America. The M. ages appear to have been unbroken by

volcanic eruptions, and in this respect as well as in their fauna and flora differ from the Palaeozoic ages. Cycads and conifers represented the early M. flora, and later monocotyledons flourished. In the animal world great changes took place. Brachiopods diminished in number, as also did the Crinoids, while the Echinoderms, as represented by the Urchins, occupied a prominent position. The Ammonites were the typical M. cephalopoda, and the variety and abundance of reptilian life constitute a remarkable feature of the life of the period. The first mammals made their appearance in marsupial forms during the M. time, and the first species of bird, *Archaeopteryx macrura*, has been found in the Jurassic rocks of Germany. (See illustration, p. 176.)

Mess (O.F. *mes*, modern: *meta*, dish), in its original meaning, a portion of food, or provision of food for a party for one meal. It was especially applied in early times to more or less liquid food, such as porridge, soup, or broth (cf. the biblical 'mess of pottage'). The term is now used of a company of persons who sit at meals together, especially of the members of an official or professional body. At one time the number in a M. was usually a small group of about four, seated at one table and sharing the same dishes. In the Inns of Court parties of four benchers or four students are still common, but in the naval or military service the number in a M. is considerably larger, consisting of the parties into which a ship's company or a regiment is divided for meals. Most ships in the Brit. Navy have the officers' or ward-room M., the junior officers' M., and the warrant officers' M. The admiral and the captain usually take their meals alone. Similarly in the army there are officers' and sergeants' M.s., and separate M.s. for the men. The M. is generally managed by a committee of officers and supported by the joint subscriptions of the members, supplemented by a small yearly allowance from the gov. There is often a small monthly subscription for newspapers, magazines, and washing. Meals are served in the barracks; but married men are allowed to dine at home, and there are sometimes certain exemptions for others. The senior officer present is responsible for the discipline. Billiards, smoking, and reading rooms are often attached to the M. house, as well as the 'common room' or dining-hall, kitchen, and cellars.

Messenger, André (1853-1929). Fr. operetta composer, pupil of Saint-Saëns, was known by his operettas and comic operas, of which *La Béarnaise* (1885) was his first marked success. His others were *La Basoche* (1890); *Madame Chrysanthème* (1893); *Mirette* (written for the Savoy Theatre, London, 1894); *Les Petites Michus* (1897); *Véronique* (1898); *Fortunio* (1907); *Monsieur Beaucaire* (1919); and *L'Amour masqué* (1923). From 1901 to 1906 he was artistic director at Covent Garden, and from 1907 to 1914 at the Opéra in Paris. Debussy dedicated his *Pelléas et Mélisande* to him. See life by L. Beydts, 1947.

Messageries Maritimes, chief passenger steamship line in France, with headquarters at Marseilles, and London offices at 97 Cannon Street, E.C. Before the Second World War it had a fleet of sixty-five steamers, aggregating 293,669 tons. It trades with the Levant and Black Sea, carries mail to Italy, Egypt, Syria, Greece, India, China, and Spain, and includes a service to Australia and S. America and the S.E. coast of Africa.

orator, but none of his works is extant. His friendship for Horace and his intimacy with Tibullus are well known. In the elegies of the latter poet the name of M. is continually introduced. Of M.'s many works, oratorical, historical, grammatical, and poetical, some of the titles alone remain. Yet some estimate of his literary merit may be formed from the testimonies of his contemporaries and successors.

Messalina, **Valeria**, daughter of Marcus

MESOZOIC PLANTS

1-6, cycads; 7 and 8, conifers. 1. Stem of *Cycadoidea superba*, South Dakota; 2. Leaves of *Zamites feneonis*, France; 3. Leaves of *Olozamites bearii*, England; 4. Leaf of *Nelssonia polymorpha* (Triassic); 5. Leaf of *Zamites arcticus*, Greenland; 6. Cone of *Williamsonia gigas* (Liassic); 7. *Voltria heterophyllas*; 8. *Araucaria microphylla* (Jurassic). After Wieland, Saporta, Nathorst, Heer, and Schimper.

Messala, or **Messalla**, name of a distinguished family of the *Valeria gens* at Rome. The first who bore the name of M. was **Marcus Valerius Maximus Corvinus M.**, consul 263 B.C., who carried on the war against the Carthaginians in Sicily, and received this cognomen in consequence of his relieving Messina. The most celebrated member of the family was **Marcus Valerius Corvinus**. He fought on the republican side at the battle of Philippi (42 B.C.), but was afterwards pardoned by the triumvirs, and became one of the chief generals and friends of Augustus. He was consul 31 B.C., and proconsul of Aquitania 28, 27, B.C. about 3 B.C.-A.D. 3. M. was a patron of learning, and was himself an historian, a poet, a grammarian, and an

Valerius Messala Barbatus, and wife of the Rom. emperor, **Claudius**, a woman infamous for her lasciviousness, her avarice, and the atrocities which she perpetrated. Taking advantage of the weakness and stupidity of the emperor, and exercising an unbounded empire over him, she played the adulteress without restraint, and unrelentingly caused all to be put to death who stood in the way of her unhallowed gratifications. The best blood of Rome flowed at her pleasure. Among her victims were the daughters of Germanicus and Drusus, **Justus Catonius**, **Marcus Vinicius**, **Valerius Asiaticus**, and her confederate **Polybius**. She went so far in vice as to offer her charms for sale like a common prostitute, and at last, during a temporary absence of the emperor at Ostia

(A.D. 48), she publicly married one of her favourites, C. Silius, upon which Narcissus, one of the emperor's freedmen, fearing danger to his own power, represented to the emperor that M. was aiming at his destruction, and received orders for her execution. She was put to death by Enodius, a tribune of the guards, in the gardens of Lucullus, A.D. 48.

Messapii, see APULIA and IAPYGIA.

Messene, cap. of Messenia in Greece, founded by Epaminondas in 369 B.C. Erected as a check to the power of Sparta, it was strongly fortified. Pausanias describes it. The site is now occupied by the vil. of Mauromati.

Messengers, King's or Queen's, are officers of the Brit. Gov., who are appointed or held in readiness to carry official dispatches, both at home and abroad. They are employed under the secretaries of state.

Messenia, country of anct. Greece, was bounded on the E. by Laconia, on the N. by Elis and Arcadia, and was surrounded by the sea on the W. and S. sides. It was separated from Laconia by the mt. chain of Taygetus, and from Elis and Arcadia by the R. Neda and the high land which runs between the bed of the Neda and the sources of Pamisus. M. is described by Pausanias as the most fertile prov. in the Peloponnesus. The W. part of M. is drained by the R. Pamisus, which rises in the mts., between Arcadia and M., and flows southward into the Messenian bay (gulf of Koroni). The basin of the Pamisus is divided into two distinct parts. The upper part, usually called the plain of Stenyclérus, is of small extent and moderate fertility, but the lower part S. of Ithôme is an extensive plain, celebrated in anct. times for its great fertility, whence it was frequently called Macaria, or the 'Blessed.' The W. part of M. is diversified by hills and valleys, but contains no high mts. The chief tns. on the W. coast were Pylos and Mothône, or Methône (Modon). The bay of Pylos (Navarino), which is protected from the swell of the sea by the is. of Sphaacteria (Sphagial), is the best harbour in the Peloponnesus. The only tn. inland of any importance was Messene, at the foot of Mt. Ithôme, on the summit of which was the citadel. The country is now a prefecture of Greece (cap. Kalamai, pop. 29,000), and produces fruit in abundance. Pop. 297,200.

Messenius, Arnold Johan (1608-51), son of Johan M., was historiographer to Christina of Sweden (1646), and ennobled (1647). Arnold and his son were executed for writing a libel on the royal family. See *Anecdotes de Suède* (The Hague), 1716.

Messenius, Johan (c. 1579-1636), Swedish historian and dramatic author. The Emperor Rodolphe made him *poeta Cæsareus*, and he became prof. of law at Upsala Univ. (1609). He was imprisoned (1616) on a charge of treasonable correspondence with the Jesuits. His chief historical work, *Scandia Illustrata*, was written in confinement. Other works were *Chronicon episcoporum oer Sueciam* . . . (1611), and the dramas *Dina* (1611) and *Signil* 1612. See P. Stenbeck, *De Vita et Meritis Mes-*

seniorum, 1741, and *Biographiskt-Lexicon öfver ramnikunnige Svenska Män*.

Messerschmitt, Wilhelm (b. 1898), (Ger. aircraft designer and maker. He designed his first aeroplane in 1916 and estab. a manufacturing firm under his own name a few years after the First World War. He was chief engineer of the Bayerische Flugzeugwerke (Bavarian Aircraft Works) until it was absorbed in 1938 by the M. Company. M. received the Lillienthal prize for research in aviation, 1937. His Mo. 109, after sev. developments, emerged as a standard Ger. single-seat fighter of the 1944-45 period; carrying two machine guns and three 20 mm. cannon, its speed was 428 m.p.h. and its ceiling nearly 40,000 ft. Twin-engined fighter bombers were represented by the Mo. 110, 210, and 410. The tailless rocket-propelled fighter monoplane, Mo. 163 (see AEROPLANE) was the first operational type capable of over 550 m.p.h., but was not a very great success; the 262, a twin-engined fighter, was the best Ger. jet-propelled aircraft.

Messiah (Gk. *Messias*, Aram. *Mesihā*, anointed - Gk. *Χριστός*), title applied to Jesus as fulfilling the long-continued hope of the Jews for a king who should be a deliverer, kings being anointed in Israel. The messianic idea was of comparatively late development among the Hebrews, and in its later form dates only from the Exile. Before this the M. was regarded as purely human. See J. Drummond, *Jewish Messiah*, 1877; V. H. Stanton, *Jewish and Christian Messiah*, 1886; C. H. Briggs, *Messianic Prophecy*, 1886; and M. J. Langrange, *Le Messianisme chez les Juifs*, 1909. See also Jkws, and the article in J. Hastings's *Dictionary of the Bible*, 1898.

Messina, Antonella da, see ANTONELLO.

Messina, city of Sicily, cap. of the prov. M., on the strait of M., about 8 m. N.N.W. of Reggio. Formerly a beautiful and flourishing city, it was totally destroyed in 1908 by an earthquake. Its original name was Zunclo (*Záyλον*), the Sicilian equivalent of the Gk. *Ζέφυρον*). The harbour is one of the best in the world, and, not being damaged by the earthquake, can still carry on an extensive trade, the chief exports being oranges and lemons. Of the univ. only the law faculty has been reopened, but the valuable Gk. MSS., which were in the library, were saved, as well as some of the treasures of the Museo. The cathedral, which dated back to the Norman period, was almost totally destroyed, but the statue of Don John of Austria, in the Corso Cavour, still remains. M. was founded by pirates from Cumæ in the eighth century B.C. During the Punic wars it was a Rom. naval station. In 1072 the Normans expelled the Saracens, who had held possession for over 250 years. A little over a century later M. belonged to the house of Hohenstaufen, under the Emperor Henry VI., and in 1282 it passed to Spain, who held possession until 1713. Great damage was done to the city in 1848, when it was taken by the Neapolitan troops, after a fierce bombardment of

five days. The city was visited by a plague in 1743, when 40,000 people were carried off, and it has also suffered severely from earthquakes, the most disastrous occurring in 1908, which destroyed the city and involved a loss of 100,000 lives, a total only exceeded by the Syrian earthquake of A.D. 526, and the Jap. earthquake of 1923 in which 150,000 perished. Pop. 215,190.

In the Second World War the city was a constant target for allied bombers and suffered heavily. The cathedral was badly damaged, but its early Gothic facade, with figures by Mazzola, was relatively unspoiled. The apse and its fourteenth-century mosaics were ruined; together with the side chapels and their statues of the apostles by Montosorli. Work on the reconstruction of the facade was completed in 1946. Other churches damaged were the Annunziata dei Catalani, which, however, remained structurally sound, S. Elia and S. Giovanni di Malta. The old city wall of the port was destroyed and the statue of Neptune was injured.

Messina, Strait of (anct. *Mamertinum Fretum*), separates Sicily from Italy, and has a length of 24 m. with a breadth varying from 2½ m. to 12 m. Here are to be found the Scylla and Charybdis of Gk. mythology, the former a rock off the small tn. of Scylla, the latter a rapid or whirlpool in front of the harbour of M.

Messines Ridge, spur of rising ground 6 m. S. of Ypres, Belgium, captured by the Gers. in the First World War after severe fighting in Nov. 1914, and the scene of further fighting in June 1917 and April 1918. See FRANCE AND FLANDERS, FIRST WORLD WAR CAMPAIGNS IN.

Mestre, tn. of Italy, in the prov. of Venice, situated on a lagoon 6 m. N.W. of the city of that name. There are saw-mills and foundries, and the tn. is an important railway junction. Pop. 28,500.

Mestrovic, Ivan (b. 1883), Croat sculptor, b. at Vrpolje in N. Dalmatia. A peasant's son, he tended sheep as a boy, was taught wood-carving by his father, apprenticed to a marble-cutter at Spalato, and studied sculptures at Vienna. He designed the Serb national temple for Kosovo; two equestrian statues in bronze of Amer. Indians for Chicago city; portraits of Masaryk, Hoover, Pius XI.; the memorial chapel to the unknown soldier on Avala Mt., Belgrade, etc. There is a torso by him in the Victoria and Albert Museum, London.

Meta: 1. Intendancy of Colombia, with Yichada to the E., Boyaca to the N., Cundinamarca and Huila to the W., and Vaupés to the S. The cap. is Villavieja. Area 32,895 sq. m. Pop. 52,100. 2. Riv. of Colombia, S. America, which rises in the Sumapaz glacier, 40 m. S. of Bogotá. It flows N.E. to the Orinoco, after a course of about 650 m.

Meta, trade name for metaldehyde, a polymer (q.v.) of acetaldehyde (q.v.). It is used as a solid fuel in spirit lamps and stoves, and mixed with bran, as a slug and snail destroyer.

Metabolism is the sum total of the chemical changes within living organisms.

These changes are of two kinds: (1) synthetic or anabolic; (2) destructive or katabolic. If anabolism exceed katabolism, growth will result; if katabolism proceed more rapidly than anabolism, reduction or 'wasting' will occur (see GROWTH).

Green plants synthesise proteins, fats, and carbohydrates from carbon dioxide, water, and mineral salts. Animals cannot synthesise from such simple materials, but use the products of plant anabolism, digest and distribute them, and re-synthesise them in various parts of the body. The protein, fat, and carbohydrate incorporated in the cell substance of organisms are not used in normal metabolism. Some of this endogenous material may be used during starvation, but if the material be reduced beyond the minimum essential to the composition of a living cell, the cell will die. The materials used in normal M. are exogenous, i.e. stored in or around the tissues or carried in circulation. Animals and plants gain energy by the oxidation (respiration) of these materials, and carbon dioxide and water are two almost universal products of this katabolic process. The liver of mammals plays a great part in the M. of fats, carbohydrates, and proteins. The pancreas is important as an organ of secretion, forming both pancreatic juice and insulin; if too little or too much insulin be secreted, the normal carbohydrate M. is disturbed, and *Diabetes mellitus* and hypoglycaemia, respectively, result. Mammals fed on protein, carbohydrate, and the requisite vitamins can synthesise fat, so that fat is not an essential article of diet, though it is usually regarded as desirable, being particularly useful for the production of energy when it is oxidised. In the tissues of mammals is a considerable amount of fat not rendered visible by the ordinary methods of detection, but when certain toxins are introduced into the body this fat forms visible droplets. The deposition of normally invisible fat is the cause of fatty degeneration. The M. which takes place when the body is given just sufficient food to sustain it during complete rest is termed basal M. (see under DIET), or basal metabolic rate (B. M. R.), and is used as a standard for comparison with M. during disease, e.g. exophthalmic goitre (see PHYSIOLOGY). See E. F. Du Bois, *Basal Metabolism*, 1936; E. Holmes, *The Metabolism of Living Tissues*, 1937; and A. B. Callow, *Food and Health*, 1938.

Metallography, see under METALLURGY (PHYSICAL METALLURGY).

Metallurgy can be defined as the theory and practice of metal treatment. The term embraces the extraction of the pure metal from its ores; the study of the physical and chemical properties of the pure metal; the study of the physical properties of the alloys of two or more pure metals; the study of the various ways in which a metal and its alloys can be rendered into a suitable form and condition for use in the home and industry; and the study of the means of protecting metals and alloys against corrosive agencies. Much of M. is applied physical chem. while some branches are applied chem.

and others applied physics. The numerous aspects of the subject can conveniently be classified under the headings used below:

PHYSICAL METALLURGY attempts to define exactly what a metal is and to correlate its properties with both its fundamental atomic structure and also its crystal structure. In the case of alloys the properties are related to the micro-constituents, known as 'phases,' present. It studies the changes which take place during heat treatment and during deformation, the effect of dissolved gases, of traces of impurity and phenomena associated with solidification. The ideal to which the metal physicist looks is to be able to forecast what metals will alloy together and what will be the properties of the alloys so formed. Conversely should an alloy with given properties be required he aims eventually to be able to indicate what metals to use, in what proportion and what heat treatment will develop the properties most fully. Considerable progress has been made in recent years, but this ideal is still very far from fulfilment. The structures of alloys containing more than three or four metals are so difficult to represent, even in models, that the object may never be attained except for alloys of the simplest kind. To answer the question, 'What is a metal?' one must consider the smallest particle of the metal which can still be identified as the metal, *i.e.* the atom (*see ATOM AND ATOMIC THEORY*). The atom consists of a central core called the nucleus which is made up of two kinds of matter: the neutron which is electrically neutral, and the proton which is positively charged. Around the nucleus revolve a number of electrons which are negatively charged. The atom as a whole is neutral, so there must be exactly as many electrons as there are protons so that their charges balance. The lightest element of all, hydrogen, has only one proton in the nucleus and therefore only one electron outside it, but as the weights of the elements increase the number of protons increases, and hence the number of electrons likewise until the heaviest element of all, uranium, has ninety-two of each. The electrons revolve in a number of orbits or shells, each shell being only capable of containing up to a certain maximum number of electrons, hence the number of shells increases with the number of electrons. The first shell will hold only two electrons, the second up to eight, the third up to eighteen, etc. The inner shells fill up before the outer ones begin and, in fact, it is the tendency for atoms to form completed shells that accounts for the properties that makes a metal behave as a metal. The electrons in the partly completed outermost shell are less tightly bound to the nucleus than those in the innermost shells and are quite easily parted with leaving the remainder of the atom positively charged, that is, 'ionised.' Now consider, for example, the atom of an element like aluminium. This has three electrons only in the eight-electron shell and so requires five to fill it, but it is easier to take the alternative course

and get rid of the three electrons in order to arrive at the condition of no partly completed shells. This leaves the aluminium ion with three positive charges. Chlorine, on the other hand, only requires a single electron to complete all its shells, and if it manages to acquire one from somewhere the extra electron makes the atom become a negatively charged ion of chlorine. If aluminium atoms and chlorine atoms are now brought together, three chlorine atoms are able to complete their shells by each taking one of the three electrons which the aluminium is able to spare. The positive aluminium ion and the three negative chlorine ions are at once attracted to each other, giving a molecule of aluminium chloride. This, then, is one major distinction between a metal and a non-metal: the metal completes its shells by losing electrons and forming a positive ion, while the non-metal does so by acquiring electrons and forming a negative ion. An element like silicon with four 'valency' electrons, as those in the outermost shell are called, can arrive at the stable state by either losing four or acquiring four electrons, and in actual fact does either according to the circumstances. In the first case it shows metallic properties, in the second case non-metallic properties, *e.g.* in silicon tetrafluoride it is in the basic part of the compound like a metal, but in sodium silicate it is in the acid part like a non-metal. For other reasons it is classed as a non-metal. Even aluminium forms aluminates as if it were a non-metal. The second distinction between a metal and non-metal concerns the arrangement of the atoms in the crystal. In crystals the atoms are arranged in a regular pattern and are regarded as being located at various positions on an imaginary framework or lattice. In a crystal of a non-metal such as carbon or sulphur the bond between one atom and another results from a sharing of electrons, and it is this which determines the arrangement of the atoms in the lattice. As a result the electrons are tightly bound to the atoms which share them and the crystal is hard and rigid. On the other hand, the electrons of a metal are much more loosely bound to their atoms and can move round the lattice comparatively freely like a cloud of negative charges. It is this ability of the electrons to move through the lattice which enables them to conduct an electric current through the metal and, the loose bonding of the atoms accounts for the ductility of the metal.

Metallic crystals are usually of three types: body-centred cubic, face-centred cubic, and hexagonal close-packed. If atoms of one metal are added to atoms of another to form an alloy, the second metal will generally form a solid solution with the first and the structure will be of the same type as that of the first if only a few atoms are added. As more atoms of the second metal are added a point may arrive when a second phase with a different crystal structure is formed and later, as still more atoms are added, a third and fourth phase may be present. Solid

solution phases are, as a rule, very ductile and are therefore required for alloys which have to be cold-formed, e.g. yellow brass for deep-drawing into cartridge cases. Such alloys, however, have not the high strength required for structural purposes, and a composition is chosen which provides a sufficient proportion of a second, more rigid phase; a less ductile solid solution, or, better still, an intermetallic compound. The latter are hard and brittle and provide the rigid skeleton which ordains the alloy with stiffness while the solid solution supplies the ductility which prevents it from breaking under shock. Steel is a good example of this where the compound iron carbide stiffens the soft iron. Research by Hume-Rothery and others has revealed some of the laws which govern the crystal structure of the various phases which occur in an alloy. It has been found that these depend upon such factors

alternating with layers of the other, or dots of one in a background of the other.

Solidification of a Metal.—A pure metal cooling from the liquid state begins to solidify as soon as the freezing-point is reached only if nuclei (not to be confused with atomic nuclei) such as specks of dust are present to 'touch off,' so to speak, the process of crystallisation. If these nuclei are absent the liquid will 'under-cool' well below its true solidification temp.; then suddenly something, perhaps a slight shock, will cause crystallisation to begin and rapidly go to completion, resulting in a mass of very fine crystals. The more nuclei there are present the more crystals there will be, and therefore the smaller they will be. A small number of nuclei and crystallisation at the freezing-point yields coarse crystals. Rapid cooling causes undercooling and therefore induces small crystals, while very slow

NICKEL-COPPER PHASE
DIAGRAM

EUTECTIC TYPE OF PHASE
DIAGRAM

as the relative sizes of the atoms concerned, the system in which each crystallises, their relative positions in the electro-motive series, and the ratio of electrons to atoms.

Phase diagrams are diagrams in which the various phases in an alloy are represented when the percentage composition is plotted against temp. The simplest is exemplified by alloys of copper and nickel in which a single solid solution is present over the whole range from 100 per cent copper to 100 per cent nickel. It will be noticed that although the pure metals solidify at fixed temps. the alloys have a 'mushy' range in which both solid and liquid are present together. In another very common type of diagram there are two phases present, the α and the β solid solutions. Suppose an alloy consists of 70 per cent of metal A and 30 per cent of metal B. As this alloy cools, the α -solid solution begins to crystallise at point L; at point S the remaining liquid solidifies and consists of both the α and the β solid solutions together in the ratio given by point E. E is called the eutectic. Under the microscope a eutectic has a very characteristic appearance, showing most commonly layers of one solid solution

cooling has the reverse effect. Hence the reason why die-castings in metal moulds are fine-grained and large sand-castings are coarse-grained. For most applications fine grains are preferred. The growth of a crystal takes place in a special way. As soon as a nucleus has initiated the formation of a crystal a number of branches spread outwards; soon these begin to grow secondary branches, and these in turn grow their own side-shoots until eventually all the space between the original 'dendrites' is filled in and the whole becomes a crystal, as seen under the microscope. Normally there are numerous small dendritic systems all growing at the same time, so that in due course these touch and no more liquid is left. In an alloy where there are often phases of different freezing-points and low freezing-point impurities the high freezing-point phases always crystallise first and the low freezing-point phases and impurities solidify last in the grain boundaries.

Metallography.—Although the arrangement of the atoms in the crystal of a metal or alloy and hence the system in which it crystallises can only be determined by the methods of X-ray crystal-

lography, the various phases which are present in an alloy and the arrangement of the crystals can be identified by ordinary microscopy. To do this one face of a small piece of the alloy is ground flat on a grindstone or file and then taken down almost to a polish on successively finer grades of emery paper, *e.g.* coarse, 1M, 1F, O, OO, OOO. Finally a revolving wheel covered with velvet or such as Selvyt cloth, to which has been applied an aqueous suspension of very finely divided alumina, magnesia, or chromic oxide, removes the last remaining scratches and leaves a mirror finish. Etching this

differences in the depth of etching, and the reflecting microscope which employs mirrors instead of lenses and has a much greater working distance than the ordinary microscope, thus enabling phase changes at high temp. to be followed without risk of damage to the instrument.

EXTRACTION METALLURGY is the science and art of extracting the metal from its ores and refining it. In general only the precious metals such as gold, platinum, etc., are found 'native,' that is in the elemental state. Baser metals, owing to their higher chemical reactivity, are more often found in combination with non-

PHOTOMICROGRAPHS

surface with dilute acid or other reagent for a few seconds, washing first in water and then alcohol, and drying in a stream of air reveals the micro-structure. The etchant is always a reagent which attacks the constituents to varying degrees. For instance, one phase may appear dark, another light because it is untouched, and a third coloured. Grain boundaries appear as dark lines. Unlike the biological microscope which transmits light through the transparent specimen, the metallurgical microscope reflects light from the face of the opaque specimen. In recent years the electron microscope, using plastic replicas of the etched metal surface, has revealed much new information about the very finest micro-structures. Other recent developments are the phase contrast microscope which emphasises minute

metallic material such as oxides, sulphides, sulphates, carbonates, phosphates, silicates, etc. It is common to find the minerals of two or more metals deposited together, *e.g.* the nickeliferous magnetic pyrites of Canada, which consist of nickel, copper, and iron sulphides associated together. Other minerals may consist of the double compound of two metals, *e.g.* dolomite, a calcium-magnesium carbonate. The ore generally consists of the metal-bearing mineral associated with a more or less large proportion of earthy material or 'gangue.' It is only when the cost of extraction, considered in conjunction with marketing costs (*e.g.* transport over long distances when the metal is found in remote regions), is economic relative to the selling price (a factor governed by supply and demand) that the deposit is

reckoned as an ore. It is commercially practicable to mine and treat material containing very small percentages of the precious metals, e.g. gold ores may contain as little as 0.2 oz. per ton, while on the other hand it does not pay in most countries to deal with iron deposits containing less than about 20 per cent of iron. Before the extraction processes can be carried out as much of the earthy material as possible must be removed from the ore, the process being known as ore dressing. Rock ores are first broken down in jaw-, gyratory-, or roll-crushers, or in stamp mills, then finely ground to a slime in ball mills. The next stage is classification sorting of the slime into metal-bearing and metal-free fractions. Most classifiers operate on the principle of Stokes's law, in which a rising column of water in a tank containing the slime carries away the less dense earthy material while leaving the denser metalliferous material in the tank. 'Concentration' follows: magnetic material can be separated from non-magnetic in the magnetic separator. Jigs and concentrating tables and the old gold-miner's pan all depend upon separation of the less dense 'tailings' and denser 'concentrates' into two layers, a process known as stratification, when the slime is treated with a stream of water. 'Froth flotation' is able to concentrate extremely fine material and is particularly applicable to sulphide ores. In this method frothing and collecting agents are added to the slime in a tank and air bubbled through it from the bottom. The mineral adheres to the bubbles and is carried to the surface, where it is scraped off into separate containers. After concentration the mineral must be filtered and dried ready for the extraction processes. The metal may be extracted by the application of high temps. (pyro-metallurgy) or electric currents (electro-metallurgy) or a combination of both. The former is the most widely used. The term pyro-metallurgy covers calcining, roasting, sintering, smelting, converting, and distilling. *Calcining* in kilns decomposes carbonates to oxides and drives off water from hydroxides. *Roasting* is generally intended to oxidise sulphides to oxides or sulphates, and is usually performed in a tall cylindrical furnace with a number of superimposed hearths fitted with mechanical rabbles which rake the charge as it falls from hearth to hearth down the furnace. *Sintering* causes finely ground material to cake, so that it can be charged into smelting furnaces without fear of clogging them with dust.

Smelting is the process in which the metallic compound is broken down to yield the metal. Two types of furnace are used: the reverberatory furnace and the blast furnace. In the reverberatory furnace the fuel (coal, coke, gas, or oil) is burned in a separate chamber from the hearth where the concentrate lies. The products of combustion pass into the hearth and heat the charge to above its melting-point. An excess of oxygen is provided which oxidises sulphides to oxides, then, as in the case of the copper-

iron 'matte' in copper smelting, an oxide-sulphide reaction takes place which yields copper and sulphur dioxide in this example, the iron reacting with the silica to form an iron-silicate slag which floats on the copper. In blast-furnace smelting the metalliferous material and fuel in the form of coke are mixed together in the same chamber and air blown in from tuyères at the bottom. The coke serves two purposes: to be a source of heat and to provide carbon which reduces the oxide to metal, e.g. the iron blast furnace. Limestone is added to form a slag with the silica still remaining from the original gangue. In the case of certain metals, notably zinc, the temp. of dissociation of the compound is so high that the metal appears as a vapour. When this is so the coke for reduction and the metalliferous material are heated together in a retort by an external flame. As the metal vaporises it distills over into a condenser where it is liquefied.

Electro-metallurgical extraction applies to the deposition of a metal from one of its salts by the passage of an electric current. In many cases an aqueous solution of the salt can be used, e.g. copper is deposited from copper sulphate solution, but for electro-chemical reasons other metals cannot be so treated; instead the salt is fused and the current passed through the molten bath, e.g. extraction of aluminium from bauxite. In electro-refining the principle is the same but the conditions are so adjusted that only the metal required is deposited, the contaminating metals being left in solution.

Hydro-metallurgy is closely connected with ore-dressing. It is often possible to dissolve out the metallic compounds from the ore and leave the gangue behind. Sulphide ores may be rendered soluble by roasting to oxides and then converting to sulphates by the addition of sulphuric acid. The sulphates are 'leached' out with water. In the case of copper, electrolysis is a logical continuation; in gold extraction the metal is precipitated by cyanide.

METALLURGICAL HEAT TREATMENT. In order to develop to the utmost the properties of an alloy it is almost always necessary to heat treat it. Except in the single instance of alloys made by the methods of powder M. all alloys start life as castings. Sometimes they are cast directly into the shape of the article required, but more often they are cast first into ingots which are rolled into bar or sheet for final forming. Whichever method is used the alloy first develops a structure which is typical of cast metals, e.g. large crystal size with the crystals often orientated in directions which give planes of weakness; non-uniform dispersal of constituents and unwanted phases present. In addition, cooling stresses will very likely be present. Therefore one of the most important heat treatments, *annealing*, is adopted, to remove this 'as cast' structure. As already discussed, most engineering alloys are made up of a ductile solid solution, together with one or more relatively brittle phases. Fortun-

ately when nearly all alloys are heated to above a certain temp., which varies from one alloy to another, the brittle phase is taken into solution in the first phase. As soon as solution is complete the first phase recrystallises into a mass of minute new crystals. As the temp. rises still further the new crystals begin to run together and form larger ones; for this reason the temp. must not be any higher or the time any longer than necessary. During the rapid cooling that always follows casting there is not sufficient time for the diffusion processes, which enable the metals to sort themselves out into the various phases, to take place. Consequently there is sometimes more, sometimes less, of a particular phase present than there would be under conditions of slower cooling. By bringing the alloy to a single phase, holding at temp. for a while to enable rediffusion to take place and cooling very slowly in the furnace, the required proportion of the phases is brought about. Annealing is frequently used for another purpose. Metals and alloys become hard when cold worked, *e.g.* rolled, beaten, or pressed, and if the cold-working is continued beyond a certain point tearing or cracking begins; an intermediate anneal between stages brings about recrystallisation and the metal is softened enough to permit further cold work.

Normalising is a term applied solely to steel. It is similar to annealing, except that the soaking time at temp. is shorter and cooling is in air. It confers a finer and therefore tougher structure to the steel.

The Effect of Quenching.—When an alloy which contains two phases at room temp. is heated to a single phase condition and then cooled again, the second phase which has been dissolved reprecipitates, and the form which it assumes as it does so depends upon the rate of cooling. With very slow cooling in the furnace it usually has time to form a network in the boundaries of the grains of the first phase. With quicker cooling, say in air, it may not be able to do this, but instead precipitates as separate particles within the grains. Very often with fairly rapid cooling it deposits as plates in the crystallographic planes of the first phase. The condition of uniformly dispersed particles gives the best mechanical properties. When cooling is extremely rapid the precipitation of the second phase may be inhibited altogether so that at room temp. only one phase is present instead of two. This is extremely useful because it enables the alloy to be fabricated to the required shape. A second, lower temp., treatment then brings about the precipitation of the dissolved phase and the alloy hardens. The particles of a phase reprecipitated in this way are often exceedingly fine, sometimes sub-microscopic, but if the temp. is raised too high they coalesce and the hardness of the alloy falls. This is the basis of the 'solution heat treatment and ageing' of aluminium alloys, and the hardening and tempering of steels. In the latter, however, quenching does not prevent reprecipitation of the second

phase and the condition of incipient precipitation makes the steel glass-hard. Tempering takes the precipitation a stage further and the resultant fall in hardness is accompanied by a development of toughness.

Case-hardening is the treatment accorded to low carbon steels whereby a high carbon 'case' up to about $\frac{1}{16}$ in. thick is formed at the surface. The low carbon core is tough but soft, and the object of the high carbon case is to provide resistance to wear, only a hard brittle material being able to do this. The case can be applied in two ways: (a) by pack-hardening. The article is packed in charcoal containing an activating agent such as barium carbonate and the whole heated to 900–950° C. for sev. hours, followed by a grain-refining treatment; (b) by cyanide hardening. The article is this time immersed for $\frac{1}{2}$ to 1½ hrs. in molten sodium cyanide. The above two methods are alternatively called 'case-carburising' because the case is derived from absorbed carbon. Another kind of case is applied by 'nitriding.' The steel is heated to 450–500° C. in an atmosphere of ammonia gas. The steel combines with the nitrogen in the ammonia and forms iron nitride in the form of needles to the depth of 1 millimetre. Special steels have been developed for nitriding of which one, Nitralloy, covered by patent, is well known. These steels contain such alloying metals as chromium, vanadium, titanium, etc., with the object of reducing the brittleness of the nitrided case, and about 1 per cent of aluminium has been found to be beneficial. An initially higher carbon provides for loss during treatment.

Flame Hardening and Induction Hardening are two methods of conferring a hard surface on steel purely by quench hardening the outer layers. A shallow depth of, say, $\frac{1}{8}$ in. of the steel is heated to hardening temp. by, in flame hardening, an oxy-acetylene flame, and in induction hardening an electrical high-frequency induction coil. Heating is extremely rapid, and immediately the correct temp. is reached the source of heat is removed and a water spray turned on so as to shock-cool the steel. Fully automatic machines have been developed for production hardening of standard components by both flame and induction hardening. Gear-teeth hardening particularly lends itself to this, *e.g.* Shorterising.

METALLURGICAL FURNACES serve two main purposes:

(1) *Melting*, which may be (a) purely remelting of ingot and scrap, etc. (b) remelting with some degree of refining, or (c) part of an extraction process. Examples of (a) are the electric induction melting of steel and the crucible melting of brasses, bronzes, aluminium, lead, tin, and zinc base alloys; of (b) the basic electric arc furnace for steel where impurities like sulphur and phosphorus are largely eliminated, the carbon and manganese adjusted to any required value and alloy additions made; and of (c) the blast furnace for producing pig-iron and the reverberatory smelting of copper. Remelting furnaces

find their widest application in the foundry and in plants where alloys are made up into 'notch bars' from their constituent pure metals to definite specifications. For non-ferrous alloys the crucible furnace is the most popular. Originally heated by coke fire, modern crucible furnaces are almost universally oil or gas fired. The crucible stands in a refractory-lined case closed by a lid. The oil or gas burner injects the flame tangentially into the bottom of the case, so that the flame spirals upward round the crucible and leaves at the top. The air supply to the burner is under compression from a blower. The furnace may be of the bale-out (metal baled out with a ladle), lift-out (crucible lifted out with tongs), or tilting type (furnace tilts on trunnions by means of either hand or power operation). For larger quantities of metal the Ajax-Wyatt low-frequency electric furnace or the rocking arc electric furnace may be used. In the former a V-shaped channel below and connected with the main chamber acts as the secondary coil of an electrical transformer. The low-frequency current induced in the channel heats the metal. The rocking arc furnace consists essentially of a spherical chamber with an electrode entering from each side on the horizontal axis, and meeting at the centre to form a spark-gap. The furnace is mounted on trunnions and is rocked mechanically about the horizontal axis through an angle of about 90° during melting so that once in each cycle part of the lining is first heated directly by the radiation from the arc and then passes under the charge to which it imparts its heat. Rapid heating of the charge is thus ensured. For steel remelting the coke-fired pit crucible furnace is still used for tool steels, but for large melts the high-frequency electrical induction furnace is a more modern development. In this the metal is placed in a crucible in a tilting case. A water-cooled coil round the crucible carries a high-frequency current which induces eddy currents in the steel, and melting results from the heat generated by the steel's resistance to these.

(2) *Heat-treatment furnaces* are either of the 'batch' type, which are loaded at the beginning of the treatment and unloaded again at the end, or of the 'continuous' type in which the work is continuously loaded at one door, and after moving slowly through the furnace are unloaded at another. The latter type may consist either of an annular hearth which rotates continually at predetermined speeds, the loading and unloading doors being side by side, so that the work completes one revolution during treatment; or it may be a straight-through furnace with a loading door at one end and an unloading door at the other. The work is carried through either on a moving hearth working on the continuous belt principle or on rollers, in which latter case a ram pushes it from behind. Heat-treatment furnaces in the majority of heat-treatment shops are either gas fired or electrically heated. Though special alloys, e.g. tool steels, require temps. above

1000° C., for the commoner industrial alloys furnaces capable of operating continuously at up to this temp. cover most needs. Gas-fired furnaces are mostly of the muffle type, and generally the flames from a row of burners down each side pass into the chamber, the burners being so designed that the flames follow the curve of the arch of the roof, and escape to a chimney. Particularly in large high-temp. furnaces much heat which would otherwise be lost up the chimney is saved by incorporating a recuperative system. For smaller furnaces such as laboratory muffles, or wherever direct contact between the charge and flame is undesirable, a special muffle lining heated by gas flames on the outside holds the charge. For temps. over 1000° C. a fan-type blower provides a forced draught for combustion. Electrically heated furnaces of the muffle type have the heating elements of special alloy such as nichrome (80/20 nickel/chrome) disposed inside the chamber along the walls and roof, and under the heat-resisting alloy hearth plate. To avoid a lower temp. at the door end due to heat loss through the door, the door also is often fitted with rows of elements. The freedom from the necessity of providing burner inlets and exit flues makes electric furnaces ideal for inert atmosphere work. Such furnaces, e.g. the bell type, are used for 'bright annealing' steel and copper alloy, etc., wire, sheet, and strip where the inert atmosphere preserves the original bright finish. Cracked ammonia is widely used for this purpose. For treatments when close limits are set to the temp. range it is vitally essential to ensure that all parts of the furnace are at the same temp. Up to a temp. of about 750° C. the vertical air-circulating furnace fulfils these requirements. It is a vertical cylindrical furnace closed with a cover at the top. The heating elements are on the inside of the insulating outer case, but outside the metal basket which carries the charge. The basket has sheet-metal sides, a grid bottom, and open top. A fan beneath the basket draws air over the elements, where it is heated and blows it up through the grid into the basket, from which it passes out at the top and is recirculated over the elements. Some alloys are heat treated in baths of molten salts heated by gas or electricity, e.g. the solution treatment of aluminium alloy sheet. Automatic temp. control can be provided on all furnaces by thermo-electric controllers operating motorised valves on gas furnaces and relay-operated contractors on electric furnaces.

ELECTRO-METALLURGY, broadly speaking, is the application of electricity to metallurgical processes; hence in its widest sense it is often applied to processes in which electricity is used merely as a source of heat to motivate purely chemical or physical reactions, e.g. the electric arc furnace for steel-making and electric welding. More correctly the term should be limited to electrolytic processes. *Electro-deposition* embraces the electrolytic extraction of a metal from its salts, either molten, e.g. aluminium, or in

aqueous solution, as in electro-plating and its specialised application electro-forming. In order to understand the principles of electro-deposition, consider the case of silver. When silver nitrate is dissolved in water it ionises into the positively charged silver ion and the negatively charged nitrate ion. If two pieces of metal, to act as electrodes, say a spoon connected to the negative terminal of a battery and a piece of sheet silver connected to the positive terminal are immersed in the solution, the current will begin to flow in at the piece of silver, through the solution and out again at the spoon. The spoon, being the negative electrode is called the cathode, and the piece of silver, being positive, is the anode. As the current flows the silver ions are attracted to the cathode, pick up their missing electrons, and become silver metal which deposits on the spoon. The nitrate ions migrate to the anode, give up their excess electrons, and then react with the water to form nitric acid and release bubbles of oxygen from it. At the same time some of the silver from the sheet-silver electrode dissolves and keeps the silver-nitrate content of the solution constant. In electroplating the nature of the plate can be governed quite widely from mat to shiny and from strongly adherent to crumbly by control of the condition of the bath, e.g. composition, acidity, temp., presence of certain 'addition agents,' current density, etc. Some metals which give a good bright, non-tarnishing finish to the basis metal of the article to be plated do not adhere very well to it, and also being porous may allow moisture to permeate through and set up corrosion which eventually causes the plate to strip off. A case in point is chromium plate on steel. To overcome this difficulty layers of one or more metals which supply the missing properties are deposited first, e.g. copper first on steel for adhesion, then a layer of nickel for corrosion protection, and finally chromium for its non-tarnishing lustre. Alloys may be deposited by electrolysis of a solution of the mixed salts of the component metals, e.g. brass can be plated out from a mixed copper and zinc solution. The same principles apply to the electrolysis of molten salts. In the case of bauxite dissolved in cryolite, a very heavy current is required because of the high energy of association binding aluminium and oxygen together. Electro-forming is the reproduction of any surface, metallic or otherwise, by electrode position methods. An example is the copying of the 'master' gramophone record in order to be able to mould thousands of replicas for sale. To do this the master of wax is coated with a very fine metallic powder to render it conducting. It is then made the cathode in a bath of copper sulphate, a plate of copper being the anode, and a current passed until the copper which plates out on the disk is thick enough. Next the wax is stripped off and the copper negative used to make, by similar plating processes, a hard steel negative in the form of a die. Two such dies, one with the obverse and the other the reverse

recording, are then placed in a press where the resinous material of which the final record is made is heated to the plastic state, pressed and cooled and becomes the positive replica of the original wax recording. In electrotyping the same principle is applied for the formation of a copper printing medium from a wax or plastic original (see further under PRINTING).

METALLIC CORROSION can take place as a result of two general forms of attack: (a) Electro-chemical (electrolytic) and (b) direct oxidation.

Electro-chemical Corrosion.—Though most metals tarnish due to reaction with gases in the atmosphere practically all the deterioration of structural alloys in common use is due to electrolytic attack, that is, small local electric cells are formed all over the surface of the metal. If two plates, one of copper and the other of zinc, are immersed in an electrolyte (a solution which will conduct an electric current), e.g. dilute sulphuric acid, and joined together by a wire, a current will flow from the copper to the zinc and the current will have a definite value. The zinc dissolves in the acid and hydrogen forms in bubbles on the copper. Now suppose we have a large panel of zinc, say as a roof sheeting, and this zinc has minute specks of copper embedded in the surface due to accidental pick-up during rolling. Now suppose that the roof is in an industrial atmosphere which contains large quantities of sulphurous gases from coal and coke fires; these gases combine with the water vapour in the atmosphere to form sulphuric acid which descends with fog and dew upon the zinc roof. The zinc, acid, and particle of copper now produce an electrolytic cell, and the zinc begins to dissolve until a small pit is visible on the surface. The pit in time grows larger and joins with neighbouring pits until in due course a hole has been eaten right through the sheet. In a similar manner, water containing softening salts which are electrolytic will cause holes to appear in aluminium pans. Not all electrolytes are acids; many neutral salts such as common salt and ammoniac are strong electrolytes. This explains why corrosion is such a problem on and near the sea, for the air is laden with salt-water drops carried by the wind from spray, etc. It is not always necessary for two different metals to be present to form a cell. Two different phases of one alloy may, in the presence of an electrolyte, have an appreciable potential difference, so that one phase dissolves and corrosion takes place on a microscopic scale. This explains why pure metals are more resistant to corrosion than their alloys, even in the presence of quite strong acids, for only one phase is present. It is possible to draw up a table, called an electro-chemical series, in which metal electrolyte combinations are ranged in order from the most electro-positive at the top to the most electro-negative at the bottom. Metals which lie at the extremes of the table form, if used together, a powerful cell with a high voltage, and corrosion takes place rapidly. Such a

combination should never be used in a structure unless it is either well coated with paint to keep the damp out or an insulating layer is placed between the two metals. Metals which are close together in the table, on the other hand, may be used together with safety.

Direct Oxidation.—Apart from light tarnishing, direct oxidation of metals to the extent of scaling only takes place at high temps.

Protection against Corrosion.—As moisture is essential to all forms of electrolytic corrosion, the best way of preventing attack is by keeping out the moisture by means of a coat of paint, oil, wax, or any other water-repellent material. Paints tend to be slightly porous, and often corrosion inhibitors, such as chromates, are incorporated in the primer to minimise the effect of such water as does manage to get through. Zinc coating (galvanising) on steel sheeting preserves the iron by 'sacrificial protection,' i.e. the zinc is anode to iron and dissolves instead of the iron which would otherwise go into solution as a hydroxide of iron and appear as rust. Another method is to passivate the metal by causing it to develop an oxide or other film under controlled conditions. This film often also forms a good 'key' for a paint layer. Examples of this are the anodising of aluminium (aluminium oxide film), the Bower-Barff process for iron (iron oxide film) and Coslettising, Parkerising, and Bonderising for steel (iron phosphate film). Some metals like chromium form a passive oxide film naturally and are therefore more corrosion resistant than others and do not require extra protective layers. It is the chromic oxide film which gives stainless steel its resistance to corrosion.

POWDER METALLURGY is the study of a method of preparation of solid metal articles from powder. One of the earliest applications was in the manuf. of tungsten filaments for electric bulbs. Tungsten was available in powder form, but owing to its high melting-point of 3360° C. could not be melted and cast into bar for wire-drawing in the usual way. The difficulty was overcome by subjecting the powder to very high pressure in a steel die so that a small bar was formed which, though very weak and brittle, could be handled without falling to pieces. The bar was next placed in a tube containing hydrogen to keep the air from reaching the tungsten and oxidising it, and an electric current passed through it so that it became heated to a high temp. as a result of its own electrical resistance. This sintered the grains of powder together and the bar became strong enough to be hammered into a rod, and eventually drawn into fine wire. The same method, with improvements, is still used to-day. The stages of pressing and sintering are an essential part of powder M. Pressing locks the particles of powder together more or less mechanically, though it is possible that some superficial welding takes place, and the 'compact,' as it is called, usually has very little strength,

its density is much lower than that of the finished article, and the microscope reveals the presence of numerous cavities. Heating to a temp. near to, but below the melting-point causes diffusion of the grains, so that the cavities disappear and the density rises. When an alloy compact is being made, as for instance bronze, the two constituent metals, copper and tin in powder form, are thoroughly mixed together, pressed, and sintered. On completion of sintering, the tin and copper are found to have diffused together so thoroughly that instead of individual grains of reddish copper and grey tin being visible, the microscope shows only yellowish-red grains of the α -bronze phase. This is one of the reasons why the initial powders must be in an extremely fine state of subdiv., for then it takes a much shorter time for the various metals to diffuse into a homogeneous alloy. Sometimes incipient melting of one metal so that it can cement the grains of other higher melting-point constituents together is permitted, e.g. cobalt mixed with tungsten carbide for high-speed tool tips. It is possible for a compact to be hot-pressed, i.e. pressing and sintering combined in one operation. Hot-pressing is, however, more expensive than cold-pressing because of the difficulties of heating massive steel dies and because the die life is shorter. Another interesting application of powder M. is the manuf. of self-lubricating bearings. Copper and tin powder, together with a little graphite, are pressed and sintered, but the compact is deliberately left porous so that oil can be forced into the pores. So much oil is left in the bearing that it will run a life-time without re-oiling. By suitably shaping the die the powders can be pressed into the final shape of the article required, in the same way that plastics can, and the surface finish and dimensional accuracy are very good. So far various considerations, such as the pressure required, have limited power compacts to a few pounds in weight, but it has found numerous applications where the older methods of fabrication could not easily have been used.

FABRICATION OF METALS.—This covers all the different ways in which the ingot metal from the smelters is rendered useful for engineering or decorative purposes. The actual manipulation of the metal is largely the business of the engineer or foundryman, but he has to work in close co-operation with the metallurgist, who will keep him informed of such matters as the effect the processes are having on the internal structure of the metal, e.g. grain size, growth, and orientation; internal tears due to over-stressing, heat treatments before and after manipulation, etc. The fabrication methods are briefly:

Rolling.—This can serve two purposes: (1) to break down the coarse cast structure of the original ingot or slab, and (2) to give the required final shape and finish, e.g. square, round, or hexagonal bar, rod for wire-drawing, or sheet of various gauges with or without a mirror finish.

The final stages, where the reduction per pass is small, are often performed in the cold so that the metal is work-hardened in order to obtain greater strength (hard-rolled).

Forging embraces hammer-forging, drop-forging, and press-forging. In hammer-forging a steam or pneumatically operated hammer reciprocates and beats the metal between itself and the anvil. It is useful for forging comparatively simple shapes and for breaking down the cast structure of ingots for further processing. In drop-forging the metal, initially in the form of a piece of rod or bar, is forced, under a blow, to fill the cavity in a mould or die and thereby reproduce its shape. The die is split into two and the top half is attached to a heavy 'tup,' the bottom half being attached to the base of the machine. The tup is raised mechanically to some 10 ft. above the base, and then allowed to fall under gravity so that it drops on to the bottom half-die, and the blow forces the bar into the cavity. A shallow trough round the die cavity receives excess metal or 'flash,' which is later trimmed off. Where the shape is complicated sev. sets of preforming dies may be necessary to fashion the bar roughly to shape before the final operation. Press-forging employs a squeeze rather than a blow. Drop-stamping is very similar to drop-forging, but applies more particularly to the shaping of sheet metal into hollow-ware.

Extrusion is a process by which a cast billet is forced, by hydraulic pressure, through a hole in a die at the end of a cylindrical container in a comparable manner to tooth-paste being squeezed out of a tube. The hole in the die may be simple in shape, such as round or hexagonal, or it may be quite complicated, such as in the shape of the Gk. letter psi (ψ), which would be impossible by rolling. Brass and aluminium alloys are two commonly extruded metals.

Spinning is a process of forming hollow-ware of circular cross-section. A flat disk of the metal is revolved at high speed, and by means of special tools is gradually spread over a wooden mandrel of the required shape. It is particularly applied to soft metals like pewter, aluminium, and silver.

Wire-drawing consists of reducing rod to wire by drawing it on a special draw-bench through die-holes of tungsten carbide or diamond, using suitable lubricants.

Casting performed in the foundry consists of pouring molten metal into a mould. The mould is most commonly silica sand, bonded together with a small amount of clay material, water, and sometimes a cereal binder such as dextrine. Metals with fairly low melting-points may, however, be die-cast, that is, cast into a metal die. In gravity die-casting the metal is caused to fill the mould by the force of gravity, as in sand casting; in pressure die-casting hydraulic pressure is employed to force the metal into the die. In centrifugal casting, centrifugal force helps the metal to fill all intricacies of the mould.

METAL TESTING.—Tests of metals and

alloys fall into two categories: (1) destructive and (2) non-destructive. In general the destructive tests give information on the mechanical properties of the material, whereas the non-destructive tests only indicate whether the material, or more often a fabricated article, is free from defects.

Destructive Tests.—Most destructive tests involve the use of a test-piece, either specially formed as an appendage to the article being produced, e.g. to a casting or forging, or taken from a representative sample of the raw material, or machined out of the article itself. Whichever is the source of the test-piece, the latter is always stressed until it breaks. The two standard tests most used in engineering are the tensile and the impact test. To these may be added the hardness test which is not, strictly speaking, destructive, though a small mark remains.

The tensile test-piece is essentially a rod of circular cross-section (except when a flat strip is used as for sheet material) which is gripped at both ends and pulled

A NORMAL TENSILE TEST CURVE

apart by a machine which is capable of measuring the load applied. The centre portion is marked off by two small 'pop holes' an accurately measured distance apart, and this distance is the gauge-length. On each side of the gauge-length the rod increases in diameter to ensure that the fracture takes place in the gauge-length. The test-piece may be of any size, but for comparable results between different sizes it has been found that the gauge-length must be four times the square root of the cross-sectional area. In the most popular size of test-bar the gauge-length is 2 in. and its diameter 0.543 in., so that the cross-sectional area is $\frac{1}{4}$ sq. in. If the load on the test-piece is increased in small increments of, say, half a ton and the corresponding stretch or extension measured and a load-extension graph plotted, it is found that there is first a straight line up to the 'limit of proportionality', then a curved portion which reaches a peak at the ultimate tensile stress (U.T.S.), after which there is a fall to the point at which fracture takes place, the breaking stress. After the bar has been broken the two halves are fitted together and the distance apart of the pop-holes measured; from this the elongation per cent can be calculated. Also it will be found that if the metal is ductile the fracture will have occurred in the middle of a well-marked waist which has appeared;

measurement of the diameter at this point enables the reduction of area per cent to be calculated. While the ultimate tensile stress indicates the highest stress which the metal will stand, the elongation and reduction of area are measures of the ductility.

The impact test is a means of determining the ability of the metal to resist a sudden shock. The principle of the test is that a standard size of notch is machined in a round or square section bar to concentrate the stress. The bar is gripped vertically in a vice which holds it against the blow of a weight at the end of a pendulum. The energy in foot-pounds absorbed in breaking the bar is proportional to the distance which the bar swings after impact, and is quoted as the impact value. The Izod and Charpy tests are the best known impact tests. There are sev. methods for determining the hardness of a metal, but the indentation test is the most universally accepted test in M. and engineering. Examples are the Brinell, Vickers, and Rockwell tests. In the Brinell test a heavy load forces a hard steel ball (3000 kg. load and 10 mm. diameter ball for steel testing) into the metal, and the diameter of the impression left is measured and translated into hardness units. The standard Vickers test employs a pyramidal diamond, and the length of the diagonal of the diamond impression is converted into hardness units. The Rockwell test may use either a ball or diamond, but in each case the depth of penetration, after applying an initial light load, is measured.

The fatigue test: many mechanical components built from metal with a high tensile strength are found to have

fractured in service when it is quite certain that the ultimate tensile strength has not been reached. It is nearly always found that stresses have been of a reciprocating nature, as in the case of an axle-shaft revolving under a bending stress, or a piston connecting rod which is alternately stretched and compressed once every stroke. Such failures under alternating stresses show a characteristic shiny fracture, and are known as fatigue failures. Common tests which give an evaluation of performance under fatigue conditions are the Wöhler, Haig, and Schenk tests. The Wöhler test consists of a revolving bar of circular cross-section, gripped at one end

by the revolving mechanism and having a weight hanging from a ball-race at the other, there being no further support between the two. The speed is 2850 r.p.m. In the Haig and Schenk tests the bar is compressed and tensioned alternately thousands of times per minute, plus and minus any desired load. Whichever test is used a graph can be plotted of load against the number of reversals of stress required to cause fracture. At low loads no fracture will occur after an infinite number of reversals, but as the load is increased the specimens begin to fail after decreasing numbers of reversals. The endurance limit is the lowest load which will cause the test-piece to break within a stated number of stress reversals, e.g. 10,000,000.

The creep test is applied to alloys which spend most of their service life under stress at high temp., e.g. turbine blades. Such components slowly 'creep,' i.e. extend over a period of hundreds of hours and then finally break under loads far lower than the normal short-time strength at that temp. There are three stages of creep: the first is an initial extension as the load is first applied; this merges into the second stage, where the rate of extension is much less than in stage 1, and may even be zero; then in the final stage the extension begins to proceed at an ever-increasing rate until it is terminated by fracture. Under low loads the third stage may never be reached even after thousands of hours, but with heavier loads the third stage appears, and as the loads are increased both the second and third stages become steeper, and fracture follows after a comparatively few hours. The results of the test can be applied in two ways: either the highest load is determined which, at the required temp., will not cause fracture within a measurable period of time, or, if the conditions are particularly arduous, as in the case of a gas-turbine blade, it is first decided how long the component shall be required to last and then determine the highest load which will give this life without rupture.

Non-destructive Tests.—It is wasteful to saw up a casting, for instance, to look for shrinkage cavities or a welded component to investigate the soundness of the weld or a forging for internal tears. By the use of X-rays much of this is eliminated.

To take an X-ray photograph, a special X-ray film in a light-tight cassette is placed at one side of the article to be radiographed, and a beam of X-rays directed at it from the other. The 'hardness' or penetrating power of the rays is controlled by the voltage across the generating tube, and this and the time of exposure are adjusted according to the thickness and density of the material being investigated. After development the film shows dense parts of the article in a light tone, while porosity, holes, etc., show up as dark areas. Internal flaws, etc., in bar stock or forgings can be revealed by the supersonic crack detector, by which a note of supersonic frequency is transmitted into the metal from a 'prod' containing a vibrating crystal. The 'echo' from a flaw is picked up by a receiving prod and its presence shown on an oscillograph screen. External cracks on magnetic material such as carbon steels can be revealed by the magnetic crack detector. The metal is first magnetised by passing a current through it or by placing a coil round it, and then a suspension of fine iron powder in paraffin is poured over it. The two edges of a crack behave as opposite magnetic poles, and the accumulation of iron powder between them shows up the otherwise invisible crack. Non-magnetic materials may be tested for cracks by fluorescence. A solution of a fluorescent substance such as anthracene in a volatile solvent is poured over the article being tested. The solution penetrates the cracks, so that when excess solution has been wiped away and the solvent evaporated, a deposit of anthracene is left in the cracks. This deposit fluoresces under ultra-violet light from a lamp, and is visible in a darkened room.

Metals. By reason of certain properties which are common to a large number of the elements and more or less absent in others, the elements are divided into two classes—*metals* and *non-metals*. Gold, silver, copper, lead, tin, etc., are M.; sulphur, bromine, hydrogen, phosphorus, etc., non-M. From earliest days M. have been distinguished from all other substances by their peculiar properties and applied to useful purposes. In the earliest list, we have records of the use of the seven M., gold, silver, lead, copper, iron, tin, and mercury. The M. are usually

opaque, their smooth surfaces reflect light to a high degree, giving them the property known as metallic lustre; they are good conductors of heat and electricity. All M., except mercury, are solid at ordinary temps., and all of them will crystallise under suitable conditions. They are usually characterised by having high specific gravities relative to the non-M., but there are exceptions to this, notably lithium (0.534), sodium (0.98), potassium (0.86), beryllium (1.85), and calcium (1.54). The melting points of the M. range from 26° C. (caesium) to as much as 3270° C. (tungsten), excluding mercury which freezes at -38.9° C. Some M., like antimony, are quite brittle, while others, like iron, possess great tenacity, whilst malleability is very common. The non-M., on the other hand, may be either gases, liquids, or solids, possessing little tenacity. They do not give the peculiar metallic lustre (graphite does, however, show a very definite lustre) and are bad heat and electricity conductors. Their sp. gr. is low, and hardness usually poor, whilst the solids are often very brittle. The two classes of M. and non-M. merge into one another, and certain elements are placed sometimes in one class and sometimes in the other, according as the distinction is based on physical or chemical properties. Arsenic, for example, possesses many of the physical properties of a metal, but in its chemical reactions it is more nearly allied to the non-M. Such elements as these are sometimes known as metalloids.

The chief chemical properties of M. include their strong affinity for certain non-metallic elements, e.g. sulphur, chlorine, and oxygen, with which they form sulphides, chlorides, and oxides. The metallic oxides are solid white or coloured bodies with an earthy appearance. Sometimes these oxides dissolve in water to give alkaline hydroxides (e.g. sodium, potassium, calcium). In any case there is always at least one oxide of a given metal which will function as a basic oxide by dissolving in acids to form salts, together with water. This capacity for the production of basic oxides is a very distinctive one. At the same time it must be remembered that a few metallic hydroxides (such as those of aluminium and zinc) can behave as 'amphoteric electrolytes' by exhibiting both basic and acidic properties, under favourable conditions. M. will, when fused, enter into the forming of alloys (q.v.). Because of their strong affinity for other elements M. are generally found combined with other elements, and consequently they have to be extracted from their ores by processes described under METALLURGY. The halogen compounds of the metal are stable as a general rule, and even in the cases where this is not so the decomposition of the halides by water is only of a partial nature. Thus sodium chloride is perfectly stable in contact with water, bismuth chloride is partially decomposed or hydrolysed by cold water, whilst the chloride of a non-metal like phosphorus is completely decomposed under like conditions. Again the M. have the power of entering into the

formation of complex salts, e.g. iron in potassium ferrocyanide $K_4Fe(CN)_6$. The non-M. do not do this. The tendency of M. to combine with hydrogen is very small. They either do not form hydrides at all, or if they do the resulting compounds are of a very loose nature (see **SODIUM** and **CALCIUM**). This raises the question as to whether the element hydrogen is to be regarded as a metal or as a non-metal. The facts are conflicting. In appearance hydrogen is a gas, and physically a typical non-metal. It shows (unlike non-M. such as sulphur) little tendency to combine with M., but, on the other hand, the compounds formed are more like salt in appearance than a typical alloy of one metal with another. But hydrogen shares with the M. that all-important electro-positive character to an exceptionally high degree. It gives rise to the hydrogen ion ($q.r.$), which, like the metallic ions, carries a positive charge. No non-metal can do this. In the processes of electro-chemical deposition (see **ELECTROLYSIS**) M. act like hydrogen, and are always set free at the cathode. Many of the M. can decompose water or steam with the production of hydrogen, whilst many more are capable of dissolving in acids to form salts, often with the production of hydrogen. The following schemes are essentially connected with M.:
 Metal + acid = salt + hydrogen.
 Metal oxide + acid = salt + water.
 Metal hydroxide + acid = salt + water.
 Metal carbonate + acid = salt + water + carbon dioxide.

Classification.—Sev. schemes of classification of the M. have been suggested from time to time. One old method depended on the relative ease of decomposition of water and of acids by them. A modern scheme is based on measurements of the potential difference between a metal and a normal solution of one of its salts under standard conditions, taking the zero value as that of a platinum electrode saturated with hydrogen at 1 atmosphere pressure in contact with a solution normal in respect to hydrogen. Some of the results are $Li - 3.02$; $K - 2.92$; $Na - 2.72$; $Mg - 1.56$; $Al - 1.34$; $Zn - .76$; $Fe - .43$; $Ni - .22$; $Sn - .14$; $Pb - .13$ (II O); $Sb + .1$; $Bi + .2$; $Cu + .34$; $Hg + .79$; $Ag + .80$; $Au + 1.5$. In this electromotive series, one metal will replace another lower down in the series thus:

The further they are away in the series the better the chance of the change taking place. The M. may also be classified into (1) **LIGHT METALS**: (a) *alkali metals*, e.g. potassium; (b) *alkaline earth metals*, e.g. calcium; (c) *earthy metals*, e.g. aluminium; and (2) **HEAVY METALS**: (a) *metals whose oxides form strong bases*, e.g. iron; (b) *those whose oxides form weak bases or acids*, e.g. arsenic; and (c) *noble metals*, e.g. gold. Another method of classification adopted more generally is to take them in their order as suggested by the periodic system (see **CHEMISTRY**). Thus:

I. (a) Lithium, sodium, potassium, rubidium, cesium; (b) copper, silver, gold.

II. (a) Calcium, strontium, barium, radium; (b) beryllium, magnesium, zinc, cadmium, mercury.

III. (a) Scandium, yttrium; (b) Aluminium, gallium, indium, thallium; (c) the rare earth metals.

IV. (a) Titanium, zirconium, thorium; (b) germanium, tin, lead.

V. (a) Vanadium, niobium, tantalum; (b) arsenic, antimony, bismuth.

VI. (a) Chromium, molybdenum, tungsten, uranium.

VII. Manganese.

VIII. Iron, cobalt, nickel, ruthenium, rhodium, palladium, osmium, iridium, platinum. See list of works cited under **CHEMISTRY**. See also **ALLOY**; **ATOMIC THEORY**; **ELEMENTS**. See Hille, *Metals and Alloys*, 1949.

Metal Testing, see under **METALLURGY**.

Metalwork, art of shaping and joining metal either for decorative or utilitarian purposes, or for a combination of these. The many uses to which metals ($q.r.$) may be put are the result of their properties; they are malleable, ductile, fusible (see **CASTING**), and capable of being joined together by the application of heat (see **WELDING**; **SOLDERING**). In the purely decorative uses of metal the precious metals take first place. They were probably the first metals known to man and have from the earliest times been used in the making of jewellery and articles of personal adornment (see **GOLD-SMITHS**; **SILVERSMITHS**).

The working of metal precedes the Bronze Age ($q.r.$). Considerable skill was attained in early civilisations in working gold and copper before the discovery of bronze. Copper was known to the Mediterranean civilisation as early as 3500 B.C. and bronze about 2000 B.C. In the second millennium also tin was being worked in Britain. Iron was known in China and India much earlier, and artistic work in iron was being carried out in Egypt before the first millennium. With the coming of bronze, solid casting and then hollow casting were developed. Casting, hammering, and riveting are the basic methods in M. Other techniques which developed later are inlaying, damascening, niello work, engraving, embossing, repoussé, and filigree ($q.r.$). Enamelling ($q.r.$) is another form of decorative M.

Examples of skilled M. survive from all early civilisations, including the Minoan, Sumerian, Egyptian, Indian, and Chinese, and reveal that all methods of treating metal were known and practised. The precious metals, bronze, and copper were preferred for decorative and artistic work until late Rom. times, iron finding its uses chiefly in the making of weapons and utensils. In the Middle Ages, however, wrought iron was put to decorative uses. Early Gothic work from the eleventh to the fourteenth centuries is notable for its elaborate scrolls and flower designs, decorative hinges, locks, and grilles. The dignitaries of the Church and the nobles turned their wealth into plate, thus giving ample opportunity to the smith. Later Gothic work was heavier,

more geometrical, and regular in design. Iron was treated cold, and the metal-worker borrowed his style from the stonemason. The file, the saw, and the drill took the place of the forge for artistic work. Pierced work became the fashion; that is, the riveting of decorative pieces to sheet metal, thus building up the decoration against a solid background. An excellent example is the screen made by John Tresilian, fifteenth-century work in St. George's Chapel, Windsor. Examples of oriental M. came to be known in Europe as a result of the Crusades and the commerce conducted by Venice. It, smiths were encouraged to perfect the art of engraving, gold and silver inlay, and damascening. In Italy in the Renaissance the quatrefoil design prevailed in open-work wrought-iron grilles. During the early Renaissance M. was as a result of classical influences excluded from architecture as much as possible in the work of Palladio and others. By the end of the sixteenth century, however, particularly in Venice, M. had come into use for railings, screens, balconies, staircases, lamp holders, etc. Mention must also be made of the Renaissance M. in Germany and Spain, principally in the service of the Church. The method of chiselling the required article from the solid iron came to be known as peculiarly Fr. from the excellent work done in the fifteenth century, but it later gave way to the It. style of working with thin strips of metal. In the baroque period of the later Renaissance, however, the Fr. smiths gave free play to elaborate designs in wrought iron, and during the seventeenth century the Fr. influence was predominant in Europe. The great châteaux of France show examples of wrought-iron gates, balustrades, and staircases which are unsurpassed. One of the greatest of the Fr. smiths, Jean Tijou, came to England at the invitation of William III., and examples of his work are to be seen in Hampton Court Palace and St. Paul's Cathedral. The eighteenth century was the great period of Eng. wrought-iron work, which only declined when cast-iron work came into general use. This was the result of using coal in smelting, first tried in England by Dud Dudley (q.v.). Wren used cast iron for the railings round St. Paul's Cathedral. The use of M. in the service of architecture must not obscure its other uses as a means of artistic impression in the hands of the locksmith, the pewterer and copper-smith (for domestic utensils), and the brassfounder (for church candlesticks, lecterns, and memorial brasses). Decorative work in lead is not common because of the nature of the material and is to be seen mainly on cisterns and water-pipe heads.

In recent times in Europe and the U.S.A. there has been an increasing use of M. in furniture and a revival of wrought iron in interior decoration. Greater opportunities have been allowed for original design, bringing new life to an art which suffered through the nineteenth century from the standardised production of decoration in cast iron and brass. See

also BRONZE AGE; IRON AGE; IRON WORK. See C. J. Monkos, *Decorative Ironwork from the Eleventh to the Eighteenth Centuries*, 1913; G. K. Geerlings, *Wrought Iron in Architecture*, 1929; H. M. Adam and J. H. Evans, *Metalwork*, 1939; and D. Smith, *Metalwork*, 1948; also the handbooks issued by the Victoria and Albert Museum.

Metamorphism. The term is sometimes restricted to changes due to the action of temp. and pressure upon rocks. It is more usually applied to any change in a rock after it has once been formed. Both aqueous and igneous rocks after their original formation undergo more or less alteration constitutionally, texturally, or structurally by the action of water, heat, and pressure. Rocks slightly modified, and which retain most of their original features, are called 'altered rocks,' while those whose original characteristics have been wholly disguised or obliterated are designated 'metamorphic rocks.' The M. of sedimentary rocks by water is illustrated by the formation of glassy quartzite from loose sandstones by the deposition of silica deposited in the interstices from percolating waters. The effect of heat in modifying the physical characteristics of stratified deposits is to be observed around the margins of intruded dykes, sills, and bosses. Thus clays and shales are baked to porcellanite and lydian-stones, sandstones are changed to quartzites, and limestones are marmorised. Around granite bosses an 'aureole' of 'contact M.' can be seen. In the surrounding rocks new minerals are developed, such as chloritoid, mica, and garnet, and the M. decreases in intensity, zone by zone, as we pass outwards from the margin of the boss. The aureoles of the granite bosses of Galloway are 2 m. in breadth, and show a gradation from unaltered greywackes through schists to fine-grained gneisses.

Where wide regions have been subjected to pressure and crushing by crust-creep (dynamic-M.), we have areas of 'regional' M. The original structural features are often obliterated and new structures developed; e.g. argillaceous rocks are contorted and cleaved into slates and schists. The action of crust-creep on strata of alternately soft and hard bands gives rise to crush-breccias and crush-conglomerates. The pre-Cambrian fundamental gneisses and schists were held to be original deposits from a primeval ocean. It is now, however, generally admitted that the schistose structures of these foliated rocks are not of necessity primary, but may be secondary structures due to deformation. The majority of the foliated rocks in areas of regional M. appear to be of pre-Cambrian age, but many have received their foliated structures in post-Archaean times. See W. H. Hobbs, *Earth Features and their Meaning*, 1921, and J. Joly, *Surface-history of the Earth*, 1925, 1930.

Metamorphosis (Gr. μεταμόρφωσις, transformation) is the change in form which many animals undergo during their life hist. The larval existence is usually

passed in an environment in which the animal can accumulate food supplies sufficient to enable differentiation to be completed during a resting stage. This may be passed in complete quiescence, as in the pupation of insects, or the 'rest' may be of much more partial nature, as in the transformation of tadpole to frog. Some animals achieve their final adult form by a series of gradual changes shown progressively at every moult, and are said to undergo incomplete M. Marked M. occurs in many aquatic animals, in Amphibia, Insecta, and in many animal parasites. The larva of some Crustacea changes its form sev. times before reaching the adult stage. Work on Amphibian larva has shown that their M. may be prevented by extirpation of the thyroid or of the pituitary gland. The M. of normal tadpoles may be accelerated by injecting appropriate extracts of either of these glands. The M. of Amphibia depends on the products of the endocrine system, and certain strains of axolotls apparently never metamorphose unless they are given thyroid preparations. By preventing frog or toad tadpoles from rising to the surface of the water, their M. may be retarded for . . . year or more; if the larva then be allowed to come to the surface, they metamorphose in the usual way. Amongst insects the M. of the caterpillar into pupa and butterfly, and of the house-fly from maggot to pupa and adult fly, are well-known examples. Some threadworms have a free-living larval form which assumes the adult form in a plant or animal host. Other threadworms, freshwater mussels, and Ichneumon flies are among the animals parasitic as larvae, and free-living as adults. Parasites having a larval form in one host and becoming adult in a second or even a third host are not infrequent. Certain larval hookworms and tapeworms parasitise invertebrates and the adults live in vertebrates. See INSECTS and PARASITISM.

Metaphor (Gk. *μεταφορά*, from *μεταφέρειν*, to carry over), figure of speech by which an attribute or name is given to an object which is not literally applicable to it, e.g. in Lamb's *Essays of Elia* the phrase, 'A healthy book,' occurs, or again a ship is frequently spoken of as 'ploughing the waves.' Thus a M. is a comparison implied but not formally expressed, and in this it differs from the simile, which is a formal and explicit comparison.

Metaphysical Poets. The title M. P. was given by Dryden to that school of poetry of which Donne was the founder and most illustrious example, and Cowley the best known follower. The fault of this school is the attempt to use lyric poetry as a vehicle for the expression of all manner of subjective or reflective ideas, and hence to subordinate to subtlety of thought and reasoning that appeal to the primary emotions which is the very *raison d'être* of lyric poetry. The use of philosophical conclusions, as exemplified by Francis Thompson's magnificent apostrophes to the sun, is perfectly legitimate; but the M. P. proved the futility of using the processes too.

Metaphysic(s), name originally applied to those books of Aristotle which followed his *Physics*, and which his editors called 'the book after the physics' (*μετὰ τὰ φυσικά*). As a philosophical term it is first used by Boethius (480-525). The medieval scholastics held Ms. to be the science of Being as such, and divided it into general Ms. or ontology, dealing with the immaterial concepts of essence, existence, causality, etc., and special Ms. comprising psychology and natural theology. The great debates of the Thomist and Scotist schools on the real distinction of essence and existence, as well as the disputes between the Arabian and Christian Aristotelian philosophers, were all fought out on the battlefield of Ms.

In modern times the word has been variously applied, but is usually defined as the science which treats of the most fundamental problems of knowledge and reality. Knowledge is discussed in a separate art, and Ms. is dealt with here only as touching upon the nature of reality transcending experience. The very possibility of a science beyond experience has been denied by numerous philosophers, and many works called metaphysical should rather be termed inquiries into the possibility of Ms. Thus Kant's celebrated work, *Die Kritik der reinen Vernunft*, is a mere inquiry into the possibility of a theoretical science of things beyond experience, and concludes with a denial of such possibility. Hence some modern philosophers have considered Kant as no metaphysician, but as a critic of the mental faculties whose labours were to be the precursors of a new system of speculation. Positivism likewise appears to deny the possibility of Ms., and certainly rejects its use.

Metaphysicians are concerned with six main problems in discussing the nature of reality: (1) The existence of anything permanent lying as it were behind and forming the basis of the constantly changing phenomena of experience. The early Ionian philosophers, the Eleatics, Plato, Aristotle, and Spinoza all affirm such permanent reality against such opponents as Heraclitus, Bergson, and W. James. (2) The unity or otherwise of reality. The attempt to answer this question has given rise to monism (q.v.) and pluralism (q.v.). The former has found its prin. adherents in Thales, Anaxagoras, the Eleatics, Plato, and Spinoza, whilst pluralism is represented by such names as Democritus, Descartes, and Leibniz. (3) Assuming that reality is not one but many, is it of one kind? Leibniz maintains that the monads which constitute the total of reality are of one spiritual kind, but differ in degree. Descartes, on the other hand, argues a plurality of substances, both material and mental, and God from whom both are distinct. (4) The number of fundamental attributes belonging to reality. The defenders of monism, such as Leibniz, the materialists, voluntarists (e.g. Schopenhauer, Nietzsche), and neutral monists (e.g. W. James, Bertrand Russell), all hold one such attribute. A multiplicity of irreducible attributes is defended

by Spinoza and Descartes, and seems to be implicit in von Hartmann's 'philosophy of the unconscious.' (5) The relation between the various units or modes of reality. The mechanists and determinists affirm that each is absolutely determined by the others. The opposite view, allowing at least some measure of freedom of self-determination. Is taught by creative evolution (Bergson), emergence (Lloyd Morgan, S. Alexander), teleology, libertarianism, necessitarianism, and the extreme school of tychism. (6) Finally the existence of anything which can be called divine. Generally the atheists and materialists deny such a reality. Their opponents may be classed as theists, deists, and pantheists. Theists include all the historical churches; deists many freethinkers of the seventeenth and eighteenth centuries; and pantheists spiritual monists, the stoics, and Spinoza.

Metasequoia, genus of trees which is closely allied to the *Sequoia* (q.v.) or *Wellingtonia*. Up to 1945, it was known only from paleobotanic specimens as a fossil age tree. But in that year were discovered three trees in N.E. Szechuan, near the Hupeh border, which were subsequently identified as the same species known by the paleobotanists. It was known that the species *M. glyptostroboidea* was widely distributed, but it was on the verge of extinction. Expeditions to Szechuan in 1946-47 located in all only 100 trees. The largest was found to be more than 108 ft. high and about 7 1/2 ft. in girth and, like the *Larix* and *Taxodium*, it is deciduous. Many genera which existed during the Mesozoic or Triassic eras are known to us only through fossilised remains, although some examples exist, as in *Ginkgo biloba*, 'the maidenhair tree,' of genera which have survived until the present day.

Metastasio (originally Trapassi), Pietro Antonio Domenico Bonaventura (1698-1782), became court poet in Vienna under Charles VI. in 1730. He is famous as a librettist through his association with Mozart (q.v.), who composed *La Clemenza di Tito* to a 'book' by M. Other composers who availed themselves of his writings were Handel, Porpora, Scarlatti, Paër, Hasse, Gluck, Reissiger, Jommelli, Spontini, and Cimarosa. M.'s poetry was fluent and rich rather than dramatic; and the absence of strong climax would have been fatal in an age whose composers

studied declamation and prosody, apart from the higher ideals of opera. His chief efforts were *Didone abbandonata* (1724); *Calone in Utira*; *Ezio* (1732); *Olimpiade* (1733); and *La Clemenza di Tito* (1752).

Metauro, riv. of central Italy, which rises in the Apennines and, flowing N.E., enters the Adriatic Sea 10 m. S.E. of Pesaro. Length 68 m.

Metaxas, John (1871-1941), Gk. general and statesman, b. in Ithaca, entered the military academy at the age of twenty, and fought in the unsuccessful Thessalian campaign against Turkey (1897). He studied military science in Germany, and became prof. in the Gk. military academy (1903) and, later, joined the general staff, serving with distinction in the Balkan wars of 1912-13, and becoming chief of staff. He disapproved of Gk. intervention in the First World War, and having quarrelled with Venizelos, was forced to flee to Italy. For years after the war he was in opposition to Venizelos. In 1935 he joined the gov. as minister without portfolio at the time of Venizelos's abortive military and naval coup, and later played an important part in the restoration of King George II. Becoming minister of war and then Prime Minister, he assumed the role of dictator, and projected drastic reforms in all branches of Gk. life. After strengthening the armed forces and fortifying the frontiers, he pursued a prudent and statesmanlike foreign policy primarily based on a close understanding with Turkey. On the outbreak of war in 1939 he tried to organise, with Turkey, a solid Balkan combination, but was not successful. When Italy invaded Greece in 1940 he led Greece in her gallant resistance. See WORLD WAR, SECOND, *The Fall of Greece*; GREECE, *History*; GREECE, SECOND WORLD WAR CAMPAIGN IN.

Metayer System, system of land cultivation, in vogue principally in France and Italy, which has been evolved mainly by compulsion of circumstances as a result of the decay of feudal serfdom. Under this system the peasant landholder or cultivator pays no fixed rent either in money or kind, but tills the soil for the landowner on condition of receiving half (hence the name from Low Lat. *medietarius*, in its turn derived from *medius*, middle) its produce or some other proportion (in Italy usually two-thirds) thereof; while the landlord furnishes the whole or part of the stock, tools, and implements of husbandry. A true peasant proprietor has the strongest of incentives to make his holding a success; but the quasi-partnership of metayage can, strictly speaking, be dissolved at will by the landowner, or, what amounts to the same thing, be rendered inoperative by a perfectly legal augmentation of demands on the part of the dormant partner. For an appreciation of the merits of the system see J. C. L. de Sismondi's *New Principles of Political Economy*, book III, 1819, and J. S. Mill's *Principles of Political Economy*, chap. viii., 1848.

Metazoa. The animal kingdom is broadly divided into two main sections, the Protozoa and the M. The former are typically unicellular, though they in many

cases exist in colonies; Ms. are multicellular, and include all the higher forms of animal life. The place of sponges in this classification was long disputed. They are now considered to be definitely Metazoa.

Metcalf, John (1717-1810), Eng. road and bridge builder, b. at Knaresborough, of poor parents. He lost his eyesight, when six years old, in consequence of small-pox, whence his nickname 'Blind Jack of Knaresborough.' He was taught the violin to enable him to earn a livelihood as a strolling player, but he soon proved that his resourcefulness and courage allied to a robust physique (he was 6 ft. 2 in. tall) could rise superior to adversity. Early he became a good rider and swimmer, huntsman and cock-fighter. He married a publican's daughter and is said to have proved a model husband. In the '45 rebellion he was a recruiting sergeant on the King's side and actually fought at Falkirk and Culloden. He then set up a stage-coach between York and Knaresborough (1754) and familiarised himself with the Eng. N. roads. It was this that led to his career as a pioneer road-maker and bridge-builder. In 1765, Parliament having passed an Act authorising the construction of a new turnpike road between Harrogate and Borough-bridge, M. offered to construct a portion of the road. The master surveyor, having confidence in his skill, let him the whole contract. M. devoted himself wholly to this new task and completed it with entire success. Altogether he constructed nearly 200 m. of turnpike roads and eventually retired to a small farm (1792). See *Smiles's Telford* (1867) and *hist.* of Knaresborough by Hargrove (1809) and Calvert (1814).

Metchnikov, Ilya (1815-1916), Russian biologist, b. at Ivanavka, son of Maj.-Gen. Ilya M., of noble Moldavian descent. Educated at the high school and univ., Kharkov, he graduated at nineteen, and went to Heligoland to study marine organisms. At Glessen he worked under Leuckart, with whom he went to Göttingen; at Munich under Siebold, and thence to Naples. Returning to Russia in 1867 he became docent in zoology at Odessa and St. Petersburg, being appointed prof. of zoology and comparative anatomy at Odessa 1870. With Kowalevsky he laid the foundations in 1866-1886 of the cellular embryology of the invertebrates. In 1882 he removed to Messina, and pub. his *Intra-Cellular Digestion*, the first intimation of the function of the white corpuscles of the blood. He became director of the new bacteriological laboratory at Odessa, 1886. In 1888 he went to Paris, where a laboratory was provided for him by Pasteur at the Ecole Normale. In 1892 he issued *The Comparative Pathology of Inflammation*, showing curative nature of inflammatory process. In 1901 *Immunity from Infectious Diseases* attributed immunity to activity of phagocytes. *The Nature of Man* (1903) discussed among other things the cause of the decrepit state known as old age, mainly, poisonous matter formed

in large intestine. Wrote also *Optimistic Essays* (1907); *The Prolongation of Human Life* (1910); and monographs on various invertebrates. See life by his second wife, 1922.

Metellus, distinguished plebeian family of the *Cecilia gens* at Rome.

L. Cæcilius Metellus was consul in 251 B.C., when he defeated the Carthaginians in Sicily at Panormus; consul a second time in 249; and afterwards pontifex maximus; while holding the latter dignity he rescued the Palladium when the temple of Vesta was on fire, and lost his sight in consequence.

Q. Cæcilius Metellus Macedonicus, prætor in 148 B.C. In 146 he defeated the Achæans near Thermopylæ, and on his return to Rome obtained a triumph and the surname Macedonicus for his conquest of Macedonia. M., in his consulship (113), was sent into Spain, where he remained two years and gained sev. victories, but was succeeded in the command before the conclusion of the war by Q. Pompeius. Pliny cites M. as an extraordinary example of human happiness. 'For besides the possession of the highest dignities,' says Pliny, 'and having obtained a surname from the conquest of Macedonia, he was carried to the funeral pyre by four sons, of whom one had been prætor, three had been consuls, two had enjoyed a triumph, and one had been censor' (*Historia Naturalis*, vii. 45).

Q. Cæcilius Metellus Numidicus, consul 109 B.C., carried on the war against Jugurtha in Numidia with great success, receiving in consequence the surname of Numidicus. In 107 he was superseded in the command by Marius. In 102 he was censor, in which capacity he expelled Servilius Glaucia and Appuleius Saturninus from the senate, and two years afterwards (100) he was banished from Rome through the intrigues of his enemies Marius and Saturninus, who had returned to the senate. He was, however, recalled in the following year (99), but was probably poisoned shortly after his return. M. was one of the chief leaders of the aristocratic party, and a man of unsullied character.

Cæcilius Metellus Pius, son of the preceding, received the surname of Pius on account of the love which he displayed for his father when he besought the people to recall him from banishment in 99 B.C. He was prætor 89, and one of the commanders in the Marsic or Social war. He subsequently fought as one of Sulla's generals against the Marian party, and was consul with Sulla himself in 80. In the following year (79) he went as proconsul into Spain, where he carried on the war against Sertorius (79-72). From the year 76 B.C. Pompeius was his colleague, and they triumphed together at the end of the war. M. was pontifex maximus, and on his death (63) he was succeeded in that dignity by Julius Cæsar.

Q. Cæcilius Metellus Pius Scipio was the son of P. Scipio Nasica, prætor in 84 B.C. Pompey married Cornelia, the daughter of M. Scipio, in 52, and in the same year made his father-in-law his

colleague in the consulship. Scipio fought on the side of Pompey in the civil war, and after the battle of Pharsalia crossed over to Africa, where he received the command of the Pompeian troops. He was defeated by Cæsar at the battle of Thapsus in 46, and shortly afterwards he committed suicide.

Q. Cæcilius Metellus Creticus, consul 69 B.C., carried on the war against Crete, which he subdued in the course of three years.

L. Cæcilius Metellus, brother of the last, prætor 71 B.C., and as proprætor the successor of Verres in the gov. of Sicily.

Quintus Cæcilius Metellus Celer was prætor in 63 B.C., when he commanded three legions in the war against Catiline, whom he prevented from crossing the Apennines and so crossing into Gaul. He became consul in 60, in which capacity he opposed Pompey and the aristocratic party, especially in the matter of the Agrarian laws. He d. in 59.

Metempsychosis, see TRANSMIGRATION.

E.N.A.

THE WILLAMETTE METEORITE: 16½ TONS
(OREGON, U.S.A.)

Meteorite. Meteors (*q.v.*) are occasionally large enough to reach the earth's surface before they have vaporised. The name given to such stones is *Ms.* They are generally of an igneous nature, containing large proportions of iron and smaller amounts of nickel, chromium, and magnesium. The approach of a *M.* is signalled by the appearance of the large incandescent meteor, known as a fireball, and the enormous air-currents set up by the compression of the air in front of the meteor moving with a speed of sev. m. per sec. The sound waves thus created give the impression of a thunderclap. The speed of the meteor is rapidly diminished by the increased air-resistance as it approaches and it ceases to be incandescent and breaks up into fragments. It is these fragments that are called *Ms.*, and they vary in size from small grains to enormous masses weighing 50 tons or more. *Ms.* of the latter size are extremely rare; a well-known one fell in Siberia in 1908; its impact was recorded on seismographs in England and the air-currents destroyed forests over a large area in Siberia. Another large *M.* fell in the Amur R. valley, E. Siberia in 1947. The largest *M.* crater is in Arizona. Less than

ten *Ms.* have been found in England. The metallic kind of *Ms.* are also called siderites, those of the stony kind aerolites. These latter are analogous to the ultrabasic rocks of the crust of the earth.

Meteoritic Hypothesis. Sir N. Lockyer, in a work entitled *The Meteoritic Hypothesis* (1890), endeavoured to show that nebule are composed of sparsely aggregated swarms of *Ms.*, and that stellar systems are evolved from them. The light emitted by nebule is assigned to the collision of the *Ms.* with one another, the aggregate result of many collisions affording a constant emanation of light. The theory being based on spectroscopic evidence it remains to be explained why the spectra of these nebule never show metals, but only hydrogen, helium, and nebularium.

See Fletcher, in *Introduction to the Study of Meteorites*; Prior, *Guide to the Collection of Meteorites in the British Museum*. See also Acts xix. 35.

Meteorograph, instrument which gives a continuous record of the fluctuations in the temp., pressure, and humidity of the atmosphere. One type consists of a combined thermograph, barograph, and hydrograph, and lines are plotted on a cylinder which, driven by clockwork, revolves once in about 8 hrs. Made of aluminium and enclosed in a cage, the whole apparatus only weighs about 30 to 40 oz., and is attached, for use, about 60 ft. below a kite. The more usual light variety can be used with hydrogen-filled balloons rising to the stratosphere. Thus a continuous record of the meteorological conditions prevailing at various heights in the atmosphere is obtained. The development of radio-sonde is limiting the use of *Ms.*

Meteorological Office, estab. in 1854 under the Board of Trade and transferred in 1867 to the control of the Royal Society, the issue of forecasts and warnings being suspended until 1874, when it was resumed under pressure from the Board of Trade and the public. Since 1919 the *M. O.* has been administered by the Air Council (*q.v.*). The responsibility for the work of the Brit. Rainfall Organisation was transferred to the *M. O.* in 1919. The *M. O.* maintains numerous stations for daily telegraphic reports on which weather forecasts and warnings of gales are based, and also stations in various parts of the country for giving meteorological information to aircraft. It also collects and discusses meteorological observations from ocean and land areas all over the world, and maintains observatories for weather study and cognate subjects. The Gaslot Committee of the Royal Society advises the *M. O.* on geophysical subjects. Pubs. of the *M. O.*: *Daily Weather Report*, *Daily Aerological Record*, *Weekly Weather Report*, *Monthly Weather Report*, *Meteorological Magazine*, *Marine Observer*, *British Rainfall Observatories' Year Book*, *Résumé Mondial*, *Professional Notes*, *Meteorological Reports*, *Geophysical Memoirs*, and *Meteorological Glossary*; also handbooks, manuals, text-books, and tables of frequencies and averages.

Meteorological Society, Royal. The first Eng. society was founded in 1823 and was followed by the M. S. of London, which existed from 1836 to 1842. The Brit. M. S. was initiated in 1850 and assumed its present designation as R. M. S. in 1882. The Scottish M. S. amalgamated with the R. M. S. in 1921. Pubs. of the society: *Quarterly Journal, Weather, Bibliography of Meteorological Literature, Ethnological Report, Memoirs, Reports of the Council, and Proceedings. Meteorological Record*, which contained statistical data, is now superseded by pubs. of the Meteorological Office, such as the *Monthly Weather Report*. Offices: 49 Cromwell Road, London S.W.7.

Meteorology is the science which deals with the study of atmospheric conditions and changes which mainly constitute the weather. Apart from some observations included by Aristotle in his book *Meteorologia*, very little was accomplished in the direction of making M. an exact science until the end of the sixteenth century, when Galileo and the Florentine academicians constructed the first thermometer of any importance, and when Torricelli in 1643 discovered the principle of the barometer. The work of Boyle on gases, and that of his assistant, Hooke, on barometers, advanced the physical basis of M. Hooke actually constructed a barometer with the weather indications, a practice which is still followed. The invention of a superior mercury thermometer by Fahrenheit provided further means for the record of weather elements. In the early years of the nineteenth century a chain of meteorological stations was estab. in France, and weather maps were constructed from the data collected. The first weather map in England showing the trade winds and monsoon was made in 1688, and the first telegraphic weather report appeared on Aug. 31, 1848. In the *Daily News*, but was suspended after three months; after considerable demand the report was resumed on an improved basis in March 1849. The first daily telegraphic weather map was prepared at the 1851 exhibition, but the Meteorological Office was not estab. in London until 1854. It was then founded as a dept. of the Board of Trade under the direction of Adm. Fitzroy; since 1919 it has formed part of the Air Ministry. In 1860 Adm. Fitzroy began the first regular daily collections of weather observations by telegraph and with them produced the first Brit. daily weather report, the first daily printed maps appearing in 1868. The advance of M. since the inventions of the telegraph, telephone, and wireless has been extremely rapid; for these made possible that rapid collection of data at headquarters, most essential in the production of a useful forecast.

With the growth of aviation and scientific planning M. has grown in importance. Meteorological services throughout the world have increased in both size and complexity. Observations are collected, not only from thousands of land stations, but also from special weather ships, from aircraft, and from self-recording and

automatic transmitting stations, such as the radio-sonde (q.v.). Recently the invention of radar (q.v.) has brought a new instrument which can 'map' a rain cloud, a thunderstorm, or even a tropical storm on a small screen. Atmospheric, so annoying to the radio listener, have been traced to thundery activity, and specially equipped stations pick up bearings of these storms so that it is possible to plot all activity within a thousand miles or so. Weather knows no boundaries or frontiers. All countries unite in the International Meteorological Organisation (soon to become the World Meteorological Organisation) of which the directors of the meteorological services of all countries form the supreme authority, the 'Conference of Directors,' under whom, to make recommendations, are various commissions and sub-commissions of specialists for such subjects as agric. M., climatology, instruments and methods of observation, synoptic weather information, etc. There are also six regional commissions, one for each major continental region of the globe.

The atmosphere consists of a mixture of gases, of which oxygen and nitrogen account for about 99 per cent, together with small quantities of argon, carbon dioxide, helium, hydrogen, krypton, neon, ozone, radon, and xenon; to these gases, which are in almost fixed proportions, are added very variable amounts of water vapour, water and ice drops, and smoke, dust, and other particles which are so small that they are kept up in the air by turbulence. None of the gases can be seen, not even the water vapour, but smoke and dust particles are often visible as haze, and the water and ice drops can be seen as mist, fog, cloud, drizzle, rain, snow, or hail. The nature of M. is to describe, record, explain, and forecast the changes in the quantities of these elements, including also the changes in physical state of the air.

OBSERVATIONS.—It is not possible to examine the air in great detail over even part of a small country like England; the next best thing is to examine the weather at a few places in very great detail, and have a large number of places where the examination is neither so detailed nor so rigorous. Observing stations may be classified as follows:

Observatories, where reliable standard and absolute measurements are made as far as possible with autographic instruments, which are often duplicated for checking and research purposes. Some elements such as atmospheric electricity, solar radiation, etc., are measured only at observatories and other research estab. Kew is the main meteorological observatory in Britain, but other observatories are at Greenwich (where M. is only a small side-line), Eskdalemuir in the S. uplands of Scotland (where the earth's magnetism is the chief interest), Lerwick in the Shetlands (where the aurora is also studied), and Valentia in S.W. Ireland. Most observatories send in reports by telegraph, as do synoptic stations (see below), but their main purpose is research

and standardisation; their observations are pub. by the Meteorological Office in the *Observatories' Year Book*, which contains hourly values of the observations.

Climatological Reporting Stations report the general daily weather conditions, and make one or two observations at standard hours during the day so as to provide the cumulative data, such as average temp., maximum and minimum temps., rainfall, sunshine, mean pressure, days of fog, frost, snowfall, and of the extent and persistence of snow-cover. After statistical analysis, climatic charts and tables are constructed containing the frequency of the different weather elements, such as gales, frost, etc. This information is invaluable for planning; it is used more and more by agriculturists, architects, engineers, and many industrialists. Climatic information from the hundreds of Brit. stations is pub. in the *Monthly Weather Report*, and periodically in tables of averages and frequencies.

Crop-weather Stations make special observations for use in agric. M., where, besides the more obvious necessity for long-period or seasonal forecasts, the elements of the weather need to be studied in very close detail, micrometeorology or microclimatology as it is called. Most agric. plants grow no higher than 4 ft., and it is necessary to know the temp., humidity, and wind in great detail at heights less than this to be able first to study, and then to control the plant diseases spread by the aphid or wind-borne virus. The details of frost hollows and the sharpness of frost necessary to damage a plant must all be studied.

Rainfall Stations, of which there are nearly 5000 in Great Britain alone, measure the amount of rain that falls. Most stations measure the daily amount, but some stations in out of the way moorland areas only measure the rainfall monthly. Their observations are pub. in an ann. vol., *British Rainfall*, a selection being pub. every month in the *Meteorological Magazine*.

Synoptic Reporting Stations, where observations are made simultaneously throughout the world, report in a mutually agreed form so that the observations at any one station can be compared directly with the observations at any other. These observations are mainly for and restricted to the elements considered essential for forecasting; they have to be brief and easily assimilated into code form suitable for rapid transmission to all parts. The code used is an international one; it is formulated by the Commission for Synoptic Weather Information of the International Meteorological Organisation. Reports are received at a national centre and a selection broadcast immediately for use by all other countries. Reports from more than fifty Brit. stations are broadcast regularly every 6 hrs., and almost as many every 3 hrs. Similarly large numbers of stations report at the same intervals from all other countries, from Greenland, N.W. Canada, Spitzbergen, and the wastes of Siberia and Lomonosov Land (Franz Joseph Land) to Tristan da Cunha, and

the lonely outposts of Graham Land in Antarctica.

Meteorological observations, for whatever purpose, must be clear, precise, and strictly comparable between one station and another. It is easy to decide whether it is fine or cloudy, or if there is a thunderstorm; the distinctions between rain, snow, and hail are obvious; sleet is wet snow, melting snow, or a mixture of rain and snow; soft hail is half-way between snow and hail; and drizzle, which consists of very small drops, is half-way between rain and cloud, the water drops being just large enough to fall to the ground. It is useful also to describe the rain as showery, intermittent, or continuous, as light, moderate, or heavy. More precise measurements of rain can be made with a rain-gauge (q.v.); this will give the total rainfall during a given period or even from some types of gauge the rate of rainfall. Wind strength and direction can be measured in great detail by anemometers and wind vanes, but its general run can also be measured solely by observation of wind effects on natural objects, using a wind scale which was devised by Adm. Beaufort in 1806. This was originally based on the amount of sail it was possible to carry on a man of war. Each Beaufort force has been trans. into the equivalent effect on land (rustling in leaves, whistling through telegraph wires, blowing down of chimney pots, etc.), and also into the equivalent wind speed in m.p.h. or knots (see further under WIND). Clouds are closely related with the other weather conditions and careful observations of the amount and types of cloud are made, the classification following broadly that given by Luke Howard in the early nineteenth century, but brought up to date as a result of closer observation from aircraft and a greater understanding of the physical processes forming the clouds (see further under CLOUD). Fog (q.v.) may be thought of as cloud on the surface; it can indeed be cloud on the surface which drifts with the wind (as in sea and hill fogs); fog can also form on clear, quiet nights by the contact of the air with the cooling earth, the air then becoming saturated and condensing some of its water vapour into droplets. In M. an arbitrary distinction is made between fog and mist; objects being visible at more than 1 km. in mist, but not in fog.

Above any place the atmosphere extends vertically for some 200 m. or more, and, although some indication of the condition of the air above can be deduced from cloud observations, actual measurements of the physical state of the atmosphere are made at as great a height as possible. The weight of the air above any point presses downwards, producing a force in all directions which is called the air pressure; it is measured by barometers and barographs, the unit of measurement being the millibar (mb.). With increase in height there is less air above and therefore pressure decreases with height. Providing the temp. of the air is known it is quite easy to calculate this decrease in pressure; near sea level it amounts to

about 3 mb. in every 100 ft. Since it is useful to compare pressures between many stations at a constant level pressures are 'reduced to sea level,' i.e. a suitable correction is added to or subtracted from the pressure as read by the barometer to find out what it would read if it were at sea level in the same place. To measure the temp. of the air is more difficult, for a thermometer gives the temp. of itself, not necessarily of its surroundings. In addition the temp. varies irregularly with height, particularly in the first few feet above the earth's surface. On a hot sunny afternoon the temp. at 4 ft. may

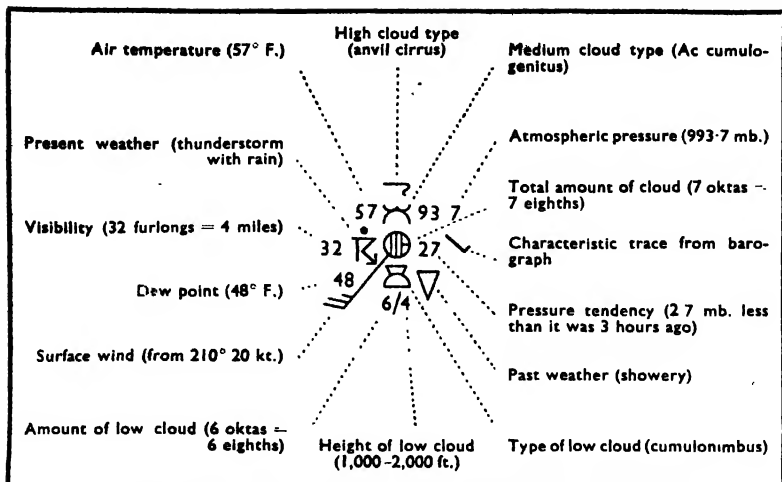

lose by radiation is continually balanced by transference of heat to or from new quantities of air. This is the principle behind the sling psychrometers, which are whirled through the air; aspirated thermometers, which suck the air mechanically past the thermometer bulbs; or thermometers attached to aircraft (in this last case the motion is too rapid and a correction has to be applied to counter the heating of the thermometer by compression of air against it). The humidity of the air is found by comparing the temps. measured by the ordinary thermometer and by one whose bulb is covered by moist muslin (see further under *HYGROMETER*, where other methods of measuring humidity are also described). The temp. and humidity in the upper air are measured by attaching instruments to an aircraft, to a small balloon, or even to a rocket. With aircraft measurements have been made up to more than 50,000 ft., with balloons to 100,000 ft., and with rockets to more than 100 m. At first balloon-carrying instruments had to be recovered before any results were obtained; now, with the invention of short-wave radio, the radio-sonde balloon transmits the observations to earth. Balloons can also be used to measure the winds aloft, for, since they are carried by the wind, following their movement by theodolite, direction-finding radio or radar will enable their drift to be calculated, thus determining the winds at the different heights through which the balloon passes. Reports from ships follow exactly the same patterns as those from land stations, but also include the sea temp. and the state of the sea. Recently ships have been specially equipped to cruise at a fixed 'ocean weather station' making observations, including radio-sonde ascents at the standard intervals. These ocean weather ships are also used as navigational beacons for transoceanic aircraft, and provide rescue services if required. Transport and other aircraft also make reports. Special meteorological aircraft fly at a constant height, occasionally measure the sea-level pressure (by flying at a very small known height above the sea), and describe the weather as they fly along. Normally they make an ascent from near sea level to about 18,000 ft. and, a little further on, a descent, thus obtaining the same data (to the limited height reached) as by two radio-sonde ascents. Before the establishment of ocean weather ships many meteorological flights used to cover large stretches of the Atlantic, but they are not so numerous there now. New routes are, however, being flown, one of which is from Alaska to the N. pole and back.

ANALYSIS OF OBSERVATIONS. — The huge mass of synoptic data collected and disseminated for forecasting purposes is plotted on synoptic weather charts in a form suitable for rapid and easy assimilation. The weather elements are plotted round a station circle in a fixed order, with symbols and figures agreed internationally. Modified copies of these charts are published by most meteorological services. The

STEVENSON SCREEN
Front view with door open.

easily be 5° F. or 10° F. lower than the temp. near the surface, whereas on a following clear night the reverse usually occurs. On the other hand the temp. of air which rises 100 ft. only cools about 1° F. by reason of its change of height and consequent expansion due to decrease in pressure. Therefore temps. are read at a standard height (usually 4 ft.) above the surface, and not reduced to sea level. To make the thermometers the same temp. as the air they are sheltered in a Stevenson screen which protects the thermometers from radiation from sun or earth by white wooden walls which are double-louvered to allow the air to circulate freely. An alternative method is to make the air blow so rapidly past the thermometers that any heat they may gain or

SPECIMEN OF PLOTTING OF THE WEATHER AT A STATION ON A SYNOPTIC CHART

Brit. *Daily Weather Report* is divided into three sections, and contains a detailed map of the weather over the Brit. Isles, and also a less detailed map of the weather over the N. hemisphere, and the *Daily Aerological Record* contains full reports of the radio-sonde ascents made over the Brit. Isles, and from some of the ocean weather ships, together with maps of the heights of the 700 mb., 500 mb., and 300 mb.

pressure surfaces which give a picture of the winds at 10,000 ft., 18,000 ft., and 30,000 ft.; there is also a map of the height of the tropopause. Ships' reports are plotted on the same charts, using the same symbolic form. Data from radio-sondes and aircraft are plotted on upper air charts and on temp.-height diagrams, the diagram in use in Britain being the tephigram (q.r.). With the help of this diagram it is possible to predict the formation or otherwise of clouds, showers, or thunderstorms, and sometimes to identify where the air comes from (see also WEATHER FORECAST).

In the early days of weather charts, when few stations were available, the features that seemed to stand out most clearly were the easily recognisable patterns made by isobars (lines joining places of equal pressure), forming regions of low pressure (depressions or cyclones), regions of high pressure (anticyclones), and the connecting patterns: ridges, troughs, cols, and secondary depressions. It was soon noticed that the wind bore a definite relation to pressure which was enunciated by Prof. Buys Ballot of Utrecht in 1857 in the form 'that, in the N. hemisphere, if you stand with your back to the wind, pressure is lower on your left hand than on your right, while in the S. hemisphere the reverse is true.' This law was later confirmed by a dynamical formula based on physical principles which gave a theoretical speed and direction to the wind in the free atmosphere, known as the gradient wind. This wind blows along the isobars with low pressure on the left in the N. hemisphere with a speed proportional to the gradient of pressure between the isobars (the closer the isobars are together, the stronger the wind). It

CHARACTERISTIC PRESSURE PATTERNS ON A WEATHER CHART

	snowstorm		continuous slight rain		slight thunderstorm with rain
	sandstorm		continuous heavy snow		heavy thunderstorm with hail

SOME EXAMPLES OF INTERNATIONAL WEATHER SYMBOLS

is increased by a smaller quantity for anti-cyclonic curvature, and decreased similarly for cyclonic curvature of the isobars. The effect of the curved isobars is normally small enough to neglect; then the theoretical wind is known as the geostrophic wind. However, both the gradient and geostrophic winds neglect change of pressure with time and vertical motion, as well as frictional forces. These terms are all generally small and the wind speed at about 2000 ft. above the surface may be read off the synoptic chart by placing a scale appropriate to the lat. across the isobars. The surface wind is affected considerably by friction and the configuration of the land, especially in hilly regions where it tends to blow along the valleys; the speed is usually less than the gradient wind, and the direction at an angle (often 20-30°) across the isobars from high pressure to low. The effects neglected by the gradient-wind equation are important, for it is these that lead to inflow of surface air into regions of low or falling pressure and, conversely, of outflow from regions of high and rising pressure. If the surface air is flowing into a region then the air must escape by rising and spreading out aloft; this leads to adiabatic cooling and instability, cloud, and unsettled weather; conversely diverging air leads to subsidence, adiabatic warming, stability, clear skies, and settled weather. These theories are, in general, confirmed by the observation of unsettled weather in cyclones and quiet weather in anticyclones. When air blows over hills and mts, it is forced to rise and, if it contains enough moisture, cloud is formed; if the process continues long enough or the air is very moist or unstable, rain falls. This type of rain is called orographic rain, and is very prevalent on coasts exposed to frequent winds from the sea. Even if rain is not formed (if, for instance, the moist layer is only shallow) drizzle sometimes occurs, and even very low hills may be shrouded in cloud; these are the conditions of a 'scotch mist' in the W. Isles or the 'crachin' of S. China. Areas sheltered from these winds, which have lost some of their moisture on the hills, are likely to have finer and drier weather.

During the First World War Norwegian

meteorologists, notably V. and J. Bjerknes, using a very close network of reporting stations, discovered that the change from one relatively homogeneous type of air—air masses it is called—to another was often very rapid and usually along a clearly marked line. These lines were called fronts. Near fronts are regions of widespread cloud, rain, or snow, as will be shown later; the air masses, however, also exhibit many different weather characteristics according to whether they are moving from colder to warmer regions or vice versa, and whether they contain much or little moisture. If they move to warmer regions the lower atmosphere becomes warm and the air becomes unstable, leading to cumulus cloud and showers (see further under THERMIDRAM); if they move to colder regions the lower air becomes colder, and may therefore develop fog or a very low cloud sheet known as stratus. At first the air masses were called polar or tropical, but present practice is to classify the air masses broadly according to where they originate as a more or less homogeneous mass, laying stress on both humidity and temp. They are:

Arctic or Antarctic Air, which originates over the polar ice-caps, Greenland, and Antarctica, and on reaching low lands is very cold and unstable; it carries little moisture even if saturated. As it passes over unfrozen seas, cumulus, cumulo-nimbus, and showers develop; the showers are very frequent on exposed coasts.

Polar Continental Air, which may be even colder than arctic air at low levels; it is not so cold aloft, is stable and very dry, having its origin in winter anticyclones that persist over Russia, Siberia, and Canada. When passing over the sea convection clouds develop more slowly than with arctic air; stratus or stratocumulus appear first, shower cloud develops after a comparatively long sea track. The coldest temps. in England are recorded when this air mass comes from the E., since it has only a very short sea track.

Polar Maritime Air, which is formed when arctic air has been for some time over the ocean or may form in both anticyclones and stationary depressions over the oceans in high lats. It is moist and

unstable, and very prolific of cumulus, cumulonimbus, and showers. It is the commonest air mass over the Brit. Isles.

Tropical Maritime Air.—This forms in subtropical anticyclones (such as the semi-permanent Azores anticyclone), and is moist and stable. It brings muggy conditions to Britain with S.W. winds. It is moist and stable with sea fog or very low stratus cloud very prevalent over the S. and W. coasts of Britain. The top of the cloud is rarely above 3000 ft., often only about 2000 ft., with clear blue skies above.

Tropical Continental Air, which accumulates over the hot continents in summer, mainly central Asia, Africa, mid U.S.A., and Australia. It is very unstable, but dry, so rarely contains any cloud. It is hazy, and, with rising winds,

it upwards. This is not a convective process, although latent instability (see TEMPERAM) may become active after some lifting has taken place, and produce convection. Sheet clouds are therefore formed, and steady rain falls. Generally rain begins to reach the ground when the cloud base comes below about 10,000 ft.; since the warm front slopes at about 1:100, the rain belt at a warm front is about 200 m. wide, following a 'pre-frontal' cloud belt 400 m. wide. The haloes which can be seen through the cirrostratus of a warm front are therefore usually a sign of coming rain. The cold front normally has a slope twice as steep as that of the warm front, so that the rain belt is not so wide; further, the warm air high up at the rear of the cold front often travels faster than the cold air beneath, so

WARM FRONT

COLD FRONT

For the meaning of abbreviations of cloud types see CLOUD.

picks up sand from the deserts to form sandstorms, such as the khamsin or ghibli in Egypt. When tropical continental air from the Sahara crosses the cooler Mediterranean Sea it picks up moisture and brings hot, oppressive, damp conditions; it is known as the scirocco.

Equatorial Air.—This exists in a wide semi-stagnant belt near the equator; it is hot, moist, and unstable, with cumulus cloud, which develops into cumulonimbus and heavy showers or thunderstorms when it passes over the land in the afternoon. Because of the high moisture content it is very uncomfortable, and the very dry tropical continental air, which sometimes replaces it in W. Africa, is therefore known as the harmattan or 'doctor.'

Fronts.—At the transition zone between two air masses the warmer air, being lighter, rides over the colder, so that, providing the following air is moving the faster relative to the front, when warm air replaces cold (a warm front) the warm air slides above the cold, and when cold air replaces warm (a cold front) the cold air undercuts the warm air and pushes

BEGINNING OF AN OCCLUSION

COLD OCCLUSION

WARM OCCLUSION

that it slides down the cold front, which, in that part, is therefore free from cloud. Instability often develops at a cold front, and then the frontal cloud no longer remains in sheet form, but develops into cumulonimbus with heavy rain or even thunder. If, owing to friction, the warm surface air is held back, it gets trapped by overrunning cold air, which causes violent turbulence leading to a line-squall with a typical roll cloud. When a cold front overtakes a warm front the cold air meets cold again, and the warm air is lifted entirely off the surface. This combined front is called an occlusion. If the cold air ahead is warmer than that behind, it too is lifted, the cold occlusion; if the cold air behind is warmer, it slides up above

1 Wave develops on an almost stationary front

2. Wave develops a small centre of low pressure, the wind beginning to circulate round it.

3 The fully developed depression; the occlusion is beginning to form. The rain is a little in front of the cold front in some places.

4. The occlusion is now well developed (here a warm occlusion); the end of the cold front is becoming more parallel with the isobars and moves very slowly.

5. The occlusion has begun to curl around the centre of the depression, which is now moving quite slowly. A new wave has begun to develop on the almost stationary part of the cold front

the former as at a warm front, the warm occlusion. When equatorial air replaces tropical continental air, as in the beginning of the S.W. monsoon in India, a monsoon front is formed which is a cold front below and a warm front above. This system has a very high latent instability, so that monsoon rains often break with a violent thunderstorm.

Formation of Depressions in the Temperate Zone.—The present theory of the formation of depressions, first stated by the Norwegian school of meteorologists, is that they start as small bends or waves in a more or less stationary front, with warm air inside the bend, which is convex towards the cold air. In favourable circumstances the depth of the wave increases, and the wave itself moves along the front, the first part of the wave acting as a warm front (warm air overtaking cold), and the rear part as a cold front. As the depth of the wave increases the air pressure falls inside and around it, and the winds in the neighbourhood increase. The cold front moves faster than the warm, begins to overtake it, and an occlusion is formed; eventually the cold air lifts all the warm air out of the circulation of the low or pushes it well away from the centre where the front then tends to become quasi-stationary; a new low may then develop. The process is illustrated on p. 203 with shaded areas representing the rain, dotted areas where the sheet cloud persists, and the international shower symbols where showers are most predominant.

Forecasting.—When once a synoptic chart has been analysed and the causes of the different weather phenomena in the different parts understood, it is possible to 'move' the different weather conditions along from one place to another by measuring the gradient wind, and making due allowance for such effects as large pressure tendencies, vertical motion, etc. Making allowance also for the different terrain which the new air masses and fronts would now occupy or have passed over, and for the different time of day, the weather a few hours hence may be described with a fair degree of accuracy. This is short-term forecasting; it is reasonably dependable for as much as twenty-four hours ahead. For longer periods the number of interdependent factors becomes so large that the task, except in a few typical and well-established situations, is far too complex for any real accuracy to-day (see WEATHER FORECAST).

The Upper Air is now becoming a familiar region; it has long been known that the air temp. decreases from the ground upwards, except for certain levels known as inversions (associated with anticyclones or frontal surfaces) where the temp. may increase temporarily with height, and to an upper region called the stratosphere, where the temp. usually remains constant or with little change for several miles upwards. The level where the stratosphere begins is called the tropopause; below is known as the troposphere. The tropopause is at varying heights, being highest in equatorial air at about

50,000 ft., and lowest in arctic air at about 16,000 ft. Since the temp. decreases at high levels in the troposphere at about 4° F. or 5° F. in every 1000 ft. the coldest air temp. is found, not at the poles, but in equatorial lats. at the tropopause where it is highest. In the stratosphere, as has already been stated, the temp. remains fairly constant for some 20 m., but at a height of about 25–30 m. it has been found to increase again, reaching, at a height of some 40 m., temps. higher than any experienced on the earth's surface; it drops to a minimum again at about 50 m. up, and then increases to very high temps. These temps., which were originally estimated from the propagation of sound, and have recently been measured in America, using rockets, are still a little problematical, for the air is so thin at these great heights that it is doubtful what is meant by temp. Upper air charts, which are now drawn regularly, suffer from two great difficulties: the comparatively small number of observations, at best some 300 m. apart, except in the United Kingdom, and the difficulty of knowing the height of the observation with any degree of accuracy. The height of the observation is, in fact, except when modern radar methods are used, calculated from the measured temps. and pressures up to that height. The gradient wind equation still applies at the higher levels, but, because of the decrease in air density, the wind speeds are much greater for the same pressure gradient than they are at the surface. However, by using the gradient wind equation the change in height for constant pressure instead of the change in pressure for constant height, this difficulty is overcome. Consequently upper air charts are now drawn with contour heights of the 700 mb., 500 mb., or 300 mb. pressure surfaces, taking the place of isobars (as in the *Daily Aerological Record*). Further charts are now drawn showing the difference in height between the 1000 mb. and 500 mb. pressure surfaces; the winds calculated from these charts represent not an actual wind, but the wind difference between the air near the earth's surface and the wind in the upper air, i.e. they illustrate the relative motion of the air at the two levels. Attempts are being made to extend the period of short-term forecasts by study of these charts, for their patterns have been found to change comparatively slowly. Additionally circulation indices (single figures expressing the total westerly wind current in a zone round the world) and other regional 'means,' as well as short-period mean pressure and temp. maps are being studied.

Seasonal forecasting has been attempted in the past, sometimes successfully, by correlating mean temp. and pressure at various chosen places over the globe with other elements such as the time of onset of the monsoon rains in India, with sunset activity, with rainfall observations, and even with the extent or drift of polar ice. See also CLIMATE; CLOUD; FOG; HYGROMETER; RAIN AND RAINFALL; THERMOGRAPH; THUNDERSTORMS; WAVES; WIND.

Meteors, or **Shooting Stars**, consist of small portions of solid matter sometimes resulting from the breaking up of comets on a close approach to a giant planet or to the sun under the gravitational attraction of the latter. They exist in enormous numbers in the solar system, mostly comparable in size with grains of sand, and when they enter the earth's atmosphere from outer space become incandescent owing to the friction between the air and the M., which are travelling with velocities that may be as high as 40 m. per sec. or more. M. are occasionally sufficiently large to reach the earth's surface before they have been vaporised, and such stones have been called meteorites (*q.v.*). Thousands of millions of M. enter the earth's atmosphere every day, and on any clear night, after a few minutes' watching, the observer will see a shooting star, but at certain times in the year a large number of M. may be observed which appear to come from particular quarters of the sky. These are technically known as the 'radiant-points.' The periodicity of meteoric showers is due to the fact that the small particles of matter which form M. are subject to the universal law of gravitation and revolve round the sun in elliptical orbits in the same manner as do the planets. Whenever, therefore, the earth in its revolution intersects the orbit of the meteoric stream, there must occur a display of shooting stars, and as it occasionally happens that the earth passes through the nucleus of the stream, the display is then exceedingly brilliant. Chief among such periodic brilliant displays are the Leonids (Nov. 16), the M. of Pons-Winnecke's comet in June and those from Jacobini-Zinner's comet that appear in Oct. Prominent displays are listed under 'Meteors' in *Whitaker's Almanack*. The astronomical importance of M. arises from the evidence they afford of the orbits of their parent comets in whose wake the M. follow.

Meter, Electric, see **ELECTRIC METER**.

Meter, Gas, see **GAS METER**.

Methane, or **Marsh Gas**, CH_4 , the simplest hydrocarbon of the paraffin series. It is produced in nature by the decay of

vegetable matter under water, and thus rises in bubbles from marshes and swamps. It also occurs in the natural gas of petroleum dists., is set free from fissures in coal as 'fire damp,' and is one of the chief constituents of coal gas. It is prepared by heating a mixture of sodium acetate and soda lime, according to the equation: $\text{C}_2\text{H}_3\text{O}_2\text{Na} + \text{NaOH} = \text{CH}_4 + \text{Na}_2\text{CO}_3$. Better methods of obtaining the pure gas are (i.) the action of water on aluminium carbide: $\text{Al}_4\text{C}_3 + 12\text{H}_2\text{O} = 4\text{Al}(\text{OH})_3 + 3\text{CH}_4$, and (ii.) the action of dilute hydrochloric acid upon methyl magnesium iodide: $2\text{CH}_3\text{MgI} + 2\text{HCl} = 2\text{CH}_4 + \text{MgI}_2 + \text{MgCl}_2$.

M. is a colourless, tasteless gas, which is liquefied at -11°C . under a pressure of 180 atmospheres. It burns with a pale blue flame and forms a highly explosive mixture with certain proportions of air or oxygen, the explosions in coal-mines being largely due to the ignition of such a mixture. It is almost insoluble in water, more soluble in alcohol, and is a very stable gas, resisting the action of a large number of reagents. When mixed with chlorine in the dark, no action occurs, but on exposure to sunlight an explosion occurs and carbon is deposited. In diffused sunlight no explosion occurs, but the hydrogen atoms are displaced by equivalent quantities of chlorine, with the formation of substitution products; the most important is chloroform, CHCl_3 .

Methanol, see **METHYL ALCOHOL**.

Metheglin, see under **MEAD**.

Methil, seaport of W. Fifeshire, Scotland, on the N. shore of the frith of Forth, and 1 m. S.W. of Leven. A new dock was opened in 1911, and M. has become one of the chief coal ports of the frith of Forth. Pop. 12,000.

Methley, tn. in Yorkshire, England, 7 m. S.E. of Leeds, with coal-mines. Pop. 5000.

Methodism (Gk. *methodos*, rule), term applied to a religious organisation which owes its origin to John and Charles Wesley. The name 'Methodists' was given to certain Oxford students who, with the brothers Wesley, met together at fixed times to acquire regular habits of religious study and prayer. In 1735 the Wesley brothers took up missionary work in Georgia, with little success. In 1738 John Wesley experienced a spiritual transformation, from which resulted the whole of his evangelical work. He and his fellow evangelists were repudiated by the Church of England, and, not being able to preach in Anglican churches, they adopted the plan of preaching in the open air. After preaching Wesley encouraged his listeners to meet among themselves in his absence, and in 1740 a society under the control of John Wesley met habitually in a room in the Old Foundry near Moorfields, London. He later drew up 'Rules of the Society,' which are still accepted by the Wesleyan Methodist Church. In 1741 Wesley declared his support of the Arminian doctrine, and the emphasis upon the communion of the individual with God without priestly intervention, and the universal hope of salvation, is the keynote of

M. along with its Presbyterian rather than episcopal organisation.

The chief characteristic of the church is the 'class-meeting.' Any one who feels a 'desire to flee from the wrath to come and be saved from his sins,' may become a member of a class-meeting, by which act he is enrolled as a member of the church. No one can be a member of the Methodist Church without having his name down on a 'class-book,' though attempts have been made to alter this rule. The classes meet weekly for the purposes of Christian fellowship under the guidance of a 'leader.' Each church has its stewards, whose duties are partly religious and partly financial. A circuit quarterly meeting is also held, formed of representatives from different churches or chapels in the neighbourhood, which together make up a 'circuit.' A minister is invited to a church by the quarterly meeting. Besides ordained 'travelling' ministers, there are 'local preachers.' These are laymen who offer voluntary services on Sunday, and after passing certain examinations are then enrolled as preachers. The whole connexion is governed by an ann. assembly, held in different pts. of the United Kingdom, known as the conference. Down to the year 1784 it was a select ministerial council, presided over by John Wesley. In that year its rights were defined, and it was given specific control over the ministers and churches throughout the connection. In 1878 lay representatives were introduced into conference, and in 1911 women were admitted under the same rules as laymen. It is an elected body of 650 members, half ministers and half laymen. The Methodist Church is governed primarily by the conference, secondarily by the synods (held in September and May), consisting of all the ministers and of selected laymen in each dist., over which a chairman is appointed by the conference; and thirdly by quarterly meetings of the ministers and lay officers of each circuit. The authority of both synods and quarterly meetings is subordinate to the conference, which has the supreme legislative and judicial power in M.

There are seven Brit. theological colleges for the training of ministers, at Richmond (Surrey), Didsbury, Huddersworth, Readingley, Cambridge, Belfast, and Manchester, and two schools for the children of Wesleyan ministers, Trinity Hall, Southampton, for girls and Kingswood School, Bath, for boys. The National Children's Home and Orphanage is under the superintendence of the conference. The Methodist Book-room in City Road, London, issues a number of tracts and religious publications. The chief papers of the society are the *London Quarterly Review* and the *Methodist Magazine*. The *Methodist Recorder* is an independent publication.

In England there were many secessions from the Wesleyan Church, but in 1932 an amalgamation was effected of Wesleyan, Primitive, and United Methodists. The Methodist New Connexion was formed

in 1797 under the leadership of Alexander Kilham, who, in his pamphlet *The Progress of Liberty* (1795), asked for more power for laymen and less for the ministers. In 1907 this body amalgamated with the United Methodist Free Churches (estab. 1857) under the name of the United Methodist Church. The Protestant Methodists formed themselves into a separate body as a protest against placing an organ in the Brunswick Methodist Church, Leeds (1828). The Bible Christians or Bryanites found the restrictions of conference irksome in evangelistic work among the Cornish miners, and separated from the larger body in 1815. These two latter joined the United Methodists in 1907. Another secession took place in 1812, through the expulsion of Hugh Bourne and Wm. Clowes, who, in spite of the expressed wish of conference, persisted in holding open-air revival meetings. They consequently organised an independent church, called the Primitive Methodist Connexion, which held its first conference in 1820. The Wesleyan Reform Union (q.v.) still survives. The Welsh Calvinistic Methodists were founded by Whitefield independently of the Wesleyan Methodist movement in England. Their church gov. resembles that of the Presbyterian Church. The Methodist Episcopal Church of the U.S.A. originated in the evangelistic work of some Irish immigrants, who settled in New York in 1766. It received its first bishops in Francis Asbury and the Rev. Thomas Coke, who were ordained by John Wesley. The Amer., unlike the Eng., Methodist Church, has the episcopal form of gov. John Wesley ordained a few ministers in Scotland, and even in England, but he did not himself desire the separation from the Church of England, and his rule was that Methodist services were not to be held at the same time as those of the Anglican Church; this rule has since been abandoned.

The Methodist Protestant Connexion of America arose in 1844 on the question of more democratic gov. A further secession from the Methodist Episcopal Church took place in 1844 on the question of slavery when the Methodist Episcopal Church, South, was formed. There are some nineteen Methodist bodies in the U.S.A. The Methodist Episcopal Church has over 4,000,000 members. The Methodist Episcopal Church, South, a reminder of the cleavage in the country during the Civil War—has about 2,500,000 members. There are a number of churches composed of Negro citizens, the largest being the African Methodists with 546,000 members and the African Methodist Episcopal Zion Church with 457,000. The various Methodist societies of Canada united into one church in 1833. The various Methodist denominations in Australia, New Zealand, Tasmania, and the S. Seas united with the Wesleyans in 1900-2, forming one M. in the S. Pacific, while in Ireland and in Africa the various Methodist Societies have also united. In 1946 in association with the conference in Great Britain and Ireland (at home and abroad), there were 5495 ministers, 42,641 lay preachers,

1,233,542 members and probationers, 20,535 churches, 15,620 Sunday schools, 128,300 Sunday school officers and teachers and 948,415 Sunday scholars. The 1939 statistics of M. throughout the world were: ministers, 54,340; local preachers, 83,263; members and probationers, 11,666,646; Sunday schools, 76,057; officers and teachers, 820,202; scholars, 7,495,834; churches and other preaching places, 91,175. See further under WESLEY, JOHN, and CHARLES; WHITEFIELD, GEORGE; and the bibliographies thereto.

Method, Scientific, see SCIENTIFIC METHOD.

Methuen, Paul Sanford, third Baron (1845-1932), Brit. field marshal, b. at Minehead, Somerset, succeeded Frederick Henry Paul M., the second baron (1818-1891). He was descended from the lord chancellor of Ireland, John M. (d. 1706). Educated at Eton, he joined the Scots Guards in 1864. He took part in the Ashanti war of 1871 and in the Egyptian war of 1882. He commanded 'Methuen's Horse' in the Bechuanaland expedition of 1884-85. During the Boer war of 1899-1902 he was in command of the 1st Div. of the First Army Corps. After defeating the Boers at Belmont, Emslin, and the Modder R., he was taken prisoner in 1902 by De la Rey, but released. He was appointed commander-in-chief of the E. command in 1903, and was general officer commanding-in-chief of S. Africa, 1908-1912. From 1909 to 1915 he was governor of Natal, and from 1915 to 1919 of Malta. He was made field marshal in 1911 and governor of the Tower of London in 1920.

Methuen. The publishing house of M. was founded in 1889 by Algernon M. Marshall Stedman, afterwards Sir Algernon M., Bart. The nucleus of the new firm was formed by the founder's own school text-books, some of which are still standard educational works. From the

outset books by outstanding authors appeared in M.'s list, one of the first being S. Baring-Gould. In 1892 appeared the first vol. of Kipling's verse, *Barrack Room Ballads*, followed by other collections of his poetry, *The Seven Seas*, *The Five Nations*, *Departmental Ditties*, and *The Years Between*. Pub. of these and works by such authors as G. K. Chesterton and Arnold Bennett had given the firm a distinguished place in the publishing trade by the time of the founder's death in 1924. His place as chairman was taken by E. V. Lucas and the ever-growing list of famous authors later contained the names of Kenneth Grahame, W. W. Jacobs, and such present day favourites as A. P. Herbert, H. V. Morton, A. A. Milne, Pearl Buck, and Joan Grant. M.'s have always pub. a large number of scientific and academic works, and this policy is continuing at the present time. In 1939 the firm acquired the controlling interest in Chapman & Hall, publishers of Dickens's works.

Methuen, tn. of Essex co., Massachusetts, U.S.A., 2 m. N.N.W. of Lawrence. There are manufs. of textiles, shoes, etc. Pop. 15,000.

Methuen Treaty, commercial treaty arranged between England and Portugal in 1703. It was negotiated by Paul Methuen, son of John Methuen, chancellor of Ireland, and by it Portugal was to provide 28,000 troops for the war of the Sp. Succession, Britain to maintain half of them; Portuguese wines were received at a lower duty than those imported from France; and a similar advantage given to Eng. wool in Portugal. It was abandoned in 1836. The heavy consumption of port wine in England dates from the M. T.

Methuselah, according to Genesis, the son of Enoch and grandfather of Noah, of the family of Seth. He is the oldest man mentioned in the Bible, dying at the age of 969 years.

Methven, vill. in Perthshire, Scotland, 6 m. W.N.W. of Perth. The Eng. defeated Bruce here in 1306. Pop. 2000.

Methyl (CH₃), compound radicle, i.e. a collection of atoms which can enter into the composition of a series of compounds and retain its identity. It functions in the role of a positive radicle, and in this respect has something in common with the positive radicle ammonium, NH₄. It has no stable separate existence, though it can be isolated for a very brief period.

Methyl hydride or methane	CH ₄ , H
Dimethyl or ethane	CH ₃ , CH ₃
Methyl chloride	CH ₃ , Cl
Methyl alcohol	CH ₃ , (OH)
Methyl sulphate	(CH ₃) ₂ , SO ₄
Methyl cyanide	CH ₃ , CN
Methylamine	CH ₃ , NH ₂
Methyl acetate	CH ₃ , COOCH ₃
Dimethyl ether	(CH ₃) ₂ , O
Nitromethane	CH ₃ , NO ₂

Methyl Alcohol (OH, OH), **Methanol** or **Carbinol**, the simplest of the monohydric alcohols, occurs in sev. natural substances, e.g. as methyl salicylate in oil of wintergreen. On distilling this oil with dilute

potash an aqueous solution of pure M. A. is obtained. It is chiefly prepared from the products of the destructive distillation of seasoned hard wood, such as oak, thorn, birch, and beech, from which the bark has been removed. The operation is performed in iron retorts at 200–260° C. The alcohol is obtained by redistilling the crude distillate over lime, finally purifying by the formation of the crystalline calcium chloride compound or of the oxalic ester, from which it is obtained by distillation with water or with potash. 100 parts of dry wood produce about 50 parts of 'pyroligneous acid' containing 4 per cent of M. A., together with acetic acid, acetone, tar water, etc. M. A. is a colourless liquid (sp. gr. 0.814 at 20° C.); it boils at 64.7° C., and has a vinous odour and burning taste. It mixes with water in all proportions. When passed over a copper or nickel catalyst at 240° C. it decomposes into hydrogen and formaldehyde. This has important applications. It is largely used in the preparation of organic dyes and varnishes, and for the preparation of methylated spirit and perfumes.

Synthetic Methanol.—Methods have been perfected for the synthetic production of methanol. It had been known for some time that carbon monoxide could be made to combine with hydrogen, $\text{CO} + 2\text{H}_2 = \text{CH}_3\text{OH}$, with the aid of catalysts. Many of these have been investigated on the large scale, but the most efficient appears to be a mixture of zinc oxide and chromium sesquioxide obtained from basic zinc chromate. In presence of this water gas alone, or a mixture of hydrogen and carbon monoxide in the ratio $\text{CO}:\text{H}_2::1:2$, gives methanol at 350–400° C. under pressures of about 200 atmospheres. This is condensed and redistilled.

Methylaniline, colourless liquid, smelling like aniline; chemical formula, $\text{C}_6\text{H}_5\text{NHCH}_3$; sp. gr. 0.976 at 15°; boiling point, 192°. It is readily oxidised in air when it becomes brownish in colour. It is obtained by heating aniline hydrochloride and methyl alcohol under pressure at 180°; the base is separated by adding an alkali and distilling in steam and, after separation, drying over caustic soda, and distilling. It can also be obtained by reducing methylene-aniline, $\text{C}_6\text{H}_5\text{N}:\text{CH}_3$, by zinc and sodium hydroxide. M. has been used as a drug under the name 'exalgin.'

Methylated Spirit. In order to meet the large demand for alcohol destined to be used for purposes other than drinking, there are two alcohol mixtures which can be obtained duty free.

Mineralised Methylated Spirit.—This is obtained by mixing 9 volumes of ordinary 'plain' spirit (which shall be not less than 50° under proof, and is usually more) with 1 volume of wood naphtha or wood spirit, and a small amount of mineral naphtha. The last ingredient serves the purpose of making the liquid unfit to drink. Since 1918 colouring material in the form of methyl violet has also been included. Such a spirit contains methyl alcohol (7.7 per cent), ethyl alcohol (83 per

cent), water (19.21 per cent), as well as small amounts of acetone and other ketones, esters, unsaturated compounds, and substances of a basic nature. This spirit finds wide applications in everyday life. It gives a white opalescence when added to water. By law it may not be purified.

Industrial Methylated Spirit.—This is meant to meet the need for an alcohol which contains a higher percentage of ethyl alcohol, and which can be employed for the many industrial operations in which this compound is required, particularly as a solvent for varnishes, drugs, perfumes, etc. It contains 95 per cent of ethyl alcohol and 5 per cent of crude naphtha, without the addition of any mineral naphtha. There is no colouring material added and no turbidity is given when mixed with water. Numerous restrictions are placed on the proper use of this form of spirit. It can only be obtained direct from the methylators in quantities of 5 gallons or over, and it must not be used for drinking purposes, or left in any final product which can be taken internally.

Methyl Benzene, see TOLUENE.

Methyl-Butadiene, see ISOPRENE.

Methyl-Glycine, see SARCOSINE.

Methyl Methacrylate, see under PLASTICS.

Metis (Μῆτις), in Gk. mythology, was the personification of prudence. She was the daughter of Oceanus and Tethys and the first wife of Zeus, who, in fear lest she should give birth to a child more powerful than himself, devoured her in wrath. He afterwards himself gave birth to Athene, who issued from his head.

Metius, Adrian (1571–1635), Dutch geometer, b. at Alkmaar. He found out a truer relation of the circumference of a circle to its diameter, i.e. the value π , which had previously been represented by $\frac{22}{7}$. Among his works are *Doctrina spherica libri v.*; *Calendarius perpetuus* (1627); and *Praxis nova geometrica Problemata astronomica* (1665).

Metius, James, brother of Adrian, also a native of Alkmaar. He is said to have invented the refracting telescope in 1609, on the mere report of which invention Galileo constructed his first telescope the following year.

Metol, white, crystalline sulphate of para-methylanilino-phenol $\text{C}_6\text{H}_4(\text{OH})\text{NHCH}_3$, made from monochloroacetic acid (1 molecule) and para-aminophenol (2 molecules). M. is used as a developer (see PHOTOGRAPHY), particularly for under-exposed plates. It darkens in light, and has the drawback of often producing skin trouble.

Meton (Gk. Μῆτων) (fl. 432 B.C.), astronomer of anct. Athens. He is famous for having introduced the metonic cycle, a period of nineteen solar years and to determine eccles. feasts.

Metope (Gk. μετώπη, a middle space), term in architecture for that part of the front which is interposed between two triglyphs in a Doric frieze.

Metre, in poetry, is that arrangement of syllables in an orderly succession so as to constitute verse. The syllables are

divided into a number of similar or dissimilar groups, each of which constitutes a line or verse (Gk. *στίχον*), and in modern languages the end syllables of these lines are often related by rhyme or assonance. The lines themselves can be subdivided into feet, each line normally consisting of a certain number of these feet regularly repeated. In Gk. and Lat. verse M. consisted in a regular succession of long and short syllables, and the verse accent did not usually coincide with the ordinary accent of the word. In Eng., however, quantity has ceased to be definite and definable, and it is upon the accent that M. depends. It is, therefore, with the alternation of accented and unaccented syllables that the laws of M. deal.

In Eng. each foot is supposed to consist of an accented syllable combined with either one or two unaccented syllables. In this way five kinds of measure are secured: (1) The commonest of feet is the *iambus*, consisting of one unaccented and one accented, such as the word *esdite*. (2) The *trochee*, one accented and one unaccented, as *hōly*. (3) The *dactyl* (Gk. *δάκτυλος*, a finger, from its three joints), consisting of an accented syllable followed by two unaccented, as in *bedriness*. (4) The *anapaest* (through a.k.), the dactyl reversed, as in *promenade*. (5) The *anaphibrach*, an accented syllable between two unaccented, as in *appearance*. These different feet may be arranged so as to form various kinds of lines. Theoretically each line should consist of a certain number of similar feet, but in practice there is not often this regularity. Freedom in the use of syllabic equivalents makes the verse supple instead of stiff, and its value was clearly understood by so early a poet as Chaucer. The doctrine of 'syllabic equivalents' is, briefly, that two unaccented syllables are equivalent to one accented. Hence in spite of the conventional demand for an accented syllable in each foot, many a one in reality consists only of three unaccented syllables. This great freedom, which is characteristic of the best Eng. verse, makes it difficult and wellnigh impossible to measure this verse by rule of thumb. Much of it could be scanned in many ways, and could be brought within the bounds of no limited system.

It is possible, however, to speak of certain types of verse, and to show the normal construction to which all the variants are related. Perhaps the best known verse is the *iambic pentameter*, known as the *heroic couplet* when each pair of lines is connected by rhyme, and as *blank verse* when unrhymed. The elegiac is also a decasyllabic measure, but here the rhymes are alternate and the verse is generally divided into stanzas of four lines (e.g. Gray's *Elegy*). *Rhyme royal*, used by Chaucer in sev. of his minor poems, is written in stanzas of seven iambic pentameter lines rhyming *a b a b b c c*. *Octosyllables*, consisting generally of four iambic feet, are useful for quicker narrative, and were commonly used by Scott and Byron for this purpose. The M. usually known as *ballad metre*, also very common in

hymn tunes of quatrains, consists of lines of eight and six syllables alternately. Anapaests and trochees are frequently substituted for iambs, the latter being especially used at the beginning of a line. See J. B. Mayor, *Chapters on English Metre*, 1886; G. E. Saintsbury, *Historical Manual of English Prosody*, 1906-9; W. E. Leonard, *The Scansion of Middle English Alliterative Verse*, 1920; Elsie Fogerty, *The Speaking of English Verse*, 1923; T. Talg, *Rhythm and Metre*, 1929; and S. O. Andrew, *The Old English Alliterative Measure*, 1931.

Metric System. This system of weights and measures was introduced by the Fr. Republic in 1801. Its fundamental unit of length is the metre, which was taken as one ten-millionth part of the distance from the poles to the equator. Recent investigation has shown that this is inaccurate, and the standard is now defined as the length of a bar of an alloy of iridium and platinum kept in the archives in Paris. It is by far the most practical system. Its various units for larger and smaller distances than the metre being multiples and sub-multiples of ten of the metre. Thus to convert metres into decimetres it is only necessary to multiply by ten. It is a legal system in Great Britain by Act of Parliament (1864), although the Act has remained practically inoperative. The system is universally used in scientific investigation.

Measures of Length.—1 kilometre = 1000 metres; 1 metre = 100 centimetres = 1000 millimetres. The Brit. equivalent for 1 metre = 39.37 in. Therefore 1 centimetre = 0.3937 in.

Measures of Area.—As in the Eng. system the term 'square foot' is used, so in the M. S. there is a square metre, and the following denominations are commonly used: 100 square millimetres = 1 square centimetre; 10,000 square centimetres = 1 square metre; 1 square kilometre = 1,000,000 square metres. The Brit. equivalents are 1 square metre = 1.196 square yards; 1 square kilometre = 0.386 square miles. The denominations 1 hectare = 10,000 square metres, 1 are = 100 square metres are occasionally used.

Measures of Volume.—1 litre = 1000 cubic centimetres = 1.76 pints; various multiples and submultiples of the litre being also used.

Measures of Mass.—1000 milligrammes = 1 gramme; 1000 grammes = 1 kilogramme; 1 gramme = 15.4 grains; 1 kilogramme = 2.205 lb. The various measures are connected by the relation that 1 cubic centimetre of water at temp. 4° C. weighs 1 gramme, or that 1 litre, i.e. 1 cubic decimetre or 1000 cubic centimetres, weighs 1 kilogramme.

Metronome. Instrument used for determining and securing the movement of musical compositions. It was invented by Maelzel about 1814, and consists essentially of a pendulum of which the point of suspension is between the extremities. The pendulum is driven by a spring and wheel which ticks the oscillations. A movable weight is attached to the pendulum and an upright scale graduated to

correspond with marks on the rod is placed behind. The period of the pendulum's vibration can thus be varied to any required time by adjusting the weight until it is opposite one of these lines. The mark near the line giving the number of oscillations per minute.

Metropolitan Opera House, New York, U.S.A., was first built on 39th Street in 1883. Ten years later it was burned down and the present building replacing it was opened in 1893. The M. O. H. has a seating capacity of 3418. It is famous for the high standard of its productions, and an appearance there is a prize coveted by the greatest singers from all over the world. See R. R. Wilson, *New York, 1909*, and W. F. Bonnet, *New York, the World's Metropolis, 1629-1924, 1924*.

Metropolitan Police. The M. P. came into being as the result of Peel's Police Bill of 1829, in the form of the 'New Police' experiment of that year. After a

are the authority for regulating the street traffic, and they issue licences to proprietors, drivers, and conductors of conveyances enabling omnibuses, carriages, taxis, etc., to ply or stand for hire within the M. P. dist.; and they have power to make by-laws for regulating the conduct of all such persons. The M. P. are the only force for which the home secretary is responsible to Parliament, but the city of London is policed separately by a force of about 1100 men organised and controlled by the common council of the city (Metropolitan Police Acts, 1829 and 1839). The authorised estab. of the M. P. on Dec. 31, 1948, was 18,335, exclusive of C.I.D., 1404, and women police, 338. The actual strength on that date was uniform branch, 14,152, C.I.D. full strength, and women 223. The force is administered by a commissioner, with a deputy commissioner and four assistant commissioners, and a number of other officials constituting the M. P. office at New Scotland Yard, London, S.W. In a memorandum (issued as a White Paper on May 11, 1935) the gov. accepted in principle Lord Trenchard's (then commissioner) proposal to reorganise the M. P., chiefly by recruiting young men to the higher posts by a system of competitive selection. A M. P. college was instituted at Hendon shortly before the Second World War, but criticism of Lord Trenchard's scheme, both in theory and practice, led to its abandonment, and the college was not reopened after the war. A new police college for members of all police forces was opened at Ryton-on-Dunsmore, Warwickshire, in Oct. 1948. See also **METROPOLITAN POLICE COURTS.**

Metropolitan Police Courts, petty sessional courts presided over by paid professional magistrates, generally called stipendiaries. Other large towns have such courts as distinct from those of the unpaid magistracy, but the police court (in the sense in which it is used in this article) originated in London in the early Georgian period when the previous tentative efforts to police Westminster were developed by the appointment of constables, and 'annoyance juries,' who reported on public nuisances, annoyances, and other small offences. In 1792 the Crown was given power to establish seven public courts in specified metropolitan parishes, and to appoint three justices drawn from the Middlesex and Surrey magistracy for each of such courts. The Act of 1792 was repealed and re-enacted by an Act passed in 1802, and this later Act may be regarded as the real charter of the metropolitan stipendiaries. The seven courts or 'public offices,' as they were styled, were established at the parishes of St. Margaret, Westminster; St. James, Westminster; St. James, Clerkenwell; St. Leonard, Shoreditch; St. Mary, Whitechapel; and St. Paul, Shadwell (for Middlesex), and at or near St. Margaret's Hill, Southwark (for Surrey). The result of this estab. of paid magistrates in the metropolis was that they enjoyed a monopoly of fees at their public offices within the limits of the Weekly Bills of Mortality, for henceforth,

John H. Stone

SCOTLAND YARD

period of struggle for existence in the face of fierce popular hostility, they succeeded in securing public approval and respect, and they were in general outline the model on which all the prov. forces were allowed to develop. The area under the supervision of the M. P. includes the whole of the administrative co. of London, which comprises its twenty-eight boroughs, and it includes also the whole of the administrative co. of Middlesex and parts of the cos. of Surrey, Kent, Essex, and Hertfordshire (roughly speaking, the area within a fifteen-mile radius of Charing Cross). Like other police, their primary duties are the prevention and detection of crime and the preservation of order. They

with few exceptions, no fees could be taken by any other justices under a penalty of £100. The excepted cases were, *inter alia*, fees for licensing alehouses, and fees for the purpose of enforcing the payment of taxes and assessments arising within the par. concerned, and generally fees taken at Bow Street Public Office, this celebrated place being thus early a central institution. Notwithstanding these changes, the policing of the metropolis left much to be desired, especially in the vicinity of the Thames. The 'hooliganism' in the neighbourhood of the riv. resulted in the estab. of a police office at Wapping New Stairs with three justices and seven constables. Altogether in 1797 there were not above 2000 constables or 'watchmen' in the metropolis. Accordingly, in 1830, another court was estab. at Westminster, and the 'metropolitan police dist.' constituted, the component parts of which were henceforth to be policed by the new 'police force,' who were placed under the direct control of the justices, and superseded the old London watchmen. A later Act extended the jurisdiction of the M. P. C. by giving the police constables of the metropolitan force powers in Buckinghamshire and Berkshire, in addition to the metropolitan area proper, so called. The M. P. C. now number fourteen: Bow Street with three magistrates, Clerkenwell two, Greenwich and Woolwich two between them, Lambeth two, Marylebone two, Thames two, Tower Bridge one, N. London two, Old Street two, W. London two, Great Marlborough Street two, S.W. two, and W. Ham one. Juvenile courts were estab. by order in council of Dec. 2, 1909, at Bow Street, Clerkenwell, Tower Bridge, Westminster, Old Street, and Greenwich. Children's courts in separate buildings from police courts have been constituted by orders in council; they are held at (a) St. John's Hall, Westminster; Stamford House, Goldhawk Road, W.; Toynbee Hall, Commercial Street, E.; Lambeth Tn. Hall, Brixton Hill, S.W.; Morley College, Westminster Bridge Road, S.E.; Chelsea Juvenile Court, Lennox Gardens, S.W.; Friends House, Euston Road, N.W.

The Crown is empowered under the Metropolitan Police Courts Act, 1839, to alter the number of the courts and magistrates, and under an Act of 1840 to constitute police court divs., with a police court for each, provided only the number of the magistrates does not at any time exceed twenty-seven. Courts are held every day, Sundays and holidays excepted. The salary of the chief magistrate is now £2300, that of each of the others being £2000. Bow Street has the distinction of being the only court having jurisdiction in extradition cases. Everything which can be said to relate to public order or the prevention of nuisances comes within the general jurisdiction of the M. P. C.; serious crimes are remitted to the London sessions or criminal sessions at the Central Criminal Court.

Metropolitan Water Board, body responsible for the water supply to the administrative co. of London, a duty which

was formerly left to the initiative of the various metropolitan water companies. The board, as constituted by the provisions of the Metropolitan Water Act, 1902, is composed of sixty-six members, fourteen of whom are appointed by the London Co. Council, two by the common council of the city, two by the city council of the bor. of Westminster, one by each of the remaining metropolitan bor. councils and the remainder by the local authorities of those dists. which, though outside the co. of London, are included within the metropolitan water area. Its supply services cover an area of 575 sq. m., comprising a pop. of 7,549,000 inhab. The ann. supply in 1940-41 was 110,000,000,000 gallons (representing 491,300,000 tons), being a daily average of 300.69 million gallons. The chief sources of supply are the Thames and Lea Rrs., and another source is the New Riv. Company's undertaking, which famous scheme was inaugurated in 1603 by Sir Hugh Myddleton to bring water from Amwell and Chadwell, Hertfordshire, to London. The largest reservoirs are near Staines. The board's charges are levied on rateable value at such rate, not exceeding 8½ per cent, as the board may fix. The capital debt of the board is about £56,660,000 (1940), and the net water rental approximately £5,336,000 (1910).

Metrorrhagia, see under MENSTRUATION.
Metsu, or **Metzu**, **Gabriel** (1630-87), Dutch painter, b. at Leyden. He studied under Gerard Dow, and in 1648 was admitted into the Painters' Guild at Leyden, but left that city two years later for Amsterdam, where he settled as a painter of genre pictures. His chief works are 'The Market-place of Amsterdam,' at the Louvre; 'The Sportsman,' at The Hague; 'The Game-dealer's Shop,' at Dresden; 'The Repast,' at the Hermitage, Leningrad; and 'The Duet' and 'The Music Lesson' in the National Gallery, London. See R. H. Wilenski, *Introduction to Dutch Art*, 1927.

Metternich-Winneburg, **Clemens Wenzel Nepomuk Lothar, Duke of Portella**, and later **Prince von Metternich** (1773-1859), Austrian statesman, b. at Koblenz, his father being Franz Georg Karl von M.,-W., also a statesman. In 1795 he married the daughter of Prince Kaunitz, and henceforward assumed a prominent position in the diplomatic world. He became minister at Dresden in 1801, and two years later was transferred to Berlin. During the years 1806-7 he represented Austria at Paris, where, in spite of his anti-Napoleonic policy, he managed to keep on good terms with Napoleon, whom he tried to bring into an alliance with Austria. The war which followed was terminated by Napoleon's victory at Wagram and the treaty of Vienna (1809). After this M. became chancellor and foreign minister. For some time he veiled his enmity against Napoleon, and succeeded in negotiating the marriage between that emperor and Maria Louise in 1810. But during the next two years the attitude and the successes of Napoleon led to the formation of the great alliance between Russia, Austria,

and Prussia, in which, by acute diplomacy, M. secured for Austria the leading position (Töplitz, 1813). The victory of Leipzig enabled him to dictate terms to Napoleon, and he took a leading part in the negotiations which followed this event.

From this date M. figures as the champion of Conservatism throughout Europe. By his diplomacy he again managed to secure the leading position in the Holy Alliance, which he used as an instrument for furthering these aims. The revolution of 1818 came as a great shock to him, and its results were seen in Austria in the fall of his gov. He left Austria with an armed escort and took refuge in England. In 1851 he removed to his castle of Johannisburg on the Rhine. He *d.* at Vienna in 1859.

In the search by M., Castlereagh, and the Tsar Alexander I. for a European order, M. was the real protagonist, and for a generation he was the mainstay of a federal Europe which at least preserved a species of European peace. It was in the search for a more constructive cure for the revolutionary malady than mere suppression that M. and his contemporaries encountered difficulties, and M. was clear-sighted enough to see that his system of securing co-operation against revolution must sooner or later fail before the fundamental dilemmas of his policy. Perhaps he was the last of the eighteenth-century benevolent despots. He was never a Liberal. In the last resort he was unalterably opposed to popular sovereignty, yet too cynical and even too humane to believe in mere blind repression. Towards the end of his life he said: 'The people let themselves be duped easily enough; you cannot exaggerate the goodness of the people. I might even say of all peoples; but their ignorance is as great; therefore they must be led.' He believed in a philosophy of equilibrium, both in relation to the classes and powers within a state and to the interrelations of the European powers. Since both had been disturbed by the Fr. Revolution and Napoleon, M. conceived it essential to restore the balance and to maintain it. In that he realised that paternal gov. must justify itself by its wisdom, popularity, and efficiency, M. was a reformer. He advanced schemes for the strengthening of the council of state, and for rallying popular support by reviving prov. sentiment. But he was the servant of an autocrat who disliked change, and nothing came of his reforms; and, as with so many of the great men of hist., his reputation sank to its lowest point in the generation following his death. His memoirs were pub. at Vienna (1878-84), and were trans. into Eng. in 1880. See A. Beer, *Zehn Jahre österreichischer Politik, 1801-10*, 1877, etc.; A. Sorci, *L'Europe et la révolution française*, 1883; and E. L. Woodward, *Three Studies in European Conservatism*, 1920. See also P. Quennell (ed., with biographical foreword), *The Private Letters of Princess Lieven to Prince Metternich, 1820-26, 1848*, and life by A. Cecil, 1948.

Mettmann, tn. in the Rhineland, Germany, about 8 m. N.E. of Düsseldorf.

In the vicinity the Neander Cave, containing the remains of a prehistoric human being, the Neanderthal Man (see NEANDERTHAL), was discovered. Pop. 11,000.

Mettur Dam, in Madras, the essential part of the Cauvery-M. system of irrigation. It was inaugurated on Aug. 21, 1934, and the project was framed with two main objects: to improve the existing fluctuating water supplies for the Cauvery R. delta irrigation of over 1,000,000 ac., and to extend irrigation to a new area of 300,000 ac. The construction of the dam itself was undertaken to store the flood waters of the riv. and to pass them down to the delta as and when required. The construction of the dam increases the potentiality of the M. dist. as an industrial centre, and that dist. now has the advantages of cheap power, an ample supply of water, and proximity to cotton and ground-nut tracts.

Metz, tn. and fortress, formerly of Germany, in Alsace-Lorraine, now the chief tn. of the Fr. dept. of Moselle, 33 m. N. of Nancy. It is situated on the Moselle at its confluence with the Seille, and is surrounded by a system of fortifications. Its streets are wide and clean, and it contains numerous spacious squares. The cathedral, a Gothic edifice, was begun in 1014 and finished in 1546. The church of Notre-Dame-de-la-Ronde is a noteworthy structure with a choir built in 1130. In the cemetery of Chambière there is a memorial to the 8400 Frenchmen who fell in the war of 1870. Its industry is active, the chief employments being lace-making, tanning, and embroidering, and there is trade in corn, poultry, fruit, and wine; there are also brass and copper foundries.

M., known to the Romans by the name of Divodurum, was the chief tn. of a people called the Mediomatrici, whose name it took at a later date. In the fifth century the corrupted form Mettis first came into use, whence the modern M. It surrendered to the Gers. in 1870. It was restored to France with Lorraine in Nov. 1918, when all the streets were renamed. It was entered by the Fr. troops under Gen. Pétain on Nov. 19, 1918. M. once again changed hands when France collapsed in 1940, and remained in Ger. possession for 4½ yrs. By Sept. 11, 1944, the Allies had estab. themselves in strength on the E. bank of the Moselle between M. and Nancy. In the M. area Patton's (g.v.) Third Army forces had captured Aumetz on that date, and driven to Thionville, 12 m. N. of M. by the 13th. The city itself, however, was stubbornly defended, and the siege was long and arduous. On the Third Army's front Nancy fell on Sept. 15, but M., strongly defended by its outer ring of forts, held out until the allied offensive ultimately reduced the great stronghold on Nov. 22. Pop. 83,000. See further under WESTERN FRONT in SECOND WORLD WAR.

Metzingen, tn. in Württemberg-Baden, Germany, on the R. Neckar, 18 m. S.S.E. of Stuttgart. Pop. 7000.

Metztitan, tn. of Mexico in the state of Hidalgo, 40 m. N. of Pachuca. Pop. 8000.

Metzu, Gabriel, see MYTSU.

Meudon, tn. and S.W. suburb of Paris, France, in the dept. of Seine-et-Oise. It manufs. glass, ammunition, and linen goods. Here is one of the eight observatories outside Paris. Pop. 20,800.

Meulebeke, industrial tn. near Courtrai, Belgium, in the prov. of W. Flanders, with manufs. of lace and textiles, and bleaching works. Pop. 9200.

Meulen, Adam François van der (1632-1690), Flem. painter, b. in Brussels. He was a pupil of Peter Snayers, but soon surpassed his master. Colbert appointed him battle-painter to Louis XIV. He painted the prin. battles and sieges in Flanders for the château of Marly. In 1673 he was made a member of the academy. Many of his pictures are at the Louvre and Versailles.

Meum, genus of umbelliferous plants. *M. athamanticum* is the Spiguel. Men, or Baldmoney of Scotland. The leaves are bipinnate, with crowded, bristle-like segments, and the umbels of flowers are yellow.

Meung, Jean de (Jean Clopinel) (c. 1250-1305), Fr. satirist, lived in Paris. He wrote over 20,000 lines in continuation of Guillaume de Lorris's *Roman de la rose*, the style, logical expository, and virility of which entitle him to be called the first of Fr. medieval poets. In his contempt for romance, superstition, feudalism, monasticism, the papacy, and royalty, he was, moreover, the Voltaire of his age.

Meunier, Constantin (1831-1905), Belgian sculptor and painter, b. near Brussels. Among his best known pictures are 'The Salle St. Roch' (1857); 'A Trappist Funeral' (1860); and the notable series depicting the miners and factory hands in Lemonnier's *Le Tour du monde*. But it is primarily as a sculptor he will live. His best statues are 'Miner' (1885); 'Puddler' (1885); and 'Mower' (1892); and a series of bas-reliefs which he called a 'Monument to Labour.' See lives by G. Treu, 1898, and C. Lemonnier, 1903.

Meurice, François Paul (1818-1905), Fr. dramatist, studied law and literature, was made chief editor of Victor Hugo's *Écœnement*, and imprisoned as such for six months. In 1878 he dramatised *Les Misérables*, and afterwards *Notre Dame de Paris* and *Quatre-vingt-treize*. Two of his original plays were *Benvenuto Cellini* (1852) and *Struensee* (1893); whilst for *Falstaff* (1842) and *Hamlet* (1843) he had collaborators.

Meursius, Johannes (properly Jan de Meurs) (1579-1639), Dutch classical scholar, became prof. of hist. and afterwards of Gk. at Leyden Univ. (1610 and 1611), and in 1625 accepted the chair of hist. at Sorbø in Denmark, as the execution of Barneveldt, whose children he taught, had exposed him to ceaseless persecutions. Among many other works he wrote *Rea Belgica* (1612); a *Glossarium Græco-Barbarum* (1614); and *Historia Danica* (1630). See also J. Gronovius, *Thesaurus Græcarum Antiquitatum*, 1697-1702.

Meurthe et Moselle, dept. in the N.E. of France, being formed, after the treaty

with Germany in 1871, out of the remnants of the old depts. of Meurthe and Moselle. It consists of the four arrons. of Nancy, Briey, Lunéville, and Toul. The prov. is drained by the Moselle, an affluent of the Rhine, and its tribs., and by the Chiers, a trib. of the Meuse. Grand Rougemont (2041 ft.) in the Vosges is the highest peak. The Paris-Strasbourg main line passes through Nancy, the cap. The manufs. of cast and sheet iron, of iron and steel goods, and of earthenware and glass are very considerable. Rock-salt is found in abundance. Viticulture flourishes, and cereals, potatoes, and hops are widely grown. Area 2036 sq. m. Pop. 528,800.

Meuse: 1. Dept. of N.E. France, composed of portions of Lorraine and Champagne. It consists of the three arrons. of Bar-le-Duc, Commercy, and Verdun. The basin of the Meuse, which flows N. from E. to W., occupies one-half of the dept., the rest being drained in the N.E. by the Orne and Chiers and other streams. The main ridge of highlands, which sink from S. northwards, forms the watershed between the Seine and Rhine. The hills of the Argonne are clothed with magnificent oak forests. Cereals, potatoes, and mangel-wurzels are the staple agric. products, and the vine is profitably cultivated. Freestone is quarried, but neither the mineral wealth nor the industries are important. Cap., Bar-le-Duc. Area 2408 sq. m. Pop. 188,700. 2. Or Maas, riv. over 550 m. long, rising in the dept. of Haute-Marne, France. Passing Verdun and Sedan in a northerly direction it enters Belgium, and after bending eastward beyond Namur, flows northward again past Liège in Belgium and Maastricht in Holland. After a sharp curve westward it enters the Waal, that is the left arm of the Rhine, at Woudrichem. It now divides, the N. branch, called the Merwede, proceeding to Dordrecht, whence it eventually reaches the sea through two channels, the Oude and the Nieuwe-Maas, and the S. which, after entering the Hollandsche Diep, flows into the sea through the Haringvliet and Krammer. Rotterdam and Dinnant are both on its banks. Its main affluents are the Sambre, the Ourthe, the Geer, and the Roer. For the military operations in the dept. and in the M. valley in the First World War, see FRANCE AND FLANDERS, FIRST WORLD WAR CAMPAIGNS IN; WORLD WAR, FIRST, under various sub-headings relating to the W. front. The M. to the S. of Namur, was part of the main line of defence of Belgium, in the Second World War, stretching N. over Wavre and Koningshoeke to Antwerp. The crossing of the M. was forced in the sector defended by the Fr. Ninth Army at Houx, 4 m. N. of Dinant on May 13. For the operations of the First and Third Amer. Armies on the M. around Namur, Dinant, and Commercy, and St. Mihiel, in Sept. 1914; for details of von Runstedt's Ardennes counter offensive (Dec. 17, 1914) and plan to break through the Allies' thin line of defences in a sudden blitz drive to the M. in the Liège-Namur area; and for the operations in Holland at Nijmegen and

Arnhem over the M. in the autumn of 1944, see WESTERN FRONT IN SECOND WORLD WAR.

Meuselwitz, manufacturing tn. in Thuringia, Germany, 8 m. N.W. of Altenburg. Pop. 10,000.

Meux, Sir Hedworth, see LAMETON.

Mevagissey, pillared fishing station and health resort, 12 m. E. of Truro, Cornwall, England. Pop. 3,500.

Mevis, see NEVIS.

Mewès, Charles Frédéric (1858-1914), Fr. architect, by birth a Fr. Alsatian, his ancestors being emigrants from the Baltic provs. who settled in Strasbourg. He studied under Pascal (q.v.) at the École des Beaux Arts, where he won sev. distinctions. His design of the Palais de Congrès for the exhibition of 1900 gained him the Légion of Honour. He was the first to create a style of architecture and decoration which was generally adopted for hotels all over the world. His contribution to the architectural development of the London of the early twentieth century was noteworthy and it is by that work that his name will be chiefly remembered, as he produced relatively little in his own country. His most significant building in France was the Paris Ritz, entrusted to him by César Ritz, the famous *hôte*, whose name has passed into the language. Situated in the Place Vendôme, this small exclusive hotel became the model for all subsequent buildings of its type and the standard by which the design and equipment of a modern high-class hotel was judged. Soon after the Paris Ritz was opened in 1900 M. came to London to take charge of the interior planning of the new Carlton Hotel in Pall Mall, built from the designs of the Eng. architect Henry Florence. M. and his partner, Arthur Davis, revised the plans and completed the building, with its central palm court. He and Davis were then invited to design the Ritz in Piccadilly and in this they were the pioneers of many innovations. They also designed the old *Morning Post* offices at the junction of the Strand and Aldwych; the club-house of the Royal Automobile Club, which embodies some of M.'s ideas in his earlier hydropathic estab. at Contrexville, and many fn. and country houses, such as Luton Hoo in England and sev. fine houses in Cologne and Hamburg. M. was an exponent of logical and practical planning on axial lines, with a strong feeling for style and proportion, eminently suitable for luxury hotels, clubs, private residences, and, later, for the interiors of mammoth liners, among these latter the *Imperator* (*Beregarria*) in which he collaborated with his Swiss partner, Bischoff.

Mexborough, tn. with potteries and iron and glass works, on the Don, 54 m. N.E. by N. of Rotherham in the W. Riding of Yorkshire, England. There are coal-mines near by. Pop. 17,900.

Mexia, Pedro (1496-1552), Sp. historian, was appointed historiographer to the Emperor Charles V. in 1548. In his *Historia Imperial y Cesarea* (1547) he chronicled the reigns of all the Rom. emperors from Julius Caesar to the

Austrian Maximilian. His chief work is *Silva de l'arta Lectoris* (1543).

Mexican and Central American Native Languages. Unlike N. America (see under NORTH AMERICAN NATIVE LANGUAGES), in Mexico and a great part of Central and S. America (see SOUTH AMERICAN NATIVE LANGUAGES) the native pop. still flourishes. Of the seventeen republics of Lat. America, only three (Costa Rica, Argentina, and Uruguay) are mainly white, nine (Mexico, Salvador, Honduras, Nicaragua, Panama, Venezuela, Colombia, Chile, and Paraguay) are mainly *mestizo*, i.e. of mixed descent, four are mainly Indian (Guatemala, Ecuador, Peru, and Bolivia), and the vast republic of Brazil is about half white.

The native language of Mexico is Aztec, a Nahuatl language, i.e. belonging to the Nahuatl linguistic family. It is spoken by some 650,000 people in N. and central Mexico. The great state of Oaxaca in S. Mexico offers the most complex linguistic situation existing in that country. There are a large number of tribal and linguistic groups, speaking about fifty different languages, which differ greatly in culture. Nowadays, however, the most important native languages are Mixtec, and, especially, Zapotec, which is spoken by sev. thousand people in S. Oaxaca; a Zapotec dialect, called Villa Alta, is spoken in N.E. Oaxaca.

The Mayas, one of the most important and most civilised peoples of native America, still form the bulk of the pop. of Yucatan. They may be divided into three main groups, speaking allied languages: (1) the Mayas proper, subdivided into many tribes speaking various dialects, and numbering about 300,000, in Yucatan, and the neighbouring states of Mexico and Guatemala; (2) the Quiché (some 300,000), between Lake Atitlan and the Pacific, S. Guatemala; and (3) the Huasteca (about 50,000) in Vera Cruz, Hidalgo, Tamaulipas, and San Luis Potosí, already separated from the main stock in ancient times. See also under LINGUISTIC FAMILIES. See LANGUAGES (CLASSIFICATION OF): NORTH AMERICAN NATIVE LANGUAGES; SOUTH AMERICAN NATIVE LANGUAGES.

Mexico (*Estados Unidos Mexicanos*), republic in the N. of the Amer. sub-continent, occupying the S. extension of the continent towards Central America. It is bounded N. by the U.S.A. and S.E. by Brit. Honduras and Guatemala, and has a coast-line of over 1500 m. on the Atlantic (gulf of M.) and of over 2000 m. on the Pacific side. Its area is 760,175 sq. m., and pop. (1946) 22,776,000.

Physical Features.—The elevation upon which M. lies is formed by the mt. range of the Sierra Madre (the Mexican name for the Sierra Nevada) which runs parallel with the E. coast, and which, like the Rockies, is prolonged from the N. into M., the two ranges eventually converging in the narrow isthmus of Tehuantepec or unting to form the Nudo Mixteco or Mixteco Knot. There are steep slopes from this plateau both to the Pacific and the Atlantic or gulf of M. The plateau

between the ranges is known as the plateau of Anahuac, which is broken up into many deep and broad valleys, and surrounded by the peaks of mts., the ridges of which form its surface; it is the region of the anc. Mexican civilisation. This tableland or plateau (of some 270,200 sq. m.) gradually expands in breadth northwards, and remains on an average elevation of about 6000 ft as far as 120 m. from the city of M., after which it gradually declines. In the W. is the long peninsula of California, with a mountainous surface separated from the Mexican mainland by the gulf of Lower California. The Sierra Madre ends in a series of volcanic peaks from Colima

Norte flows from Ciudad Juarez, in the state of Chihuahua, to Matamoros in the state of Tamaulipas. It rises S. of the tn. of Las Cruces in the state of Texas and its course in M. (976 m.) is one of calm and shallow waters reaching great widths in certain places. Its Mexican tribs. are the Conchos and San Juan Rs., besides other streams that considerably augment its volume and enhance its value for irrigation purposes. The largest freshwater lakes are Chapala (70 m. long by 20 wide), Patzeuaro, and Xochimilco. In the N.W. in an arid region are saline lakes. All the littorals, especially those of the Caribbean Sea, Pacific, and gulf of California (also called gulf of Cortez), are

Mexican Embassy

CITLALTEPETL, OR PICO DE ORIZABA MEXICO (18,344 FT.)

(12,800 ft.) on the W. to Citlaltepetl, or Pico de Orizaba (18,311 ft.) on the E. Other peaks are Popocatepetl (17,866 ft.), Ixtaccihuatl (17,114 ft.), and others of considerable altitude, whose summits are covered with perpetual snows. The low-lying lands of the coast are tropical regions below 3000 ft. in altitude; the temperate regions are at an altitude from 3000 to 6000 ft. and the height of the plateau forms the cold region over 6000 ft. The only rvs. of note are the Rio Grande del Norte or Bravo, which forms part of the N. boundary and is navigable for over 60 m. from its mouth in the gulf of M., and the Rio Grande de Santiago, which flows from Lake Chapala to the Pacific Ocean. The remaining streams—Jernna and Balsas, both emptying in the Pacific; Panuco, Papaloapan, and the Coatzacoalcas flowing into the gulf of M.; and the Usamaclinta and Grijalva further S. at the commencement of the Yucatan peninsula—run in mt. torrents between the deep canyons or *barrancas*. The Rio Grande del

dotted with a number of small is., of a total area of about 1931 sq. m. Those in the Caribbean are Mujeres (it was here that the Spaniards first set foot on Mexican ter.) and Cautoy, off the extreme N.E. corner of Yucatan. In the gulf of M. the largest are Carmen and Puerto Real. In the gulf of California are Angel de la Guarda and Tiburon, and, to the S. off the coast of the peninsula, are the is. of El Carmen, San José, Espíritu Santo, and Cerralvo. Maria Madre, Maria Magdalena, and Maria Clefas Is. (commonly known as Islas Marianas) lie off the port of San Blas in the state of Nayarit. W. of the port of Mazzanillo is the archipelago of Revillagigedo, formed by the is. of Roca Partida, San Benedicto, and Socorro. Guadalupe, San Benito, Cedros, and Santo Tomas lie off the S.W. coast of the peninsula of Lower California.

Climate.—M. is divided almost equally by the tropic of Cancer so that the S. half lies in the torrid and the N. half in the temperate zone. From this position M.

should have a hot and uniform climate somewhat cooler in the N., but the altitude and other factors modify such general uniformity and give rise to a considerable variety. The warmer region is S. of the tropic of Cancer, especially in the lowlands up to an elevation of 2600-2900 ft., and here the hottest dist. is the Balsas Valley, the S. part of Yucatan and the coastal zone of Tehuantepec having an average ann. temp. of 28° C. The temperate regions extending N. and S. of the tropic of Cancer along the mt. ranges and the central plateau enjoy a mild climate all the year round. The cold zone is that of the mt. and sierras over 9000 ft. up to 14,000 ft. Only the snowy summits of the highest peaks exceed these altitudes and so correspond to the glacial climes. The coastal regions, especially those of the Isthmus of Tehuantepec and the gulf of M., have the same high temps. and abundant rainfall and belong to the hot and damp type of climate. The Central Plateau enjoys a mild climate throughout its extent. The rainfall of M. varies, but is regular in its seasons. In 15 per cent of the country it rains less than thirty days in the year; in 38 per cent from thirty to sixty days; in 28 per cent sixty to ninety days; and in the remaining nineteen per cent the rainy season is still longer. As a whole the ann. rainfall is estimated at 15½ in. for 30 per cent of the country, 15½ to 31½ in. for 35 per cent, and of over 31½ in. for the remaining 35 per cent.

Races.—The pop. of M. includes the aborigines or Indian races, the white, the *mestizos* or mixed races, and sev. other groups from various nations. The white race penetrated into M. with the arrival of the Spaniards. During the Sp. colonial period the immigration of subjects of other European countries was prohibited, so that non-Sp. immigrants were few. The *mestizos*, who represent about 52 per cent of the total pop., are the descendants of the inter-marriage of European colonisers and natives. Ethnologists have studied the distinctive characteristics of each group of the pure Indian races and subdivide them into families: the Nahoas family, extending from the state of Sinaloa to Tabasco, include numerous tribes, e.g. the Mexicans of the federal dist., the Cholultecas of Puebla and the Tuxtecos of Vera Cruz. The great Mayaquiché family occupies Yucatan and the E. isthmian portion of Tabasco and Chiapa. The Mixtecas and Zapotecas are confined to Oaxaca, and with them dwell other aboriginal groups, such as the Chantotecos of the Papaloapan region. The Tarasca family occupies the Tarasco-Nahua region corresponding to the state of Michoacan, and stretches N. through the extensive tablelands beyond the Lerma R. The Otomies and their branches inhabit the states of M. Hidalgo, Puebla, Queretaro, Guanajuato, San Luis Potosí and Tamaulipas. The Tamaulipicos, Coahuiltecos, and Tobosos form the Atapascans family, and the Opas and Pimas the Pimanas or Sonorense family. The name of N.

Nahoas is assigned to the Yaqui and Mayo tribes, as well as to others of the W. Sierra Madre. Descendants of the Zoques, Chiapas, and others still inhabit the Isthmian region.

Fauna and Flora.—M. breeds all kinds of domestic animals, and aviculture, cattle-raising, apiculture, and sericulture are widely carried on. Fur-bearing animals are scarce, but foxes, otters, and skunks are to be found. There are no dangerous animals, except the rare species of the tigrillo and wild cat. Rabbits and hares are abundant, as also are quail and dove, all these being so much sought as to necessitate restrictive regulations. The flora of the *Tierra caliente* is most striking; Mexican vanilla is famous. Mexican flowers enjoy wide admiration: bougainvillea, camelias, orchids, gardenias, and magnolias in the tropical regions; roses, carnations, and pansies in the temperate clime; and violets, rhododendrons, and dahlias in the cold regions.

Agriculture, Minerals, and Manufactures.—M. imports large quantities of food, although the country is potentially a rich agric. area. There are vast tracts of virgin soil on the central plateau and in the tropical areas, and millions of ac. which have been only superficially worked by the primitive farming methods of the peasants could produce a far higher yield with the aid of modern agric. science and machinery. Systematic irrigation is in its infancy; over 17,000,000 ac. of arable land were farmed in 1946, but only about 12 per cent of this was irrigated. By law the vil. (*ejido*) is the unit for communal land-holding. Up to Sept. 1, 1945, 65,000,000 ac. had been confiscated by the state and redistributed to over 2,000,000 families. Alienation of the land in the *ejido* is not possible, since the state holds the title to it on behalf of the vil. Stock-raising, agriculture, and mining are the chief occupations. The prin. agric. crops are maize, wheat, barley, beans, Chile pepper, coffee, cotton, sugar, tobacco, vanilla, and all kinds of tropical fruit. Other products are chick-peas and chick-gum. The maguey or Mexican aloe is cultivated for the beverage known as 'pulque,' and other species of this plant yield sisal-hemp or henequen and pitafax. Half of the world's supply of sisal is grown in Yucatan. The Mexican forests abound in mahogany, ebony, rose-wood, and caoutchouc trees, large-scale cultivation of rubber being undertaken under supervision by Amer. experts in 1941. There are great numbers of livestock, including 10,000,000 cattle, 1,000,000 sheep, 2,000,000 horses, 7,000,000 goats, and 5,000,000 pigs. M. is potentially the leading silver-producing country in the world, and could meet a demand of 200,000,000 oz. a year. Output to-day is about 40 per cent of world production, but has declined from 86,000,000 fine oz. in 1943 to 61,000,000 oz. in 1946. Other minerals produced are gold, iron, copper, manganese, magnesite, lead, zinc, mercury, and antimony. M. is the fourth largest petroleum producer in the world. Her reserves were estimated at 9,000,000

barrels in 1947. The output of petroleum in 1946 exceeded 49,000,000 barrels; of this, rather less than 20 per cent was exported, the U.S.A. being the biggest single customer. On March 18, 1938, the three large companies which controlled most of the oilfields were nationalised by decree. In 1942 M. agreed to pay the U.S.A. \$24,000,000 compensation for Amer. property confiscated, and five years later promised compensation of \$81,250,000 to former Brit. and Dutch owners of oil properties. The oil-fields employ about 22,200 men and have a refining capacity of 200,000 barrels a day. There are nearly 900 producing oil wells and a dozen refineries. M. is predominantly rural, with, consequently, few industries apart from agriculture and mining and therefore large towns are not numerous. But, though M. is not a manufacturing country, there was a considerable development of manufacturing industries between the two world wars. There are some fifty tobacco factories, 1000 textile factories, and some hundreds of timber mills, metal factories, chemical plants, and food-making plants. In all, according to the 1945 census, there were 28,513 factories, employing 512,400 workers.

Trade.—The trade of M. in 1946 was valued at 2,636,787,000 pesos for imports and 1,915,261,000 pesos for exports. Exports included mainly precious metals, coffee, chicle, and oil. Of the total exports over 70 per cent went to the U.S.A. The chief imports are usually wheat and sugar, but in 1946 these came next in order after trucks and motor-cars. Of total imports 83½ per cent came from the U.S.A., nearly 2 per cent from Britain, 3 per cent from Argentina. From S. and Central America as a whole imports were 7·7 per cent of the total and from the Brit. Empire 3·8 per cent. M.'s heavy adverse balance with the U.S.A. reflects the flow of investments resulting in the reconstruction of Mexican mining, transportation, and manufacturing industries.

Communications.—There are thirty-nine ocean ports, the chief being Vera Cruz and Tampico, both on the gulf of M. Total shipping under the Mexican flag (as at 1940) was 10,368 vessels of 1,658,000 gross tons. There are three railroad lines connecting the centre of the republic with the U.S.A., these being the National Railways, the S. Pacific Railroad, and the Mexican Railway. Two lines run from M. city to Vera Cruz. Another line extends S. to the Guatemalan border, and there are numerous branch lines joining these main arteries. The total railway system exceeds 15,000 m. There are paved highways from Laredo city to M. city, from M. city to Acapulco, Vera Cruz, Guadalajara and Morelia, Celaya, Puebla, Tehuacan, Queretaro, Tampico, Tuxpan, Toluca, and Cuapixtlan. Many new automobile roads have been opened in recent years and many others are still under construction. Fourteen air lines operate in M., whose routes represent a total length of 112,000 m. of airways.

Constitution.—The constitution of 1917,

amending that of 1857, has itself been amended sev. times between 1929 and 1946. M. is a federal republic, comprising twenty-eight states, each autonomous in local affairs. Congress consists of a chamber of 147 deputies, elected for three years by universal suffrage, and a senate of fifty-eight members, two for each state and the federal dist., elected for six years. The president, who is elected for six years, is chosen by direct popular vote at a general election. The president and a council of the heads of depts. and the secretaries of the ministries direct the administration. The seat of the republican legislature, executive, and judiciary is M. city. The judicial power is vested in the supreme court, consisting of twenty-one judges, and also in the dist. attorneys and circuit magistrates. In 1938 women were given equal citizenship and suffrage with men, subject to ratification of this constitutional amendment by two-thirds of the states. The constitution divides the functions of the legislature, executive, and judicial depts. of gov. in a similar manner to that estab. by the constitutions of other Amer. countries and provides the basis on which regulative legislation respecting labour, social services, etc., must be dictated.

M. consists of the following states: Aguascalientes (cap. Aguascalientes) 2,199 sq. m., pop. 161,700; Campeche (Campeche) 19,670 sq. m., 90,500; Chiapas (Tuxtla Gutiérrez) 28,700 sq. m., 679,800; Chihuahua (Chihuahua) 94,800 sq. m., 624,000; Coahuila (Saltillo) 58,000 sq. m., 550,700; Colima (Colima) 2,000 sq. m., 78,800; Durango (Durango) 42,270 sq. m., 483,800; Guanajuato (Guanajuato) 11,800 sq. m., 1,046,500; Guerrero (Chilpancingo) 21,885 sq. m., 733,000; Hidalgo (Pachuca) 8,057 sq. m., 771,800; Jalisco (Guadalajara) 31,149 sq. m., 1,418,300; M. state (Toluca) 8,267 sq. m., 1,146,000; Michoacán (Morelia) 23,200 sq. m., 1,182,000; Morelos (Cuernavaca) 19,160 sq. m., 1,827,000; Nayarit (Tepic) 10,144 sq. m., 216,700; Nuevo León (Monterrey) 25,134 sq. m., 541,100; Oaxaca (Oaxaca) 36,371 sq. m., 1,193,000; Puebla (Puebla) 13,124 sq. m., 1,294,600; Querétaro (Querétaro) 4,432 sq. m., 245,000; San Luis Potosí (San Luis Potosí) 21,415 sq. m., 679,000; Sinaloa (Culliacán) 22,580 sq. m., 493,000; Sonora (Hermosillo) 70,477 sq. m., 364,200; Tabasco (Villa Hermosa) 9,782 sq. m., 285,600; Tamaulipas (Ciudad Victoria) 30,731 sq. m., 459,000; Tlaxcala (Tlaxcala) 1,535 sq. m., 224,000; Vera Cruz (Jalapa) 27,736 sq. m., 1,619,300; Yucatán (Merida) 23,926 sq. m., 418,200; and Zacatecas (Zacatecas) 28,120 sq. m., 565,400. There are also three ters., N. and S. Lower California and Quintana Roo; the federal is., comprising the is. around M., which are inhabited; and the federal dist. (ter. acquired from M. state by the Mexican Gov. for its especial use, comprising M. city and a small area around it). Each state has its own constitution, taxes, and laws; and a governor, legislature, and judicial officers popularly elected. All states must publish and enforce the

federal laws. The governors of the N. and S. ters. of Lower California, of Quintana Roo, and of the federal dist. are appointed by the president of the republic. The judicial power of these ters. is exercised by judges nominated by the supreme court of justice. They have representatives in the federal Congress but have no legislative power.

Education and Religion.—There is, in theory, compulsory free primary education until the age of fifteen, but the census taken in 1940 showed that 54.1 per cent of the pop. over ten years of age was illiterate, and this percentage was doubled in the federal dist. In 1946 there were 69,880 estab. for the education of illiterate adult civilians, while the army had over 150 regimental schools for the instruction of its illiterates. In the federal dist. and in the ters. the national gov. supervises education, but elsewhere it is the concern of state authorities. Boys are compelled to do military drill. The eleven univs. possess a large measure of independence. The National Univ. at M. city (founded 1553) is the most important, and admits women; since 1910 it has been practically autonomous. In 1945 it had over 22,000 students. A time lapse of a generation should show a considerable reduction in the number of illiterates, for there are many modern training colleges for primary and secondary teachers, and many vil. schools have been built during the past thirty years. A fine building, often the best in the vil., is found among the peasants' hovels. It is the focus of new ideas, and the school-master is generally the leader of progressive activities. The 21,000 primary schools have nearly 2,000,000 pupils; 45,000 children attend the secondary schools. Entire reform of agric. education was foreshadowed in a lav. pub. in July 1916. There are twenty-nine industrial and commercial schools, with 14,000 pupils.

The pop. is predominantly Rom. Catholic. Prior to M. attaining independence (see further under *History*) the Catholic Church had immense power in the state, and owned half the property in the country. The bitter anti-clericalism of Mexican Govs. in the nineteenth and twentieth centuries represented the reaction against this situation. The constitution of 1857 completely severed Church from State, and the constitution in force in 1949 was in effect extremely anti-clerical. It strictly confined and regulated the Catholic confession and all others, although the open persecution of the priesthood which was waged by the Calles Gov. (1924-28) had ceased. In 1947 there were about 350 authorised priests; but some latitude was allowed to churches which stood completely aloof from secular affairs, and in 1946-37 many states allowed Catholic churches to reopen. Some religious instruction could again be given to children. But Church property has been considered the possession of the state since 1917, and eccles. bodies forbidden to acquire property in land.

Language.—Sp. is the official language, but the native language is Aztec, belonging to the Nahua linguistic family. In Yucatán natives speak the Maya tongue, but they are as a rule familiar with Sp. (see MEXICAN AND CENTRAL AMERICAN NATIVE LANGUAGES). The Maya civilisation dates from an earlier epoch than the Aztec culture and Maya is an aboriginal idiom. Its origin is prior to the Nahua immigration or source of the various primitive branches such as Tolteca, Chichimeca, Tlaxcalteca, Azteca, etc.

Currency and Finance.—M. informed the International Monetary Fund in 1946 that the unit of account was the peso, valued at 20.5973 cents (U.S.), or 0.183042 gramme of fine gold. The peso was pegged at 4.85 to the dollar at the end of 1911, but was later freed. The old Sp. measures are still used, although the metrical weights and measures system was officially enforced in 1928.

The estimated revenue (budget) in 1948 was 2,050,000,000 pesos and expenditure, 2,300,000,000 pesos. National debt (Dec. 31, 1947) was as follows: Consolidated, 1,482,700,000 pesos; floating, 195,800,000 pesos; and external debt, 230,630,000 pesos.

Chief Cities with Population at the 1940 Census.—M. city, 1,448,100; Guadalajara, 236,600; Monterrey, 190,100; Puebla, 148,700; Mérida, 115,200; Aguascalientes, 104,300; León, 103,300; Toluca, 98,000; San Luis Potosí, 97,800; Culiacán, 93,300; Torreón, 87,800; Tampico, 84,000; Chihuahua, 78,800; Morelia, 77,600; Vera Cruz, 75,800; Saltillo, 75,700; Querétaro, 73,000; Mazatlán, 63,300; Durango, 62,200; Centro, 62,000; Irapuato, 60,600; Pachuca, 59,400; Ciudad Juárez, 55,000; Jalapa, 46,800.

Population.—Estimated pop., Dec. 31, 1946, was 22,776,000, an increase of 15.8 per cent since 1940.

History.—In the absence of all definite evidence, and in the face of an unparalleled dearth of contemporary MSS., it is impossible to fix, with any degree of certainty, the earlier events in Mexican hist. We know that about the seventh century of the Christian era the Nahua nations began to settle in the valley of M., and a leading tribe, the Toltecs (probably meaning artificers), founded a city named Tollan on the site of the present vil. of Tula, about 30 m. N.W. of M. city. This kingdom long flourished and was a centre of civilisation. This archaic civilisation, in the eleventh century, fell before the assaults of another Nahua tribe, the Chichimecs, and these adopted the arts and culture of the race they had overthrown. The various subdivs. of this family founded cities throughout a tract of ter. commensurate with modern M. Of them the Aztecs were the chief, and they founded the city of Anahuac or M., and at the time of the Sp. conquest they had attained a widespread suzerainty. On the coming of the Spaniards under Cortez in 1519, Aztec rule was finally overthrown, chiefly by means of the assistance the Spaniards received from the peoples who had been subjugated by

the Aztecs. After the disgrace of Cortez M. was governed by a viceroys and council for nearly three hundred years.

In 1821, after a prolonged revolutionary campaign, the independence of M. was secured, and an emperor, Augustin de Iturbide, seated on the throne. He abdicated in 1823, but, attempting to return, was shot in the following year. M. was proclaimed a republic in 1824. In 1846 there was war with the U.S.A., which ended in the defeat of M. New M. and Upper California were ceded to the conquerors, who, however, paid compensation of \$15,000,000. In 1863, through the intervention of Napoleon III. of France, the unfortunate Maximilian, an Austrian archduke, was created emperor of M. His reign was brief, and despite President Porfirio Diaz obtained control Fr. assistance he was deposed and executed. After a long period of anarchy, of affairs. He did far more to bring the republic into line with other civilised communities than any of his predecessors. After a long and prosperous term of office a series of revolutionary movements destroyed his power and in 1911 he was forced to fly the country. His successor was Madero, but complete anarchy had set in, and in 1913 he was murdered. The next president was Gen. Huerta, who seemed likely to restore order and began to rule with a strong hand. However, he incurred the hostility of the U.S.A., who favoured his rival Carranza, and in 1914 he was forced to fly; thus the last prospect of order in M. vanished. Carranza managed to hold power for some six stormy years, but in 1920 he was assassinated. Obregon and Calles, who were the next presidents, effected some improvements, and order and prosperity began to return, but Obregon, on the eve of his second term as president, was assassinated in 1928. Calles, who was president from 1924 to 1928, carried out various reforms, but his administration was marked by a bitter struggle between Church and State. Up to this time the constitutional provisions curtailing religious liberties had been almost wholly otiose. The Mexican Catholic episcopate chose this time to attack these provisions, being encouraged thereto by an apostolic letter of Pope Pius XI. expressing sympathy with the Mexican clergy on account of the 'wicked . . . regulations and laws' against 'the Catholic citizens of Mexico.' Calles, however, refused to modify the law, and churches or church property which had not then been nationalised were taken in control by gov. agents, though the churches were kept open for worship. The gov. offered to transfer the custody of the churches to the clergy if the latter agreed to recognise the law. This led to outbreaks, which were suppressed, and many members of the episcopate were deported (1927) (see further under *Religion and Education*). There was an abortive revolution in the early spring of 1930, when many army units maintained under the leadership of Gen. Aguirre. Calles was then invited to become war minister to cope with the rebels. The U.S. Gov.

greatly assisted the federal gov. by announcing that they would continue to pursue a policy of extending moral and material aid to the latter and continue the 1924 embargo on munitions. The Amer. Gov. also sent supplies of rifles and small arms ammunition and bombs to the federal gov., and the further announcement that they would not recognise the rebels as belligerents had of necessity the effect that the latter were unable to borrow on the Amer. market or declare a blockade or forfeit contraband. Sev. severe engagements followed, notably the battle of Reforma, near Jimenez, but the revolt was short-lived, and after the capture and execution of Aguirre the revolt collapsed. The remainder of the year saw peaceful conditions under the administration of President Portes Gil, who succeeded Calles, the latter having been driven into exile in the U.S.A. (1936). In the ensuing elections, which were conducted without disturbance, either during the campaign or at the polls, Pascual Ortiz Rubio, a candidate of the so-called Revolutionary party, was elected by an enormous majority, polling over 1,800,000 votes, or practically 100 per cent of the votes cast, but he soon resigned and was succeeded in 1934 by Gen. Cardenas.

Relations between Church and State are strained and there is in M. no true religious liberty. Recently an arrangement was concluded between the national bishops and the gov. office-holders through whose acquiescence the Church was allowed to restore public worship and, to some extent, administer to the spiritual welfare of her children in M.

A question which agitated M. for five years (1937-41) was that of the ownership and control of the oil resources. In 1937 President Cardenas promulgated a decree which aimed at bringing all these resources under national control. Power was vested in the president to transfer to the National Petroleum Corporation leases to foreign countries as they expired. In a dispute between the foreign oil companies and their employees the federal board made an award mulcting the companies in nearly \$2,000,000 and, as the latter made no attempt to carry out the award, the gov. declared their property expropriated. The companies, sceptical of the Mexican offer of indemnification, appealed to their respective gov's. Meanwhile one result of taking over the oil-fields was that the gov., eschewing its democratic ideology, contracted to supply both Germany and Italy with oil. These attacks on foreign capital reacted unfavourably on the country's economic condition and created unrest among the propertied classes, and there was a short-lived revolt in 1938 under Gen. Cedillo, a guerrilla leader. In 1940 Cardenas was asked by the U.S. Gov. to submit the oil dispute to arbitration. By now the gov., in view of the heavy decrease in petroleum exports in consequence of the war, decided to reduce expenses by reorganising the industry in such a way as to involve restrictions on labour. But in view of the

country's sympathy for the Allies' cause this did not jeopardise the gov.'s prospects at the election (1940) and Gen. Camacho, the nominee of Cardenas, was elected by an overwhelming majority. The oil question was eventually settled in 1941 on the basis of expert valuations and a cash deposit by the Mexican Gov. of \$9,000,000; and, at the same time, the gov. agreed to pay \$40,000,000 in settlement of the long-standing general and agrarian claims by Amer. citizens.

M. is to-day preponderantly a democratic nation, and in 1936 Calles, who had then been almost a dictator for eleven years, was expelled for opposing the gov.'s efforts to set up a dictatorship on the Soviet model. The democratic sympathies were shown during the Sp. civil war, when M. exported considerable supplies of arms and ammunition to the Sp. Gov. The Camacho Gov. fully realised the danger to M. implicit in the aggressive designs of the Axis powers and therefore readily responded to the various proposals made by the U.S.A. in 1941 for closer co-operation and settlement of outstanding differences. For its part, the gov. took prompt measures for the improvement of ports, the expansion of air bases, and the increase of the army. A trade agreement was concluded with the U.S.A. which provided for the purchase by the U.S.A. of all M.'s surplus products and the export by M. of certain materials only to the U.S.A. or to Latin-Amer. nations which exercised export control, thus depriving Japan of one valuable source of supply of metals and minerals. The murder in M. in 1940 of Leon Trotsky, who had been granted an asylum there some years previously, involved the gov. in difficulties with the Communists, who were assumed to be responsible for the outrage. But the incident was soon forgotten in the world's greater tragedy, and by the end of 1941 M. had broken off relations with the Axis states and the country prepared for war, Gen. Cardenas being appointed commander-in-chief. M. completed central Amer. solidarity by a formal declaration of war on June 2, 1942, as a response to Axis sinkings of Mexican ships. Relations with Britain, severed in 1938 during the oil expropriation dispute, were resumed but nothing was done to settle the Brit. claims. Up to the autumn of 1943 M.'s contribution to the war was wholly represented by the supply of strategic materials, but President Camacho in an address to Congress (Sept.) stated that, if necessary, M. was ready to take a more direct part. More than 11,000 Mexicans were then already enlisted in the Amer. forces. On Jan. 27, 1945, the final report of the Mexican-Amer. commission for economic co-operation was issued: it dealt with industrial development, agriculture, aviation, highway transport, and tourism. In the same month, in Congress, Camacho pledged M. to continued collaboration with the United Nations. It was on the initiative of M. that a conference of foreign ministers of all the member states (excepting Argentina) of the Pan-Amer.

Union was opened at M. city (Feb. 1945). The succeeding year was marked by the drawing closer of the ties of friendship with the U.S.A. In March 1947 President Truman paid a visit of goodwill to M. city and emphasised America's adherence to the principles laid down by F. Roosevelt regarding relations with the other Amer. republics. President Miguel Alemán—who was elected president by popular vote on July 7, 1946, and assumed office on Dec. 1 of that year—paid a return visit to Washington (April 1947), where he addressed the Amer. Congress. During the Second World War M. had been in the favoured position of selling in a world market which would absorb all its production. But with the end of the war her trade balances became adverse, draining the country of dollar credits. In 1946 inflationary conditions, bad in all Lat.-Amer. countries, compelled the gov. to prohibit the importation of luxury goods and to raise the duties on semi-luxury articles. President Alemán began his term of office with a programme of sound economic reforms combined with one or two references to social security. It was in this year that formal agreements were reached for the settlement of the Brit. and Dutch oil expropriation claims. These claims for \$250,000,000 were scaled to \$21,225,000. Also, a final payment of \$4,085,327 was made to U.S. firms, bringing the total U.S. payment to \$29,137,700. In Nov. 1947 M. city was *en fêre* for the general conference of Unesco (q.v.).

Archæological Research.—The anct. monuments and other traces of their life and art executed by the aborigines give a high estimation of the degree of civilisation to which they had attained. In many parts of the country, especially at Cholula, Papantla, Tula, and Xochicalco, are found graduated pyramids known as Teocalli, or 'Houses of the Gods', constructed of mounds of earth faced with masonry, in some instances elaborately carved. The fearful rite of human sacrifice was common; some authorities consider that 20,000 victims were destroyed annually in the cap. alone. On the summit of these pyramids the sacrifices took place to the god Tezcatlipoca, 'the soul of the world,' or to Huiztlopoctli, the god of war, or to Tlaloc, the rain god. Few traces of domestic architecture remain.

The form of gov. was elective monarchy, which was almost absolute, though the king was expected to confer with his council before deciding upon any important step. There was a well-defined code of laws, and the standard of morals was high. Wars were frequent, and the arms and armour of the Aztecs, though inadequate to oppose the Spaniards, were elaborate. The Mexican rank and file wore no armour; the chiefs had quilted cotton tunics and some reinforced them by thin plates of gold or silver. Their missile weapons were slings; bows and arrows, and javelins, pointed with bone or copper. Their warfare with the Spaniards resembled that of the Persians against the Gks. Prisoners-of-war were usually reserved for sacrifice.

The Aztecs were highly cultured, and, besides possessing a rudimentary system of picture writing, they were extraordinarily gifted in the pictorial and minor graphic arts, and especially in feather work, of which the garments of the upper classes principally consisted. Prescott remarks that the Aztecs and the Incas far surpassed all other races on the American continents in civilisation. The Mexican civilisation, though inferior to that of Peru in political capacity and most of the arts, was sufficiently imposing, and its ruthless destruction was a loss to the world. As will be seen in the article MAYAS, archaeologists have, in recent years, shown great interest in Mayan culture, more especially in Brit. Honduras. In M., however, the U.S. Gov. has assisted research work to considerable effect. Notable stone carvings have been found at Tenayuca, a site which has, in the opinion of experts, been continuously occupied since the Archaic period.

Art and Culture.—Not only did the Aztecs produce a massive, well-proportioned architectural style, the remains of which still survive. They also cut many delicate miniature figures from crystal and jade, and showed a high degree of skill in fashioning copper and gold ornaments. Their craftsmanship is at its finest in the sacred masks used in religious celebrations; many of these are extant, and are encrusted with elaborate and fanciful patterns of pearls, turquoise, and other jewels, in which a feather motif predominates. The Aztecs' unusual and effective colour combinations are still favoured by the Mexican peasant. The Sp. conquerors introduced renaissance and baroque styles. But Sp.-Mexican architecture shows marked signs of Mexican-Indian influence, even at the time when every effort was being made to eradicate all traces of the Indian civilisation. This is particularly noticeable in church architecture; baroque is often simply a basis on to which Indian masons and artists have moulded their traditional patterns. Churches are frequently decorated with multicoloured, polished glass, wood, or stone ornamentation; beaten metalwork is worked in Indian designs. Examples of this fusion in M. city include the churches of St. Fernando and St. Francisco, and the facade of the cathedral. Prov. architecture bears still stronger traces of Indian style, as at Pueblo and Morelia. Both Sp. and Indian strains in art survive to-day, together with an abundant oral literature of myth and legend, which is being consciously invoked by modern Mexican artists in their determination to create a truly Mexican culture, while at the same time absorbing the artistic influences of Europe and N. America. (For *Literature* see SPANISH-AMERICAN LITERATURE.)

Mexico, state of the republic of M., with Guerrero and Morelos to the S., and Hidalgo to the N. The federal dist. is an enclave in the state. Popocatepetl volcano is in the mts. which comprise the central and S.E. dists. Gold and silver mining and stockbreeding are carried on; tobacco, coffee, sugar, and cereals are grown; and there are manufs. of glass, pottery, and textiles. Cap. Toluca. Area 8267 sq. m. Pop. 1,146,000.

Mexico City, cap. of the United States of Mexico. It is the chief Lat.-Amer. cap. after Buenos Aires in point of pop., and far superior in historical associations. It is 16 m. in circumference, covers 15 sq. m., and is situated in a fine valley, the valley of M., on the Anahuac plateau, well above sea level, at the S. extremity of the Mesa tableland and near the former lake of Texcoco. Its high elevation (7350 ft.) ensures an equable climate. The range of temp. is 20-85° F. with 58° as a mean; the nights are always cool; normal ann. rainfall is 26 in. No other city in the new world is richer in historical tradition or romantic lore. It was the heart of the Aztec culture, and on its broad plaza stands the great Teocalli or sacrificial pyramid. Tenochtitlan, the veritable Mecca of M. When Cortez first saw M. it was built on an is. in a large lake, with causeways to the shores. The lake has been reduced by drainage and dessication, and much of the new city has spread over the dried bed. After the conquest the city became the cap. of 'New Spain' and the seat of viceroys, and, even though the rule of Iturbide, its first national emperor, was short, the city could boast of being the cap. of the third largest empire of the world, ranking only after China and Russia. The greatest names in its list, are those of Juarez, the lawyer-president, Hidalgo, the priest liberator, and Morelos, another champion of popular liberties. Generally speaking, the city is spacious and pleasing. The plaza, or zocalo, is over 300 yds. long and is overlooked by the splendid cathedral whose two towers rise to over 200 ft. and are a conspicuous landmark. The cathedral (the foundations of which were laid in 1573 and the whole building completed in 1811) stands upon the site of the Teocalli: it is 400 ft. long by 200 ft. wide, and is in the form of a Gk. cross; it has twenty-two side chapels,

an altar of marble columns, a balustrade with sixty-two statues, a giant candelabrum of precious metals, and some twenty Doric columns support the vaulted roof, while rich carvings and gildings and some rare paintings adorn the walls. This cathedral is probably the finest ecclesiastical building on the Amer. continent. The city is laid out with geometric exactness; the streets are wide and handsome, though the chief business thoroughfare, the Plateros, is narrow. This street is, however, lined with many magnificent shops. Near the plaza is the Palacio Nacional, containing the gov. depts.; the museum observatory; the senate, and other im-

portant institutions. Over the portals of the Palacio hangs the 'liberty bell' of Hidalgo, which is rung by the president at midnight on the anniversary of Mexican independence. The present Palacio replaces another which was destroyed in 1689. It was built in 1691, but the top floor was added by President Calles. The museum contains among other interesting objects the Calendar Stone, assigned to Toltec culture, and the Sacrificial Stone which was found in the ruins of the great Teocalli. Among other important buildings are the national library, containing 1,250,000 books; the Minería or school of mining engineering (one of the oldest buildings); the new legislative house, palace of justice, univ., and the Monte de Piedad or state pawnshop (this latter founded in 1775). A beautiful example of Churrigueresque architecture survives in La Merced Monastery, in the N. quarter of

buildings are the post office, E. of the National Theatre, and the Palace of Fine Arts Theatre—the domes of the halls and theatre proper are lavishly ornamented with coloured stone. From the city the Paseo de la Reforma, a broad boulevard, extends in a N.-westerly direction for some 3 m. to the castle of Chapultepec, one of the residences of the presidents. The older suburbs, or residential centres, are Tacubaya, San Angel, Tlalpan, all quaint and attractive. On account of marshy subsoil interlacing steel rafts provide the foundation for many buildings in the city.

The city is a general clearing-house for

E.N.A.

portant institutions. Over the portals of the Palacio hangs the 'liberty bell' of Hidalgo, which is rung by the president at midnight on the anniversary of Mexican independence. The present Palacio replaces another which was destroyed in 1689. It was built in 1691, but the top floor was added by President Calles. The museum contains among other interesting objects the Calendar Stone, assigned to Toltec culture, and the Sacrificial Stone which was found in the ruins of the great Teocalli. Among other important buildings are the national library, containing 1,250,000 books; the Minería or school of mining engineering (one of the oldest buildings); the new legislative house, palace of justice, univ., and the Monte de Piedad or state pawnshop (this latter founded in 1775). A beautiful example of Churrigueresque architecture survives in La Merced Monastery, in the N. quarter of

the transit trade of the country, but its industries, which include the manuf. of tobacco and saddlery, are on a small scale. It is well supplied with water by means of two aqueducts. Although the climate is dry, healthy, and temperate, M. C. has hitherto had a reputation for unhealthiness, owing to unsatisfactory sanitary conditions, which, however, are now being improved. The death-rate is about 50 per 1000. From M. the snow-covered peaks of the volcanoes Popocatepetl and Ixtaccihuatl can be clearly distinguished. M. C. has been termed the 'Paris of America'; it is cosmopolitan in character. Pop. (1940) 1,148,400, (estimated 1949) 1,651,800.

Mexico, Gulf of, great inlet situated between U.S.A. on the N. and M. on the W. and S. It has an area of some 800,000 sq. m., and is entered by the Gulf Stream, which sweeps its shores in a semicircle. It is subject to sudden wind-storms.

Meyer, Felix (1653-1713), Swiss painter, became famous by executing a series of frescoes for the abbey of St. Florian (Upper Austria). Deficient in the art of figure drawing, he excelled in portraying the beauties of his native landscape.

Meyer, Hans (1858-1929), Ger. explorer, b. at Hildburghausen. He was director of the Bibliographisches Institut, 1885-1914. After exploring Ger. E. Africa he ascended Kilimanjaro; in 1889 reached the summit of Kibo and found the crater, and studied the volcanoes and glaciation of Ecuadorian Cordilleras in 1903. In 1911 he made another long expedition in E. Africa. From 1915 to 1928 he was prof. of colonial geography and colonial politics in the univ. of Leipzig. His explorations are recorded in *Eine Weltreise* (1884); *Zum Schneedom des Kilimanjaro* (1888); *Ostafrikanische Gletscherfahrten* (1890); *Gegenwart und Zukunft der deutschen Kolonien* (1916); *In Tälern und Höhen des Himalaja* (1926); and *Koloniale Studien* (1928).

Meyer, Heinrich (1759-1832), Ger. painter and art critic, made the acquaintance of Goethe in Rome (1786), and in 1797 settled down in Weimar, where he enjoyed the great poet's friendship, and inspired him, it seems, with many of those opinions on art and aesthetics which appeared in *Kunst und Alterthum*; *Winckelmann und sein Jahrhundert* (1805, with Goethe), etc. Besides editing Winckelmann's works (1808-20) M. himself composed a hist., badly arranged, of Gk. and Rom. art (1821).

Meyer, Heinrich August Wilhelm (1800-1873), Ger. Protestant divine and exegete, b. at Gotha, studied theology at Jena. He became pastor in 1841, but gave up the active ministry in 1848 and settled in Hannover. His great work was his N.T. commentaries, which appeared in the monumental *Kritisch-ergetischer Kommentar zum Neuen Testament* (16 vols., 1832-59), of which he was chief author.

Meyer, Julius Lothar (1830-95), Ger. chemist, b. at Varel, Oldenburg, studied medicine at Zurich, chem. under Bunsen at Heidelberg, and physics at Königsberg under Neumann. Virchow was his teacher in pathology, but under the influence of K. F. W. Ludwig and Kirchhoff he turned his attention to physiological chem. and mathematical physics. In 1859 he began to lecture on physics and chem. at Breslau. During the Franco-Prussian war he tended the sick and wounded at Karlsruhe Polytechnic. From 1876 onward he held the chair of chem. at Tübingen. In his *Die modernen Theorien der Chemie* (1864) he helped to develop the startling theory of the periodic classification of elements, and recalculated the atomic weights.

Meyer, Victor (1818-97), Ger. chemist, b. at Berlin. He became prof. of chem. at Zürich in 1872, at Göttingen in 1885, and four years later succeeded Bunsen, his old master, at his own univ. of Heidelberg. Besides important work in organic chem., he discovered thiophen and a convenient method of ascertaining the density of vapours. He was awarded the Davy

medal by the Royal Society in 1891. See life by R. Meyer, 1917.

Meyerbeer, Giacomo, really **Meyer-Beer** (1791-1864), Ger. musical composer of Jewish extraction, b. in Berlin, son of Herz Beer, a banker. He appeared as a prodigy pianist at the age of six, and studied under Clementi, Zelter, and the Abbé Vogler. Abandoning his early intention of being a pianist, he went to Venice to study composition (1815), where he composed sev. lit. operas in the style of Rossini, none of them of any importance except the last, *Il Crociato in Egitto* (1824). In 1826 M. took up his abode in Paris, where his chief operas were produced: *Robert le Diable* (1831); *Les Huguenots* (1836); and *Le Prophète* (1843). Meanwhile he received the appointment of *kapellmeister* to the king of Prussia and, in Berlin, produced a Ger. opera entitled *Ein Fiedlager in Schlesien*, in which Jenny Lind (q.v.) made her first appearance in Prussia, and was his prima donna thereafter. Weber was his life-long friend, and it was Weber who had persuaded M. to give up imitations of It. opera despite his success in them. In Berlin M., after the death of Weber, produced the latter's *Euryanthe* and, with equal selflessness, procured the acceptance of *Renzi* and *Der fliegende Holländer*, the earliest of the operas of Wagner, who was then living in poverty and exile. In 1854 he produced *L'Étoile du nord* at the Opéra comique, and in 1859 *Le Pardon de Ploermel*. His last major work was *L'Africaine* (1865), a revision of which was in preparation at the Académie when he was seized with a sudden illness and d. The opera was, however, produced with scrupulous attention to M.'s ideas.

M. is one of the most important figures in the hist. of Fr. opera, both *grand* and *comique*. His work is remarkable for its brilliant effects and powerful climaxes, rather than for any mastery of form or coherence. He wrote much instrumental and choral music of a less ambitious nature, and about forty songs.

Meyeroth, Otto Fritz (b. 1884), Ger. physiologist, b. at Berlin, educated at Königliche Wilhelms gymnasium, Berlin. Prof. at Kiel, 1918-24, he was a member of the Kaiser Institute for biology, Berlin-Dahlem, 1924-29, and director of research at the Institute of biology, Paris, 1935-40. He investigated conversion of energy and process of spasm in muscles, publishing *Energy transformation and Chemistry of Muscle* (1922), and shared the Nobel prize for physiology and medicine with A. V. Hill, in 1923. Other pub., on respiration and fermentation of cells and enzymes (in Eng.): *Chemical Dynamics of Life Phenomena* (1924) and 'Chemical Studies on Muscle' in *Journal of General Physiology* (1926).

Meyer-Lübke, Wilhelm (1861-1936), Ger. philologist, b. at Dübendorf. He studied at Zürich and Berlin, and in 1887 was made prof. of romance philology at Jena, holding the same chair at Vienna Univ. in 1890. He pub. *Grammatica Linguae Graeco vulgaris*, by S. Porcius, with a grammatical and historical commentary, and *Grammatik der romanischen*

Sprachen (1890–1900), which is his greatest work.

Meynell, Alice Christiana (1849–1922). Eng. poet and essayist, daughter of T. J. Thompson. She spent most of her young days in Italy. Her first vol. of verse, *Preludes* (1875), was illustrated by her sister, Lady Butler, the painter of 'The Roll Call,' and won warm praise from Ruskin. Then, for nearly twenty years, poetry was left aside for marriage (to Wilfrid M., q.v.) and journalism. For A. M. children were part of marriage. Her *Poems*, pub. in 1895, definitely estab. her fame, while her *Rhythm of Life*, pub. at the same date, placed her in the front rank of living writers in prose. This was followed by *The Colour of Life and other Essays* (1896); *The Children* (1896); *The Flower of the Mind* (1897, an anthology of Eng. verse); and *The Spirit of Peace* (1898). She also ed. the *Selected Poems of Hake* and the *Poetry of Pathos and Delight* of Patmore, and contributed to the *National Observer*, the *Pall Mall Gazette*, the *Saturday Review*, etc. Among later works are *London Impressions* (1898); *John Ruskin* (1900); *Later Poems* (1901); *Children of the Old Masters*, *Italian School* (1903); *Ceres Runaway* (1910); *Mary, Mother of Jesus* (1912); *Collected Poems* (1913); *Essays* (1914); and *Last Poems* (1923). Her writing is akin to that of Christina Rossetti in fine and delicate craftsmanship. Her poetry, it is said, consists less of sounds than of silences. This is also true of her prose. She was at once impassioned and austere, but her emotions were under severe control to the end, that her reticence might prevail. See life by Viola Meynell, 1947.

Meynell, Sir Francis (b. 1891), Eng. book designer and typographer, the younger son of Wilfrid M.; educated at Downside, and Trinity College, Dublin. From 1918 to 1920 he was a director of the *Daily Herald* and in 1923 founded the Nonesuch Press (q.v.), which became known for many well-produced and scholarly eds. of standard authors. The press also pub. the successful anthology, *The Week-end Book* (1924), of which M. was co-editor. In 1945 M. became a member of the Council of Industrial Design, and from that date has been typographic adviser to H.M. Stationery Office. During the Second World War he was adviser to the Board of Trade. He was knighted in 1946. Pubs.: *The Typography of Newspaper Advertisements* (1929); *Seventeen Poems* (1945); and *English Printed Books* (1946).

Meynell, Wilfrid (1852–1948), Brit. journalist and editor, poet and essayist, b. at Newcastle upon Tyne, son of an affluent small-coaliery owner and husband of Alice Thompson (see MEYNELL, ALICE CHRISTIANA). In their early married days M. and his wife pub. the *Pen*, a critical monthly review of brief existence. A more significant joint venture was *Merry England*, a monthly of twelve years' duration, the contributions to which were largely their own work. M., who left the Society of Friends for the Rom. Catholic Church at eighteen, ed. for Cardinal Manning, his greatly revered friend, the

Register, which he conducted according to a home rule and 'Young England' policy, in contrast with that of the *Tablet*, which was the paper of Rom. Catholic Toryism. Meanwhile M. was writing stories, verse, and articles, sometimes under his own name and sometimes as 'John Oldcastle,' as in his practical handbook, *Journals and Journalism* (1880), as 'Francis Phillimore,' and anonymously. Throughout the forty-five years of their married life M. and his wife collaborated in numerous literary projects of one kind or another. Alice M. d. in 1922, and M. survived her for twenty-six years. His 'services to literature,' a phrase which properly covered his devoted help to many young writers, as well as his own voluminous writings, including the editing of a sixteen penny series of classics, were publicly recognised when he was ninety by the award of the C.B.E. Perhaps his greatest service to literature was his discovery of Francis Thompson some time after the starving poet had sent to *Merry England* a contribution written on blue sugar-bag paper. When at last M. read it he sought the poet everywhere until he found him. For nineteen years Thompson was an adopted son in or near the M. household. M. not only ed. Thompson's collected works, but also pub. them. Of his own writings, which are mostly uncollected from the literary monthlies and weeklies of the nineties, his story *Aunt Sarah and the War* (1914) had the largest public success.

Meze, seaport in the dept. of Ilérault, France, 20 m. S.W. of Montpellier. Wines are made and salt is an important product. Pop. 5000.

Mezen: 1. Tn. and seaport in the Archangel Region of the R.S.F.S.R., 15 m. from the mouth of M. R. There are saw-mills and wood-working plants, and paper manufs.; timber is exported. Pop. 1800. 2. Riv. of N. Russia, with a length of 515 m., which flows into the White Sea through M. Bay.

Mezeray, François Eudes de (1610–83), Fr. historian, b. near Argentan, and educated at Caen Univ. and in Paris. After serving in two or three campaigns in Flanders he pub. his *Histoire de France*, on the completion of which, in 1651, he became historiographer of France and a member of the Fr. Academy. He also wrote *Histoire des Turques*, 1612–1649.

Mezereon, or *Daphne mezereum*, small fragrant shrub (family Thymelaeaceae, indigenous to Britain, with fragrant red or white flowers borne in Feb. and followed by red berries. It is poisonous, but has medicinal uses.

Mezhels, see under SENCUSI.

Mézières, fort. tn. in the dept. of Ardennes, France. Founded in the ninth century it now has ammunition factories and copper foundries. Captured by the Gers. in Aug. 1914 it suffered heavy destruction on their withdrawal in 1918 (see also MANGIN). Pop. 10,200.

Mező-Beregy, manufacturing tn. 6 m. N.W. of Békés, Hungary. Pop. 13,000.

Mezőhegyes, mkt. tn. of Csanád co., Hungary, 30 m. N.E. of Szegedin. There

is horse breeding and sugar refining. Pop. 7500.

Mezőkövezsd, tn. in Borsod co., Hungary, 50 m. W.N.W. of Debreczen. Pop. 20,800.

Mezőtúr, mrkt. tn. of Hungary, near Debreczen, with manufs. of pottery. Pop. 28,100.

Mezozoth, or **Mezurzah**, narrow hollow strip of wood or other substance, with a piece cut out near the top and containing a scroll of parchment on which are written or printed selections from the chapters of the Sherrai (Deut. vi. 4, 9, and xi. 13, 20). On the back of the scroll is written the Heb. word 'Almighty,' and this is left exposed when the scroll is fixed in the case. The M. is hung up outside or inside Jewish houses. All Jews, when either going in or coming out of a dwelling, touch the word with their right hand, and repeat the eighth verse of Psalm cxxi.: 'The Lord shall preserve thy going out and thy coming in from this time forth and even for evermore.' See M. Friedlander, *Text Book of Jewish Religion*, 1891.

Mezzanine, see ENTRESOL.

Mezzofanti, Giuseppe (1774-1819), It. linguist and cardinal, was the son of a carpenter, and b. at Bologna. He was educated in his native city, and in 1797 became prof. of Arabic in the univ. there, and later assistant librarian of the institute and prof. of Gk. In 1831 he went to Rome, and having attracted the attention of Pope Gregory XVI. was made a cardinal in 1838. He acquired a considerable reputation as a linguist, and spoke in all some fifty-eight languages. See lives by C. W. Russell, 1855, and A. Bellesheim, 1890.

Mezzo-soprano, species of voice which has a somewhat lower range than a soprano, but is higher than a contralto. It is the voice more usually found in women, and has a varying compass generally from A beneath the treble stave to F on the fifth line.

Mezzotint, method of engraving invented about the middle of the seventeenth century, and known on the Continent as 'la manière anglaise.' Mts. are engraved on copper, which, in the early part of the nineteenth century, were sometimes steel. The method of mezzotinting is to cover the surface of the plate, in all directions, uniformly with fine dots, sometimes as many as one hundred to the inch, by means of a rocker or a roulette. The former is a chisel-shaped instrument with a slightly curved edge, serrated with fine teeth. A print from the plate so prepared, in consequence of the number of cavities and the burr raised round them, would appear a deep uniform black. The plate is then worked on with a 'scraper' to obtain the high lights, and the burnisher is finally used to obtain the highest lights, the artist working from dark to light. Mezzotinting was introduced about the reign of Charles I. by Prince Rupert, the inventor being L. von Slogen, and the great exponents of the method are J. R. McDell, Fisher, Dixon, V. Green, J. R. Smith. See also ENGRAVING.

Mfumbiro, chain of volcanic mts. near

the S.W. boundary of Brit. E. Africa. It consists of two groups: the W. which lies directly N. of Lake Kiya, and contains the active volcanoes Kirungacha-gongo and Kirunga-namagira, and the E. where the loftiest peak is Karissimbi (14,683 ft.).

Mglin, tn. in the Chernigov Region of the Ukrainian S.S.R., about 125 m. N.E. of Chernigov. Pop. 8000.

Mho (the reciprocal of the ohm), practical unit of electric conductivity. Thus if a wire had a resistance of 10 ohms its conductivity would be $\frac{1}{10}$ or 0.1 mho.

Mhow, tn. in Indore, India, with a military cantonment. Pop. (including garrison), 40,000.

Miagao, trading and manufacturing tn. on the S. coast of Panay Is. in the Philippines. Pop. 25,000.

Miami, tribe of N. Amer. Indians, belonging to the Algonquian family which originally inhabited Wisconsin. The survivors live on a reservation in Wabach co., Indiana. They took the side of the Eng. in the Amer. war.

Miami: 1. City and co. seat of Dade co., Florida, U.S.A., on M. R. and Biscayne Bay. It is the centre of a country famous for the production of grape-fruit, pineapples, and winter vegetables, and there is a considerable amount of fishing. There are sponge fisheries in Biscayne Bay. M. is just N. of the tropics, and is a flourishing winter health resort. It is studded with skyscrapers like a small New York. It is an important taking-off ground for air services to the W. Indies and S. America. It is subject to visitation by hurricanes, the worst occurring in 1926. Pop. 172,100. 2. Riv. in Ohio, joining Ohio R., in the S.W. of the state. Length 155 m.

Miami University, state univ. in Oxford, Ohio, U.S.A., founded in 1809. It has nearly 600 students, and a library of 40,000 vols. The study of Pan-Amer. problems is a speciality.

Miani, or **Meeanee**, vil. in Sind, India, on the Indus, 5 m. N. of Hyderabad. A battle was fought here in 1843.

Miaotse, aboriginal tribes inhabiting the mt. dists. of S.W. China. They originally occupied the central prov. of the empire, but were driven S.W. to their present abode by the Chinese.

Miaskovsky, Nikolai Yokovlevich (b. 1881), Russian composer, b. near Warsaw, son of a Russian military engineer stationed in Poland. M. joined the army, but resigned his commission in 1907, already having composed sev. pianoforte preludes, studied with Glière and Krizanovsky, and entered the St. Petersburg Conservatoire in 1906 to study under Rimsky-Korsakov. He was badly wounded in the First World War. In 1921 he became prof. of composition at the Moscow Conservatoire. His works include the oratorio *Kirov is with us*, twenty-five symphonies, the symphonic poems *Silence* (after Poe) and *Alastor* (after Shelley), and numerous other pieces. See G. Abraham, *Eight Soviet Composers*, 1943.

• **Miasma** (Gk. *μίασμα*, corruption or pollution), see MALARIA.

Miava, industrial tn. 46 m. N.N.E. of

Bratislava, Czechoslovakia, on the R. M. Pop. 11,000.

Miazzi, Giovanni (1699-c. 1780), It. architect, was a native of Bergamo. Among his best-known works are the church of S. Giambattista at Bassano and the theatre at Treviso.

Mica, group of minerals which are distinguished by their very perfect basal cleavage, causing them to split readily into thin flakes, and by their vitreous, pearly lustre. The Mts. are complex silicates of aluminium and either alkali metals or iron and magnesium, together with water and occasionally fluorine. Average hardness 2.5. Sp. gr. about 3. They are frequently found in schists, gneisses, and granites. Muscovite or white potash M. is clear and colourless, and may be obtained in large, flexible, and elastic plates. It was formerly used for glazing windows under the name of Muscovy glass, and is still in use for lamp chimneys. Lepidolite, or lithia M., is generally rose-red or violet in colour, while biotite, magnesite M., is black or dark brown. Other types of M. are phlogopite, lepidomelan, paragonite, and Zinnwaldite. The minerals of the M. group are alike in having a prism angle of nearly 60°, thus simulating hexagonal structure, perfect basal cleavage, and in crystallising in the monoclinic (or oblique) system.

Michael, spoken of in Dan. x. 13, 21; xii. 1, as one of the chief of the heavenly host and as the guardian of Israel. It is also as the guardian of the church that he appears in Jude 9 and Rev. xii. 7. His festival day is Sept. 29 (see MICHAELMAS DAY). In the Rom. Church he is also commemorated on May 8 in honour of his apparition in 492 to a herdsman of Monte Gargano.

Michael (Mihail), king of Rumania. See under CHARLES (CAROL) II.; RUMANIA, History.

Michael (1596-1645), first tsar of Russia of the house of Romanov. He was elected tsar by the national assembly, Feb. 21, 1613, and crowned on the following July 22. He freed his ters. from the gangs of robbers which had made life precarious, and by the treaties of Stolbova (1617) and Deulina (1619) he made terms with Sweden and Poland. From 1619 to 1633 he ruled jointly with his father, the Patriarch, Philaret of Moscow. See R. Nisbet-Bain, *The First of the Romanovs*, 1905.

Michael, name of a succession of eight emperors who, at different periods, occupied the throne of the E. from 811 to 1282, the last being Michael VIII., the founder of the Palaeologian dynasty.

Michael, St., and St. George, Order of, order of knighthood which was originally founded for the Ionian Isles and Malta in 1818. It was reorganised in 1869, so as to admit crown servants connected with the colonies. It now consists of not more than 100 Knights Grand Cross, 300 Knights Commanders and 600 Companions, and is essentially an order for men who have rendered distinguished public service for the empire.

Michael, 'the Brave' (1558-1601), voi-

vode of Wallachia, succeeded to the throne in 1593, and secured for Wallachia during his reign a place in world hist. He invaded Turkish ter., aided by Sigismund Bathory, and took by storm Rustchuk, Silistria, and other places on the Danube, and also defeated a large Turkish and Tartar army which invaded Wallachia. In 1595 he gained a further victory at Mantin, and subsequently defeated Sinan Pasha, who invaded Wallachia with 100,000 men, and stormed Bucharest. His independence was acknowledged by the sultan in 1597. In 1599 he invaded Transylvania, defeated Andreas Bathory (Sigismund's successor), and was proclaimed prince, and, having expelled the voivode of Moldavia, united under his sceptre three principalities. He was, however, driven out of Transylvania by a revolt, but returned, and with the imperial Gen. Basta defeated the Transylvanian forces at Goroslo, expelling Sigismund Bathory. He was murdered in 1601 by Basta's orders.

Michaelis, Johann David (1717-91), Ger. biblical scholar, b. at Itulle. He was educated in his native city, and lectured there for some time. He visited England in 1741-42, and also travelled through Holland, and in 1746 was appointed prof. of philosophy at Gottingen, and in addition prof. of oriental languages in 1750. Among his works are *Mosaisches Recht* (1770-71); *Orientalische und exegetische Bibliothek* (1775-85); *Supplementa ad Lexica Hebraica* (1784-92); *Neue O. und E. Bib.* (1786-91); *Litterarischer Briefwechsel* (1794-96); and *Introduction to the New Testament* (4th ed., 1823). He also pub. a reprint of Lowth's *Praelectiones*, with important additions (1758-62), and a Ger. trans. of the Bible with notes (1773-92).

Michaelis, John E.-r-jamin (1746-72), b. at Tittau. He studied medicine at Leipzig, but being attracted by poetry pub., with Gellert and Weisse, a collection of fables, and soon after gave up his profession of a doctor. His works, which consist of odes, satires, lyrics, comic operas, etc., were pub. at Vienna in 1791.

Michaelis, Karin (b. 1872), Dan. writer, b. at Randers, wife of Sophus M. (1865-1932), also a writer. Author of romantic novels displaying an intimate knowledge of female psychology, and coined the phrase 'the dangerous age.'

Michaelmas Daisy, name given by gardeners to *Aster tradescuntii*. Known also by this name is the sea aster or starwort (*A. trifolium*).

Michaelmas Day, festival of St. Michael and All Angels, celebrated in the W. Church on Sept. 29. M. is frequently used for dating terms, etc.

Micah, the Morashtite (i.e. native of Moresheth, a vil. near Gath, on the confines of Judah), one of the twelve minor Heb. prophets. He was the younger contemporary of Isaiah, and is referred to in Jer. xvi. 18 as having prophesied in the days of Ihozekiah and Ahaz, kings of Judah. Almost all critics are agreed that only a part of the book that bears his name can be attributed to the prophet M. himself. Interpolations, generally post-

exile, are frequent, and continually break the chain of thought. Thus the first three chapters deal with the approaching destruction of Samaria, and with the sinfulness of Judah, but verses 12 ff. of chap. ii. deal with the restoration of the people, and plainly presuppose the exile. Chaps. iv. and v. are Messianic, dealing with the future glory of Zion and the world-wide rule of the Messiah. See commentaries by T. K. Cheyne, 1882; G. A. Smith, 1896; J. Wellhausen, 1899; and G. W. Wade, 1925. See also G. C. Findlay, *The Books of the Prophets*, 1913, and T. H. Robinson, *Prophecy and Prophets in Ancient Israel*, 1923.

Mica Schist, schistose or fine-grained foliated rock, composed of alternating thin lenticular sheets of mica and quartz. It is a typical metamorphic rock, and occurs very largely in the Highlands, where the older strata outcrop (q.v.). The contained mica is generally muscovite; and garnet, kyanite, schorl, felspar, chlorite, etc., are accessory minerals.

Michaud, Joseph François (1767-1839), Fr. historian and publicist, b. at Albens, Savoy. He was educated at Bourgen-Bresse, and went to Paris in 1791 where he became the editor of *La Quotidienne*, in which he espoused the royalist cause. He narrowly escaped death during the Reign of Terror, and after 1800 abandoned journalism and began to write books. His *Biographie moderne, ou dictionnaire des hommes qui se sont fait un nom en Europe depuis 1789*, pub. in 1806, was the earliest work of its kind. He pub. *Histoire des croisades*, his prin. work; *Correspondance d'Orient*, as a result of his visit to Syria and Egypt for the purpose of collecting material for his *Histoire* and other works.

Michaux, André (1746-1802), Fr. botanist and traveller, b. in Sartory. He made journeys to sev. parts of the world, first to England (1779), from which country he introduced into France sev. new varieties of trees and shrubs; second, to the Auvergne and the Pyrenees (1780), bringing back sev. sorts of grain; third, to Persia (1782), whence he brought back a fine herbarium and valuable seeds; fourth, to N. America (1785), travelling from Hudson Bay to Florida and the Mississippi. Unfortunately nearly all his collection was lost.

Michel, Clémence Louise (1830-1905), Fr. anarchist, b. at Broncourt in Haute-Saône. She became a teacher in Paris, but soon gave this up for social and political work. She joined the Communists at the outbreak of their rising of 1871 and was transported to New Caledonia. On her release she returned to Paris and joined another anarchist rising, for which she was sentenced to six years' imprisonment. She was, however, released after three years, in 1886, and soon afterwards went to London. She returned to Paris in 1895, where she d. Her works include *La Misère; Mémoires* (1886); *Les Microbes humains* (1886); *Le Monde nouveau* (1888); *Les Crimes de l'époque*; and *La Commune* (1898). See E. Giraut, *La Bonne Louise*, 1906.

Michel de Notre-dame, see *NOSTRADAMUS*.

Michel, Francisque (1809-87), Fr. antiquary, b. at Lyons, became prof. of literature at Bordeaux. He visited England and Scotland to carry out his archaeological researches. He ed. old Fr. works, such as *La Chanson de Roland*, *Chansons de Courcy*, trans. Eng. works into Fr., and pub. original works, the chief of which are *Histoires des races maudites de la France et de l'Espagne; Le Pays basque; and Les Écossais en France et les français en Écosse*.

Michel, Nicolaievich (1832-1909), Russian prince, was brother to Tsar Alexander II. He was governor-general of the Caucasus in 1863, field marshal and later director-general of artillery, and president of the council of the empire. During the war with Turkey in 1877 he captured Ardahan and Kars.

Michelangelo, or Michael Angelo, Buonarroti (1475-1564), It. sculptor, architect, painter, and poet, b. at Caprese, of an honourable and anct. though poor family. After being at school with Maestro Francesco da Urbino, he made friends with Francesco Granacci, a pupil of Domenico del Ghirlandaio, with whom M.'s father, although holding art in contempt, at length allowed him to study. His talent even at this early age was very marked, so that he was chosen by Ghirlandaio as one of the youths whom Lorenzo de' Medici, the Magnificent, allowed to work in his garden under Bertoldo. Here he executed the 'Faun's Head,' which so delighted Lorenzo that he took him into 'as estab. and treated him as his son. M. was between fifteen and sixteen years of age when he entered Lorenzo's house, and he stayed with him until the latter's death in April 1492; whilst there he executed the bas-relief called 'The Rape of Delianra,' or 'The Battle of the Centaurs,' now in the Casa Buonarroti, Florence. On the death of Lorenzo M. returned to his father's house for a short period until Pier de' Medici, Lorenzo's heir, requested his presence. He left Florence, it is said, on account of a visionary premonition which one Cardice had of the fall of the Medici, and went to Bologna, where Messer Gian Francesco Aldovrandi befriended him. Returning to Florence in 1496 he went to Rome to the Cardinal di San Giorgio, who had bought a Cupid by M. under the impression that it was a real antique. During his stay in Rome M. executed a Cupid (now at S. Kensington) and a Bacchus (now in the National Museum, Florence) for Messer Jacopo Galli, and the Madonna della Pietà (now in St. Peter's, Rome) at the request of Cardinal Iovano. In 1501 he returned to Florence on family affairs, and in 1504 carved the colossal statue of David, nine braccia high, out of a block of marble spoil in the roughing out brought from Carrara, probably by Ag. stho di Antonio di Duccio. This is now in the Accademia delle Belle Arti, Florence. In the same year he commenced the cartoon for the decoration of the council hall at Florence

a work on which Leonardo da Vinci was also engaged. The paintings of both have been lost.

After the death of Pope Alexander VI. Julius II. called M. to Rome, and commissioned him to make his monument. The design for this work was very highly approved by the pope, and in April 1505 M. went to Carrara to superintend the quarrying of the necessary marble, an operation which occupied over eight months. The architect Bramante, who was jealous of M., influenced the pope against him, and shortly after his return from Carrara he was refused admittance to the papal antechamber. In anger he returned to Florence, where he stayed

MICHELANGELO

until the pope had sent three briefs demanding his return; at length he went to see the pope at Bologna, and whilst there he executed a portrait statue of Julius in bronze, three times life-size, which was placed on the front of the Church of San Petronio, but destroyed on the return of the Bentivogli. When M. returned to Rome Bramante persuaded the pope that it would be a bad omen for his tomb to be built before his death, and induced him to ask M. to paint the vaulting of the Sistine Chapel, thinking that such a work would show his genius in a less favourable light. Although unwilling M. yielded to the importunity of the pope, and finished the work, unaided save for workmen and writers for the lettering, in twenty months. This, his greatest work in painting, represents the creation of the world and of man, the flood, and various biblical stories. When the Sistine Chapel was completed M. again became involved in 'The Tragedy of the Tomb.' On his return from Florence, whither he had gone after the completion of the chapel, he again started work on his designs for the tomb of Julius, but the death of the latter interrupted the work. Leo X., Julius's

successor, ordered him to undertake the ornamentation of the façade of San Lorenzo at Florence. This was a great disappointment to M., but his protests were unavailing. He was also obliged to spend six years in procuring marble from the quarries of Pietrasanta. In 1521 M. executed the 'Risen Christ,' now in the church of Santa Maria Sopra Minerva, Rome, a work which was finished, and therefore marred, in details, by other hands. When Clement VII. became pope he lost no time in setting M. to work, and by 1524 the tombs of the Medici were fairly under way. These were not destined to be finished, and it was not until 1535 that M. finished what work there is of his in the building, including the grand figures of Day and Night, Morning and Evening. In 1529 he had been appointed general over the construction of the walls and defences of the city of Florence, which fell in the following year. After this 'The Tragedy of the Tomb' was at length completed; the finished work contained only the 'Moses' by M. himself. In 1534 he was commissioned by Pope Paul III. to do the 'Last Judgement' in the Sistine Chapel, a great work which occupied him for six years. In 1547 Pope Paul conferred the post of architect-in-chief at St. Peter's upon M. and he designed the dome. In 1549 the two frescoes for the walls of the Capella Paolina, Rome, were completed, representing the Martyrdom of St. Peter and the Conversion of St. Paul.

All through his life M. composed sonnets when his sculpture was not going well and he was disturbed; the best are addressed to Vittoria Colonna, the widow of the marquis of Pescara, whose friendship was the great solace of M.'s life. Along with her praises the main themes of his poetry are the Christian faith, the joy of platonist love, and the power and mysteries of art. His poetic style is strenuous and concentrated and he wrote with labour and much correction, always with the goal of perfection before his eyes, urged on by the same ardour and impetuosity that characterises his work as a sculptor and painter. The death of Vittoria Colonna in 1547, together with an infirmity which began to afflict him in 1544, left him broken in health and heart. He d. on Feb. 18, 1564. See also ITALIAN ART; MEDICI CHAPEL. See A. Condivi, *Vita di Michelangelo Buonarroti, Scritta da A. C., suo discepolo*, 1553 (ed. by P. d'Ancona, 1938); G. Vasari, *Le Vite dei più eccellenti Pittori, Scultori, ed Architetti*, 1647; J. Wittkower, *Michel Angelo Bibliographie, 1510-1921*, 1927; and C. de Tolnay, *The Medici Chapel*, 1948; also A. C. Benson and H. F. W. Tatham, study in 'Men of Might' series, 1923; and studies by C. Clement, 1930; Lord Finlayson, 1936; and C. de Tolnay, 1946.

Michelet, Jules (1798-1874). Fr. historian, b. in Paris, was the son of a printer. He was educated at the Lycée

Charlemagne, and in 1821 was appointed prof. of hist. in the Collège Rollin. His first works appeared in 1825-27, and were concerned with modern hist., and in 1827 he was appointed *maître de conférences* at the École normale, becoming assistant to Guizot at the Sorbonne in 1830. In 1831 he pub. the *Introduction à l'histoire universelle*, and soon afterwards entered upon his chief work, the *Histoire de France* (from early times to the outbreak of the revolution), publishing about the same time *Œuvres choisies de Fico*, the *Mémoires de Luther*, and the *Origines du droit français*. In 1838 he was appointed to the chair of hist. at the Collège de France, and pub. his lectures on *Le Prêtre, la femme et la famille*, and *Le Peuple*. In 1839 his *Histoire romaine* appeared, and besides his great hist. he wrote *Histoire de la révolution française* (1893-99). He also wrote books on natural hist.: *L'Oiseau* (1836); *L'Insecte* (1859); *La Mer* (1861); and *La Montagne* (1868); as well as *Les Femmes de la révolution* (1854); *L'Amour* (1859), one of his most popular books; *La Femme* (1860); *La Sorcière* (1862); *La Bible de l'humanité* (1864), an historical sketch of religion; and *Nos fils* (1869), a treatise on education. His complete works were pub. 1893 ff.

Michelson, Albert Abraham (1852-1931), Polish-Amer. physicist, b. at Strelno, near Posen; lived in the U.S.A. from 1854 until his death. A distinguished prof. at the univ. of Chicago, M. was the first Amer. scientist to win the Nobel prize; in the same year (1907) he was awarded the Copley medal of the Royal Society. His greatest achievement was the construction of the interferometer (*q.v.*) that bears his name, and its applications to the determination of the standard metre in Paris, to the measurement of the angular diameter of a star (Betelgeuse) for the first time (1920), and to an attempt, made in collaboration with Morley, to detect the motion of the earth through the ether. The negative result of this experiment was the prelude to Einstein's theory of relativity. Other notable achievements were the determination of the velocity of light and the construction of the échelon diffraction grating for the examination of the fine structure of spectral lines. His pub. include *Velocity of Light* (1902); *Light Waves and their Uses* (1903); and *Studies in Optics* (1927). See also MICHELSON-MORLEY EXPERIMENT.

Michelson-Morley Experiment. In the nineteenth century light was believed to travel through a medium called the ether, which was supposed to permeate all space and all bodies. It was further supposed that all bodies, including planets and celestial objects, moved through this absolute ether without disturbing it. If these suppositions were correct, then it would be possible to refer the motions of all celestial bodies to axes fixed in this absolute ether. Such motions would be absolute in the real sense that they were measured relative to these axes.

In order to test these hypotheses Michelson and Morley in 1887 performed an experiment to determine the velocity

with which the earth moved through the ether. The idea that prompted the experiment can best be understood by considering the following problem. Suppose a man can row a boat in still water with a velocity of c m.p.h. If he now rows the boat in a riv. that is running with a velocity of v m.p.h., a distance l m. up stream and then back l m. to his starting point, what is the time he takes for this double journey? The first half of the

trip takes him $\frac{l}{c-v}$ hrs., the return $\frac{l}{c+v}$ hrs., so that the time for the whole journey is $\frac{l}{c-v} + \frac{l}{c+v}$, which is equal

to $\frac{2lc}{c^2 - v^2}$ hrs. If he rows across the stream for a distance l m. and back again, a simple calculation shows that the time taken is $\frac{2l}{\sqrt{c^2 - v^2}}$ hrs. In other words,

the experiment demonstrates that the riv. is actually running, and it enables the man to determine the velocity v m.p.h. with which it is running. This idea may be applied to the problem of the earth's velocity through the ether. Michelson

THE MICHELSON-MORLEY EXPERIMENT

and Morley's apparatus (essentially Michelson's interferometer) is represented in the figure. Light from a source S strikes a half-silvered mirror M , so that part of the light is reflected to the mirror at B , while part is reflected at the mirror A . The two trains of light return to M and are there superposed to form interference fringes seen by an observer at O . The experimenters arranged that MA , for example, was parallel to the direction in which the earth was moving, so that the light that travels with velocity c m.p.h. relative to the still ether, would travel up stream from M to A with a velocity $(c-v)$ m.p.h. relative to the mirrors, and back down stream with a velocity $(c+v)$ m.p.h. to the mirrors. At the same time the light travelling along MB and back again moves with a velocity $\sqrt{c^2 - v^2}$ m.p.h. relative to the mirrors, for MB 's perpendicular to the direction in

which the earth is moving. Hence this journey would take less time than the other, and the difference between the two times could be detected and measured by observing the displacement of the interference fringes that would take place on rotating the whole apparatus through 90° , so that the positions of MA and MB are interchanged. The measurement would be one of extreme delicacy, because c is so very much greater than v that the difference between the two journeys is exceedingly small. Nevertheless the apparatus was capable of performing this measurement, but the result of the experiment was negative; subsequent attempts confirmed this. It was not possible to detect or measure the velocity with which the earth moved through the ether. This surprising result was at first thought to deny the existence of such an ether, but Lorentz and Fitzgerald pointed out that the experiment failed in its crucial test for the reason that the length of a measuring rod laid parallel to MA is different from its length when laid parallel to MB, and that this difference is of the exact amount to make the times for the journeys MA and MB the same. The Lorentz-Fitzgerald hypothesis of the contraction of the measuring rod was the beginning of the theory of relativity, and the hypothesis was inspired by the necessity for an explanation of the M.-M. E. See INTERFEROMETER; RELATIVITY.

Michigan, N.-central state of the U.S.A., having an area of 96,720 sq. m., of which 39,698 sq. m. are inland water. It is known as the peninsula state, because it consists of two peninsulas; the lower and larger lies N. of Indiana and Ohio, with Lakes Erie and Huron on the E. and Lake Michigan on the W. To the N., separated from it by the strait of Mackinac, is the upper peninsula, which adjoins Wisconsin on the S.W., and lies between Lakes Michigan and Superior; the Sault Ste. Marie Ship Canal, the busiest canal in the world, separates it from Canada on the W. The chief highlands are the Porcupine Mts. (1830 ft. above sea level) in the N.W., and the chief rivers, the Muskegon, Grand, St. Joseph, and Kalamazoo, which are important for the power they supply rather than for their navigation. There are more than 6000 small lakes. The state, formerly agric., is now chiefly industrial; the staple crops are oats, potatoes, hay, wheat, maize, beans, grapes, celery, peppermint, and sugar beet. Fruits, chiefly apples, are widely grown, and the live-stock, especially sheep, is considerable. Mineral wealth in the N. peninsula compensates for comparative infertility, and output averages over \$140,000,000 annually. Copper and iron are the chief products of the mines; coal, salt, and silver mines are also worked, and petroleum and Portland cement are other valuable products. The most important industry is the manuf. of automobiles, especially at Detroit. There are also manufs. of aeroplanes, paper, furniture, and machinery. Lumbering is very important, chiefly in the upper peninsula,

though not to so great an extent as formerly; reforestation is being carried on. There is some shipbuilding and a lake fishing industry. Communications by rail and water are good and there are 209 airports. Michigan Univ. was founded in 1837 at Ann Arbor, and has over 18,000 students. There is a Senate of thirty-two and a House of Representatives of 100 members, and in the national assemblies M. is represented by two senators and seventeen representatives. Detroit is the chief tn., pop. (1910) 1,623,000, and the state cap. is Lansing (pop. 79,000). Other important tns. are Grand Rapids (164,300); Flint (151,600); Saginaw (82,800); Pontiac (66,600); Dearborn (63,600); Kalamazoo (54,000); Highland Park (50,800); Hamtramck (50,000); Jackson (49,700); Bay City (48,000); Muskegon (47,700); Battle Creek (43,500); Port Huron (32,800); Wyandotte (30,700). Father Marquette, a Jesuit missionary, founded a settlement here in 1668. The state was ceded by the Fr. to the Eng. in 1760 and passed to America in 1796. It was admitted to the union in 1837. Pop. 6,249,000. See G. N. Miller (ed.), *Michigan: a Centennial History of the State and its People*, 1939, and Federal Writers' Project, *Michigan: a Guide to the Wolverine State*, 1941.

Michigan City, lake port, 37 m. E.S.E. of Chicago, on Lake Michigan, in Laporte co., Indiana, U.S.A. Pop. 26,400.

Michigan, Lake, great lake of N. America, bounded on the N.W. and E. by Michigan, on the S. by Indiana, and on the W. by Wisconsin and Illinois. The strait of Mackinac connects it with Lake Huron. Area 22,400 sq. m. Length 325 m.; mean breadth 75 m.; mean depth 870 ft.

Michoacán, state of Mexico, having an area of 23,200 sq. m., and bordering on the Pacific for 101 m. The highlands lie S. of the Sierra Madre Occidental, Tancitaro (12,660 ft.) being the highest peak. The chief rivers are the Lerma and the Balsas. The staple products are minerals (gold, silver, iron, coal, lead, copper, petroleum, etc.), cereals, fruit, coffee, and sugar cane. Morelia (pop. 77,600) is the cap. Pop. 1,182,000.

Mischurinsk, see KOZLOV.

Micipsa, king of Numidia, was the son of Massinissa, and reigned from 148 to 118 B.C. Afraid of Jugurtha, his nephew, he sent him in 134 B.C. to Spain, to serve under Scipio.

Mickiewicz, Adam Bernard (1798-1855), Polish poet, b. at Zaosic, near Novogrodek in Lithuania. He was educated at Novogrodek until 1814, when he entered the univ. of Vilna. He was for a time a schoolmaster at Kowno. In 1824 on the condemnation of the members of the Philoretian societies M. was, after imprisonment, banished to Russia. He had already pub. two vols. of miscellaneous verse, and on his arrival at St. Petersburg was at once received in literary circles with open arms. In 1840 he was appointed to a newly founded professorship of Slavonic literature in the Collège de France, but was expelled from his chair

by the Fr. Gov. in 1844, and was without employment until 1852, when the post of librarian at the Arsenal was obtained for him by Prince Napoleon. He d. of cholera at Constantinople whilst engaged in forming a Polish legion against Russia. His remains were, in 1890, removed to the cathedral at Cracow.

M. is the most inspired poet of Poland, and the flaming ardour of his poems, allied with their national melancholy, cause him to be the most popular in his own country, although, unfortunately, but little known in England. His chief works are *Konrad Wallenrod* (1828) and *Pan Tadeusz* (1834, trans. in Everyman's Library), in addition to his sonnets, *Ode to Youth*, etc. See L. Mickiewicz (his son), Adam Mickiewicz, *sa vie et son œuvre*, 1888, and M. M. Gardner, *Adam Mickiewicz*, 1911.

Mickle, William Julius (1731-88), Scottish poet, was the son of a Presbyterian minister of Langholm, Dumfriesshire. After failing in business he became corrector to the Clarendon Press, pub. a Spenserian poem called the *Concubine* (1767, revised as *Syr Martyn*), and printed a very diffuse and rather poor trans. of Camoens's *Lusiad* (1775). Scott's *Kenilworth* is based on M.'s *Mad Gummer Hall*.

Miamaos, tribe of N. Amer. Indians of Algonquin stock, who formerly roamed Nova Scotia, New Brunswick, Prince Edward Is., and Newfoundland. During the colonial wars they were allies of the Fr. and adopted the Rom. Catholic religion. They now number about 3000.

Micon (*fl.* fifth century B.C.), Gk. painter and sculptor, was the contemporary of Phidias. He was renowned for his skill in drawing horses. His battles decorated the walls of the Cerameicus and the temple of Theseus in Athens.

Microbe, see BACTERIA.

Microchemical Analysis, term used to include the methods employed for the recognition and determination of minute quantities of substances. For the *Qualitative* tests special reagents are often used. Thus, for example, sodium-bismuth thio-sulphate will detect the presence of potassium (1 part in 57,000); alkaline phenolphthalein, decolorised by boiling with zinc powder, gives a red colour with water containing 1 part of copper per 100,000,000; potassium thiocyanate gives a blue colour with osmium compounds (1 part per 1,000,000) when shaken with ether. The *Spot or Drop Tests* are invaluable in this connection. They are carried out by allowing a drop of solution under test to react with a chosen reagent on filter-paper, when characteristic colours or stains appear. To quote two examples: (a) If a drop of a solution of a soluble lead salt is placed on a spot of ammoniacal hydrogen peroxide on filter-paper and allowed to stand, a blue coloration is observed when the spot is treated with a drop of benzidine dissolved in acetic acid (detects lead, 1 part in 33,000); (b) a drop of stannous chloride added to a spot of ammonium molybdate reagent on filter-paper gives an intense blue colour. On

warming (unless arsenic is present as well) the colour disappears.

Quantitative microanalysis has made rapid strides, and it is now possible to perform a quantitative analysis of an organic body, using as little as 2 mg. of the substance. This is invaluable, especially as many newly discovered bodies involve difficult and laborious methods even to obtain small yields. Pregl was the pioneer of the new methods. Sensitive balances, e.g. the Kuhlmann (weighing to 0.002 mg.), are used, and minute attention to detail is insisted on. See F. Pregl, *Quantitative Microanalysis* (revised by J. Grant, 4th Eng. ed.).

Microcline, name given to a species of felspar, the crystallisation of which is triclinic, with polysynthetic twinning. A section cut parallel to the base reveals a reticulated structure, this being due to the regular intergrowth of twin lamellæ. Composition is silica 64.30, alumina 19.70, ferric oxide 0.71, potash 15.69, soda 0.48. Chemical formula $K_2(Al_2)Si_6O_{16}$. Some felspars, once regarded as orthoclase, are included in the M. species, as also are part of the chesterite and amazonstone.

Microcosm and Macrocosm. Arising from the belief of the ancients that the cosmos had a soul, the idea followed that the vital movements of man, the M. or little world, corresponded to those of the universe, the macrocosm or great world. From this astrology followed, or the belief in the idea that the movements of the heavenly bodies affect human lives. Pythagoras, Plato, the Stoics, and Paracelsus were exponents of the doctrine, as were the mystics of the seventeenth century. See ASTROROLOGY.

Microcosmic Salt ($NaNH_4HPO_4 \cdot 4H_2O$), sodium ammonium phosphate, is so called because it is formed in the evaporation of human urine, and was regarded by the alchemists as an extract of the human microcosm. It is obtained by adding a strong solution of common sodium phosphate to ammonium chloride. The salt is used in blowpipe experiments, since it decomposes on heating, to give a glassy bead of sodium metaphosphate.

Microfilm Recording, see under COPYING. Microoliths. Vitreous rocks are not altogether void of crystalline material. Under the microscope numerous small crystallites are to be seen which may be drop-like (globulites), rod-shaped (belonites), or like coiled and twisted hairs (trichites). Besides these crystallites exist needle- and rod-shaped bodies called M., which are distinguished from the above by the fact that they react on polarised light (*q.r.*), and can be generally referred to some mineral species, felspar, angite, hornblende, olivine, etc. Combinations of simple M. occur presenting a curious forked appearance (skeleton crystals), and their linear arrangement indicates the fluxion structure of the rock. M. are also small points of flint used to tip arrows in prehistoric times (see STONE AGE).

Micrometer, name given to instruments for measuring accurately very small angles or spaces up to a hundredth part of a

millimetre. Gascoigne invented the first instrument in the seventeenth century. There are sev. types, of which the following are the most important. Ms. consist generally of two very fine wires, one fixed and the other movable, placed in the focal plane of a telescope. The movable wire is fixed on a sliding plate, and can be moved parallel to the other by means of a screw until the object appears between the wires. The movement can be measured by means of the screw, the pitch of which is known; and the head of the screw is subdivided in order to measure fractions of a revolution. Thus the angular distance which the object subtends can be measured. In the *position wire* M. the two parallel wires are actuated by independent screws. The whole apparatus can be rotated in the plane of the wires, so that they can be placed in any direction, the angle through which it is rotated being measured upon a small circle called the *position circle*. Another type consists of an object glass divided into two semicircles, which can be separated by sliding, so causing the image formed respectively by each half lens to move. Dollond introduced a convex lens divided similarly to the above into the eyepiece of the telescope. Various other types, which depend on the phenomenon of double refraction have been introduced. The *circular M.*, perfected by Fraunhofer, consists of a metal ring set in a perforated glass plate. The ring is placed in the focal plane of the telescope, the time when a star disappears at the outer ring and reappears at the inner ring being observed. This is chiefly used for determining the positions of stars. See HELIOMETER.

Micronesia (from Gk., small is.), name of that part of the Pacific Ocean between long. 130° and 180° E. and between lat. 20° N. and the equator, which embraces the Ladrone, Pelew, Caroline, Marshall, and Gilbert archipelagoes. Except for the Gilbert Is., which are Brit., and Guam in the Ladrone Is. (Amer.), the is. of M. formerly Ger., were, between the two world wars, under Jap. mandate. The South Sea Is. form a complex geographical, political, and racial patchwork, without any clear principles of order. But M. is the conventional name of the groups mentioned in this article as distinguished from the much more populous groups comprehensively designated Melanesia and Polynesia. The Micronesians show resemblances variously to the other two groupings, but are also marked by later overlays of race and custom from Malaysian sources. Yet all scientific evidence points to the certainty that the local peoples of all three groups are traceable back to S.E. Asia by way of the Malaysian is. The oceanic pops. are believed to have numbered about 3,500,000 when the whites first arrived, and of these the Micronesians numbered only some 200,000 (these figures are, however, only a rough estimate). At the lowest point the Micronesians fell to a little over 80,000; in 1921 the total was 90,000, and to-day is about 105,000. The pop. of the Jap. mandate, taken as a whole, grew steadily in numbers after Japan took control, but if the is. are

considered separately, quite marked differences appear. The W. groups show two clearly distinguishable pop. elements, the so-called Chamorroes, who show greater racial and ethnic affiliation with the Malaysian peoples, and the Kanakas, who, like the rest of the Micronesians, are linked more with the Polynesians and, to some extent, the Melanesians. The Amer. Is. of Guam is unique in M., and indeed in the oceanic region as a whole, for here contact with whites goes back to the sixteenth century, when the is. was a port of call for Sp. ships, and was a place of exile for lawbreakers and political prisoners from the Philippines. M. shows varied social systems and totemic clans were a widespread feature. Where peoples in M., as also in Melanesia, have been christianised, the formal change to a family organisation based on biblical standards is accomplished as part of the process of conversion. The groups are described under their separate titles. See F. M. Keesing, *The South Seas in the Modern World*, 1942; also H. Linton, *Ethnology of Polynesia and Micronesia*, 1928.

Microphone, piece of apparatus by which sound waves are converted into voice frequency electric currents which can then be transmitted by any of the known methods of electric communication or, after amplification, recorded. There are a large number of types of M. in existence, and some of these have sev. variations. The simplest example is that used in the standard G.P.O. telephone hand set instrument, which consists of a diaphragm behind which are packed granules of carbon backed by a solid surface. Sound waves meeting the diaphragm cause it to vibrate, so that, in turn, the granules are alternately compressed and released at the same frequency as the sound reaching the M. In this manner the electrical resistance of the carbon filling is made to change by the sound waves so that a current passing through it is an electrical reproduction of the original sound. These variations are passed to the telephone circuit via a suitable transformer. The quality of the output from such a M. is poor, but it is quite satisfactory for telephone communication work.

For broadcasting, recording, or other uses where quality is paramount, other types are generally employed. The moving coil M. can be compared directly with the moving coil loud speaker, whose action is the same but where the process is reversed and, in many of its variations, is capable of good quality output (see LOUD SPEAKER). The ribbon M., as its name implies, consists of a very light ribbon of aluminium foil suspended at its ends between the poles of a permanent magnet. The sound waves vibrate the foil and, as it moves to and fro between the magnet poles, voice frequency currents are induced in it. Another widely used type is the crystal M., which depends for its action upon the piezo-electric effect encountered in certain crystals such as Rochelle salt, when subjected to mechanical stress. The stress, in the case of the

M., is produced by the sound waves striking a diaphragm to which the crystal is joined, when the electric impulses appearing across the crystal can be amplified and used in the normal way for communication, etc. In the better versions of this type of M., which are capable of higher quality, no diaphragm is used, but a number of crystal elements are connected so that their outputs combine. The sound impinges directly on the

RIBBON MICROPHONE

B.B.C.

crystals and this results in a very even frequency response free from objectionable diaphragm resonances. The output voltage is, however, very low, and considerable amplification must follow before the voltage reaches usable proportions.

Each type of M. mentioned has its peculiar application and, for this reason, all are in fairly general use for broadcasting, public address systems, and recording work.

Microphotography, see under PHOTO-MICROGRAPHY.

Microscope and Microscopy. The microscope is an instrument used to render fine detail visible. For this to be possible the object studied must be magnified enough to allow the eye to separate the required details, and these must present an ap-

preciable contrast to their surroundings. The technique of preparing and exhibiting objects so that these conditions are fulfilled constitutes *microscopy*. The requisite magnification is attained by the use of lenses or mirrors (*see LENS; LIGHT*), singly or in combination, the primary distinction being between *simple Ms.*, in which the image is erect and virtual, and *compound Ms.*, in which a real and inverted image is projected into the focal plane of an auxiliary lens system or on to a screen or photographic plate.

The following account is concerned solely with the compound M., which is to be preferred to the simple in all cases where manipulation of the specimen or extreme portability is not the primary consideration, owing to its greater power of resolving fine detail, and its practical convenience. The real image, moreover, can be subjected to measurement or optical analysis in a manner impossible with a virtual one. Compound Ms. may be divided into various types according to their action, which may be by refraction or reflection, and also according to the system of image formation employed, which may be *conventional* or by *phase difference*. The term *conventional* is here used to designate all systems which fulfil the classical requirement of equality between all light paths from a point in the object to the corresponding point in the image; in the phase difference system this condition is deliberately violated in order to secure interference effects that would not otherwise occur.

Image Formation.—An object is rendered essentially visible by virtue of the disturbance which it causes to light or other waves which it intercepts. The disturbance may be analysed into several distinct components, viz. absorption, reflection, refraction, diffraction, polarisation, and fluorescence, and these are used singly or in combination to secure the visibility of the magnified image of the object. The classical theory of M. image formation, due to Abbe, may be generally summarised in the statement that a ray of light impinging on an object is modified by diffraction into an assembly consisting of an undeviated ray and a set of others diverging from it at angles dependent on the magnitude of the diffracting structure relative to the wavelength of the light. Ideally all of these should be reunited in their original phase relationships in the image, which is formed by their mutual interference (*see LIGHT*). In practice, however, this is not completely possible, and the image differs from the object according to the extent to which the ideal relationship is unfulfilled. Experiments and calculations made in the nineteenth century proved that the direct and the diffracted rays arising from objects having the nature of a periodically opaque grating were either co-phased or in reversed phase, so that when reunited in the image they interfered to produce a pattern of varying intensities: it was not, however, until 1932 that it was discovered by Zernike that this is not the

case if the object is completely transparent, and varies in thickness or refractive index; it then yields diffracted rays which are substantially a quarter of a wavelength out of phase with the direct rays, and so do not interfere to produce a pattern of varying intensities, but one of varying phases, to which the eye is not sensitive. In the phase difference (or phase contrast) system these rays are artificially brought into a relationship in which interference produces an image of varying intensities.

Components of the Microscope.—Apart from the specimen, the essential optical elements of a M. are the projecting lens (objective, object glass) and the illuminating system, whilst in common use the real image projected by the objective is received by a lens system (eyepiece, ocular) which presents to the observer's eye a virtual image further amplified, and which thus functions as a simple M. The most important of these optical elements is the *objective*, upon which the resolving power and magnification depend. This normally consists of a system of lenses of glass, quartz, or fluorite, in suitable combination, designed to project an image having a minimum degree of aberration (see LENSES) when the object and image lie in predetermined planes. As it is only possible to correct the lens for one such pair of planes, the image deteriorates if this condition is violated, and any divergence from the preselected conditions of observation must be compensated by a corresponding adjustment in the location of the image plane to restore equilibrium. The optical properties of the glasses used in construction do not permit all the spectral colours (see SPECTRUM) to be united in a perfectly corrected image; the common achromatic objectives are chromatically correct for two colours, but spherically for only one, whilst the more complex *apochromats* are chromatically corrected for three colours, and spherically for two, thus producing a more brilliant and sharper image than the former. Restriction of the illumination to approximately monochromatic conditions therefore improves the definition of the achromat, and for use in the ultra-violet region (see ULTRA-VIOLET LIGHT), where isolated spectral lines are used for illumination, objectives are spherically corrected for one wave-length only. The great advantage of the *reflecting* objective is that ideally it is free from chromatic aberration through the entire range of the ultra-violet, visual, and infra-red spectra, and its spherical correction is equally independent of wave-length. In the past the difficulties of shaping the non-spherical surfaces necessary have resulted in indifferent quality, but a new pattern constructed by Burch is found to compare favourably with the best refracting objectives. Its unique qualities lend themselves particularly to researches in microspectrometry.

The resolving power of an objective depends both on the wave-length of the illumination and the obliquity at which

the objective can accept the rays diffracted by the object. This feature is governed by the focal length and diameter of the lenses, and is measured by a factor known as the *numerical aperture* (N.A.), which in combination with the wave-length of the illumination defines the resolution possible; the minimum interval between separable points is commonly obtained from the formula

$$\text{Resolving Power} = \frac{\text{Wavelength}}{2 \times \text{N.A.}}$$

The N.A. of the system is limited in value to that of the lowest refractive index between the objective and the specimen, as the more oblique rays are lost by internal reflection. To avoid this the *homogeneous immersion* system is employed, which by the use of a suitable fluid filling the space between the objective and specimen, eliminates discrepancies of refractive index, and thus increases the possible resolving power of the system by 50 per cent; the need for tube-length variation to adjust the working conditions is also automatically obviated.

It is obviously important that the detail resolved should also be visible. To permit this it is generally stated that adjacent elements should subtend an angle of two minutes of arc at the eye, but this may be considered as a theoretical minimum based on the ultimate effort of a perfect eye. To ensure that this separation is attained, it is customary to recommend a magnification of about five hundred times the N.A., but in practice a great subtense is more convenient, and this figure can be increased by 100 per cent, or more in suitable circumstances, without deterioration of the image.

The influence of illumination on the image is profound, and a thorough appreciation of what it can be made to do is perhaps the most useful lesson that a microscopist can learn, as he will thereafter analyse the image in terms of his experience instead of regarding it as an immutable representation of the object. The illuminating system consists essentially of a suitable light source, preferably of small area and high intensity, a lens or reflecting system (*substage condenser*) to produce an image of the light source in the plane of the object, and a diaphragm to regulate the obliquity and conformation of the illuminating rays. By the employment of a diaphragm of suitable aperture and shape the rays converging in the specimen may be made to utilise only selected portions of the objective aperture, with consequent modification of the image, and by the use of very oblique illumination the image may be constituted by diffracted rays alone, appearing luminous against a dark background. Substage condensers are usually of two patterns, one conforming to the general plan of an objective, and ideally, but very seldom, as well corrected, working either dry or in immersion contact with the specimen, and the other a reflecting system invariably immersed, and furnishing extremely oblique annular illumination. The first is employed at a

suitably regulated aperture to provide direct illumination of the specimen, and may be used for oblique or darkground lighting effects with objectives of medium power: the second furnishes darkground illumination for objectives of high aperture. Attainment of the full resolving power of the objective depends almost as much on the condenser as upon the objective itself, and it is extremely important that both components should be co-axial; the condenser should therefore be provided with means to centre it to the M. axis.

In visual use the image furnished by the objective is further amplified by an eyepiece, the two being mounted in a tube the length of which is adjustable to secure the optimum circumstances for image formation. The entire tube, and the condenser independently, can be moved axially, to focus the image and illuminant; the tube is usually, and the condenser occasionally, provided with a second extremely sensitive focusing action termed the *fine adjustment*, which is perhaps the most important mechanical feature of the instrument, and which is commonly graduated for use as a micrometer.

Eyepieces vary in construction according to their purpose, and several differing systems are employed. For normal visual use Huyghens form is general, but many modern eyepieces are based on other formulae, and for use with apochromatic objectives, special correction is necessary. For photography the eyepiece is computed to project a real image, although negative lens systems unsuitable for direct vision can be employed for this purpose, or the eyepiece may be omitted altogether.

It is no longer possible to give any general description of the M. as an instrument, as specialised patterns differing widely in form and function are constructed for research in distinct fields. The ultimate resolution at present available is provided by the electron M., in which electro-magnetic fields focus beams of electrons in vacuo; the visible image is produced by fluorescence or photography, and the object usually prepared by the deposition of metallic vapour on to it. Resolution so far obtained is of the order of 0.005 microns (1 micron = 0.001 mm.), but the instrument, which is as yet in its infancy, is severely limited in application by the slight penetrating power of the radiation involved, and technical considerations that enforce a magnification measured in thousands of diameters. Protein molecules, virus and bacteriophage particles have been seen for the first time by the use of this instrument, which can also be used to measure them.

Of more general application, the ultra-violet M. likewise yields a photographic image, although in favourable cases a fluorescent eyepiece may be used with it. The resolving power is about 0.14 microns at a wave-length of 2753 Angstrom units, compared with a resolving power of 0.27 microns attainable by the visual spectrum. A special technique as well as special apparatus is

required for work in the extreme ultra-violet, but useful results are attained with the longer wave-lengths, owing to selective absorption by specific substances in the specimen, which enhance visibility. Fluorescence microscopy employs ultra-violet illumination of the object, visual light emanating from which forms a visible image; it can be used in the diagnosis of certain bacteria. Differential absorption is a marked feature of microscopy in the infra-red region, many substances having characteristic absorption spectra in that zone; as remarked earlier, the reflecting M. is particularly adapted to this work, which is of profound value in biochemistry and physiology.

Visual microscopy has lately been advanced by the phase contrast technique, which by the use of an interferometer arrangement renders slight differences of refractive index in the specimen as differences of brightness in the image. This has the result of allowing fresh unstained material to be examined living, and can reproduce in the image many of the effects hitherto attained only by staining. In conjunction with cine-photography this permits the phenomena of growth, mitosis, etc., to be recorded and studied at more convenient speeds. The phase contrast system is still capable of great development, but is clearly an advance in microscopy comparable with any of the classic advances of the past.

Bibliography. There is no completely up-to-date book on microscopy; L. C. Martin and B. K. Johnson, *Practical Microscopy* (1931), is recommended for general guidance, and C. Beck, *The Microscope* (1924) for critical study. E. M. Charnot and C. W. Mason, *Handbook of Chemical Microscopy* (1930), vol. i., is a most valuable book on the practical side, whilst among the older authors Dallinger's later eds. of W. B. Carpenter's *The Microscope and its Revelations*, 1856, 1901, and E. J. Spitta, *Microscopy*, 1907 or 1909 or 1920, will remain as outstanding works of reference. For photomicrography (*q.v.*) J. E. Barnard and F. V. Welch, *Practical Photomicrography*, 1925, 1936, is valuable.

Microscopical Society, The Royal, was estab. in 1839 for the promotion of microscopical and biological science by the communication, discussion, and pub. of observations and discoveries relating to (1) improvements in the construction and mode of application of the microscope, and (2) biological and other subjects of microscopical research. It consists of ordinary, honorary, and ex-officio fellows of either sex. The jour. of the society is pub. quarterly from the offices of the society at Brit. Medical Association House, Tavistock Square, London, W.C.1.

Microscopium (the Microscope), S. constellation discovered in 1752 by Lacaille, situated N. of Grus and Indus at the junction of Capricornus and Sagittarius.

Microstylis, genus of terrestrial orchids with handsome leaves, and small greenish-yellow or purple flowers.

Microtome, instrument adapted for cutting thin sections of material preparatory

to observation under the microscope. There are many varieties, but the essential part of the instrument is a device for leading an embedding block containing the material to a cutting instrument, or for leading the cutting instrument to the block by a sliding arrangement whose motion is exactly governed by graduated screws. A section with a uniform thickness of as little as .002 mm. can be cut. Some of the more expensive Ms. are to a high degree 'automatic.' In the Cambridge rocking M. the material is fixed in a tube containing paraffin, and moved to the cutting edge, the degree of movement being read on a graduated arc, to thousandths of a millimetre.

Microtus, *see* ARVICOLA.

Midas, son of Gordius, and king of Phrygia, renowned for his immense riches. In consequence of his kind treatment of Silenus, the companion and teacher of Dionysus, the latter allowed M. to ask a favour of him. M. in his folly desired that all things which he touched should be changed into gold. The request was granted; but as even the food which he touched became gold, he implored the god to take his favour back. Dionysus accordingly ordered him to bathe in the sources of the Pactolus, near Mt. Tmolus. This bath saved M., but the riv. from that time had an abundance of gold in its sand. Once when Pan and Apollo were engaged in a musical contest on the flute and lyre, M. was chosen to decide between them. The king decided in favour of Pan, whereupon Apollo changed his ears into those of an ass. M. contrived to conceal them under his Phrygian cap, but the servant who used to cut his hair discovered them. The secret so much harassed the man that, as he could not betray it to a human being, he dug a hole in the earth, and whispered into it: 'King Midas has ass's ears.' He then filled up the hole, but on the same spot a reed grew, which in its whispers betrayed the secret.

Middelburg: 1. Cap. of the prov. of Zeeland, Netherlands, on the Is. of Walcheren, 4 m. N. of Flushing. It has an old abbey dating from the thirteenth century. It was a Hanse tn., and its charter dates from 1225. In the Ger. bombing of Walcheren in 1940 the centre of the tn. of M. was completely flattened. Part of the destroyed portion was rebuilt during 1940-1941, before the Ger. occupation authorities put an end to civil building in order to concentrate all Dutch materials and labour on their defensive W. wall. Canadian and Brit. forces captured M. and its Ger. garrison on Nov. 9, 1941. Pop. 19,000. (*See further under* WESTERN FRONT IN SECOND WORLD WAR.) 2. Cap. of a dist. of the same name, in the Transvaal, S. Africa, on a trib. of the R. Olifant, 98 m. E. of Pretoria. Extensive coalfields are near. Pop. (Europeans) 3700. 3. Cap. of a div. of the same name, Cape Prov., S. Africa, 250 m. N. by W. of Port Elizabeth, in a fertile agric. dist. Pop. 6660 (European 3440).

Middens, Kitchen, *see* KITCHEN.

Middle Ages, The. Period known as the M. A. covers the thousand years from the

collapse of the Rom. Empire to the birth of the modern nation-state, A.D. 500 to A.D. 1500, and is the intermediate period between the culture of classical antiquity and the Renaissance. It was not, however, a homogeneous period. Until the eleventh century there was a formative age, which may appropriately be described as the Dark Ages. Much of Rom. civilisation was lost under the surge of Germanic invaders in N. Europe, Germany, and Italy, and the Moorish dominion in Spain. One link, a tradition of order, remained as an ideal in a welter of disorganisation and invasion. By the end of the eleventh century the ideal came nearer to practice as political organisation in W. Europe achieved a degree of stability sufficient to allow the growth of a civilisation which may be called medieval. The threat of Scandinavian and Moslem invasion was less immediate; international trade was growing; military techniques, with castle and knight, were effective.

Medieval knowledge of physical science was negligible, and education was conservative, but there was, in this civilisation, much of significance. Lat. was the international language, and it enabled the growth of cosmopolitan univs. and of a common fund of knowledge. The estab. of papal authority over the churches of the W. world created an international organisation more efficient than any which has appeared since the dissolution of the Rom. Empire. In political affairs the theory was held that Europe formed a super-national state, a Holy Rom. empire. Though never of any great significance in the ultimate political development of Europe, this ideal could be used as a rallying-point on occasions of general European concern; by it was raised the greatest of the crusades, in 1188, under the Emperor Frederick I. Throughout the M. A. the search for European unity was a recurrent theme. The twentieth century has seen a renewal of this theme, and with it a recognition of the brilliance of the contributions of such men as Thomas Aquinas, Dante, Chaucer, Froissart, Giotto, and Michael Angelo in the fields of philosophy, literature, and art, and of the enduring value of the architecture of the M. A., of which many noble examples are extant to-day.

land, 1948; W. R. Lethaby (revised and ed. by D. Talbot-Rice), *Medieval Art*, 1948; and V. H. Galbraith, *Studies in the Public Records*, 1949. See also *Cambridge Medieval History* (12 vols.), 1923-1939; *Cambridge Economic History of Europe from the Decline of the Roman Empire* (vol. I.), 1941; and W. R. Lethaby, *Medieval Art*, 1949.

Middleborough, tn. and summer resort in Plymouth co., Massachusetts, U.S.A. 35 m. S.E. of Boston; has manufs. of shoes, woollens, iron goods, and tiles. Pop. 9000.

Middle Caraqueet, tn. in Gloucester co., New Brunswick, Canada. 12 m. W.N.W. of Shippegan. Its chief industries are flour, lumber, and canneries. Pop. 6000.

Middle Congo (Moyen-Congo), colony of Fr. Equatorial Africa. With an area of 166,069 sq. m., it extends to the E. of the Gaboon (Gabun) ter. up to the Congo and to the lower course of the Congo's great trib., the Ubangi. It is watered by the Rs. Sanga, Alima, and the two Likoualas. S. of the Congo it embraces the basin of the R. Kouliou-Niari, which gives the colony a sea-front, but does not give the hinterland any natural outlet to the sea. Shallow, broken by rapids, it is navigable only up to 80 km. for boats of shallow draught, while a dangerous sand-bar obstructs easy communication between riv.-boats and the sea. Some 50 m. from the coast the mt. and forest massif of the Mayumbé, an extension of the Monts de Cristal, offers a serious hindrance to the estab. of communications with the interior. Brazzaville, cap. of the M. C., and seat of the governor-general of Fr. Equatorial Africa, is built on the r. b. of Stanley Pool, 400 km. from the sea opposite the Belgian tns. of Léopoldville and Kinshassa. Thanks to the splendid riv. network of the Congo, Brazzaville has easy communication with the hinterland; but its ocean communications are precarious, and depend on the tribs. of the Belgian Congo. Its main port, Pointe Noire, is accessible to large ships, and has been entirely modernised since 1935. The surface of the M. C. is partly extensive forest land and partly grassy savannahs. It is a country of palm-oil, rubber, copal, ivory, and raffia. Copper is mined in the Monts de Cristal, especially at Mindouli. Pop. 629,600.

Middle East, term loosely used to embrace the various countries in N. and N.E. Africa, countries and is. in the E. Mediterranean, and the various Arab states, together with Persia and Asia Minor. Strictly the term includes only the Turkish succession states or countries, i.e. the countries over which the Turks were suzerains before the First World War, viz., Palestine, Syria, Transjordan, Hejaz, Nejd, and Egypt, all of which countries, together with the Balkans, were previously comprised under the term 'Near E.'. The term 'M. E.' was coined by the Cairo Conference (which was held under Mr. Winston Churchill in 1921) in order to differentiate the political questions involved in these Arab states and Egypt from the quite unrelated questions, such

as the ever-recurring Dardanelles problems, and the conflicting views of Turkey and the other Balkan States concerning the Balkans generally, and thus the term 'Near E.' became restricted to the Balkans. During the Second World War, however, the term 'M. E.' soon took on a much wider significance both politically and in a military sense. All the countries included in the M. E., whether actually involved in campaigns or not, were of great strategic importance to the United Nations in the Second World War but, above all, to Great Britain in the protection of India and the Persian oilfields from attack from the W. A minister of state in the M. E. was appointed in June 1941, to represent the War Cabinet, charged with the duty of concerting measures necessary for the prosecution of the war in that part of the world, other than the conduct of military operations, and thereby relieving the military commander of many responsibilities unrelated to the actual military operations. Mr. Oliver Lyttelton (later minister of production) was the first occupant of the post, and Mr. Casey, Australian minister, succeeded him. A M. E. supply centre was set up in Cairo in April 1941, when the difficulties which arose over supplying Greece during the Greco-It. war had demonstrated the need for organising civil supplies for other ters, forming the allied base of operations in N.E. Africa and S.W. Asia. Later this body served a pop. of some 80,000,000, including in its scope Egypt, the Sudan, Palestine, Transjordan, Saudi Arabia, Eritrea, Brit. Somaliland, Syria and Lebanon, Iraq, Persia (Iran), and, for certain purposes, Turkey and Malta. The centre carried out its administrative work under the direction of the minister of state. Originally a purely Brit. agency, the centre developed into an Anglo-Amer. body by the addition of U.S. civil and military representatives. There were many notable campaigns in M. E. countries, particularly the Ger. conquest of Crete (May-June 1941); the battle of the W. Desert (Nov. 1940-Feb. 1941), in which Gen. Wavell routed Gen. Graziani's forces; the conquest of It. E. Africa, including Ethiopia (Feb. 1941-Nov. 1941) by Gens. Cunningham and Platt; the Axis (g.v.) offensive under Marshal Rommel in 1942 which was eventually stopped on the line El Alamein-Quattaro; and Gen. Alexander and Gen. Montgomery's victory over Rommel in Oct.-Nov. 1942. Syria was conquered by Brit. forces in June 1941. Axis plotting in Iraq was checked by the Brit. counter measures in April-May 1941, and Persia was occupied in Aug. 1941. See further under AFRICA, NORTH, SECOND WORLD WAR CAMPAIGNS IN; CRETE, BATTLE OF (1941); IRAQ, *Revolt in Iraq*; ITALIAN EAST AFRICA, SECOND WORLD WAR CAMPAIGN IN (1941); PERSIA, *Anglo-Soviet Invasion* (1941); SYRIA, *British Invasion* (1941). The location of R.A.F. bases in Sinai, Transjordan (th. Hashimite Kingdom of Jordan), Khartoum, and Iraq, and of U.S.S.R. bases in the Caucasus and Turkestan, the oilfields and pipe-lines in

Iraq and Persia, and the shipping routes to the M. E. all combine to give that region its vital importance in world strategy. The unsettled conflict between the Arab states and Israel, particularly over the Arab refugee question, the growing disunity among the Arab states themselves, and the unsatisfactory state of Brit. relations with many M. E. countries had, by 1949, severely upset the stability and security of the M. E. Brit. policy after the Second World War was, and remains, one of non-interference; for, until the refugee question is disposed of, there is little that can be done to provide the M. E. with the breathing space and the renewed hope which it needs if it is not to relapse into anarchy. The negotiations of June 1949 of the Conciliation Commission of the United Nations reached deadlock largely because of the refusal of Israel to take back any Arab refugees until Palestinian frontiers had been settled. At the moment there are about 900,000 Arabs in receipt of relief, 800,000 being refugees; and of these refugees 600,000 come from within Israel and 200,000 from outside that state. From the long-term point of view the refugees provide the greatest opportunity for a constructive reshaping of Brit. policy towards the M. E. They represent a much greater problem than the Arab states themselves can solve. What seems to be wanted is some large-scale development project which would at the same time provide the refugees with work and the country concerned with a prospective increase in its real wealth. The project would require wide autonomous powers, which would involve receiving concessionary rights over local resources such as those enjoyed by the oil companies. It would, if successful, provide a concrete example of W. skill diverted to a benevolent end, and to the extent that it became integrated with the general economy of the M. E. it would have a stabilising influence over it. See G. E. Kirk, *A Short History of the Middle East*, 1948.

Middle English, see ENGLISH LANGUAGE; ENGLISH LITERATURE.

Middleham, small tn. in the N. Riding of Yorkshire, England, on the R. Ure. It has the ruins of the castle of the Nevilles, lords of Raby.

Middle Latitude, in navigation, the mean of two lats. It is the distinctive name of a method called in navigation M. L. sailing, which means that, in estimating the difference of long. by means of the differences of lat., and the intermediate departure, this departure is supposed to be an arc of a parallel of long. at the intermediate or M. L. (see Riddle's *Navigation*, in which a table may be found corrective of the results).

Middle Oil, name given to one of the fractions obtained in the distillation of coal tar. The products obtained from it are naphthalene and carbolic acid.

Middle Park Plate, see RACE MEETINGS. **Middlesbrough**, city in Bell co., Kentucky, U.S.A., 64 m. N.N.E. of Knoxville, Tennessee. It has coal and iron mining, and manu. of steel and brick. Pop. 10,000.

Middlesbrough, manufacturing and iron and steel producing tn., situated at the mouth of the R. Tees in the N. Riding of Yorkshire, England, 238 m. from London. It is a municipal co. and parl. bor., incorporated in 1853; its boundaries were extended in 1913 and 1932, its pop. now being approximately 144,000. M. returns two members to Parliament. By Order in Council dated Aug. 5, 1948 the number of wards of the tn. was increased from eleven to seventeen, and accordingly the tn. council consists of seventeen aldermen and fifty-one councillors. The highly industrialised Tees-side area of which M. is the centre is the biggest producer of pig iron in the country. Within the tn. there are constructional works, chemical plants, and numerous engineering and allied industries. M. is within a development area and the Board of Trade have erected a number of modern factories for light industries. The corporation propose to supplement this development by sponsoring the relocation of light industry, sites for which must be found to afford facilities for industries displaced from other areas in the tn. which need replanning and redevelopment under the corporation's master plan for the control of future development. The heavy industries, shipyards, docks, and wharves are on the banks of the riv., and the tn., which is of comparatively recent growth, spreads southward towards the Cleveland Hills. Gas for industrial and domestic use is supplied by the corporation, and a plentiful supply of water for industrial and domestic consumers is provided by the Tees Valley Water Board, of which the corporation is the largest constituent authority. Transport facilities by road and sea are excellent. The R. Tees is spanned by a transporter bridge and a vertical lift bridge, both of which are almost without equal in the United Kingdom, but necessitated by the low-lying nature of the land on either bank. The corporation has erected more than 5000 houses on four built-up housing estates and two rapidly developing additional estates.

The tn. has two very fine natural parks, one artificial park, and sev. recreation grounds. There are two theatres and a flourishing Little Theatre catering for amateur dramatic talent. There is easy and ready access to the sea and to moor and country, all within a radius of 10 m. The tn. has a well-equipped technical college, grammar and secondary modern schools, public baths, libraries, museum, art gallery, hospital, mental hospital, and sanatorium, and one of the cheapest public omnibus transport systems in the country. Large-scale industrial developments are contemplated and in hand immediately to the E. of the tn., consisting of the construction of a huge steel-processing plant and chemical works. The Tees Conservancy Commissioners are providing considerable dock and riv. improvements to supplement the deep-water wharves, and the Brit. Railways docks which cope with ships of up to 13,000 tons.

The first attack in the Second World

War by the Ger. Air Force on an industrial target in England was directed against M. on May 25, 1940, and was followed during the course of the war by a further eleven attacks in which bombs fell on the industrial and built-up area. In the raids 78 persons were killed and 594 injured, 318 buildings were totally destroyed and 8547 damaged. St. Peter's church and vicarage were totally destroyed. See Ruth (Glass) (ed.), *The Social Background of a Plan: a Study of Middlesbrough*, 1948.

and sev. modern light industries. M. consists of two co. constituencies and twenty-six bor. constituencies, each returning one member to Parliament. Pop. 1,958,000. See M. Sharpe, *The Antiquities of Middlesex*, 1911; W. Page (ed.), *Victoria County History*, 1911; and A. Mee (ed.), *Middlesex*, 1940.

Middlesex Regiment, traces its hist. to the 59th and 77th regiments of Foot. The 59th Foot was raised in the W. country by Col. Arabin in 1755 for service in the Seven

Norman, Lang & Co. Ltd.

MIDDLESBROUGH: THE TREE TRANSPORTER BRIDGE

Total length of the bridge and approach span, from end to end, is 850 feet, the span across the water between the towers 570 feet, and the height from the high-water mark to the underside of the girders over the river 160 feet.

Middlesex, metropolitan co. of England, has an area of 233 sq. mi. M. is separated from Surrey and Kent on the S. by the Thames, between Staines and Chiswick Eyot; from Essex on the E. by the R. Lea, from Waltham Abbey to Stamford Hill; from the co. of London by a line drawn N. from Chiswick Eyot to Willesden Junction, E. to Kilburn, N. to Shoot-up Hill, E. round the N. fronts of Hampstead and Crouch Hills, round the S. to Finsbury Park, and again E. to Stamford Hill, thence to the R. Lea; the div. from Buckinghamshire on the W. is the R. Colne, from Rickmansworth to Staines, and from Hertfordshire on the N. an irregular arbitrary boundary running E. from Rickmansworth to Barnet, N. to Mimms Wood, and then E. to the Stort and Lea navigation to Waltham. The co. is intersected by the New R. and the Paddington and Grand Junction canals. The co. tn. is Brentford. Save for a small and diminishing rural area in the W. M. is covered with tns. and urb. dists., suburbs of London. There is a small-arms factory at Enfield, gov. powder mills at Hounslow,

Years war and, two years later, it was re-numbered the 57th Foot, and then, during the Amer. war, 1775, it received its second title, the W. M. R., though most of its personnel were men of Scots birth. The 77th Foot was raised by Col. James Marsh in 1787, and in 1807 was given the title of E. M. R. Formed to augment the army in India, the cost being borne by the E. India Company, it took part in the siege and capture of Seringapatam, then reputed the strongest fortress in India. In a later assault on the same fortress Lt. John Lawrence, of the regiment, was wounded, and left for dead, but survived to become the father of Sir Harry Lawrence and Lord Lawrence, two of India's most distinguished soldiers. The Peninsular war added many battle honours to those of the M. R.: the 57th's first experience of a great battle with Napoleon's veterans was at Albuera, where they earned the sobriquet of 'the Diehards' from the fact that their commanding officer, Col. Inglis, though terribly wounded, continued till the end of the fight to rally his men with the repeated

call 'Die hard, 57th, die hard.' In the siege and capture of Badajoz, in which Picton's div. was so prominent, the 77th, which was part of that div., was reduced to 100 men in all. Subsequently both the 57th and 77th regiments were sent to the Crimea and fought under the duke of Cambridge. The 77th received the surrender of Balaklava, and both regiments fought at Inkerman, and took part in the siege of Sebastopol. Later, in New Zealand, the 59th gained distinction for the courageous way in which it attacked the Maori stockades in the Maori war of 1860. In 1881 the two regiments, 57th and 77th, which had for some time been linked for the purpose of providing drafts, became permanently incorporated as the 1st and 2nd battalions of the Duke of Cambridge's Own (M. R.). In the S. African war the 2nd battalion fought at Spion Kop, Vaal Krantz, Colenso, and Pieter's Hill. The 3rd and 4th regular battalions were raised early in this war. All four regular battalions went to the W. Front in the First World War. Mons, Le Cateau, the Marne, the Aisne, the first battle of Ypres, Loos, the second battle of Ypres, the second battle of Loos, the third battle of Ypres, the Somme, Arras, Messines, Passchendaele, Cambrai (1917), Cambrai (1918), Mons (1918) were all battles in which the regiment was heavily engaged. Other battalions raised as new or territorial army units, took part in battles in Salonika, Egypt, Gallipoli, Palestine, Mesopotamia, and the advance into Bulgaria, as well as in Turkey, Siberia, and India. Before the war ended there were as many as forty-one battalions of the regiment serving at home or overseas. The M. R. fought in N.W. Europe and in Italy in the Second World War. In the battle of Normandy, 1944, they were associated with the Argyll and Sutherland Highlanders in the tremendous struggle to hold the second crossing over the R. Odon.

Middle Temple, see INNS OF COURT.

Middleton, Conyers (1683-1750), Eng. divine, b. at Richmond in Yorkshire, or at York itself. He was a fierce and bitter controversialist, and among his best-known pamphlets are *A Letter from Rome* (1729); and *An Inquiry into Miracles* (1748). He anticipated the method of historical criticism applied to the O.T. stories. His pub. an interesting and valuable *Life of Marcus Tullius Cicero* (1741), largely plagiarised, however, from Wm. Bellenden (q.v.), a seventeenth-century Scottish writer.

Middleton, or Myddelton, Sir Hugh (c. 1560-1631), Eng. engineer, b. at Denbigh, N. Wales. In 1606 he made an offer to Parliament to bring drinking water, of which there was a great scarcity, to London. In 1609 the first sod upon the works of the New R. (q.v.) was turned, and in 1613, in spite of strenuous opposition from the landowners and financial difficulty, the work was completed, largely owing to the financial support received from the king. The original New R. drew its water from chalk springs at Chadwell near Amwell, and after a

course of 38½ m. entered a reservoir at Islington.

Middleton, Thomas (c. 1570-1627), Eng. dramatist, of whose early life little is known. He was b. in London, and the inference from his plays and pamphlets is that he was a man of breeding and a good classical scholar. He was entered a student at Gray's Inn, and evidently used his legal knowledge in *The Old Law*, a play written about 1599 in collaboration with Wm. Rowley (produced 1656), and in *Michaelmas Term* (produced 1607). He wrote plays by himself and also in collaboration with Drayton, Webster, Munday, Dekker, and Rowley and, besides plays, composed many pageants and masques. The first play written by himself was *The Chester Tragedy* (1602), from which year he wrote regularly for the theatre. He was at his best when writing comedies of manners, his satire being keen and his dialogue excellent. One of his plays, *A Game at Chess* (1624) achieved the distinction of being objected to by the Sp. ambassador on political grounds; the leading politicians of England and Spain appeared under the names and guises of chequers, and the play was most successful. In later years he wrote pamphlets and composed pageants for civic ceremonials and prepared masques. He was appointed city chronologer in 1620, in which capacity he composed a chronicle of the city, now lost. His chief plays, many posthumously produced, are *A Trick to catch the Old One* (1608); *The Familie of Love* (1608); *A Mad World, my Masters* (1608), one of his best plays; *A Faire Quarrell* (1617); *A Chaste Maid in Cheapside* (1630); *Women beware Women* (1657); *No Will, No Help like a Woman* (1657); *More Dissemblers besides Women* (1657); and *The Witch* (1778). In collaboration with other playwrights are: with Dekker, *The Roaring Girl* (1611); with Ben Jonson, *The Widow* (1652); with Rowley, *The Spanish Gipsy* (1653), and *The Changeling* (1653). The outstanding characteristics of his comedies, some of which are highly praised by Lamb, are the wide observation of men and manners, and the boldness of treatment. His tragedies rival those of Webster in scenes of strong passion. He is, however, unequal as a dramatist, and repeats himself. In many he have types as old as those in Plautus: misers, courtisans, and spendthrifts, but reanimated with M.'s vigour and wit. M. obviously knew the life of the people, and was a good 'mixer.' This is manifest from his pamphlets *The Black Book* (1604) and *Father Hubbard's Tales* (1604), which show no small acquaintance with the haunts and habits of pimps, bullies, Cyprians, and thieves. His general outlook was that of a typical cultivated Englishman, with no love for the Puritans and no extremes of party feeling. Among his pageants and masques are *The Triumphs of Truth* (1613); *The Triumphs of Honour and Industry* (1617); and *The Inner Temple Masque* (1619), etc. His works were collected by Dyce in 1840 and by A. H. Bullen, 1885-86. See R. Withington, *English Pageantry*, 1918-20; W. D. Dunkel,

The Dramatic Technique of Thomas Middleton in his Comedies of London Life, 1925; and M. C. Bradbrook, Themes and Conventions of Elizabethan Tragedy, 1935.

Middleton, municipal bor. of Lancashire, England, 5 m. N.N.E. from Manchester. It is an important seat of the cotton and silk manufs. Soap and chemicals are made, and calico printing is carried on. There are coal mines and iron works. Pop. 29,100.

Middleton, or **Midelton**, mrkt. tn. of Eire, in the co. of and 13 m. E. of Cork, has a whisky distillery and flour-mills. Pop. 3500.

22 m. S.W. of Durham, England, on the R. Tees; it has lead mines. Pop. 2300.

Middle West, *The*, term rather loosely applied in the U.S.A., as much to a geographical section as to an attitude of mind in politics and economics. At various times the states of Ohio, Indiana, Illinois, Michigan, Iowa, Wisconsin, Minnesota, N. and S. Dakota, Kansas, and Nebraska have been termed middle W. states. Though some of these have considerable industrial cities, in the main they are all alike in being principally agric. states, with flat plains or prairie soil and well watered. The characteristic frame

U.S. Information Service: American Embassy

CRAWFORDSVILLE, INDIANA: A TOWN OF THE MIDDLE WEST

A town laid out in 1823 by Major Ambrose Whitlock, who named it in honour of Colonel William Crawford of Virginia, a famous Indian fighter. It is a busy manufacturing and trading city, its residential area, seen in the photograph, being surrounded by a productive agricultural area.

Middleton: 1. City and the co. seat of Middlesex co., Connecticut, U.S.A., on the Connecticut R., 16 m. S. of Hartford. It is the seat of a Wesleyan univ., and has manufs. of cotton, pumps, hydraulic machinery, typewriters, and rubber fabrics. Pop. 26,400. 2. City in Orange co., New York, U.S.A., 57 m. N.N.W. of New York city, in a rich agric. dist. Manufs. include straw hats, hardware, cigars, machine tools, and fur and leather goods. Pop. 21,900. 3. City in Butler co., Ohio, U.S.A., on the Miami R., 35 m. N. of Cincinnati, with manufs. of tobacco, paper, bicycles, steel, and agric. instruments. Pop. 31,200. 4. Tn. in Dauphin co., Pennsylvania, U.S.A., on the Susquehanna R., 9 m. S.E. of Harrisburg; has flour and planing mills, and iron manufs. Pop. 7000.

Middleton-in-Teesdale, tn. in the co. and

of mind of the farmers, who make up the bulk of the pop., is explained by the fact that, while they raise most of the food of the nation, the money control lies principally in New York, Boston, and Philadelphia. In hard times the farmers are compelled to file mortgages on their farms. These mortgages find their way to the banks, and the banks are controlled by the money situation in the E. Hence the bitter hatred often manifested towards Wall Street, the financial section of New York city. Politically most of these states are nominally Republican, but actually they have often inclined strongly to that type of Republicanism which is termed progressive. As a revolt against the gold standard and Wall Street control, the farmers and small tn. folk of many of the middle W. states in the famous campaign of 1896 followed W. J. Bryan (q.v.),

Democratic nominee for president on a free silver platform. In later days their prophet was the late R. M. La Follette (q.v.), governor of, and afterwards U.S. senator from, Wisconsin, and a progressive and radical Republican always. In the mid-war campaign of 1916, when Woodrow Wilson was running for re-election as president, on the platform 'He kept us out of the war', many of these middle W. states voted for him, notwithstanding that he was a Democrat. The type of mind so often satirised in the novels of Sinclair Lewis is primarily the middle W. mind. The people are ardently Amer., very much averse from mixing in European affairs, intensely religious, devoted to the public-school (which in America means private-school) system and suspicious of anything that has to do with high finance and big business. It was the M. W. which largely opposed America's entry into the League of Nations and which later opposed cancellation of war debts. It is the M. W., too, which has most persistently demanded relief for the farmers in every crisis brought about by low world prices. A typical M. W. tn. has been described under the pseudonym of Middletown by R. S. and H. M. Lynd. See *Middletown* (1929), and *Middletown in Transition* (1937 and 1947).

Middlewich, mkt. tn. in Cheshire, England, 21 m. E. of Chester. There are chemical works and a condensed milk factory. Salt is produced. Pop. 7000.

Midelton, Yorkshire, see **MIDDLETON**.

Midgard, name given in Norse mythology to the earth as intermediate between the Asgard (q.v.) of the gods and Utgard of the Jötuns (q.v.).

Midges are small dipterous insects (tribe Nematocera). They differ from the gnats or mosquitoes in the absence of their long, slender, horny proboscis. Most of them are quite harmless, but the females of some minute species of the genus *Ceratopogon* have the mouth highly developed, and with pointed lancet-like organs are able to draw blood. A typical M. is *Chironomus plumosus*, the aquatic larva of which is the blood worm. Many of the gull M. (Cecidomyiidae), including the Hessian fly and the wheat M., are serious plant pests.

Midhat Pasha (1822-84), Turkish statesman, b. in Constantinople. His first important mission was to subdue the brigandage in Rumelia; on returning he was promoted to the supreme council, and then made governor of Bulgaria. In 1860 he was made pasha. He visited sev. of the caps. of Europe, and then returned to frame the laws of the vilayets. In 1864 he was made governor of the vilayet of the Danube, and endeavoured to reconcile the Bulgarians to the Ottoman supremacy. He was twice grand vizier, under Abdul Aziz (1871), and again under Abdul Hamid II. (1877).

Midhurst, mkt. tn. of Sussex, England, on the Rother, 11 m. N.N.E. of Chichester. It has a grammar school (1672), Cowdray Castle, and the King Edward VII. sanatorium. Pop. of rural dist. 20,100.

Midl, region of France, comprising broadly the area between the bay of

Biscay and the Mediterranean, with Toulouse as the chief tn. Its name is due to the fact that it was once a middle land between France and Spain.

Midl, Canal du, or **Canal de Languedoc**, canal of France, connecting the Garonne with the Mediterranean. Length 150 m.

Midl, Dent du, mt. of the Alps, S. of Lake Geneva, between the Swiss valleys of Chambéry (N.W.) and Salvan (S.E.). It was first ascended in 1784 by Clément, curé of Chambéry. Height, 10,696 ft.

Midl, Pic du, peak of the Pyrenees, S. France, 6 m. S. of Bagnères-de-Bigorre, almost on the Sp. frontier. The solar corona was first photographed in full sunlight from the observatory near its summit, in 1931. Altitude 9465 ft.

Midianites, Arab race, descended, according to Gen. xxv. 2, from Midian, the son of Abraham, and his Arab wife, Keturah. They occupied the land to the S. of Moab and Edom. Joseph was sold to Midianite merchants (Gen. xxvii.). Jethro, priest of Midian, was the father-in-law of Moses (Exod. iii.). The M. frequently united with Moab against the Israelites (Num. xxii.). They were crushed by Gideon (Judges vi.-viii.). Their national god was Baal-Peor. See also **KENITES**. See Sir R. Burton, *Midian Revisited*, 1879.

Midland Bank, The, was founded in Birmingham in 1836. The original title was the Birmingham and Midland Bank, and the paid-up cap. was £28,000. The bank followed the traditional lines of Brit. banking throughout the first half-century of its career, but from 1888 onwards the policies of amalgamation and branch extension were adopted and vigorously pursued. In 1891, the Central Bank of London was absorbed, and this provided an estab. in the metropolis with a seat in the London Bankers' Clearing-House. The City Bank was absorbed in 1898, and in 1918 the largest amalgamation, that with the London Joint Stock Bank, took place. Besides the smaller banks in England and Wales which the M. B. had taken over, it acquired in 1917 the capital of the Belfast Banking Corporation, with its branches and agencies throughout N. Ireland. Similarly the capitals of the Clydesdale (1920) and N. of Scotland (1924) Banks were acquired. Each of these institutions, however, preserves its autonomy. The subscribed capital, is £12,114,872, and paid-up capital, £15,158,621, and a reserve fund of equal amount. Its combined resources exceed £500,000,000.

Midland Dialect, see under **ENGLISH LANGUAGE, Middle English**.

Midlands, name denoting the midland cos. of England. The region lies between the Thames and the Trent and between E. Anglia and the cos. on the Welsh border. It includes the cos. of Derby, Leicester, Northampton, Nottingham, Rutland, Stafford, Warwick, and Worcester. See also **ENGLAND AND WALES**. See W. G. Hoskins, *Midland England*, 1949.

Midland Railway of England, The, estab. in 1844, was an amalgamation of the N. Midland, Midland and Cos., Birmingham and Derby, and other lines. In 1868 the system was extended from Bedford to

London, the Midland trains having previously reached London from Hitchin on the Great N. lines. The main line ran from St. Pancras (London terminus) to Carlisle, serving the prin. tns. of the Midlands, W. Riding, and Manchester. There was also an Irish section, the Belfast and N. Cos. system having been acquired in 1903. It had large docks at Heysham, Lancashire, for the cross-channel service between England, Belfast, and the Isle of Man, which became the property of the L.M.S., into which group the M. R. subsequently merged. Under the present system of Brit. Railways, the London Midland Region corresponds to the system of the former L.M.S.R. in England and Wales, with headquarters at Euston, London. *See further under LONDON, MIDLAND AND SCOTTISH RAILWAY COMPANY.*

Midleton, William St. John Fremantle Brodrick (1856-1942), first Earl and ninth Viscount. Eng. statesman; son of the eighth viscount, educated at Eton and Balliol College, Oxford. He held the offices of financial secretary to the War Office, 1886-92; under-secretary of state for war, 1895-98; under-secretary of state for foreign affairs, 1898-1900; secretary of state for war, 1900-3; secretary of state for India, 1903-5. He was prominent in Unionist politics in S. Ireland, being a landowner in Cork, and he favoured home rule for Ireland subject to safeguards for loyalists. He succeeded his father in the viscountcy, 1907; was a member of the Irish Convention, 1917-18; and was created earl of Midleton and Viscount Dunsford, 1920. His book *Ireland, Dupe or Heroine*, appeared in 1932. His autobiography, *Records and Reactions, 1856-1939*, was pub. in 1939.

Midlothian, or Edinburghshire, co. of Scotland, bounded on the N. by the firth of Forth, on the W. by Lanthgowshire, on the E. by Haddingtonshire and Berwickshire, and on the S. by Lanarkshire, Peebleshire, and Selkirkshire. In the S.E. and S.W. parts of the co. are the Moorfoot Hills and the Pentland Hills, the latter of which extend to within 4 m. of Edinburgh; the chief summits are Blackhope Scar, highest point of the Moorfoot Hills (2136 ft.), Seald Law (1898 ft.) and Carnethy (1881 ft.). Of the rivers, the Gala flows S. to the Tweed, and the Tyne, after a course of only 7 m. in the co., flows into Haddingtonshire; the N. and S. Esk Rs., and the water of Leith, all flow into the firth of Forth. Half of the country consists of arable and pasture land; the most fertile part is the lowlands which stretch to the Forth. Many large farms are worked here on up-to-date methods, and dairy farming is extensively carried on in the hillier dists. The chief crops are oats, barley, turnips, and potatoes; horse-breeding is also a considerable industry. Coal is mined in the N.E. and S.E. parts, ironstone is found at Lasswade and Penicuik, and other minerals are limestone and freestone. The chief industry is paper-making, and the ales of the co. have long been famous. Other manufs. are whisky and gunpowder, whilst the fisheries are

valuable. The chief tns. of the co. are Edinburgh, Leith, Dalkeith, Musselburgh, and Portobello. Area 234,339 ac. Midlothian and Peebles send one member to Parliament. Pop. 326,200.

Midnapur, or Midnapore, cap. of a dist. of the same name in the Bardwan (or Burdwan) div. of Bengal, India, on the Kasai R. The trade is largely in indigo, silk, and brass and copper ware; rice is the chief agric. product. Pop. 40,000.

Midnight Sun. At the summer solstice, about June 21, the sun does not set, but sinks to the N. point of the horizon at midnight at the Arctic circle. At N. Cape in Norway it is visible at midnight from May 12 to June 29. This phenomenon is called the M. S., and the N.W. coast of Norway the 'land of the M. S.' Owing to the inclination of the rotational axis of the earth from the normal to the orbit, the sun is constantly visible during the summer at and within the Arctic and Antarctic circles for a period of forty-eight hours to six months, according to distance from the poles.

Midrash, oldest Heb. exposition of the O.T. which, for 1500 years after the exile, accumulated from the explanations of scriptural passages and became the basis of rabbinical teaching. It was divided into the *Halahah*, which dealt with civil and religious law and ordinances, and the *Haggadah*, the whole body of the narrative of the O.T.; to this latter part the term M. is usually confined. *See Steinschneider, Jewish Literature*, 1857.

Midriff, *see* DIAPHRAGM.

Midshipmen. On going to sea from the officers' training estab., naval cadets are promoted to the rank of midshipman, in which they have to serve for sixteen months before being commissioned as sub-lieutenant (*see* RANK and NAVAL EDUCATION). During this period they undergo intensive practical training as well as a certain amount of theoretical study. They are placed in charge of boats, work under the officer of the watch, are attached to specialist officers for different periods, and take minor positions of responsibility in manning the ship's armament. Cruisers and above carry their quota of M., which in a battleship may be as many as thirty, but they all do time in destroyers and a period is also set aside for training in naval aviation.

Midsomer Norton, par. 9 m. S.W. of Bath, Somersetshire, England. Near by is the Benedictine abbey and school of St. Gregory at Stratton-on-Fosse. In the tower of its church, St. John the Baptist, are three bells presented by Charles II. There is trade in coal from the small Somerset coalfield. Pop. (1931) 8000.

Midsummer Day, June 24, the summer solstice, and one of the four Eng. term days. It is also St. John the Baptist's Day. *See* JOHN'S, EVE OF ST., or MID-SUMMER EVE.

Midsummer Eve, *see* JOHN'S, EVE OF ST., or MID-SUMMER EVE.

Midway Island, Battle of, *see* NAVAL OPERATIONS IN SECOND WORLD WAR.

Midway Islands, group of small is. in lat. 28° 13' N., and long. 177° 23' W.,

lying N.W. of the Sandwich group and forming the W. is. of the Amer. Hawaiian group. They consist of an atoll on which are two small is., Sand Is. and Eastern Is., and a number of islets. They were discovered by Capt. Brooks of the *Gambia* in 1859, who took possession of them in the name of the U.S.A. The barrier reef here is almost continuous except for a 3-m. gap on the W. side. In the S. part of the gap is Seward Roads, opposite the passage into Welles Harbour inside the lagoon. With a smooth sea there is a boat passage through the reef westward of Eastern Is. Sand Is. is composed of white coral sand; on its N. side are cable and wireless station buildings and a light-house. Eastern Is. is covered with trees, shrubs, and coarse grass, and has a sand beach of dazzling whiteness, except in its E. point, which is coral rock. The is. were made an Amer. reservation in 1903. An Amer. naval victory over the Jap. was fought off the group in June 1942. See further under SECOND WORLD WAR, *Naval Operations*.

Midwifery (from A.-S. *mid*, with, and *wif*, woman, properly the woman or wife with or attendant upon a woman in childbirth) deals with care of women in childbirth. *M.* existed among the Israelites, and among the anc. Gks. It reached a high state of excellence. In the Middle Ages the science of *M.* fell into decay, but in the sixteenth century sev. works were pub. enumerating the general principles. As a strict branch of medical science, *M.* dates from the early eighteenth century, previous to that the matter being left as strictly a woman's province. To-day the supervision of midwives by the State is very thorough, and training and certificates are essential to all who practise *M.* The Midwives Act of 1902 regulated the craft, and gave power to the local authorities to exercise the necessary control over the *M.* of their dists. The central board has the right to delete names from the register of those who do not satisfy the regulations. See also OBSTETRICS.

Miechowitz, tn. in Polish Silesia. 3 m. W. by N. of Bytom (Beuthen). It has deposits of zinc and iron. Pop. 10,000.

Mier, tn. in the state of Tamaulipas, Mexico, on the Rio Grande del Norte, 80 m. E.N.E. of Monterey. Pop. 9,000.

Mieres, tn. in Spain, in the prov. of and 9 m. S.E. of the city of Oviedo. It has coal, sulphur, copper, and cinnabar mines, chemical factories, steel and zinc works, and blast furnaces. Pop. 53,000.

Mierevelt, or **Miereveld**, Michiel Janszoon van (1567-1641), Dutch painter, b. and d. at Delft. He studied under the engraver Jérôme Wierix and the painter Blocklandt. He produced an enormous number of careful portraits and a few interiors.

Mieris, Frans van (1635-81), called the older, Dutch painter, b. at Delft. He studied under Gerard Douw. His works are mainly portraits and domestic scenes, and he especially favoured the portrayal of the life of the wealthy. One of his best pictures is 'The Cavalier and Lacemaker'

(1656) in the Viennese gallery. There are many panels by him in the Ituhl collection in Cologne.

Mieris, Frans van (1689-1763), the younger, the son of Willem, and also a genre painter; but he is better known as an antiquary and historian. He pub. *Historie der nederlandse Vorsten* (1732-35), and *Groot charterboek der graven van Holland, van Zeeland en heren van Friesland* (1753-56).

Mieris, Willem van (1662-1747), b. at Leyden, son of Frans the elder, was a genre painter like his father, whose pupil he was, but his work is inferior.

Miers, Sir Henry Alexander (1858-1942), Brit. mineralogist. B. in Rio de Janeiro, he was educated at Eton, and Trinity College, Oxford. In Brit. Museum 1882-05 he was engaged in research in crystal morphology. Appointed first Waynflete prof. of mineralogy, at Oxford, 1895; in 1908 he became principal of the univ. of London, and vice-chancellor of Manchester Univ., and prof. of crystallography there, in 1915; he was chairman of the Brit. Educational Mission to U.S.A., 1918, and the first president of the Gemmological Association of Great Britain. His writings include a text-book on *Mineralogy* (1902), and articles on the same subject. The mineral miersite, a silver-copper oxide, was named after him in 1898.

Miglierina, tn. of Calabria, Italy, in the prov. of and 7 m. W.N.W. of the tn. of Cantanzaro, on the R. Lamato. Pop. 5,700.

Migliorati, Cosimo del, see INNOCENT (popes), Innocent VIII.

Mignard, Pierre (1610-95), Fr. portrait painter, brother of Nicolas M., the engraver (1606-68), b. at Troyes, and studied under Vouet at Paris, and later at Rome. He painted portraits of Pope Alexander VII. and many It. princes. In 1657 he was summoned to Paris by Louis XIV., and on the death of Le Brun succeeded to all that artist's positions.

Migne, Jacques Paul (1800-75), Fr. author and theologian, b. at St. Flour, Auvergne. He was ordained in 1824, and soon afterwards pub. *De la Liberté*. It was so criticised that he went to Paris and there started the paper called *L'Univers religieux*. He then opened printing works at Petit-Montrouge. Other works are *Encyclopédie théologique* (171 vols., 1844-1855); *Patrologia latina* (221 vols., 1844-1855), an exhaustive library of the Gk. and Lat. fathers of the Church; and *Scriptura sacrae cursus completus* (28 vols., 1840-45).

Mignet, François Auguste Marie (1796-1884), Fr. historian, b. at Aix-en-Provence. In 1822 he went to Paris and pub. his *Histoire de la Révolution française* (1824; trans., 1826; new ed., 1928). He represents the revolution as the natural outcome of the different conditions of time, place, climate, and national temperament. This has led to the charge of fatalism being brought against him, but his work is a remarkably clear account of its subject, giving not only a vivid picture, but at the same time detached and philosophic deductions, the whole being enhanced by

excellence of form and style. In 1830, in conjunction with his friend Thiers, M. founded the *Liberal jour. Le National*. In 1836 he was admitted into the Academy. He pub. *Notices et mémoires historiques* (1843); *Vie de Franklin* (1848); *Histoire de Marie Stuart* (1851); *Charles Quint* (1854); *Rivalité de François I. et de Charles Quint* (1872-75), and the romantic drama *Antonio Perez et Philippe II.* (1845-1846). See life by E. Petit, 1889.

Mignonette, genus *Rosa*, of annual herbs of the family Rosaceae, indigenous to the S. countries of Europe and the Mediterranean generally. The fragrant *R. odorata* was introduced into Britain from Egypt in the middle of the eighteenth century. It is a favourite garden plant, with large pyramidal white and red heads; there are dwarf and double-flowered varieties. The stem branches from the base, and the plant grows as a rather diffuse clump, bearing alternate lance-shaped leaves, simple or three-lobed.

Mignot, Louise, see DENIS, LOUISE MIGNOT.

Migraine, or **Hemiorania**, terms employed to denote a group of symptoms of which the most distressing is a severe headache. The disease is paroxysmal in character, and usually commences with a dull aching on one side of the head between the cheekbone and the temple. The pain grows gradually more intense, and the patient develops hyperæsthesia, or excessive sensibility. There is also a painful degree of nausea, often leading to vomiting, and the patient may complain of various pains, seated in widely separated parts of the body. In many cases there are indications of hysteria, and little reliance can be placed upon the statements of the patient, who may suddenly recover and appear in quite good health after having been apparently in a state of extreme exhaustion a few minutes before. Visual disturbances and illusions are characteristic. Little is known of the cause of M. It may be simply a form of neuralgia in which the optic nerve is involved. It is attributed by some to eye-strain, though many cases show no hist. of anything approaching excessive use of the eyes. Sir W. Gowers looked upon it as a form of epilepsy. It is common in, though by no means confined to, individuals of a highly strung and badly balanced nervous constitution, or to people of great mental capacity (e.g. Wheatstone the physicist and Herschel the astronomer). The attacks can be relieved to a certain extent by various drugs, such as bromides, chloral, and morphia.

Migration of Animals, periodical movement from one dist. to another, mainly regulated by the food supply, though it is concerned also with breeding. It occurs in a large variety of animals, but most consistently among birds; in fact, it is believed that nearly every bird migrates in some part of its range. Much valuable information has been collected in recent years by the work of bird marking and observation stations; mention should be made particularly of Herr Gatzke's pioneer work on Heligoland, and the more recent

investigations on wildfowl by Peter Scott, as well as the schemes originated by the Brit. Museum (Natural Hist.). Large numbers of birds are caught and liberated after metal rings have been fixed on their legs, the return of which with particulars and date of capture is invited. Fish, such as salmon, can be marked similarly, using metal tags attached to the gill cover. Apart from the enormous distances which many birds have been proved to travel, one of the most remarkable facts elucidated is that birds of a species (e.g. skylark) sometimes cross in their line of migration, some settling in dists. which others have just left. The regularity of migratory movements is remarkable in such birds as the puffin or the swift, but spasmodic or irregular migrations have occurred on various occasions, as notably in 1863 and 1888, when Pallas's sand grouse, a native of the plains of Tartary, invaded Britain in great numbers. Similarly, the cross-bill and the waxwing make occasional incursions. More than one species of Lepidoptera (butterflies) annually migrates over the North Sea. Crabs and lobsters and some molluscs are known to move considerable distances to fresh feeding-grounds. A number of fish (e.g. the salmon) are anadromous in habit; that is, they live in the sea, but enter fresh water to spawn and afterwards again descend to the sea; while, on the other hand, the eel spawns in the deep sea off Bermuda, and does not return, the young entering the rivers of Great Britain & elvers. In the search for safe breeding-grounds, most of the aquatic mammals migrate long distances from their usual haunts. Many other mammals make fairly regular migrations, their movements being regulated primarily by the changes of the seasons. The routes followed by birds and other migrating animals have remained unchanged since prehistoric times; indeed the lemming is said to swim out to sea from the Scandinavian coast in a fruitless quest for certain is. which have now disappeared. The method whereby birds find their way on their long migratory flights is unknown, though it has been suggested that they may be guided by their keen sense of time, whereby they are able to judge accurately the length of the day (which varies with the geographical latitude). It must be remembered that the young individuals of such species as the cuckoo follow their parents after a lapse of sev. weeks. The considerable distance travelled by the Arctic tern is referred to in the article on TERNS. The New Zealand mutton bird, one of the shearwaters, migrates to that country from Siberia, near the Arctic Circle, and the godwit or kuaka of the same country comes down from still further N. i. Alaska. On the last part of their journey to New Zealand, both these birds fly across the open ocean from New Caledonia Is. whereas most birds keep close to the coast lines. The departure of the kuaka from Spirits' Bay at the extreme N. of New Zealand is one of the wonders of bird life, and is described as follows by Mona K. Gordon in *Children of Tane* (1938):

'Here at the end of March and on into April the kuaka gather by companies, pouring into the bay from all parts of the country in contingents fifty to a thousand strong. They alight on the beach until there is hardly standing-room for all; every hour of the day brings more and more armies to swell the vast assemblage. Towards evening they show signs of restlessness and agitation until the sky is stained with the rose and gold of sunset. Then, as with one accord, the godwits, crowded almost inextricably on the sands, mount into the air and take a course due north in trailing, wedge-shaped formation.' See A. Meek, *The Migration of Fishes*, 1916; C. B. Williams, *The Migration of Butterflies*, 1930; A. L. Thomson, *Bird Migration*, 1936; and J. Fisher, *Bird Watching*, 1941.

Migration of People, see EMIGRATION; EMIGRATION SOCIETIES; EMPIRE SETTLEMENT ACT; OVERSEA SETTLEMENT COMMITTEE; IMMIGRATION.

Miguel, Maria Evarist, Dom (1802-66), third son of King John VI. of Portugal. In 1822 his mother, Carlota Joaquina, plotted to overthrow her husband and establish M., her favourite son, upon the throne. The attempt failed, and M. consequently spent some years in exile. In 1826, however, John VI. d., and his eldest son, Pedro of Brazil, renounced his right to the succession in favour of his daughter Maria da Gloria, it being arranged that she should marry M. Although he had sworn allegiance to the new queen and to the constitution, and in 1827 had been appointed regent, M. ignored his oath, procured his recognition as sole king, and opposed all forms of liberalism in his dominions. In 1834, faced with growing hostility by England, France, and Spain, he renounced his pretence to the throne and retired to Rome, where he d. See PORTUGAL, *History*.

Mikhailovich, Draža (1893-1946), Yugoslav soldier, b. at Shumadiza, served with the Serb. Army in the Balkan wars, 1912-1913, and in the First World War. In the Second World War, when Yugoslavia was overrun by the Gers. in 1941, he took refuge, with his troops, in the forests and hills, being recognised by the exiled Yugoslav Gov. of King Peter as commander-in-chief and war minister. He was also recognised by the Brit. military authorities in the middle E., who attached liaison officers to his forces. This was the origin of the Chetnik movement. Meanwhile, however, a Communist resistance movement was developed under Marshal Tito. M. vainly tried to combine the two resistance movements, but, eventually, his monarchist views led him to collaborate with the Gers. and its. against the Communist partisan forces. This led to savage attacks by the Gers. against the civil pop., and M. then relaxed his efforts so as to avoid such sacrifices, though the partisans of Tito let nothing deter their resistance to the Axis forces. After the Communist partisans had accused, probably with justification, the Chetniks of collaboration, allied support was trans-

ferred to Tito. M. was also repudiated by the Yugoslav exiled gov. M. fell into Tito's hands in March 1946, and three months later he was tried, convicted of treason, and shot in Belgrade. See also YUGOSLAVIA, *History*. See B. Lazitch, *La Tragédie du général Draža Mihailovich*, 1946.

Mihrab, Mohammedan architecture, the niche which, in a mosque, indicates the direction of Mecca.

Mikado, former title of the emperors of Japan, for which the Chinese Tenshi (Son of Heaven), or Tenno, has recently been substituted in general use. The present M. succeeded his father, Taisho, in 1926, and is the 126th of the imperial line, the first M., Jimmu-Tenno, having begun to reign in 660 B.C. In 1945 the Emperor Hirohito repudiated his divinity; the constitution of 1946 eliminated the phrase 'sacred and inviolable,' and made the emperor a constitutional monarch.

Mikania, large genus of evergreen climbing plants (family Compositae), natives of tropical America. *M. scandens* will grow on a trellis in the open in summer.

Mikkeli (dept. of Finland), see ST. MICHEL.

Mikkelsen, Ejnar (b. 1880), Dan. polar explorer. In 1907 he was instrumental in helping to disprove the polar land theory, as in 72° N. lat. and 150° W. long. a sounding 339 fathoms failed to reach the bottom. In 1909 M. and Iversen set out in the *Alabama* in search of Mylius Eriksen's records, the main body of the expedition returning without them. Their safety was despaired of, but, having accomplished their object, they reached Europe in 1912, after spending the previous winter on Bass Rock, near Shannon Is. He commanded the colonising expedition to Scoresby Sound in 1924 and S.E. Greenland in 1932. He has written *Conquering the Arctic Ice* (1909); *Lost in the Arctic* (1913); the novel *John Dale* (1921); and *Norden for Lov og Ret* (trans. as *Frozen Justice, a Story of Alaska*, 1922). Other works include *Med 'Grønland' til Scoresby-sund* (1925) and a hist. of the E. Greenland Eskimos (1934). M. was awarded the Patron's medal in gold by the Royal Geographical Society in 1934.

Miklas, Wilhelm (b. 1872), Austrian statesman, b. at Krems. He entered the Austrian Parliament in 1907, and became president of the republic in 1928. He retired in 1938, on the *Anschluss* of Austria to National Socialist Germany.

Miklosich, Franz von (1813-91), Slavic philologist, b. at Littenberg, Styria. From 1850 to 1886 he was prof. of Slavic philology in the univ. there. His chief works are *Lexicon Palaeoslovenico-Græco-Latinum* (2nd ed., 1865); *Etymologisches Wörterbuch der slavischen Sprachen* (1886); *Vergleichende Grammatik der slavischen Sprachen* (1871-79); and *Allslavische Lautlehre* (3rd ed., 1878). See M. Murko, *Miklosichs Jugend und Lehrjahre*, 1898.

Mikolajczyk, Stanislaw, Polish statesman, see EASTERN FRONT OF RUSSO-GERMAN CAMPAIGN IN THE SECOND WORLD WAR; POLAND, *History*.

Miknas (in Morocco), see MEKINEZ.

Mikulov, *see* NIKOLSBURG.

Milagro, tn. of Ecuador on the Guayaquil-Quito railway. It is an important shipping centre for a rich agric. dist. Pineapples are much grown here. Pop. 10,000.

Milan I. (1854-1901), prince of Serbia from 1868 to 1882, and king of Serbia from 1882 to 1889, was *b.* at Jassy in Rumania. On the assassination of his cousin, Prince Michael Obrenovitch (1868) M. was proclaimed prince, and ruled under a regent till he came of age in 1872. In

which is almost circular, is encompassed on three sides by walls and low ramparts; it has a circuit of about $7\frac{1}{2}$ m., and is entered by ten gates. Notwithstanding its great antiquity, M. possesses but few remains of its early splendid structures. Modern M. is one of the most opulent and populous cities of Italy; its best streets are regular, wide, and well paved, and kept with scrupulous care. M. abounds in churches worthy of note; of these, the principal is the famous Gothic cathedral, the Duomo, which, with the exception of

MILAN CATHEDRAL

W. F. Mansell

1876 he allied himself with Russia, and declared war against Turkey, winning the independence of Serbia, and the kingship for himself, in 1882. In 1889 he abdicated in favour of his son, Alexander, and retired to Paris. In 1894 he served as commander-in-chief of the Serbian army for a short time, but was banished as a result of a quarrel over Alexander's marriage.

Milan (It. *Milano*): 1. Prov. of N. Italy in Lombardy, 1078 sq. m. in area, bounded by the Rs. Po, Ticino, and Adda, which are connected by numerous canals. It includes most of the fertile plain of Lombardy, and its chief products are corn, rice, cheese, butter, cattle, silk, fruit, and wine. The prov. is an important industrial area, with manufs. of textiles, rubber, iron, machinery, tools, chemicals, etc. Pop. (1928) 1,891,000. 2. Chief city of Lombardy, cap. of M. prov. stands on the R. Olona, in the centre of the great plain of Lombardy. The city,

St. Peter's in Rome, is the most magnificent eccles. structure of Italy. Within it Napoleon was crowned king of Italy in 1805. Here also instead of the Lat. or Rom. liturgy, the Ambrosian liturgy is celebrated, an interesting relic of an otherwise obsolete rite. The Duomo lost all its window glass in 1943, together with some exterior figures and pinnacles, but the stained glass had been previously removed to safety. There is also the church of St. Ambrose (founded by that saint in the fourth century), the most ant. in M., containing inscriptions, sarcophagi, and monuments full of antiquarian interest. This, the most important church in the city (actually a twelfth-century building, incorporating parts of the older church of A.D. 800), suffered severely in the Second World War; the cloister by Bramante was practically destroyed, part of the nave fell, the N. wall was breached, many windows have gone, sev. chapels were

damaged, and the ceiling in the sacristy by Tiepolo was ruined. Another famous church is the Dominican church of Santa Maria delle Grazie, which contains in its refectory the famous 'Cenacolo,' or 'Last Supper,' by Leonardo da Vinci. This famous fifteenth-century abbey church was severely damaged during the recent war; the outer walls of the side chapels and vaults were demolished or displaced by blast, and the cloister was almost entirely destroyed. The wall of the refectory facing Leonardo's 'Last Supper' collapsed, bringing down the roof, and the painting by Montorfano on the opposite wall was injured. Leonardo's 'Last Supper,' which was painted on one of the end walls (1494-97) as a fresco, was, at the time of the air raids, heavily protected with sand bags and steel scaffolding; and according to official reports the painting, which has been much restored, is in satisfactory condition. Among the secular buildings of M., as they stood before the war, the most noteworthy was the magnificent Brera Palace, used as a museum and library; it has also been attached to it an observatory and a botanical garden. The Brera Gallery received a direct hit on the facade giving on to the Via Brera, and the roofs were largely burned. The State Univ., founded in 1924, accommodates about 1300 students; and there are also higher schools for agriculture, commercial education, and a veterinary college. The charitable institutions are numerous and splendidly endowed. Before the Second World War the Ospedale Maggiore, or Great Hospital, founded by the ducal house of Sforza in 1456, accommodated as many as 2000 patients. It was a vast and very fine brick structure, begun in 1457 by Antonio Filarete, but was grievously shattered in the raids, one-half of it being razed with immense interior destruction, though, at least, the central and other parts of the facade remain. The Milanese places of amusement were on as grand a scale as the other public buildings of the city, the first in point of celebrity being the theatre of La Scala (*q.v.*), which could accommodate 3000 spectators. This famous theatre, gutted in the air raids, was reopened in 1948.

As has been noted M. suffered widespread damage in the raids of the Second World War. Only in few cases, however, did this amount to complete destruction, but the damage to interiors was widespread and irredeemable. The most severe attacks were delivered Aug. 13-16, 1943, the city burning after the raids for a week owing to the scarcity of water. Subsequent air raids inflicted less damage and in many instances reconstruction by the It. authorities had been begun before the arrival of the Allies. Of the twenty-seven churches on the official list of protected monuments only five escaped damage. Those damaged included S. Lorenzo, the most anct. church in M., which was built about 560 on the ruins of a Rom. building, altered after a fire in 1071 and again restored about 1573; its interior was not damaged, but the outside wall at the E. end sustained damage, as also the cover-

ing of the dome. Again, S. Pietro in Gessate, a fifteenth-century church in the Lombard style, was half ruined, but the facade walls and part of the roof remain. The Teatro dei Filodrammatici was burnt out. The interior of the Archinti palace in the via Olmetto was destroyed, together with frescoes by the two Tiepolos. Severe damage was done to the Palazzo Litta; the Palazzo Marino (gutted); the Palazzo Ponti (only the courtyard and facade facing the garden escaped damage); Palazzo Reale (more or less burnt out); Palazzo Senato (gutted). Severe damage was also done to the Castello Sforzesco (but the art treasures stored in its basement were uninjured); the roofs of the Piazza d'Armi, including the municipal library, and of La Rocchetta (with its museum collections) were almost entirely destroyed. The Borromeo hall and the Federiciana hall of the Ambrosian Library were burnt out, but the vaulted ceilings survived. Finally, the Poldi-Pezzoli Museum was almost entirely destroyed, though the collections had been previously removed to safety; and the Scala Museum was seriously damaged. M. was occupied by the Allied Fifth Army on April 29, 1945. (See also ITALIAN FRONT IN SECOND WORLD WAR.) M. carries on an immense inland trade in grain, rice, wine, and cheese, and has considerable manufs. of silk goods, ribbons, cutlery, motor-cars, aircraft, locomotives, machinery, electric cables, furniture, porcelain, etc. The archiepiscopal see of M. is usually occupied by a cardinal of great prestige in both Church and State. Pop. 1,267,600. See Dorothy Muir, *A History of Milan under the Visconti*, 1924; and H.M.S.O., *Works of Art in Italy: Losses and Survivals*, vols. I and II, 1945.

Milan, Bishopric and Duchy of. Position of M. in the Middle Ages may be traced to the influence of her bishops. St. Ambrose, who occupied the see from 374 until 397 successfully defied the authority of the emperor Theodosius I. After the estab. of the Lombard kingdom in 569 the bishops of M. became the rallying point of opposition both to Arianism and to foreign rule; and their temporal authority was further increased by Charlemagne's defeat of the Lombards in 774. In the confusion which followed their emperor's death the archbishops became the only real centre of authority in M. During the next two hundred years the tyranny of the nobles drove the common people to seek the protection and authority of the Church, under whom the city increased in numbers and independence, and learned the art of self-government. It was archbishop Heribert (1018-45) who invited into Italy and crowned Conrad, king of Germany, with the iron crown of Lombardy. In the thirteenth century Archbishop Otto Visconti, as leader of the nobles, defeated the Torriani at Desio (1277), and from that time until 1447 the Visconti ruled the city. Following the death of Filippo Visconti in that year a republic was proclaimed. It lasted for only three years. In 1450 Francesco Sforza (1401-66) (see SFORZA) became duke of M. by right of conquest.

He had married Bianca, Filippo's heiress. The dukedom continued in the line of Francesco's eldest son Galeazzo until 1494, when it was seized by Galeazzo's brother Lodovico, il Moro (1451-1508), the patron of Leonardo da Vinci. On the death of his son Francesco in 1535 M. became a dependency of Spain under Charles V. See D. Muir, *A History of Milan under the Visconti*, 1924; and A. Colombo, *Milano preromana, romana e barbarica*, 1928.

Milan Decree, promulgated by Napoleon on Dec. 27, 1807. It purposed to declare the whole Brit. empire to be in a state of blockade, and forbade all countries to trade with Great Britain or to use any article of Brit. manuf.

Milan, Edict of, proclaimed by Constantine, after the conquest of Italy in the early years of the fourth century A.D., its object being to secure to Christians the restoration of their civil and religious liberties.

Milanian, see ATALANTA.

Milasa, or **Milas**, tn. in Asiatic Turkey 84 m. S.S.E. of Smyrna (Izmir), a centre of carpet manuf. Pop. 13,000.

Milà y Fontanals, Manuel (1818-84), Sp. scholar and author. He studied first at Barcelona and then at Cervera, obtaining a professorship of literature at the univ. of Barcelona when twenty-seven years old. Amongst his publs. may be mentioned his treatise *De los trovadores en España* (1866), and *De la poesia heroico-popular castellana* (1873). See study, with bibliography, by J. Roig y Roqués, 1912.

Milazzo (auct. *Myias*), seaport tn. in the prov. of Messina on the N. coast of Sicily. The older portion of the tn. rests upon a hill, whilst the more modern portion occupies an isthmus. There is a good harbour, and the prin. exports are tunny fish, fruit, silk, olive oil, and wine. The old cathedral, which was abandoned before the Second World War, was plundered by civilians after the bombardment of 1943. The church of the Carmine sustained some damage, but that of the Porto Salvo was damaged beyond repair, as were the Palazzo Convento, Proto, and Ryolo and the Casa Lucifero. Garibaldi defeated the Neapolitans here in 1861. The gulf of M. extends for 16 m., and has been the scene of many naval engagements, including the first Rom. naval success over the Carthaginians in 260 B.C.

Milch, Erhard (b. 1892). Ger. Air Force commander. In the First World War he was an army pilot, and afterwards became a civilian aviator. In the Nazi administration, in 1933, he was appointed secretary of state in the Air Ministry. Lieutenant-general, 1935; general, 1936; colonel-general, 1938. In the Second World War his chief service was in N. Africa and, in Dec. 1942, he had risen to air field-marshal in Tunisia. After the war he was tried at Nuremberg as a war criminal, convicted, and sentenced to imprisonment for life.

Mildenhall, nrkt. tn. of Suffolk, England, 12 m. from Bury St. Edmunds and 76 m. from London, and situated on the

R. Lark. In and before the Second World War it was an important R.A.F. aerodrome. In 1934 it was the starting point of the Britain to Australia air-race. It has a typical E. Anglian market cross and manor house. Near M., at W. Row, in 1942-43, was found a hoard of Rom. silver table-ware, now in the Brit. Museum and known to archaeologists as the M. treasure and said to be the finest of its kind to come into the keeping of the nation as treasure trove. It consists of bowls, dishes, spoons, platters, and goblets, ornamented with foreign hunting scenes, embossed figures of fine quality and classical design, and niello work. Similar boards, but not in such perfect condition, were found near Coleraine, Londonderry, in 1854 and, in 1919, during excavations on Traprain Law, East Lothian. It is assumed that these and other hoards were buried by their owners to save them from falling into the hands of marauding Picts and Scots. See J. W. Brailsford, *The Mildenhall Treasure* (Brit. Museum), 1947.

Mildew, name for a variety of microscopic parasitic fungi. Rose M., strawberry M., and hop M., are allied species. Treatment with sulphur in powder or in solution as a salt checks the spread of most M.

Mildmay, Sir Walter (1529-89), b. at Chelmsford. He became M.P. at the age of thirty-three, and was chancellor of the exchequer thirteen years later. He was the founder of Emmanuel College, Cambridge.

Mildura, city of Victoria, Australia, in a fruit-growing dist. under irrigation, 351 m. from Melbourne. A handsome bridge spans the R. Murray, which was constructed by the govs. of Victoria and New S. Wales at a cost of £150,000. It is a thriving city with five churches, two state schools, branches of seven banks, savings banks, Carnegie library, hospital, and court-house. Its industries are cordial factories, olive oil factory, saw and planing mills. Has a chamber of commerce and a fruit-growers' co-operative company. Pop. 9530. The area of the surrounding dist., M. Shore, is 4171 sq. m. and the pop. 16,000.

Mill (from Lat. *mille*, a thousand), was originally a Rom. linear measure of 1000 paces (see PACE). It has long been used as a measure of length in Eng.-speaking countries, but with varying meanings. Similarly, on the Continent of Europe the length of the M. varied with each country, often with each dist., being usually some modification of the Rom. M. The length of the legal M. in the Brit. empire and the U.S.A. is now 1760 yds. For a nautical M. see KNOT; LOG.

Mill End, dist. of E. London. Once a hamlet of Stepney par., it now forms the central and N.E. parts of the bor. of Stepney.

Miles, Nelson Appleton (1839-1925), Amer. soldier, b. in Westminister, Massachusetts. He entered the army in 1861 and served with the Federals in the Civil war. He became brigadier-general of volunteers in 1864, three years later

holding the same position in the regular army. In 1895 he became commanding general of the U.S.A., in succession to Gen. J. McA. Schofield, and was conspicuous in successfully dealing with the Indian outbreaks of the Cheyennes and Comanches, the Sioux in Montana, the Nez Percés, and the Apaches. In 1898 he directed the military operations of the war with Spain. He retired from active service in 1903. He pub. *Personal Recollections* (1896); *Military Europe* (1898); *Observations Abroad* (1899); and *Serving the Republic* (1911).

Mileto, tn. in the prov. of Catanzaro, Italy, 40 m. N.N.E. of Reggio, destroyed by an earthquake in 1908, when 2300 lives were lost.

Miletus: 1. Son of Apollo and Aria of Crete, fled from Minos to Asia, where he built the city of M. Ovid calls him a son of Apollo and Deione, and hence Deionides. 2. One of the greatest cities of Asia Minor, belonged territorially to Caria and politically to Ionia, being the southernmost of the twelve cities of the Ionian confederacy. Its ter. was rich in flocks, and the city was celebrated for its woollen fabrics, the *Milesia vellera*. At a very early period it became a great maritime state, and founded numerous colonies. It was the b.p. of the philosophers Thales, Anaximander, and Anaximenes, and of the historians Cadmus and Hecataeus. It was the centre of the great Ionian revolt against the Persians, after the suppression of which it was destroyed (494 B.C.), but recovered sufficient importance to oppose a vain resistance to Alexander the Great, which brought upon it a second ruin. Under the Rom. empire it still appears as a place of some consequence. Its site is occupied by Palatia.

Milfoil, or **Yarrow** (*Achillea Millefolium*), plant with thrice-pinnatifid leaves and white, pink, or purple flowers (family Compositæ). It is common on pastures.

Milford, Sir Humphrey Sumner (b. 1877), Brit. publisher. Educated at Winchester and New College, Oxford, he later served as assistant to the secretary to the delegates of the Clarendon Press in Oxford and in London. In 1913 he was appointed publisher to the univ. of Oxford, a position which he held until 1945. From 1919 to 1921 M. was president of the Publishers' Association of Great Britain and N. Ireland. He was knighted in 1936. Besides editing the *Oxford Book of Regency Verse*, M. has ed. the poems of Cowper (1904); Clough (1910); and Leigh Hunt (1923).

Milford: 1. Parl bor. and seaport of Pembrokeshire, S. Wales, on the Haven, 9 m. S.S.W. of Haverfordwest. It has passenger and cattle traffic with Irish ports, and is engaged in engineering, shipbuilding, and fishing. M. was originally founded in 1790 to serve as a naval station, but this was afterwards moved to Pembroke. Pop. 10,000. 2. Tn. in Worcester co., Massachusetts, U.S.A., 15 m. S.E. of Worcester, on the R. Charles. There are important granite quarries, and manufs. of boots and shoes, electric

motors, and metal, and synthetic rubber products. Pop. 15,300. 3. Tn. in Delaware, U.S.A. Pop. 4000.

Milford Haven, Marquess of (Prince Louis Alexander Battenberg, later Mountbatten, earl of Medina and Viscount Alderney) (1854-1921), b. at Gratz, son of Prince Alexander of Hesse, who morganatically married Countess Julie Thérèse von Hanke, later given the rank of princess. Early naturalised in England, he entered the Brit. Navy at fourteen years of age, becoming midshipman in 1869. In the Egyptian war he received the Egyptian medal and Khedive's Bronze Star for distinguished services. In 1884 he married his cousin, Victoria, eldest daughter of Princess Alice, and grandchild of Queen Victoria. A man of many parts, but above all a widely experienced authority on naval affairs, he served on many naval committees before his appointment as director of naval intelligence at the Admiralty, 1902. Rear-admiral 1904, he became First Sea Lord, 1912. The perfect state of the navy on the outbreak of the First World War in its readiness for immediate mobilisation was largely due to his forethought and general ability. But, by reason of his Ger. origin, totally unfounded suspicion fell on him, and in Oct. 1914 he voluntarily resigned in favour of Lord Fisher. By royal request he gave up his foreign titles in 1917, assuming the surname Mountbatten, and entering the peerage as M. of M. H. He retired from the navy in 1918. Died suddenly, and was buried with naval honours at Whippingham. Pubs.: *Men-of-War Names* (1897, 1908); *British Naval Medals* (1919); and *Naval Medals (Foreign)* (1921).

Milford Haven, natural harbour of Pembrokeshire, S. Wales, running inland for 17 m. and varying in breadth from 1 to 2 m. It is the finest harbour in Britain, with a depth of from 15 to 19 fathoms. During the Second World War it was a flying-boat base.

Milford Sound, fiord on the S.W. coast of South Is., New Zealand, extending for 10 m. and about 1 m. in breadth. It has numerous waterfalls. The only means of access to Milford Sound is by Milford Track, passing by Clinton R., which runs into Lake Te Anau.

Milhaud, Darius (b. 1892), Fr. composer, b. at Aix-en-Provence. He studied at the Paris conservatoire under Gédalge, Widor, and d'Indy. Whilst attached to the Fr. legation at Rio de Janeiro in 1917-19 he met Paul Claudel, who frequently collaborated with him as librettist. About 1920 he became a member of 'Les Six,' and two years later was represented for the first time at the festival of the International Society for Contemporary Music. In 1940 he emigrated to the U.S.A. Both as satirist and tragedian he has shown high quality; he has parodied musical comedy conventions in *Le Train bleu* (1924), and caused sensations with such flights of fancy as a setting of a florist's catalogue for chamber orchestra and voice (1921), and *Machines agricoles* for the same combination. His varied works include operas, ballets, incidental

music to Gk. plays, symphonic suites, books of songs, etc.

Miliaria Populosa, see PRICKLY HEAT.

Military Academies, see under MILITARY EDUCATION.

Military Aircraft, see AEROPLANE; BOMBER; FIGHTER.

Military Cross, instituted by royal warrant, Dec. 28, 1914, for award to Brit. officers of the substantive rank of captain or of lower commissioned rank, and to warrant officers (Indian and colonial forces included), in recognition of distinguished and meritorious services in time of war. It consists of a silver cross, having on each arm the imperial crown, and bearing in the centre the royal and imperial cipher.

attention in the course of active hostilities while other operations are conducted elsewhere. Such a demonstration during an actual attack is called a feint.

Military Education and Military Schools.

(a) *General*.—Educational training is closely co-ordinated with other forms of training in order to develop the intelligence, initiative, and sense of responsibility; to inculcate loyalty, morale, and *esprit de corps*, and to return the soldier to civil life a more efficient citizen with enhanced prospects of earning his living. The necessity for decentralising responsibility imposed by modern war makes it essential for quite junior ranks to exercise initiative, and individuals who can act

High Commissioner for New Zealand

CLINTON RIVER, FROM MILFORD TRACK: THE ROAD TO MILFORD SOUND
The mountain rising on the left is Mount Mackenzie.

The cross confers no individual precedence, but entitles the recipient to the addition after his name of the letters 'M.C.' Between Aug. 1914 and Jan. 31, 1920, 36,824 awards of the M.C. were made to personnel of the Brit. forces for services in the field. In addition to these, 2939 first, 167 second, and 4 third M.C. bars were conferred. During the Second World War a grand total of 10,892 M.C.s. were awarded. Of this number 10,784 were awarded to the army, being 10,280 crosses, plus 480 first bars, plus 24 second bars; 38 to the navy and royal marines, being 37 crosses plus 1 first bar; and 70 to the R.A.F., being 69 crosses, plus 1 first bar. The M.C. is an army decoration, and the awards to members of the other services are for good work done while attached to the army.

Military Demonstrations, in M. tactics an operation intended to deceive the enemy by pretending that danger is threatening him from another quarter, thus distracting his attention from the real, more imminent peril, and inducing him to divide his forces. A means of engaging the foe's

rightly without supervision are required to a much greater extent than formerly. It is therefore made the duty of all officers to promote educational training among other ranks.

(b) *Men*.—The purely educational training of a soldier is divided into two parts: (i.) the compulsory period, up to and including the attainment of his second class certificate of education (there are special rebates for the elementary schooling of recruits found to be virtually illiterate), and (ii.) the voluntary period, i.e. work for the first class and special certificates. In units the training is carried on under the educational officer, supervised by the Command Army Educational Corps officer at headquarters. The actual instruction is given by unit instructors for third and second class certificates and by personnel of Army Educational Corps for higher certificates. Every recruit on enlistment is educationally 'tested,' and his standard noted. This is not work for a certificate, but a part of the routine of enlistment. The syllabus for certificates includes the following subjects: arithmetic,

regimental hist., English, practical mathematics, army and empire, communications of empire, map-reading, languages, and geography. The following are, in addition, included for the special certificate: economics, mechanics, chem., physics, biology, and physiology. The army special certificate is accepted by many univs. and colleges as the equivalent of matriculation or entrance examination.

M. training commences on enlistment at depots. After a few months' training in the rudiments, the men are sent to join their service units, where training is completed. Ann. training is carried out to ensure that men are maintained at a required standard. During the winter months 'individual' training is carried out in such subjects as map-reading, use

Imperial War Museum: Crown copyright

'BATTLE SCHOOL'

of compass, field sketching, and indoor schemes. 'Collective' training is carried out during the remainder of the year, and is mainly for the benefit of leaders, from platoon commanders upwards, culminating in army manoeuvres. Musketry training is usually carried out in the summer. Courses are undergone at the various colleges, schools, and training establs., the principal being: Royal Artillery Medical College for laboratory assistants; School of Artillery, for battery surveyors, junior commanders, drill and gunnery; Army School of Chemical Warfare, for potential instructors in gas warfare; School of Education, for the training of regimental personnel in educational work; School of Hygiene, for various subjects, including training of regimental sanitary squads; School of M. Engineering, for training in engineering science; Royal M. School of Music, for training of students for bandmasterships and pupils (boys) for bandsmen; Physical Training School, to provide instructors for units and staff; R.A.O.C. Training Estab., for special training in duties; School of

Signals, instructors' courses; small arms schools, special training in musketry; vocational training centres, for teaching soldiers shortly to be discharged a trade, with a view to enhancing their prospects of obtaining employment in civil life on discharge.

(c) *Officers.*—The normal method of entry into the commissioned ranks is through the Royal M. Academy, Sandhurst (after at least six months' service in the ranks). Previously infantry and cavalry candidates were trained at the Royal M. College, Sandhurst, and artillery and engineer candidates at the Royal M. Academy, Woolwich; but in 1946 these two institutions were amalgamated as the Royal M. Academy, Sandhurst (see SANDHURST). While a course at the academy is the normal avenue to a regular commission, a proportion of commissions are offered to candidates by direct entry from the univs. and from the auxiliary forces. Courses are of eighteen months' duration. Young officers of the Royal Artillery and Royal Engineers on leaving Sandhurst undergo post-graduate courses of technical training for their respective arms, either at the School of Artillery, Cambridge Univ., or School of M. Engineering. These courses are considered necessary in view of the extended range of engineer science and the developments in modern artillery. By the time the cadets join their regiments they are well grounded in M. science, and prepared for the practical training they afterwards receive. Their first few years in the service units are of continued study with the view of passing the necessary examinations for promotion. In the case of majors, courses are arranged at the Senior Officers School in higher tactical training and theoretical and practical instruction in the actual command of troops of all arms. Officers of the Territorial Army are eligible for these courses, which are of three months' duration. Specialised training is also given at the schools and colleges mentioned above for men. Officers are encouraged to write articles and essays on professional subjects for service journals and others of good standing. Some journals grant medals for prize essays.

Military Graves, see GRAVES, SOLDIERS'.

Military Intelligence, see INTELLIGENCE, MILITARY, AND SECURITY.

Military Knights of Windsor, body of retired officers attached to the order of the Garter. They were formerly known as Poor Knights, ranking below the ordinary knights. The order originated in 1349, when it consisted of twenty-six veterans of Edward III.'s reign. They are appointed by the king from officers who have rendered meritorious service, but are not in a position suitably to maintain themselves, and they are granted a small stipend together with quarters in Windsor Castle, whence their designation. Until 1906 the order was part of an eccles. college under the dean of Windsor, but was then transferred to the governor of Windsor Castle. Their stipend comes from the college revenues, and every knight of the Garter on appointment to that order contributes

a sum for apportionment among them. Their uniform is that of the early nineteenth century, and was assigned to them by William IV., who prefixed the word 'Military' to their title. The number was fixed at thirteen in 1919.

Military Law is laid down in the *Manual of Military Law*, issued by command of the Army Council, as being 'the law which governs the soldier in peace and in war, at home and abroad.' M. L. is contained in the Army Act (see also under ARMY), the Acts relating to the Reserve and Auxiliary Forces, and certain other Acts applied to the army, such as the Cheap Trains Act, 1883, relating to conveyance of troops; the Regimental Debt Act, 1893, relating to the effects of deceased officers and men; and the Emergency Powers Act, 1920, which makes special provision for the protection of the community in cases of emergency, supplemented by the King's Regulations for the Army and the Army Reserve, by other regulations, e.g. those for the Militia (Supplementary Reserve) and Territorial Army, by Royal Warrant, e.g. those relating to pay, promotion, etc., and by Army Orders and Army Council instructions. The Army Act is an Act of Parliament dealing with discipline, courts-martial, enlistment, and allied subjects, and has in itself no part of its operation, for it continues in force so long only as Parliament from time to time decides. It is annually brought into operation by the Army and Air Force Act, which must become law by April 30, and it is by this system of ann. Acts that Parliament retains control over the land forces of the Crown. The Army Act is part of the statute law of England, and though that part of it which relates to discipline is administered by army tribunals and not by the civil courts, it is construed in the same manner, and carried into effect under the same conditions as to evidence (q.v.) and otherwise, as the ordinary criminal law of the country. Though the object of this special code of law is twofold, namely to provide for the maintenance of discipline and for administrative matters, in practice the term is more often used with reference to the disciplinary provisions alone. There is not in England, as in many foreign countries, a special law defining the relations between the military and civil power in cases of riot and insurrection or the intermediate state known as an *état de siège*. Troops when called out to assist the civil power in these cases in Great Britain are under M. L. as soldiers, but they are also as citizens subject to the ordinary civil law to the same extent as if they were not soldiers. Their M. character is superimposed on their civil character, and does not obliterate it (see A. V. Dicey, *Introduction to the Study of the Law of the Constitution*, 1885). M. L. must not be confused with martial law, which latter means the suspension of the ordinary law and the gov. of a country or parts of it by M. tribunals of its own army. See also ARMY, under various sub-heads; ENLISTMENT; COURTS-MARTIAL (showing the changes made since the First World War); IMPRESSMENT; OFFICIAL SECRETS.

In the U.S.A. the first articles of war were drawn up in 1775; in 1806 the present code was estab., which is practically the same as the Eng. code. In 1864 the first M. L. estab. was made with the name of Bureau of M. Justice. In 1883 this bureau was consolidated with the judge-advocates' dept. There is a judge-advocate for each M. div., who is responsible for the whole machinery of court-martial.

Military Medal, instituted by royal warrant in March 1916 for award to non-commissioned officers and men of the Brit. forces for bravery in the field. Women (whether subjects or foreign persons) were made eligible by a later warrant, but only on the special recommendation of a commander-in-chief, for bravery and devotion under fire. The M.M. is a silver medal, bearing the royal effigy on the obverse and, on the reverse, the words 'For Bravery in the Field,' encircled by a wreath surmounted by the royal cipher and a crown. Some 11,000 M.M.s. were awarded in the Second World War.

Military Nursing Service (Queen Alexandra's Imperial Military Nursing Service). Nursing in the army was originally performed by soldiers' wives, and it was not until Florence Nightingale went to the Crimea in 1854 with forty nurses that a proper service was inaugurated. From that beginning sprang the army nursing service, and at that time also began the slow advance towards official recognition, legal professional status not being conferred until the passing of the Nurses' Registration Act in 1919. Provision was made for the appointment of nurses to all M. general hospitals in 1866, but it was not until 1881 that an army nursing service was formed. The Egyptian campaign of 1882 accelerated the organisation of the nursing service for overseas work, and sisters were sent to military hospitals at Gibraltar and Malta. The headquarters of the service were fixed at the Royal Victoria Hospital, Netley. The reserve service came into being in 1897. During the S. African war (1899-1902) the nursing service greatly expanded, and the experiences of that campaign led, in 1902, to the appointment of a committee, under the presidency of Mr. St. John Brodriek (later Earl Middleton) to inquire into the situation. The outcome was the estab. in 1902 of the Q.A.I.M.N.S., Queen Alexandra being its first president. She was succeeded in her office by Queen Mary. In 1926 the service in India was amalgamated with the Q.A.I.M.N.S. In 1914 the actual service was only 300 strong, but in that same year 2223 trained nurses were enrolled with the reserve, and 1803 were sent abroad. By 1919 the service and its reserve had a membership of 10,404. During the First World War the service did excellent work, and many of its members gained distinction (for a brief official account see War Office, *Nursing in the Army*, 1930). At the outbreak of the Second World War, the total peace estab. of Q.A.I.M.N.S. in the various M. hospitals at home and abroad was 624. On Sept. 10, 1939, the first six army sisters landed

in France; 1300 were evacuated with the R.E.F. at Dunkirk. Army sisters sailed with the army to every war area, and shared its fortunes. In Florence Nightingale's day it was specifically stated that the nurses were for the base hospitals in the war area. In the Second World War, however, they shared the hazards of total warfare. In Singapore the sisters worked in a hospital between the Brit. fire and the Jap.; they learned that the Jap. were at their gate, and fully expected to be taken prisoner. Much the same conditions obtained in Greece. No army sisters fell into the enemy's hands in France or in Greece, but from Singapore some were lost in the evacuation, and many were missing, while in Hong Kong fourteen sisters remained in enemy hands; all were raped, and some were murdered. The sisters might be posted to base hospitals, field hospitals, casualty clearing stations, ambulance trains, hospital ships, or to mobile surgical teams. In the Second World War they were to be found wherever the R.A.M.C. were found, except in the actual battle zone, working in close co-operation, and adding their nursing skill to medical skill, to combine the most effective aid for the wounded (*see* Ada Harrison (editor), *Grey and Scarlet*, 1944).

The pay of the Q.A.I.M.N.S., as laid down in a 1946 amendment to the Pay Warrant of 1940 is at the following rates:

Rank	Pay		
	Mini- mum	Ann. Incre- ment	Maxi- mum
	£	£	£
Matron-in-chief	755	—	—
Chief principal matron	635	—	—
Principal matron	525	—	—
Matron	300	25	450
Senior sister	250	10	280
Sister:			
On appointment	130	—	—
After 1 year's service	160	10	220
After 5 years' service at £220	—	—	240
After 5 years' service at £240	—	—	260

Military Police, Royal Corps of. Branch of the M. forces which maintains law and order amongst soldiers, controls M. traffic, guards M. installations, and participates in anti-espionage work. It is not, like many European M. P. forces, such as the *It. carabinieri* or *Fr. gendarmerie*, a militarised police force, having authority over the civilian pop. of its own country. A corps of M. foot police was estab. in 1855, and in 1877 a similar body of mounted police, the two being amalgamated in 1926. Three new branches were formed in 1940: C.M.P. (V.P.) ('Blue Caps') for the security of vulnerable points; C.M.P.

(T.C.) ('White Caps'), for traffic control, including the organisation of traffic through minefield gaps; and C.M.P. (S.I.B.) for special investigation work equivalent to that carried out by the civil C.I.D. The 1942 landings in N. Africa saw the first use of beach provost companies. After the Ger. surrender the M. P. were given the task of enforcing the orders of the M. gov. of the occupied ter. Heavy casualties were suffered by the corps, which at the end of the war had a strength of 35,000. The prefix 'Royal' was granted in 1946 in recognition of the corps' wartime service. The branch is commanded by the provost-marshal under the adjutant-general, who is responsible for the discipline of the army. In the Brit. service M. P. wear red tops to their hats, and 'Red Caps' are famous the world over.

Military Prisons. The secretary of state for war has power to set apart any building or part of a building under his control as a M. prison or detention barrack. In 1939 there was only one M. prison in the United Kingdom, a part of the detention barracks at Aldershot being set aside for a prison. Offenders who are sentenced to imprisonment for purely M. offences and are not to be discharged from the army on completion of their sentences normally undergo such sentences in the M. prison, but if they have committed a civil offence and are sentenced to imprisonment they are usually sent to a civil prison; but during the Second World War sections of sev. civil prisons were set aside for soldiers serving terms for M. offences. M. P. were improvised in special camps in overseas theatres (called in U.S. Army 'stockades'). Soldiers are sentenced to various periods of detention for purely M. offences, and serve their sentences at a detention barracks. Here they continue their training as soldiers with certain limitations, e.g. they carry out drill, musketry and physical training. M. P. and detention barracks are governed by commandants, who have a staff to assist them.

Military Requisition (land), *see* LAND FOR MILITARY PURPOSES.

Military Science, *see* FIRE TACTICS

Military Security, *see* under INTELLIGENCE, MILITARY, AND SECURITY.

Military Transport, *see* MOTOR TRANSPORT, MILITARY.

Militia (Lat. *miles*, a soldier) had the acquired meaning of the domestic force for the defence of a nation, as distinguished from the regular army. The M. was a constitutional force raised under the sanction of Parliament, in which the people, in theory at least, waged their own bodies for the defence of their own souls, and in which they deputed the sole leadership and command to the sovereign and the Crown nominees. Organised by cos. and cities, it was essentially a local force; the property qualification for its officers connected it with the land, while the command of the sovereign effectually combined in it the interests of the three estates. Among the A.S., no special organisation being adopted, efficiency was rarely attained. This the nation found

to its cost when the Danes overran it during Alfred's reign. That great king, to prevent a similar occurrence, reorganised the M. or *fyrð*, dividing it into two parts to ensure continuity of service, making land the basis of numbers, but the family system that of discipline. Each shire had not only to furnish its quota in time of war, but also to provide arms, keep them in repair, and to undergo so many days' training every year. When the Crown began to contend with the Norman barons it found an effective weapon in the revival of the Saxon M., and the Eng. yeomanry became thenceforth the fear of England's enemies and a guarantee for the gradual enfranchisement of the people. The shire contingent was commanded in pre-Conquest times by the ealdorman, later by the sheriff, and lastly by the (lord) lieutenant, until 1871.

In 1604 James I. abolished the *fyrð*, and expanded and reorganised 'Trained (commonly called Train) Bands' (*q.v.*). The first stage of the Civil war of 1642 was a series of isolated struggles to secure the allegiance of the local M., and seize their magazines. An Act of 1662 reorganised the M., and this formed the basis of the M. law until 1908. Mounmouth's infantry in 1685 consisted substantially of the M. of the W. cos. The M. was neglected until 1757, when, a large portion of the regular army being absent in the Seven Years war, it was organised for home defence. Sev. M. Acts were subsequently passed, notably those of 1761, 1786, and 1802. In practice M. were raised by voluntary recruitment, but if volunteering failed a levy by ballot could be made upon all the inhab. of the locality between the ages of eighteen and fifty. The power of making this ballot always existed, and would have by law to be enforced by Parliament, but for the Militia Ballot Suspension Act, which, when the measure was unnecessary, was passed from year to year. Many classes were exempt from the ballot, as peers, soldiers, volunteers, yeomanry, resident members of univs., clergymen, par. schoolmasters, articled clerks, apprentices, seafaring men, Crown employees, free watermen of the Thames; in England any poor man with more than one lawful child; in Scotland any man with more than two lawful children, and not possessed of property to the value of £50; in Ireland any poor man not worth £10, or who did not pay £5 per annum for rent, and had more than three lawful children under the age of fourteen. The effect of this legislation was to transform the M. from a local police and national defence force into a reserve for the regular army. These earlier military functions were now fulfilled by the volunteers (*q.v.*), but against the wishes of the gov.; and from 1808 to 1812 a series of local M. Acts was passed to create a new compulsory home service force of men from eighteen to thirty. Like the general M., this force was recruited by M. authorities (in practice by par. officers); officers were required to be men of landed property, not necessarily an efficient method of selection.

To enable the maximum number of line regiments to proceed to the Crimean war and Indian mutiny, practically every M. regiment was embodied for home defence. In 1908, under the Territorial and Reserve Forces Act, a special reserve was formed which supplanted the M. The Militia Acts were not repealed, but the M. 'ceased to be raised in the United Kingdom.' The M. in Bermuda, Channel Is., and Malta were not affected by this change. In 1921 the Special Reserve was renamed the M., but it remained a part of the Army Reserve. In 1924 a new force was formed, the Supplementary Reserve. It forms such part of the Army Reserve as is in law M. (see CONSCRIPTION; RESERVE).

The M. of the U.S.A. is essentially a state and not a federal body. M. service was a feature of colonial life, and the same categories were liable to M. service in the 'plantations' as at home. The war with France in the New World was largely waged by the M. of the New England states and Virginia and New York. According to the M. law of 1903 the M. consists of every able-bodied male citizen of the respective states, and every able-bodied man of foreign birth who has declared his intention of becoming a citizen, who is more than eighteen and less than forty-five years of age. It is divided into two classes; the National Guard, which is the organized M., and the rest, which is called the Reserve M. The total strength of the National Guard of the forty-eight states is 682,048 (1948). This force consists of men who voluntarily enlist for military training and for peacetime service when called upon by the governor of their state to preserve order in case of strikes, riots, etc. In other words, the National Guard of each state is its own army, including an air component. The largest is that of New York State with a total ground force of 56,924 and an air force of 4536. The guard is organised on the same lines as the regular U.S. Army, and may also be called into service by the President of the U.S.A. Federal supervision is maintained by the National Guard Bureau. See further under UNITED STATES. Army.

Milk. Production of M. as a secretion of the female's mammary glands is the chief characteristic of the great animal div. mammalia. For young and growing animals it is a complete food, and necessarily, therefore, a highly complex mechanical mixture of a number of substances which vary not only with different species, but also with individuals and breeds of domestic animals. Though the M. of goats is probably superior to any other for the artificial feeding of children, it is the M. of cows which is of chief economic importance. The greatest progress in the scientific study and treatment of M. has taken place since about 1890, and it is in connection with tuberculosis that the M. supply has received most attention. In 1913 the existence of tuberculosis in dairy cattle became conspicuously notifiable, slaughtered animals being compensated partly by the Treasury and partly from the local rates. This had a far-reaching

effect upon the purity of the Brit. M. supply. At the same time breeders of dairy cattle have worked steadily for the production of deeper milking cows. The milking machine is still far from being in general use, but is widely used in Australia, New Zealand, and America, and its use is increasing in Great Britain. The average milker's methods still fall short of a hygienic ideal, but the inspection of cowsheds, dairies, and employees has considerably raised the hygienic standard. The M. should be drawn, after the udder has been cleaned with a damp cloth, with clean dry hands into a pail covered with muslin. Immediately afterwards, if it is to be sent away, the M. is passed through a gauze strainer into a cooler or refrigerator, in which it is reduced to a temp. about

two degrees above that of the water employed in the cooler, about five gallons of water being necessary to cool one gallon of M. The M. runs direct from the cooler into the railway churn, usually constructed to hold seventeen gallons, and, while allowing perfect ventilation, to be proof against dust, rain, or pilfering. For larger quantities, such as supply the big 'M. combines,' glass-lined tanks are used, each holding hundreds of gallons. All cans, churns, and other vessels should be sterilised by steam.

The delivery in glass bottles sealed with air-tight cardboard disks which can be used only once is now the rule. Under the Food and Drugs Act, 1899, the Ministry of Agriculture was empowered to state a standard for M. Contrary to the general idea, there is no such thing as a legal standard, but if on analysis M. is found to be inferior to the ministry's presumptive standard, it rests with the seller to prove that the M. was as yielded by the cow, and was not adulterated. This standard assumes the minimum percentage of solids, not fat, to be 8.5 per cent, and of fat 3 per cent. The grading of milk based on the number of bacteria present in one cubic centimetre of milk. The number used as a standard maximum

and the designation of the grades vary in different countries. The highest grade is certified as drawn from tuberculin-tested cattle, and has the smallest number of bacteria per cubic centimetre.

That tuberculous infection is widespread among cattle in Great Britain has been known since the report of the Cattle Diseases Committee in 1934, which also estimated that T.B. infection from milk was responsible for about 2000 deaths in England and Wales in 1931, quite apart from the ill-health it caused in many children. For many years the gov. seems to have allowed infected milk to be distributed to the pop. without taking drastic counteractive measures; but at length in 1943 the Ministries of Food and Agriculture announced their new policy in a White Paper (Cmd. 6454). A long-term measure was the improvement of the national dairy herd by a sound breeding policy. But, more important in the short term was the new veterinary inspection of cattle herds. Up to 1943 herds producing tuberculin tested milk were tested periodically for tuberculosis and had to undergo a general veterinary inspection twice a year; herds producing accredited milk underwent a general inspection every three months, but were not tested for T.B.; but owing to the shortage of veterinary staff, a very considerable number of herds were not inspected at all. In the foregoing White Paper the gov. proposed to spread out the system of inspection to cover all herds. T.T. (i.e. tuberculin tested) herds continue to be inspected twice yearly, but accredited herds are only inspected a minimum of once a year where their milk is heat-treated before sale—if not, they are inspected every three months. All other herds are inspected once a year where the milk is heat-treated, and twice a year where it is not, with additional inspections of herds with a bad disease list. Further, the responsibility for the conditions under which milk is produced, methods, buildings, and equipment, was transferred from local authorities to the Ministry of Agriculture. Further encouragement is given to the production and consumption of T.T. milk by an enhanced premium and official assistance in finding a market for the milk. In all areas that have had their milk deliveries rationalised the minister of food is empowered to make it an offence to sell milk unless it is heat-treated, T.T. milk, or milk from an accredited herd.

An order of the Local Gov. Board (now Ministry of Health) of 1912 prohibits the use of chemical preservatives in M., and the only methods of preservation, apart from the method of keeping clean and cool outlined above, are pasteurising, sterilising, and condensing. There are numerous devices for performing the operation invented by and named after Pasteur, in which the milk is usually heated to 145° F. In sterilising, M. is heated to a much higher temp., usually to about boiling point—212° F.—three times for twenty minutes each, keeping the M. in the intervals at about 90° to permit the spores left behind to germinate. Con-

densing is performed by evaporating the water at a comparatively low temp. under reduced pressure. Another continues the process of evaporation until the solids are left as a fine powder, which has a pleasant sweet taste, and can be kept for a long time without deterioration. Much attention has of late years been attracted by soured M., which for many centuries has been used in E. Europe and Asia, and was recommended by Prof. Metchnikov. The M. is sterilised, and after cooling a culture of *Bacillus bulgaricus* is introduced. The use of this bacillus is being replaced by that of *Lactobacillus acidophilus* (see LACTIC ACID THERAPY). The soured M. thus obtained is about as thick as ordinary buttermilk; its flavour is pleasant and distinctive, and it is undoubtedly a very valuable food and gastric corrective. Goats' M. is sometimes given to people with delicate digestive systems, because the casein in it does not readily clot when acted on by the acid gastric juice. See also DAIRY; DAIRY FARMING.

See W. G. Savage, *Milk and Public Health*, 1912; W. C. Harvey and H. Hill, *Milk Products*, 1937; W. L. Davies, *Chemistry of Milk*, 1939; G. S. Wilson, *The Pasteurisation of Milk*, 1942; and the Ministry of Agriculture and Fisheries, *The Handling of Milk and Milk Products*, Bulletin No. 31.

Milk Chocolate, see under COCOA AND CHOCOLATE.

Milk Fever, name given to the febrile state sometimes occurring two or three days after child-birth, frequently brought about by a chill. It can generally be subdued in a few hours by the use of cooling saline draughts and by encouraging the free flow of milk.

Milk Fever in Animals.—The cow is the chief subject of this derangement, and is rarely attacked before the third calving. Its actual cause is uncertain, but is no doubt related to the artificial treatment of the animal. Schmidts introduced a remarkable treatment, which, with proper care, reduces loss to a minimum. When the distressing symptoms appear, the udder is milked out, and pure oxygen and filtered air are injected or pumped into each quarter of the udder.

Milk Marketing Board, was estab. in Britain in 1933 to meet the need of organised milk production and supply. The functions of the board are to fix prices, control distribution, and minimise waste.

Milk River, in the U.S.A., a trib. of the Missouri, rising in the Rocky Mts., near the N. boundary of Montana, and draining part of Canada. Total length about 475 m.

Milk Sugar, see LACTOSE.

Milkwort (*Polygala*), or **Rogation Flower**, genus of hardy annuals and perennials and hardy and tender evergreen shrubs. The common M., *P. vulgaris*, occurs on chalky heaths and bears terminal racemes of white, pink, or blue flowers. Other Brit. species include the large-flowered chalk M. (*P. calcaria*), *P. amara*, with small blue flowers and fleshy leaves in a rosette, and *P. austriaca*, with large pink

flowers. Some of the hardy species are grown on sunny borders or rockeries. Sea M. is *Clauz maritima*, and belongs to the primrose family.

Milky Way, see GALAXY.

Mill, Hugh Robert (b. 1861), Scottish chemist and geographer, b. at Thurso. He became physicist and chemist to the Scottish marine station at Granton in 1884, and three years later was appointed a univ. extension lecturer. He has held successively the posts of librarian to the Royal Geographical Society, director of the Brit. Rainfall Association, honorary secretary and president of the Royal Meteorological Society. He was vice-president of the Royal Geographical Society from 1927 to 1931, and president of the Geographical Association in 1932. His publs. include *The Realm of Nature* (1891); *The English Lakes* (1895); and *The Siege of the South Pole* (1905). In 1907 he ed. the 4th ed. of the *International Geography* (1899). *Life of Sir Ernest Shackleton* (1923); *History of the Royal Geographical Society* (1930). His autobiography, *Life Interests of a Geographer*, was privately produced in 1945. Editor of *British Rainfall* and of *Symons's Meteorological Magazine* (1901-19). See life by J. Rattray, 1885.

Mill, James (1773-1836), Scottish philosopher and historian, son of a shoemaker, was b. at Montrose and, showing signs of ability, was sent to Edinburgh Univ. with a view to the ministry. He was licensed as a preacher in 1798, but gave up the idea of the church, went to London in 1802, and in that year became editor of the *Literary Journal*, and later of the *St. James's Chronicle*. From 1808 he earned his living as a contributor to the *Edinburgh* and other reviews, and by his *History of India* (1818). He was an enthusiastic supporter of Bentham, and a friend of Ricardo and other political economists. In 1821 he pub. the famous *Elements of Political Economy*, in 1829 his *Analysis of the Phenomena of the Human Mind*, and in 1835 a *Fragment on Mackintosh*, a bitter attack upon his brother philosopher. In 1819 he was given an official position on the board of control, on which he rose to be examiner, with a salary of £2000 a year. His writings belong to the utilitarian school, and he was perhaps the chief exponent of the utilitarian philosophy. See life by A. Bain, 1882.

Mill, John (c. 1645-1707), Eng. theologian, b. at Hardendale in Westmorland. In 1681 he became rector of Bletchington, Oxfordshire, and was made chaplain to Charles II. Four years later he became principal of St. Edmund's Hall, a position he retained till his death, and in 1704 was made a prebendary of Canterbury. His famous *Greek Testament*, pub. in 1707, was the fruit of thirty years' labour.

Mill, John Stuart (1806-73), Brit. philosopher and economist, was the eldest son of James M. (q.v.), the historian of India. Educated by his father, his studies embraced a range unusually wide. In 1823 he became a clerk in the India House, and was promoted until in 1856 he became thou

head of his dept., and two years later, when the gov. of India was transferred from the E. India Company to the Crown, he declined a seat on the new council, and retired on a pension of £1500 a year. He entered Parliament as member for Westminster in 1865, but retired three years later. He was a founder of the Utilitarian Society (1823), from which developed the utilitarian movement, and of the Speculative Society (1826). In 1825 he ed. Bentham's *Rationale of Judicial Evidence*. His *Logic* was pub. in 1843, and made a profound impression; and in 1848 he pub. his *Principles of Political Economy*. Between the years 1858 and 1865 he wrote his treatises on *Liberty*, *Utilitarianism*, *Representative Government*, and his *Examination of Sir W. Hamilton's Philosophy*. This examination of Hamilton's philosophy has lost its interest so far as it is merely polemical, but it remains of great value as containing M.'s own theories on the relation of mind and matter. In particular his conception of physical objects as 'permanent possibilities of sensation' has had great influence on the development of the theory of knowledge. In 1865 he entered the House of Commons as a member for Westminster, where, though highly respected, he made no great mark. After this political experiment he returned to literary pursuits, and wrote *The Subjection of Women* (1869), *The Irish Land Question* (1870), and an *Autobiography*. His *Autobiography* gives a singular, and in some respects painful, account of the methods and opinions of his father in his education. Though remaining all his life an adherent of the utilitarian philosophy, M. did not transmit it to his disciples altogether unmodified, but, deeming it too narrow and rigid for his own intellectual and moral requirements, devoted himself to widening it, and infusing into it a certain element of idealism. M. typifies the philosophic radicalism of the Victorian era. He held that systems of laws and morals should promote 'the greatest happiness of the greatest number,' that education is the cure for all social evils, and that rational argument can ultimately convince humanity of what is good. Freedom of thought, of speech, and of the individual has found few stronger supporters; the theme of his *On Liberty* is that 'If all mankind minus one were of one opinion, and only one person were of the contrary opinion, mankind would be no more justified in silencing that one person than he, if he had the power, would be justified in silencing mankind.' His *System of Logic* is of great philosophic importance; it revives the question, which Hume raised, of the validity of scientific method, and upon it inductive logic is primarily based. His *Letters*, ed. H. Elliott, were pub. in 2 vols., 1910. See G. J. Holyoake, *John Stuart Mill, as some of the Working Classes knew him*, 1873; Notices of his life, ed. by H. R. Foxbourn, 1873; W. L. Courtney, *The Metaphysics of J. S. Mill*, 1879; A. Bain, *A Criticism* (with personal recollections), 1882; T. Gomperz, *J. S. Mill, ein Nachruf*, 1889; C. M. Douglas, *John Stuart Mill*:

a Study of his Philosophy (a most important work), 1895; Prof. W. Graham, *J. S. Mill*, 1899; Sir L. Stephen, *The English Utilitarians* (vol. III.), 1900; J. MacCunn, *Six Radical Thinkers: J. S. Mill*, etc., 1907; L. Rey, *Le Roman de J. S. Mill*, 1913, and *John Stuart Mill en Avignon*, 1921; H. Gehrig, *John Stuart Mill als Sozialpolitiker*, 1914; H. K. Garner, *John Stuart Mill and the Philosophy of Mediation*, 1919; N. E. Himes, *The Place of John Stuart Mill and of Robert Owen in the History of English Neo-Malthusianism*, 1928; also lives by Mansfield Marston, 1873; W. L. Courtney, 1889; and S. Sanger (in Ger.), 1901.

Mill, see COTTON-SPINNING and MANUFACTURE; FLOUR-MILLING; WOOL.

Mill, in law. The owner of a M. is entitled to the use of a stream undiminished in volume; if owners above interfere, he can sue them.

Millais, Sir John Everett (1829-96), Eng. painter b. at Southampton, son of John Wm. M., descendant of an old Norman family settled for many generations in Jersey. He showed no inclination for study but much aptitude for sketching at an early age. In 1838, on the strong recommendation of Sir Martin Archer Shee, P.R.A., his artistic future was decided, and in that year he began to study art at Sass's school in London. He won a silver medal from the Society of Arts in 1839, and in 1840 he passed on to the Academy schools, where he was awarded all the prizes. Ambitious of lifting native art from its dull level of conventional mediocrity, he joined the Pre-Raphaelite Brotherhood with his friend Holman Hunt. The banquet scene from Keats's *Isabella* (1849) was his first painting on Pre-Raphaelite principles. It reveals all the characteristics of Pre-Raphaelite work down to the close imitation of the smallest details of nature. He contributed to what has been styled 'the trilogy of Pre-Raphaelite art' his homely and naturalistic representation of the child Christ in 'Christ in the House of his Parents,' better known as 'The Carpenter's Shop' (1850) (in the Tate Gallery). His unconventionality in this work produced a very unfavourable impression upon his critics, provoked much abuse, and even called forth an unmerited rebuke from Dickens. Ruskin, meanwhile, was championing M. with the rest of the Pre-Raphaelite band. With strict adherence to the Pre-Raphaelite style M. then produced 'The Return of the Dove to the Ark' (1851); 'Mariana of the Moated Grange' (1851); 'The Huguenot' (1852); the universally admired 'Ophelia' (1852) (in the National Gallery), for which Mrs. Rossetti was the model; 'The Proscribed Royalist' (1853); and 'The Order of Release' (1853). Mrs. Ruskin, whom M. afterwards married, sat for this last-named picture. 'The afterglow in 'Autumn Leaves' (1856) and the moonlight in 'The Eve of St. Agnes' (exhibited in 1863) are two of his most splendid atmospheric effects, and may be said to belong to his transitional period. Other pictures of this period are 'Sir Isumbras at the Ford' (1857); 'The

Escape of the Heretic' (1857); 'Apple-Blossoms' (1859); 'The Vale of Rest' (1859); and 'The Black Brunswicker' (1860). Meanwhile he illustrated Trollope's novels and Tennyson's poems (1860-1869), making altogether eighty-seven drawings for Trollope and establishing himself as the cleverest and most prolific illustrator of his time. He exhibited 'The Eve of St. Agnes' in 1863, 'Jephthah' in 1867, and 'Rosalind and Celia' in 1868. He then departed from the Pre-Raphaelite manner, forsook imaginative themes, and developed a strong individuality, with some of his finest pictures, many remarkable for their brilliant colouring,

SIR JOHN EVERETT MILLAIS

dramatic force, and expression of sentiment—such as 'The Boyhood of Raleigh' (1870) and 'Chill October' (1871). In his latter days he turned to portraits, landscapes, and single figures, as in child portraits such as 'Cherry Ripe,' 'Little Miss Muffet,' and the well-advertised 'Bubbles,' for which Adm. Sir Wm. James was the model; also a few figure-pieces such as 'The North-West Passage' (1874); 'The Yeoman of the Guard' (1877). 'Effie Deans' (1877); and 'The Princes in the Tower' (1878). 'The North-West Passage' is sometimes considered his masterpiece; it represents an old sailor, painted from Edward John Trelawny, the friend of Byron, listening to a tale of Arctic exploration in a room overlooking the sea and littered with charts. His portraits include those of W. E. Gladstone, Tennyson, Cardinal Newman, Lord Beaconsfield, and Wilkie Collins. In 1885 he was created a baronet and in 1896 he became president of the Royal Academy. While he may not have possessed the imagination of an idealist his ability to depict

what he saw produced pictures of a dramatic power and brilliance which have seldom been excelled. See *Life and Letters* by J. G. Millais, 1899; lives by J. E. Reid, 1909, and A. Fish, 1923; and Sir W. James, *The Order of Release*, 1948.

Millar, John (1735-1801). Scottish prof. of law, b. at Shotts, Lanarkshire. He became an advocate in 1760, the following year being appointed prof. of law at Glasgow. He wrote *The Origin of the Distinction of Ranks* (1781) and *Historical View of the English Government from the Settlement of the Saxons in Britain to the Accession of the House of Stuart* (1812).

Millau, tn. in dept. of Aveyron, France, on the Tarn, manufs. gloves and wool. It was formerly a Huguenot stronghold. Notre-Dame and St. François, the latter with a Gothic belfry, are fine edifices. Pop. 17,600.

Millay, Edna St. Vincent (b. 1892), Amer. poetess and playwright, b. at Rockland, Maine, graduated from Vassar in 1917. She first won distinction with 'Renaissance' (1912), pub. in 1917 as *Renaissance and other Poems*, a poem in octosyllabic couplets. Living for a time in Greenwich vil., she wrote plays for the Provincetown Players, *Aria da Capo* (1921); *Two Slatterns and a King* (1921); and *The Lamp and the Bell* (1921). The first two are satirical fantasies, the last-named is a five-act drama on the theme of the strong mutual affection of two girls of the Middle Ages. For *The Harp-Weaver* she won the Pulitzer prize in 1923. This vol. is notable for its sonnets of disillusionment. Other writings include *The Buck in the Snow* (1928); *Fatal Interview* (sonnet sequence, 1931); *Wine from these Grapes* (1934); *Conversation at Midnight* (1937); *Huntsman, What Quarry?* (1939); and *There are no Islands any more* (1940).

Millbank Prison. This prison was erected (1813-16) on a site on which the Tate Gallery now stands, and was a direct outcome of the philanthropic teaching of Howard, the old vindictive or retributive theories of punishment found expression in prisons that were veritable Alsatias of squalor; the schemes of Howard, and later of Bentham, looking to the reformatory utility of imprisonment, advocated the erection of places that should fulfil the idea of penitentiaries. The gov. of the early years of last century, impressed by the arguments of prison reformers, accordingly purchased land at Millbank, and at great cost erected the Millbank penitentiary on the methods which Bentham had described in his *Panopticon* (1791). The system failed dismally; and in 1843 there was a partial reversion to older methods. From 1870 to 1890 M. P. was a military prison. See A. G. F. Griffiths, *Memorials of Millbank*, 1875.

Millboard, tough, thick, and rigid pasteboard made from pulp. As in the case of paper, the material varies with the quality; waste paper and wood pulp give a poor quality, the better kinds having more fibre supplied from rags, rope, sack, and hemp. The finer qualities used by artists are bleached and glazed.

Coarser types are used for bookbinding, partitions, etc.

Millbury, tn. in Massachusetts, U.S.A., 7 m. from Worcester. It has cotton and woolen mills. Pop. 6,900.

Milledgeville, city of Baldwin co., Georgia, U.S.A., has grist and cotton-seed oil mills. Named after John Milledge, one-time governor of Georgia, and was once the cap. of that state. Here is the Georgia State college for women, the State lunatic asylum, and penitentiary. Pop. 6,700.

Millennium, period of 1000 years during which it was believed the kingdom of Christ would be estab. on earth. The idea originated in Judaism, but it was also very popular among the early Christians, who looked forward to the Parousia, or second coming of Christ. Indeed, in the first century of the church, chiliasm (Gk. χίλιος, thousand) was a widespread belief, to which the books of Daniel and the Apocalypse gave authority; whilst such books as the *Testament of the Twelve Patriarchs*, the Christian Sibylline books, etc., and the writers, Papias of Hierapolis, Irenaeus, and Justin Martyr gave vivid descriptions of the glory and magnificence of the M. According to them, it would be a time when all flaws in human existence would have vanished and perfect happiness prevail. But this period of bliss was to be preceded by great calamities and the triumph of the Messiah over Antichrist. The Rom. Empire was to be destroyed, Satan put in bonds, and the kingdom of Christ estab., when the righteous would arise from the dead and live, together with the surviving saints, with the Messiah in the New Jerusalem, a city which would literally descend from heaven. But lapse of time tended to stifle this belief, and when the Alexandrian philosophers, and amongst them Origen, introduced the idea that there would be no final conflict between Paganism and Christianity, but a gradual spread of truth throughout the world, dreams of chiliasm began to fade. Millenarianism, however, had some revival at the period of the Reformation, being adopted by the Anabaptists, who regarded the pope as Antichrist; and in Cromwell's time the Fifth Monarchy Men (q.v.) were millenarians. It flourished, moreover, during the Thirty Years war, and still persists in various forms. See also ADVENTISTS. See G. Calixtus, *De Chiliasmo cum antiquo tum pridem Renato*, 1692; A. Corrodi, *Kritische Geschichte des Chiliasmus*, 1794; J. Bossuet, *Religion des Judefumus*, 1926; and W. Rigg, *Das ewige Reich*, 1941.

Miller, Hugh (1802-56), Scottish geologist, was b. at Cromarty, where in 1860 his memory was honoured by a monument to his name. By trade M. was a stonemason, and it was only by being a stern 'taskmaster of his own energies' that he acquired that literary style and scientific learning which won him renown. After publishing *Poems* (1829) and *Legends* (1835) he became in 1839 editor of the bi-weekly *Witness*, and in its columns appeared a series of strikingly original geological essays, afterwards embodied in

The Old Red Sandstone (1841). His autobiography, *My Schools and Schoolmasters*, was pub. in 1852.

Miller, Joaquin (né Cincinnatus Helme Miller) (1842-1913), Amer. poet, b. in Indiana, and spent his later boyhood in Oregon. For four years (1866-70) he was judge in Grant co., and later he visited Europe many times (1870-76), and also Klondyke (1897) and the Orient (1899). He made his name with his passionate *Songs of the Sierras* (1871), and, besides writing other poems and a melodrama of Mormonism, *The Danites* (1880), pub. a *History of Montana* (1886), and *The Building of the City Beautiful* (1887), some ideas of which he attempted to put into practice in a social community on his estate. See life by M. S. Peterson, 1937.

Miller, Joseph, or Josiah (1684-1738), popular Eng. comedian of his day, who could neither read nor write. John Motley compiled a book of facetiae in 1739, which he called *Joe Miller's Jest*s without, however, obtaining M.'s permission for the liberty. A stale jest is still sometimes called a 'Joe Miller.'

Miller, William, see ADVENTISTS.
Miller, William Hallows (1801-80), Brit. mineralogist, b. at Velindre, in Pembroke-shire, and educated at St. John's College, Cambridge, becoming a fellow in 1829. His chief work was *Crystallography*, pub. in 1838.

Millerand, Alexandre (1859-1913), Fr. statesman and advocate, son of a wine merchant. B. in Paris, he was educated at the Lycée Henri-Quatre and at the Lycée Michelet. He became a journalist on the *Indépendant*, later working under Clemenceau on *Justice*. In 1881 he became an avocat of the court of appeal. In 1885 he entered the chamber, where he soon became conspicuous by supporting the aims of labour and social reform generally, and was made minister of commerce in Waldeck-Rousseau's Cabinet (1899-1902). In 1909-10 as minister of public works he performed valuable work during a serious railway strike, and again at the time of the inundations. His reforming zeal was equally marked during the time he was war minister (1912-13; 1914-15). In 1920 he became Prime Minister, and eight months later president of the Fr. Republic. But he was soon at loggerheads with the Radical and Socialist (Left) majority, which, under Herriot, had triumphed in the 1924 elections. Though re-elected to the Senate in 1927, his influence waned. His pub. books, which are all political, include *Socialisme réformiste en France* (1903); *Pour la défense nationale* (1913); and *La Guerre libératrice* (1918).

Miller's Thumb, see BULLHEAD.
Milles, Vilhelm Carl Emil (b. 1875), Swedish sculptor, b. near Uppsala, and studied in Paris. His best work consists of portrait busts, and animal groups, as well as fountains and monuments in Stockholm, Chicago, and other cities. See monograph by P. Verneuil, 1925.

Millet, Aimé (1819-91), Fr. sculptor, b. in Paris, achieved fame in 1857 with his statue of 'Ariadne,' which was bought for

the Luxembourg, Paris. This was followed by 'Mercury,' now standing in the court of the Louvre, and the famous 'Vercingétorix,' a colossal statue in beaten copper at Alise-Ste.-Reine in Côte-d'Or (1865). Other works are the 'Apollo' surmounting the Grand Opéra, 'Tombeau de Baudin,' and a monument of P. F. Dorlan, politician (1814-73), at Péc-Lachaise.

Millet, Francis Davis (1846-1912), Amer. artist, b. at Mattapoisett, Massachusetts, U.S.A. In 1898 he went to Manila as war correspondent for *The Times* and *Harper's Weekly*. In 1885 he was elected a member of the National Academy, New York. His best-known pictures are 'Between Two Fires,' in the Tate Gallery, London; 'A Cosy Corner,' and 'At the Inn.'

Millet, Jean François (1814-75), Fr. painter, was the son of a peasant of Gruchy, near Gréville (La Manche). Like Burns, he turned to his art after toiling in the fields; in 1836 he became a pupil of Mouchel in Cherbourg, and two years later entered the studio of Delaroche in Paris. After many vicissitudes he secured a notable success with 'The Winnowers,' exhibited at the Salon in 1848; 'Sowers and Binders' (1850); 'The Reapers' (1854); 'The Gleuners' (1857, now in the Louvre); 'The Angelus' and 'Death and the Woodcutter' (1859), are some of his finest works. M. was a master in depicting the sombre melancholy of work and rustic peasant life, a melancholy often emphasised by a twilight atmosphere most sensitively expressed. See lives by A. Sessler (Eng. trans. 1881); J. Cartwright (2nd ed.), 1896 (with letters); J. C. Ady, 1910; and P. Gsell, 1928.

Millet, seed of some species of *Panicum*, which are extensively cultivated in India and Africa, and also in S. Europe, being especially well suited to growth in a dry, sandy soil. The common M. is *P. miliaceum*; the little *M. P. milare*; the It. M. comes from *Setaria* or *Chlochelea italica*, and has been generally cultivated in Asia from remote times. Pearl M., *Pennisetum glaucum*, grows in tropical Africa and India. Indian M., Kafir or Guinea corn, is *Sorghum vulgare*, whose grain is known as durrâ. M. seeds are round, and vary in size and in colour from yellow to white, grey, brown, red, and black. M. is much used in food for poultry, pigeons, and cago birds. Ms. are grown largely where conditions are unfavourable for maize, and M. flour provides a staple food for large sections of the native pops. in S. Africa, N. and S. Rhodesia, the E. African ters., and in the interior of W. Africa. Production is almost entirely in the hands of natives. The great M. or sorghum is the most important M. crop, but in drier areas the lesser Ms., such as pennisetum, the bulrush M., and eleusine, are widely grown, both as pure and mixed crops. Sorghum is an important crop in the Union of S. Africa and in the high commission ters. (Bechuanaland, Basutoland, and Swaziland), Basutoland alone producing nearly 30,000 tons; Nyasaland and N. Rhodesia also depend very largely on M. for food. In Tanganyika they are the staples for food and brewing of beer.

Sorghum is also grown extensively for food in Kenya, and in parts of Uganda eleusine is the staple cereal. In N. Nigeria the prin. grain crops are bulrush M. (or gero) and sorghum. In Fr. W. Africa Ms. are the staple food throughout the N. areas, and also in the palm belt in Dahomey (Lord Hailey, *An African Survey*, 1938).

Milletia, genus of climbing trees and shrubs (family Leguminosae) with pluk and purple flowers.

Mill Hill, dist. of Greater London, 8 m. N.W. of the city, between Edgware and Tottenham, on the London Midland and E. Region railways. It is included in the bor. of Hendon. M. H. public school was founded in 1807 as a school for the sons of Nonconformists, but was reorganised on broader lines in 1869. The Jesuits have a training college at M. H. Pop. 17,100.

Milliard, word very rarely used, signifying a thousand millions; in America often termed a billion.

Millibar (abbreviation mb.), unit of atmospheric pressure used in meteorology. It is defined as one-thousandth part of a bar, which is equal to 1,000,000 dynes/sq. cm. (a dyne is the absolute unit of force in the centimetre-gramme-second system of units). The mean atmospheric pressure at sea level over the whole globe is about 1013 mb. At 0° C., in lat. 45°, 1000 mb. is equivalent to a height of 750.1 mm. or 29.531 in. of mercury.

Millikan, Robert Andrews (b. 1868), Amer. physicist, b. at Morrison, Illinois, son of the Rev. Silas Franklin M. Graduating at Oberlin, 1891, he gained a Ph.D. at Columbia, 1895, and then studied at Berlin and Göttingen, 1895-96, returning to Chicago Univ. as an assistant to Michelson (q.v.). Prof. of physics, univ. of Chicago, 1896-1921, he has been since then director of the Norman Bridge Laboratory of Physics and chairman of the Executive Council of the California Institute of Technology, at Pasadena. He was vice-chairman, National Research Council, Washington, from 1917, and in 1918 was a lieutenant-colonel in the U.S. Signal Corps. He became famous as a result of his ingenious researches that led to the most exact evaluation of the charge of the electron, and to the view that the electron is the fundamental unit of negative electricity (see his *The Electron*, Chicago Univ. Press, 1917). M. was awarded the Nobel prize in 1923 for his work on electrons. His pubs. include *The Electron: its Isolation and Measurement, and the Determination of some of its Properties* (1921); *Evolution in Science and Religion* (1927); *Science and the New Civilisation* (1930); *Time, Matter, and Values* (1932); *Cosmic Rays* (1939); and *Electrons, Protons, Photons, Neutrons, and Cosmic Rays* (revised ed. 1946).

Millin, Aubin Louis (1759-1818), Fr. archaeologist, botanist, and numismatist, b. in Paris. He became prof. of hist. and physics at the École Centrale, and at the Lycée of Paris in 1794. His pubs. include *Antiquités nationales* (1799) and *Voyages dans les départements du midi de la France* (1807-11), etc.

Millin, Sarah Gertrude (*née* Liebson) (b. 1889), S. African authoress of Jewish descent. Married a judge of the Supreme Court of S. Africa. She has written good biographies of Rhodes (1933) and (ten. Smuts (2 vols. 1936), and her own autobiography, *The Night is Long* (1941). Her numerous novels of S. African life include *The Dark River* (1920); *Adam's Rest* (1922); *The Jordans* (1923); *Mary Glenn* (1925); *The Coming of the Lord* (1928); *Three Men Die* (1934); *What Hath a Man?* (1938); and *The Herr Witchdoctor* (1941). Other works include *The South Africans* (1926, 1934); *South Africa* (1911, Brit. Commonwealth in Pictures series); and a *War Diary* in three vols. (1944-46).

MILLIPEDE

A, single segment; transverse section, highly magnified.

Millinery. This term is generally used to designate women's hats and their trimmings (ribbons, lace, feathers, artificial flowers, etc.), and is also applied to the art of making and trimming hats and bonnets. Originally the word meant 'Milan goods,' such as textile fabrics, gloves, ribbons, 'Milan bonnets,' needles, and cutlery. Many articles of M. are sold by haberdashers and drapers. Milliners are those who make and trim hats and headgear of all descriptions for women and children (as opposed to 'hatters,' who make headgear for men), and are nearly always women. See also HATS.

Milling Machines. Term 'milling' means the process of removing metal from a surface by means of rotary cutters fixed in a M. machine. Mass-production has been made possible by the rapid development of M. M. during the present century, for they are able to make perfect reproductions in any quantities of parts of machinery, and, moreover, can perform such operations quickly. There are numerous types of M. M. designed for the great variety of work required in modern machinery. The Universal M. machine is used for the production of twist drills, for various kinds of gear-wheels, as well as for straight and taper milling. Plano-millers

are used for big jobs, such as the milling of the cylinders of motor cars, while other types of M. M. are circular millers and thread millers for cutting screw threads. Many M. M. to-day are completely automatic, and by employing different cutters mounted on separate spindles they can deal with a job that requires various types of milling.

Milling Process, see under MINING.

Millipedes, or Milipedes (order Chilognatha), small, active animals forming with the centipedes the class Myriopoda (many-footed). They are vegetarian in habit, and though they consume much decaying matter, they also damage and destroy cultivated plants. Common species are *Julius gutulatus*, *J. terrestris* (sometimes called wire-worm), and *J. pulchellus*. Trapping by means of buried roots and dressing the ground with lime or soot are methods of keeping M. in check.

Millom, tn. of Cumberland, England, 9 m. from Barrow, has smelters, red hematite and iron ore mines, and blast furnaces. Pop. 9000.

Millport, watering-place on Great Cumbrae Is., Bute, Scotland, has a good sandy beach and fine harbour. There is a marine research station where oyster breeding is carried on. Pop. 2500.

Mills Bomb, see BOMB; GREENADE.

Millsprings, hamlet of Wayne co., Kentucky, U.S.A., 80 m. S. of Lexington. Here the Confederates under Crittenden were defeated by the Union forces under Thomas in 1862.

Millstones. These consist mostly of sandstone and various kinds of grit, but they have the disadvantage of becoming smooth and thus necessitate dressing from time to time. The best stone to use is one which is hard and porous; perhaps the best stones fulfilling these conditions are the Fr. burr stones. Of late years steel rollers have largely displaced those of stone.

Milltown, tn. in New Brunswick, Canada, on the St. Croix R., 62 m. W. of St. John. Pop. 3000.

Millvale, bor. of Allegheny co., Pennsylvania, U.S.A., on the Allegheny R., opposite Pittsburg. Pop. 7800.

Millville, city of Cumberland co., New Jersey, U.S.A., 35 m. S. of Philadelphia. It manufs. cottons, glass ware, iron goods, etc. Pop. 14,800.

Millwall, dist. of London, on the N. side of the Thames, in the Isle of Dogs, and the bor. of Poplar. It is bounded on the S. by the M. dock (230 ac.), the centre of the London grain trade. The name originated from seven windmills, which stood on the wall built there to keep the riv. from overflowing its banks at high tide.

Milman, Henry Hart (1791-1868), Eng. divine and historian, was a son of the physician Sir Francis M., Bart. He was educated at Eton and Brasenose College, Oxford. He took holy orders, and was in 1818 presented to the living of St. Mary's, Reading. He was prof. of poetry at Oxford from 1821 for ten years, and in 1827 was appointed Hampton lecturer. Rector of St. Margaret's, Westminster, and canon of Westminster from 1835, in 1849 he

became dean of St. Paul's. Among his earlier writings were *Pazio* (1815), a play produced in 1818 with great success; an epic poem, *Samor, the Lord of the Bright City* (1818), and a dramatic poem, *The Fall of Jerusalem* (1820). In 1838 he ed. Gibbon, and in the following year pub. a life of the historian. The works upon which his fame rests are his *History of the Jews* (1830); *History of Christianity under the Empire* (1840); and *The History of Latin Christianity down to the death of Pope Nicholas V.* (1855). See life by A. Milman, 1900.

Milne, Alan Alexander (b. 1882), Eng. journalist and playwright, began journalism in London in 1903, and was assistant editor of *Punch* from 1909 to 1914, contributing a number of pleasing articles in a light bantering vein. He pub. *The Day's Play* (1910); *Once a Week* (1914); *Mr. Pim* (1921); *If I May* (1922); *A Gallery of Children* (1925); *Four Days' Wonder* (1933); *Peace with Honour* (1934); *Behind the Lines* (1940); *War Aims Unlimited* (1941); *Once on a Time* (1943); *Chloe Marr* (1946); and *The Norman Church* (poem, 1948). His most successful work is in his tales for children, *Winnie-the-Pooh* (1926) enjoying great popularity. One of his best plays is *Mr. Pim Passes By* (1919); others are *The Romantic Age* (1920); *The Truth about Illyads* (1921); *The Ivory Door* (1927); *Other People's Lives* (1932); *Sarah Simple* (1937); and *Gentleman Unknown* (1938).

Milne, Edward Arthur (b. 1896), Brit. scientist, b. at Hull; was educated at Hyners College, Hull, and Trinity College, Cambridge. He was successively assistant director of solar physics at Cambridge observatory, 1920-21; lecturer in mathematics, Trinity College, 1924-25; Rouse Ball prof. of mathematics, Oxford, and fellow of Wadham College, 1928. Noted for his researches in astrophysics, he wrote *Equilibrium of the Chromosphere* (1924); *Thermodynamics of the Stars* (1930); *The White Dwarf Stars* (1932); *Relativity, Gravitation, and World Structure* (1935), a new theory of the universe, for which he was awarded the Royal Astronomical Society's gold medal; *Foundations of Dynamics* (1936); *Electromagnetism* (1938). He was president of the London Mathematical Society, 1937-1939, and has gained many academic distinctions in Britain and the U.S.A.

Milne, John (1850-1913), Eng. seismologist and mining engineer, educated in Rochdale, Liverpool, and London. He was employed as geologist in Dr. Beke's expedition to N.W. Arabia, 1874. He then served the Jap. Gov. for twenty years, establishing the seismic survey of Japan (968 stations). M. travelled widely in Russia, China, Borneo, the Australian colonies, U.S.A., and elsewhere. For the Brit. Association he estab. a seismic survey of the world. His works include *Earthquakes* (1883); *Seismology* (1888); and *The Miner's Handbook* (1894).

Milne-Edwards, Henri (1800-85), Fr. naturalist, b. at Bruges, son of an Englishman. He succeeded Cuvier as member of the Académie des Sciences (1838), was

prof. of entomology at the Jardin des Plantes (Muséum d'Histoire naturelle, 1841), and prof. of zoology and physiology (c. 1861). He ed. the *Annales des sciences naturelles* (1834-84); and contributed largely to it, and to the *Dictionnaire classique d'histoire naturelle*. His works include *Éléments de zoologie* (1834, 1851); *Histoire naturelle des coralliaires* (1857-1860). His monumental *Leçons sur la physiologie et l'anatomie comparée de l'homme et des animaux* (1857-81) was compiled with his son Alphonse (1835-1900).

Milne of Salonika and of Rubislaw, Sir George Francis, first Baron (1866-1948), Brit. field marshal, son of George M., of Westwood, Aberdeen. Joining the army in 1885, he served in the Sudan, 1898, and S. Africa, 1899-1902. When the First World War began he was brigadier-general commanding 4th divisional artillery. He served in France, became major-general, 1915, and commanded 27th Div. and 16th Army Corps. At the end of 1915 he was with the Brit. forces at Salonika; and from the following May commanded the whole Brit. contingent in Macedonia. He served under various Fr. commanders-in-chief in the Near E. till the Ger. surrender, remaining with the command until 1920. At home he held the E. command, 1923-26, and became field marshal, 1928, and chief of imperial general staff, 1929-33, being raised to the peerage, 1933. Governor and constable of the Tower of London, 1933-38.

Milner, Sir Alfred, Viscount (1854-1925), Brit. colonial administrator; b. March 23 at Giessen, Germany, son of Charles Milner, M.P. He was educated at Tübingen Univ., King's College, London, and Balliol College, Oxford, where in 1877 he graduated with first-class honours in classics. For four years, 1881-85, he devoted himself to journalism, writing chiefly for the *Pall Mall Gazette* under John Morley and W. T. Stead. He owed his appointment as under-secretary for finance in Egypt, where he remained for four years, 1889-92, to G. J. Goschen, chancellor of the exchequer, whom he had already served as private secretary, 1887-1889. His statesmanship was first put to a serious test when, after fulfilling admirably the functions of chairman to the Board of Inland Revenue, 1892-97, and being made K.C.B., 1895, he was made governor of Cape Colony and high commissioner for S. Africa in 1897. There is no doubt that his determination to secure for the Brit. subjects of the Transvaal that political freedom which the Dutch alone enjoyed helped to precipitate the war which broke out between the Eng. and the Boers in 1899; and this, combined with the unexpected disasters that overtook Brit. troops, accounts for the organised opposition with which he met on his return home in 1901, when he was made Baron M. But the resentment that his administration had raised, so far from securing his dismissal from S. Africa, was promptly met by his appointment as governor of the Transvaal and Orange

River colonies. This post he retained till 1905. He was made viscount in 1902; and in 1903 he sanctioned the importation of Chinese labour to work the mines, a sanction which subsequently involved him in a storm of adverse criticism. He was strongly opposed to the granting of self-government to the new colonies. On his return to England he took a leading part in the rejection of the 1909 budget.

In his *England in Egypt* (1892) he gave a clear account of the results of the Brit. occupation. Pub. *The Nation and the Empire* (1913). Before the First World War broke out he made it clear that he would enter no gov. that did not pledge itself to conscription. At the formation of the first coalition, in the spring of 1915, he became chairman of the committee on agriculture. Member of War Cabinet, without portfolio, 1916-18, he went with Lloyd George to Rome, Jan. 1917, and immediately afterwards to Russia, returning before Nicholas's abdication. Secretary for the colonies, 1919-21, he visited Egypt and reported on necessary changes; his report being neglected he resigned. See C. Headlam (ed.), *The Milner Papers, 1897-1908*, 1931-33; E. A. Walker, *Lord Milner in South Africa, 1942*; and V. Halperin, *Lord Milner et l'imperialisme britannique*, 1947.

Milner, Sir Frederick George, seventh Baron (1849-1931), second son of Sir Wm. Mordaunt Edward M., fifth Bart., of York, and educated at Eton and Christ Church, Oxford. From 1890 to 1906 he was M.P. for the Bassettlaw div. of Nottinghamshire. Privy councillor in 1904. What he observed at the close of the S. African war made him the champion of the common soldier in and after the First World War. Chiefly through his efforts the administration of pensions was transferred from the commissioners of Chelsea Hospital to a specially created ministry. He founded the first recuperative hospital for the shell-shocked at Harpenden. When this was no longer necessary its funds were transferred to Enham vil. settlement, afterwards united with Papworth (q.v.) settlement. M. identifying himself with this movement for the benefit of tuberculous patients from army and navy.

Milnes, Richard Monckton, see Houghton, Baron.

Milngavie (locally pronounced Millguy), police burgh of Scotland, in Dumbartonshire, 6 m. N.N.W. of Glasgow. There are bleach works, distillery, and dye-works, and a paper-mill. Pop. 6300.

Milnrow, tn. of Lancashire, England, 14 m. S.E. of Rochdale, with a trade in woollen goods and collieries. Pop. 8200.

Milo, or Milon, Gk. athlete who flourished in the latter part of the sixth century B.C., b. at Crotona, Magna Graecia, Italy. He was famous for his prodigious strength, and became a pupil of Pythagoras. At the Olympic and Pythian games he was twelve times victor at wrestling. He defeated the Sybarites in 511 B.C.

Milo, Titus Annius, Rom. tribune, came

into office in 57 B.C. He was a partisan of Pompey, and aided Cicero's recall from exile, thus incurring the hostility of Clodius, whom he killed in a fray (53 B.C.). The next year he was tried for homicide, and was condemned and exiled to Marselles. See Cicero, *Oratio pro Milone* (Reid's ed.), 1906.

Milo, tn. in Maine, U.S.A., on the R. Piscataquis, 30 m. N.N.W. of Bangor, has quarries of roofing slate. Pop. 3000.

Milo, is. in the Aegean Sea, see MELOS. Milovanovich, Milovan (1863-1912), Serbian statesman, educated at Belgrade and at Paris, where he became doctor of law. He was appointed prof. of law at the univ. of Belgrade. In 1908, being then Serbian minister at Rome, was appointed minister of foreign affairs, and made a tour of European caps. during the tension that followed Austria's annexation of Bosnia-Herzegovina. He became non-party premier in 1911.

Milreis, former name of the Brazilian currency unit. For many years Brazil had a dual currency, with a gold M. (100 reals or reis) for foreign trade and a paper M. for domestic trade. At one time the gold M. was worth 27*d.*, but fell to 15*d.* before the First World War. To 5-93*d.* in 1929, and to 2-78*d.* in 1938. From Nov. 1, 1942, the currency unit was renamed the cruzeiro (Cr \$), composed of 100 centavos. Metallic currency now consists of 1, 2, and 5 cruzeiros and 10, 20, and 50 centavos; notes are of the value of 10, 20, 50, etc., up to 1000 cruzeiros, all resembling the former notes for similar amounts of M. One thousand M. or cruzeiros is known as 1 conto, roughly equivalent to \$50.70, U.S. In 1946 Brazil informed the International Monetary Fund that its exchange rate would be 18.96 cruzeiros to the dollar, making the cruzeiro equal to 5.27 cents.

Milt, see PISCICULTURE.

Miltiades (c. 540-c. 488 B.C.), famous Athenian general and victor of Marathon; son of Kimon, and nephew of M. the Cekist. After the Scythian expedition of Darius M. had to leave as a result, according to Grote, of incurring the hostility of Darius, but was at the Chersonesus continuously from the outbreak of the Ionic revolt until about three years before the battle of Marathon. Was one of the four out of the ten Athenian generals who strongly advised the Polemarch, Kallimachus, to give immediate battle to the Persians, instead of resisting behind the walls of Eretria, and crowned his career by winning the battle of Marathon. Later he was entrusted with the expedition against Paros, but apparently used the occasion merely to vent a private spite against a Parian citizen, Lysagoras. Was impeached on his return by Kaulthippus, father of Pericles, but *d.* soon afterwards, leaving the fine to be paid by his son Kimon.

Milton, John (1608-74), one of the most illustrious of Eng. poets, was b. in Bread Street, London, the son of John M., a scrivener. His father, who instructed him in music, and is said to have made him a skilful organist, had him taught by a private tutor, Thomas Young, a

Scots clergyman, who eventually became master of Jesus College, Cambridge. M. was also sent to St. Paul's School, not later than 1620. He took to study passionately and, besides Lat. and Gk., he appears to have learned It., Fr., and some Heb., and to have read much Eng. literature. According to tradition he began to write poetry at the age of ten, and while at the univ. he wrote verses on current events and, *inter alia*, the sonnet on Shakespeare and the *Ode on the Nativity*. He was admitted a pensioner of Christ's College, Cambridge, on Feb. 12, 1625, and matriculated on the following April 9. His tutor at Cambridge was Wm. Chappell, who later became bishop of Cork. It was at one time intended that M. should study law, but he inclined to letters, and was allowed to follow his bent. He graduated M.A. on July 3, 1632, having taken his B.A. degree on March 26, 1629. From 1632 he lived with his father at Horton for six years, and during this period wrote *L'Allegro* and *Il Penseroso*, and the musques *Arcades* and *Comus*. The exquisite *Lycidas* was written in 1637, on the death of Edward King, M.'s mother d. in 1637, and was buried in Horton church. His father was at the same time charged by a client with misconduct in respect of funds entrusted to him for investment, but was completely exonerated by the court.

M. now obtained his father's consent to undertake a journey abroad and, in the following year (1638), he spent about a year in Italy, Switzerland, and at Paris. The dates of his sojourn are fixed by the short account of his travels in the *Defensio secunda* (1654) and references in his *Poems upon Several Occasions* (4th ed., 1705). His reception by distinguished hosts demonstrates the impression made on his contemporaries by his lofty character, prepossessing appearance (at Cambridge he had been nicknamed 'the lady' on account of his beauty and delicacy of mind) and literary culture. Among others he met Grotius, Galileo, Malatesti, and Manso, the patron of Tasso. On his return he settled in London, took two nephews as his pupils, and entered into an acrimonious theological controversy with Bishop Hall, his prin. writings being *The Reason of Church Government urged against Prelacy*, and an *Apology*, both written in 1642. In the following year he married a girl of seventeen, Mary, eldest daughter of Richard Powell (a 'joyful and free-living cavalier' of Forest Hill, near Shotover, Oxfordshire, who is said to have acknowledged, in 1627, an undischarged debt to M. of £300), who, finding life dull with the eminent but dour Puritan, went within a month of the nuptials on a visit to her father, and refused to return. Thereupon M. wrote a pamphlet on *The Doctrine and Discipline of Divorce* (1643), and followed this with *The Judgment of Martin Bucer concerning Divorce* (1644). His views on divorce made him notorious and his writings on it only ended in 1644-45 with the pamphlets *Tetrachordon* and *Colasterion*. He was attacked by the Stationers' Company for publishing pamphlets without

licence, and in reply wrote *Areopagitica* (1644), a spirited vindication of the liberty of the press, which brought him into great prominence, and gave him a position as a man of letters that had not hitherto been assigned to him. In 1646 his wife returned to him, and within six years bore him four children, dying in giving birth to the last, a son, who d. in infancy. He sided with the army against the king, and after the execution of Charles I. pub. the *Tenure of Kings and Magistrates* (1649), in which he espoused the popular side. The surrender of Oxford in 1646 completed the ruin of Powell, who d. in 1647, leaving a will which proved that his affairs were desperately confused and M., who had an 'extent' on Powell's mortgaged estate, found himself in dispute

JOHN MILTON

with his mother-in-law over the allowance for her family. M. entirely sympathised with the army in their triumph over the parli. and Presbyterian party, and he shows this sympathy in his sonnet to Fairfax upon the siege of Colchester, written in 1648, in which year he was also occupied in compiling the *History of Britain*, of which he had written four books (*Defensio secunda*), when he was recalled to public affairs by the events which led to the execution of the king.

In 1649 he became Lat. secretary to the council of state, and in his official capacity answered Gauden's *Eikon Basilike* with *Eikonoklastes*. He became blind, and had to be assisted by secretaries, the most important of whom was Andrew Marvell, but he retained his post until the Restoration, during which period he wrote sev. pamphlets, and just before the return of Charles II. pub. *The Ready and Easy Way to establish a Free Commonwealth* (1660). M. was now in considerable danger, for the Royalists were very naturally incensed against him. The House of Commons ordered that his *Defensio* should be burnt by the common hangman, and that he

should be arrested. He had gone into hiding, but was taken prisoner. The Act of Indemnity, however, put an end to his troubles.

M. had married a second time in 1658, but this wife dying two years later, he married Elizabeth Minshull in 1663. He now lived at Chalfont St. Giles in a cottage that still exists, and there he settled down to complete the great work that had long been in his mind. *Paradise Lost* was begun in 1658 and, according to Aubrey, was finished five years later, though it was not pub. until 1667. He received £10 for the work, and his widow subsequently received another £8. Thirteen hundred copies were sold in eighteen months. The poem was acclaimed by the few, but it did not at once bring the author the great fame that is his to-day. When M. showed Thomas Ellwood the MS. of *Paradise Lost* Ellwood remarked: 'Thou hast said much here of *Paradise Lost*, but what hast thou to say of *Paradise Found*?' M. may have taken the hint, or he may have already planned *Paradise Regained*, which was pub. in 1671. In the same year appeared his last important work, *Samson Agonistes*, a drama on the Gk. model, but not adapted for theatrical representation. He d. on Nov. 8, 1674, and was buried in St. Giles, Cripplegate.

M. stands high among Eng. poets, and is second only to Shakespeare himself. His splendid vocabulary, his swinging rhyme, and majestic diction are unrivalled. He demands reverence rather than love, for he is, above all things, austere. Love touched him not, and of humour he had not a spark. Yet in spite of these defects *Paradise Lost* is a triumph of the poetic art, that all must admire and none can contemplate without awe. M.'s art derives its power from the fact that he kept the feeling for music which sustained the Elizabethan lyrists in their verse and that his ear was accustomed to the lute and madrigal singing. Not only was he the son of a musician, but composers like Henry Lawes (who set his *Comus* and *Arcades* to music) figure intimately in the idealistic life which, as a poet, he early shaped for himself. Great as were his epic achievements, the realisation of what reserves of song lay behind his lyric triumphs, leaves these supreme in their kind. His *Hymn on the Morning of Christ's Nativity* (1629) is a truly remarkable work for a youth of twenty. Its melody, 'based on vocal rhythms of high resilience, sustained with power throughout,' suggests a demonic energy irresistibly bent on its own unfettered expression, and leaves us wondering what he could have accomplished in this sphere had he chosen it rather than that of the epic poet and political pamphleteer. It is indeed not a little curious that politics should have taken so strong a hold on a man who literally felt the needs of poetry grow upon him, and who, as a youth, had steeped himself in the reading of Spenser, Marlowe, Chapman, Shakespeare, Fletcher, Donne, and others, and who, on going to Cambridge, seemed to realise his own force in the utterance of noble harmonies. His

lyric testament, *At a Solemn Music* (1630), a bold experiment in dominant and cadent effects, suggests that the poet 'who had been writing sonnets, broke under the spur of music the sonnet form, and achieved a Pindaresque triumph.' His power of experimentation in the lyric form was quickly developed after leaving Cambridge for Horton, for there his descriptive lyrics *L'Allegro* and *Il Penseroso* revealed a polish that makes previous examples of the art, e.g. in Ben Jonson, Lyly, and Fletcher, read like rudimentary improvisations. *Comus* and *Lycidas*, also written at Horton, touch the height of Eng. verse in point of imagination, truth of idea, and great language combining to produce the utmost lyric harmony. When, within a few months of having written *Lycidas*, M. went to Italy, it was as one who was already deeply immersed in it. This preparation no doubt led his mind back to the sublime and comprehensive theme that was dear to him. It has been said that he originally designed this great theme to be Arthurian; but when he went to Italy it seems clear that he had begun to dream of an immortal work that should be founded on but rise far superior to an It. tragedy on the Fall of Man which had imprinted itself on his fancy. But in its ultimate expression his great theme was unquestionably shaped by his reactions to the Civil war which broke out at the time he returned to England. It is possible that war as an inspirer of poetic achievement did more for him than would any Arthurian medievalism; be that as it may, the result was to emphasise M. as the orator of his own passion, the great symbolist ranging over the whole field of nature, art, hist., and philosophy for the accents and allusions and images to carry his message.

His purpose, as was that of Aeschylus and other Gk. tragic poets, was to dispense with both the Gk. and the Heb. theogony, and to substitute a supernatural system acceptable to modern minds capable of 'that willing suspension of disbelief for the moment which constitutes poetic faith.' Yet *Paradise Lost* was little known in M.'s lifetime, and it was not until Addison wrote his well-known critique on it that its merits came to be understood. This is indicated by the meagre price M. received for it from Matthias Walker of St. Dunstan's; and the agreement between Walker and the poet is still preserved in the Brit. Museum. The total sum reckoned in modern values was about £250.

By his first wife M. had three daughters, two of whom used to read to him in various languages, though they are said to have understood only their own. His remains were interred at the par. church of St. Giles, Cripplegate, where a monument was erected to his memory, and there is another in Westminster Abbey. See the classic work by D. Masson, *Life of John Milton, narrated in connection with the Political, Ecclesiastical, and Literary History of his Time* (6 vols.), 1859-80. Masson also ed. M.'s works (2nd ed., 1890). See lives and studies by M. Patti-

son, 1879; S. A. Brooke, 1879; R. Garnett, 1890; W. Raleigh, 1894; E. M. W. Tillyard, 1930; H. Bellou, 1935; and R. Warner, 1949; also R. Graves, *The Story of Marie Powell, Wife to Mr. Milton*, 1943; D. Saurat, *Milton, Man and Thinker*, 1944; and F. E. Hutchinson, *Milton and the English Mind*, 1949.

Milton. There are sev. places of this name in England: (1) M.-next-Sittingbourne (q.v.); (2) Small watering-place on Christchurch Bay, Hampshire, 6 m. from Lymington; (3) M. Abbas, a model vil. in Dorset, 7 m. from Blandford. There was formerly an abbey here, and the fine church still stands.

Milton: 1. Tn. of Norfolk co., Massachusetts, U.S.A., on the Neponset R., 7 m. S. of Boston. The U.S. Meteorological Bureau has an observatory and station on the Blue Hills near by. Fine granite is quarried, and there are manufs. of sealing-wax, paper, cement, and tallow. Pop. 18,700. 2. Bor. of Northumberland co., Pennsylvania, U.S.A., on the Susquehanna R. (W. branch), 52 m. N. of Harrisburg. Pop. 8300.

Miltonia, genus of epiphytal orchids, with large, flat, brilliantly coloured flowers resembling pansies in shape.

Milton-next-Sittingbourne mrkt. tn. and urb. dist. of Kent, on Milton Creek, an opening of the Swale, 10 m. E. of Chatham, on the S. Region railway. Paper is made here and the creek is noted for its oysters. Pop. 8000 (dist. 21,000).

Milward, Sir Clement Arthur (b. 1877), Eng. soldier, b. at Redditch, Warwickshire. He was educated at Rugby. In the First World War he took part in the campaigns in France and Mesopotamia. Between 1920 and 1931 he served in India, and was commander of the Lucknow dist. from 1934 until his retirement in 1938. Major-general, 1931. He was A.D.C. to the king from 1926 to 1931.

Milwaukee, chief city and port of M. co., Wisconsin, U.S.A., on the W. shore of Lake Michigan. It has a fine harbour, and carries on a large export trade in barley, wheat, and oats. The chief industries are agric. implements, including tractors; motor-vehicle bodies and parts; wholesale meat packing; electrical machinery; malt and malt liquors; steel-works and rolling-mills; cranes; dredging, excavating, and road-building machinery, and iron-castings; tanneries (enrried and finished leather products); flour-mills; and manufs. of clothing machinery. The products of M. in 1939 were valued at \$754,000,000. The city has numerous fine public parks, a free hospital and sanatoria, a city hall, library, and museum, and sev. important educational institutions. Pop. 387,400. See J. S. Buck, *Pioneer History of Milwaukee*, 1876-1886; L. M. Larson, *Financial and Administrative History of Milwaukee*, 1908; and E. A. Fitzpatrick, *Wisconsin*, 1928.

Milyukov, Pavel Nikolaevich (1859-1943), Russian historian and politician, b. near St. Petersburg. He taught hist. in the univ. of Moscow, 1886-05, was banished, and became prof. at Sofia, 1897-98, and member of faculty, Chicago

Univ., 1901-5. Returning to Russia in 1905, he was a member of the first Duma as a Constitutional Democrat. In 1917 he was foreign minister under Prince Lvov, and left Russia when the Bolsheviks obtained power. He settled in Paris after the peace (1919) and ed. a jour. (1921) advocating a patriotic Socialist alliance. Historical works include *Main Currents of Russian Historical Thought* (1893-95) and *Sketches of the History of Russian Culture* (1895-96).

Mimamsa (Sanskrit, investigation), two divs. of the orthodox Hindu philosophy, comprising a series of commentaries on the *Vedas*, the sacred books of India. The first div. is the *Purva-mimamsa* ('Prior Inquiry'), called also the *Karma-mimamsa* ('Investigation concerning Works'). The second is the *Uttara-mimamsa* ('Latter Inquiry') or *Brahma-mimamsa* ('Investigation as to the Supreme Spirit'). The principles of the M. are given in a series of *sutras*, or aphorisms, which are themselves so obscure as to need elaborate commentaries. The sage Jaimini is supposed to have been the founder of this kind of knowledge. The subject matter is the ritual given in the *Vedas*, on which it supplies a commentary. See R. K. Garbe, *Philosophy of Ancient India*, 1897.

Mime, in Rom. drama, was a vulgar presentment of character or situation, compounded of song, dance, and dialogue. Ms. were popular during the new political era under Augustus, when the legitimate drama had ceased to exist except in small literary coteries. The best-known writers of M. were Decius Laberius (105-43 B.C.) and Publilius Syrus. Women played in them and cuckoldry was a stock theme. Gk. M. was originated by Sophron of Syracuse (c. 440 B.C.). See MIMOS.

Mimicry, evolutionary process by selection, which occurs both in animals and plants, giving them in the simplest way the equivalent of some advantage possessed by the object imitated. Sometimes the mimic assumes the appearance of a harmless creature so as to come within easy reach of its unsuspecting prey; an instance of this is the caracara, or curassow hawk, of Central America, which very closely resembles the gallinaceous curassow, and the hawk's victim, confusing them, allows it to approach within striking distance. More commonly M. is protective, and instances of this occur in many branches of the animal kingdom, such as the stick caterpillars, which assume a marvellously twig-like appearance on the shrub or trees where they feed; or stingless insects, which bear a sufficiently close resemblance to wasps and bees to be avoided by birds and other insectivorous enemies. A striking example of M. is the angler fish, which dangles small fleshy lumps at the end of long filaments over its large mouth. The small fish that nibble at the 'bait' fall an easy prey. M. occurs most frequently in plants, where the object is to attract insect pollinators. 'Müllerian M.' occurs when sev. species of animals (e.g. butterflies) all mimic one another and in this way reduce the mortality involved in the 'education'

of their predators. See also COLOURS OF ANIMALS. See G. D. H. Carpenter and E. B. Ford, *Mimicry*, 1933, and H. B. Cott, *Adaptive Coloration in Animals*, 1940.

Mimir, water-giant of Norse mythology, to whom belonged the fountain of wisdom beneath the world-ash Yggdrasil. This fountain was regarded as the source of memory and wisdom, and known as M.'s Well.

Mimnermus of Colophon, Gk. poet and contemporary of Solon. *M.* in the latter half of the seventh century B.C. He is said to have invented the pentameter verse, to have brought the elegy back to its original design, the expression of personal grief. Fragments of his poems have been collected by Estienne, Brunck, Boissonade, and Diehl. See C. Marx, *Dissertation de Mimnerme*, 1831.

Mimos, in Gk. drama, a development of the Doric farce. It was an 'imitation' of a single humorous scene or personality, and its most brilliant exponents were Sophron (*M.* c. fifth century B.C.) and Herondas (c. 250 B.C.). He wrote in Doric prose, and dispensed with both chorus and plot.

MIMOSA PUDICA

A, the leaf closed after stimulation, B, the expanded leaf.

Mimosa, large genus of leguminous plants with feather-shaped leaves which in some species are sensitive to the touch, particularly *M. pudica* and *M. sensitiva*, both natives of Brazil, one bearing rose and the other purple flowers. The plant wrongly known as *M.* by florists is *Acacia*, a member of the same family, *Mimosaceae*.

Mimulus, or **Monkey Flower**, genus of fragrant annuals and perennials of the family *Scrophulariaceae*. *M. moschatius* is the common musk. *M. cardinalis*, cardinal flower, is a popular garden plant bearing blooms which vary from scarlet to pale yellow. *M. cupreus* is orange and crimson. *M. glutinosus* is a valuable shrub which bears orange or scarlet flowers almost all the year round. *M. guttatus* is a N.W. Amer. plant, now naturalised in Britain; it has showy yellow flowers and is common by the sides of streams.

Min, Egyptian deity, god of fields and highways, later identified with Amon. The oldest Egyptian statuary is the three colossi of *M.* in limestone, discovered at Coptos in 1894 by Petrie.

Min, riv. of China in the prov. of Fukien. It discharges into the sea 30 m. below Fuchou-Fu. Length 375 m.

Mina (Heb. *māneh*, weight, from *mānāh*, to divide): 1. Gk. weight, containing 100

drachmæ, or close upon 16 oz. 2. Sum of money equal to the sixtieth part of a talent. The coin was never minted, but only employed for purposes of account. The value of the Attic *M.* was £4 18. 3d., that of the Æginetan *M.* £5 14s. 7d.

Minab, or **Minau**, tn. of Persia, in the prov. of Kerman, 52 m. S.E. of Bender Abbas, in an oasis noted for dates. Pop. 10,000.

Minæan Inscriptions. The importance of the *M. I.*, numbering sev. hundreds, can be gauged when we consider that practically all we know of Minæan hist. is based upon them. The *M. I.*, as well as the other S. Arabian inscriptions, especially Sabæan, are indeed our main source for the study of the once flourishing kingdoms facing on the Red Sea and the Indian Ocean, whose splendour has been immortalised by the biblical account of Solomon and the queen of Sheba. The biblical table of nations (Gen. x. 26-29) contains in genealogical form a record of peoples of S. Arabia, but the names of the Minæans and of some other famous peoples mentioned in the inscriptions are lacking, from which it may be concluded that they did not rise to prominence till a later date. It must, however, be pointed out that the Minæans are not even mentioned in the numerous Sabæan inscriptions, which partly at least were contemporary. Scholars have tried to explain this curious omission by the fact that very few Sabæan inscriptions are historical in content. The earliest Gk. account of the Minæans (*Μινναίων* or *Μινναίων*; *Ma'in* of the inscriptions) is given by Eratosthenes (276-194 B.C.) in Strabo, xv. 4, 2; the Minæan kingdom was situated on the Red Sea; its cap. was Carna; there was an important trade in frankincense, myrrh, and other spices, and the merchants made the journey from *Elana* (in Heb., Elath, near modern Akabah) to Minna in seventy days. The Rom. Emperor Augustus entrusted Ailius Gallus with an expedition to S. Arabia (Strabo, xvi. 4. 22). The expedition brought back a considerable knowledge of the country, and Pliny the Elder's account of this region (*Historia Naturalis*, xli) is partly based on the results of this expedition and partly on the itineraries of travellers to India. Even more important is the *Periplus Maris Erythraei*, written by an anonymous contemporary of Pliny probably in A.D. 77.

Doubts as to the great importance of anc. S. Arabia, as attested by the Bible and by the vague references in classical writers, persisted not only until Carsten Niebuhr's (a Dan. scholar) expedition in 1761-69, which marked the beginning of S. Arabian exploration, but even far into the nineteenth century. In 1869 J. Halévy carried out the first exploration of the rock-cut inscriptions, and brought back nearly 700 inscriptions from this region. E. Glaser (1855-1908) and other scholars increased the number of the S. Arabian inscriptions by sev. thousands. Some twenty-seven kings are known from the Minæan inscriptions, and twenty of them are known to be related to one another. Their hist. must thus cover sev.

centuries. The Minæan kings were independent of the Sabeans and were their rivals in the trade with the neighbouring countries as well as with regard to the hegemony of parts of Hadramaut. Various inscriptions couched in Minæan were found in the dist. of the important oasis al-'Ula, in N. Arabia. It is therefore assumed that the Minæans had colonies in that region.

The relative age of the Minæan and the other S. Arabian inscriptions is a matter of dispute among scholars. Until recently the Minæan kingdom was considered as the oldest: E. Glaser placed its beginnings in the second or even the third millennium B.C.; F. Hommel dated the Minæan kingdom between 1300-1200 and 700 B.C.; D. H. Müller thought that none of the M. I. is earlier than about 800 B.C. According to the recent theory of the Canadian scholar F. V. Winnett (1939), the beginnings of the Minæan kingdom should not be dated beyond 500 B.C.; it flourished in the Hellenistic period, and its collapse occurred somewhere between 24 B.C. and A.D. 50. The M. I. are written in a variety of the S. Semitic script (see under ALPHABET).

Minaret, Eng. form of the Arabic *minaret* from *manar*, lighthouse. It is the name of the story-tell turret, which embellishes Mohammedan mosques and from the balcony of which the muezzins chant the 'azan' to summon believers to prayer.

Minas, tn. of Uruguay, cap. of the dept. of Lavalleja and 80 m. by rail from Montevideo. One of the most picturesque tns. in the country. There are quarries and mines in the neighbourhood. Pop. 30,000.

Minas de Rio Tinto, see RIO TINTO.

Minas Gerais (general mines), inland state of Brazil, N. of Rio de Janeiro, with an area of 221,894 sq. m. The surface is for the most part mountainous, with well-watered plateaus. The climate is extreme, and for the most part unhealthy. Sugar-cane, tobacco, rice, and cereals are extensively cultivated, coffee is grown, and there is great modern agric. development. As regards mineral wealth, M. G. ranks among the first of the Brazilian states. Gold, silver, copper, manganese, platinum, diamonds, rubies, and other precious stones are found, extensive iron works have been erected, and aluminium has been produced since 1945. Cotton and wool-weaving, and the making of cigarettes, are important industries. Cap. Belo Horizonte. Pop. 7,556,800.

Minatitlan, tn. of the state of Vera Cruz, Mexico, 19 m. from Puerto Mexico. It has one of the largest petroleum refineries in Mexico. Connected by rail with Puerto Mexico (Coahuacalcos), Carmen, and Vera Cruz. Its main products are coffee, cereals, timber, rice, sugar, and petroleum.

Minbu, tn. of Burma and the cap. of the dist. of Minbu, on the r. b. of the Irrawaddy. Rice, grain, millet, beans, peas, and tobacco are grown. Pop. of dist. 302,400; of tn. 6700.

Minch, or **Minsh** (stormy seas), arm of the Atlantic Ocean which separates the

N.W. mainland of Scotland from the is. of Lewis, belonging to the Hebrides. It is from 20 to 46 m. in width, and about 60 m. from N.N.E. to S.S.W., and has a rapid current. A portion of it, called the Little M., is a passage separating the is. of Skye, in the Inner Hebrides, from the middle part of the outer Hebrides, S. Harris, N. Uist, and Benbecula. This is from 14 m. to 20 m. in width.

Minchinhampton, tn. of Gloucestershire, England, 4 m. S.E. of Stroud. M. Common is a noted beauty spot of the Cotswolds. There are breweries and a woollen mill. Pop. 1500.

Mincio (anct. *Mincius*), riv. of Italy, which rises in Lake Garda. It flows S. and S.E. through Mantua, and enters the R. Po about 10 m. S.E. of Mantua. Length 120 m.

Mind, seat of consciousness, thought, volition, and feeling; soul (*q.v.*) as opposed to body. St. Thomas Aquinas defines M. (*mens*, from *mensurare*, to measure) as those faculties of the soul which in their operation dispense entirely with matter. Primitive man is not conscious of a material body and an immaterial M., but rather an acting, feeling, and thinking body—the unity of himself, or of the material conscious self; and if such phenomena as dreams and ghost-seeing may have made him conceive the possibility of a separation of himself from his earthly body, yet this conception never took the form of anything we should call immaterial. The inner self, the soul or ghost, remains with him, still only a more tenuous body. Gk. philosophers were not preoccupied with the question of M. and matter: their chief problem was the question rather of idea and matter, or the conceptual world as separated off from the world of the senses. To behold the idea, said Plato, man must get rid, so far as he can, of eyes and ears, and the whole body, and rely solely upon the pure light of the M.; for to the body are due only our aberrations and failures to see the truth. The problem of the relation of M. and body only becomes an insistent one from the time of Descartes. The basis on which Descartes builds is the undeniableness of consciousness, from which he proceeds to establish the existence of God and of the world and, through the medium of the principle of causality, assumes that he has bridged the gulf between himself and external reality. The main point about which this development centres is the sharp distinction which Descartes draws between M. and matter—the two substances into which the world of experience is divided. With him M. is a thing which thinks and 'however we may regard the adequacy of this term to express the essential character of the soul, at least it emphasises the entirely immaterial nature of consciousness, and makes it possible for exact thinking to avoid that confusion of the conscious life with the outer world, which lies at the bottom of the obscure hylozoism of earlier philosophers, and the conscious materialism of more modern times' (A. K. Rogers, *History of*

Philosophy, 1901). If M. and matter are so absolutely and totally different in their nature, how can they come together to form a single world, or react upon and affect each other, as apparently they do? In his *Traicté on l'An* Descartes undertakes to show how, assuming the body to be nothing but a machine of clay, the mere mechanical motion of parts is enough to account for what we call life; but 'clearly when the *reasonable soul* shall be in this machine, it will have its principal seat in the brain.' But Descartes was not prepared to carry out his conception to the final consequences, for that would have been to deny altogether the influence of the will, i.e. of ourselves, upon our actions. Accordingly he admits that while our more habitual and reflex actions are due to mechanism alone, yet it also is possible for the M. to interfere and alter the motions of the body. The seat of this interaction he supposed to be a part of the brain known as the pineal gland; but how this conjecture could conceivably be tested he did not explain. In short, he admitted the fact of a mutual influence between the soul and the body, but did not attempt to explain its possibility. Whence the doctrine of Occasionalism (see GEULINCX; MALEBRANCHE), which admitted the difficulty of an interaction but 'solves' it by falling back on the omnipotence of God: i.e. it is no power of the human M. that effects an alteration in the physical world, but a direct act of God.

Descartes had seen that strictly there is only a single substance: matter and M. are not conceivable in themselves, but can only be understood by reference to God; and Spinoza therefore is entirely consistent in reducing them from substances to mere attributes of the one substance, God (see SUBSTANCE). Spinoza's doctrine of substance leads the way to a different solution of the problem of the Cartesians concerning the relation of M. and body or, in other words, the problem of explaining how one substance can act upon another of a wholly different nature and how to avoid the apparent automatism which man seems to share with brutes and even inanimate things—difficulties not really obviated by Occasionalism. According to Spinoza, if the attributes of thought and extension (the only two *known* attributes of an infinite number belonging to the nature of God) are not two separate things, but only aspects of one and the same thing, they cannot interfere or interact on each other. But as they are both attributes of the same substance, that which in one light appears as a mode of extension or physical fact will be, in another light, a mode of thought or fact of consciousness; and therefore the two modes will correspond. In this way Spinoza purports to justify the claim of science to explain all physical events, including the movements of the body, in purely physical terms. Leibniz put forward a reconstruction of the idea of substance, both mental and material. Descartes had defined matter as *extended* substance, passive, inert, and able to receive motion only from outside. Leib-

niz substituted power of resistance for extension as the essential quality of matter, and from that new standpoint there was opened up the possibility of removing the absoluteness of that distinction between matter and M. upon which Descartes was so insistent. With Leibniz reality is made up of an infinite host of individual beings, or monads (see MONAD and MONADISM), representing an infinite number of different grades of development, and what we call a body is, for him, not an actual material thing, but a group of monads of the less developed sort; and every soul or higher monad has such a group of inferior associates with which it stands in a specially close connection. In this way Leibniz attempts to establish a real unity in the world.

In the nineteenth century the scientific doctrine, or law of the conservation of energy (see under ENERGY), gave a new unity to the mechanical interpretation of the universe, together with a new emphasis to the feeling, on the part of scientists, that it is impossible to make consciousness serve in any sense as an explanation of bodily acts. In the result, therefore, there has been a widespread disposition to accept the old Cartesian doctrine of the automatism of the physical body, and to regard the psychical processes as simply running alongside the physical movements, without exerting any influence upon them (the doctrine of psycho-physical parallelism). Modern science, however, is recognising increasingly the importance of the mental factor both in health and disease (see PSYCHOLOGY; PSYCHIATRY), and from the opposite approach it is significant that such concepts as 'the free-will of the atom' have been introduced into the latest theories of matter.

For centuries different schools of philosophy have sought to resolve the old and most fundamental problem of the relation between M. and matter. Some have sought to show that M. is nothing more than an emanation in the course of evolution from matter; others that matter is nothing more than a concept of the M., which alone is real. These efforts have been unsuccessful, and neither view has won general assent. The former, or materialists, seem to ignore the obvious lessons of daily experience, for we see, every moment, events which cannot be accounted for by derivations, however subtle, from physical or chemical processes. The latter, or idealists, on the other hand, 'do not explain the fact, which we must accept from astronomy, geology, and anthropology, that the stars and planets and this earth existed *before* man existed and cannot therefore be a product of human thought' (Viscount Samuel). If it is said that matter may still be an emanation of M.—the M. of God—that is merely an evasion in the manner of Occasionalism. The whole effort to resolve M. into matter or vice versa is the outcome of 'the philosophic craving for unity' (T. H. Green). But some deny the need for any such unification and offer the alternative of an essential duality in

nature. Scientists have estab. that the acceptance of sense stimuli, the transmission of their effects along the nerve fibres, and their activation of different parts of the brain, are mechanical; and whether the approach is from bio-physics or biochemistry, anatomy or pathology, the conclusion is the same—these are material activities, obeying mechanical laws. But 'no more than the physiologist is the anatomist able even to suggest how the physico-chemical phenomena associated with the passage of nervous impulses from one part of the brain to another can be translated into a mental experience' (Prof. Le Gros Clark). Aristotle, 2000 years ago, was asking how is the M. attached to the body? Mankind is still asking that question.

For bibliography see works mentioned in the articles PHILOSOPHY; PSYCHOLOGY.

Mindanao, second largest and most southerly of the Philippine Is., covering an area of 36,537 sq. m. Three or four ridges cross the is., with intermediate depressions and many rvs. and lakes. It has the volcanoes of Apo (10,312 ft.), Macaturing, and Sangul in the N., and in the S.W. stretches a long, narrow peninsula continuing in the Basilan Is. and Sulu group. The prin. bays are Butuan on the N., Davao on the S.E., Savangan, Sibuley, and Illana on the S. The chief rvs. are the Rio Grande de M., rising in the N. and flowing into Illana Bay, and navigable for 70 m. from its mouth, and the Butuan. The interior of the is. is wild, and covered for the most part with unexplored forests. The raising of cattle and horses is the chief industry; timber, gold, and petroleum are produced. Pop. 2,943,300.

In the Second World War Jap. forces landed on M. at Davao (Dec. 20, 1941) and heavy fighting ensued with Amer.-Filipino forces. Resistance, however, was overwhelmed by vastly superior forces and the is. fell in April 1942. M. remained in Jap. hands for more than three years. Amer. forces landed on May 11, 1945, and on the 13th captured the largest aerodrome and the rest of the is. See PHILIPPINE ISLANDS.

Minden, tn. in Westphalia, Germany, on the l. b. of the Weser, about 38 m. W.S.W. of Hanover by rail. There is a fine Catholic cathedral, dating from the eleventh and thirteenth centuries, which suffered severe damage in the Second World War. The manufs. are linen and woollen goods, chemicals and glassware. In 1759 a victory was gained here by the Hanoverian, Brit., and Brunswick forces over the Fr. Pop. 27,000.

Mindererus Spirit, known in the *Pharmacopæia* as *Liquor ammonii acetatis*, the dose being 2 to 6 fluid drachms, is a solution of ammonium acetate, prepared by neutralising ammonium carbonate with acetic acid. It is used as a diaphoretic in febrile diseases, as an eyewash, and also on hot flannels in the case of mumps.

Mindoro, one of the Philippine Is., lying S. of Luzon, 110 m. long, 56 m. broad, and covering an area of 3759 sq. m. The highest point of the is. is Mt. Halcón

(8868 ft.). Calapan, in the N.E., is the cap. Rice, cocoa, tobacco, hemp, cotton, etc., are raised, and various kinds of timber are exported and coal and sulphur are worked. It was captured by the Jap. forces early in 1942, and occupied until Dec. 1944. Pop. 167,700.

Mindszenty, Cardinal Joseph (b. 1892), primate of Hungary, the son of a peasant couple named Pehm. During the Second World War, while still a par. priest, he changed his name to M. after the vil. Cséhimindszent where he was born. He openly defied the Nazis and was imprisoned by the Gers. until his release by the Red Army. He was made cardinal in 1945 and his popularity soon made him a powerful force in Hungary. The advent of a Communist regime brought him into conflict with the State. He refused to compromise on Christian principles, especially in regard to education, or to leave the country, and in 1948 was arrested on charges of offences against the State, having previously warned his people against any confessions that might be extracted from him. His trial was a travesty of justice and he was sentenced to life imprisonment. See also HUNGARY.

Mine Cases, see under COAL-MINING.

Minehead, mkt. tn. and watering-place of Somerset, England, 2½ m. N.W. of Dunster and 25 m. from Taunton, on the W. Region Railway. It is a hunting centre. There is a small harbour and North Hill overlooks the tn. From here tourists can reach Exmoor. Pop. 7000.

Mineo (anc. Menæ), tn. of Sicily in the prov. of Catania, 27 m. S.W. by W. therefrom. Pop. 10,000.

Mineral Dressing, purification of ores, coal, oil, etc. See also METALLS.

Mineral Kingdom, one of the three great depts. into which nature has been divided, viz. animal, vegetable, and mineral. Members of the animal and vegetable kingdoms are characterised by the development of special organs or structures adapted for 'life' or 'growth.' The M. K., however, is concerned only with minerals which may be described as natural homogeneous substances, formed under conditions in which neither animal nor vegetable life has taken part. Minerals increase by a process of accretion, not by assimilation, as in the organic kingdoms, and are also bounded, in their most developed form, by plane surface, i.e. are crystallised.

Mineralogy. Treatises on M. by Theophrastus, Dioscorides, and Pliny, although now of little scientific value, show that the study is of great antiquity. Agricola in the sixteenth century, in his work, typifies the advance made in descriptive M.; Wallerius in 1747 issued the first systematic descriptive work, and René de Lisle in his *Crystallographie* (1772) first applied to the science the principles of crystallography. Later mineralogists, Werner, Haüy, von Kobell, and others of the present day, have brought the science to its present exactness. M. is concerned with the chemical and physical characters of minerals (which embrace crystallography), and on the geological side discusses their modes of occurrence,

whether original or secondary, and their modes of origin, whether aqueous, igneous, or organic. With regard to the chemical composition of the minerals, qualitative and quantitative analyses can be performed. Complete analysis in the wet way is necessary to determine a formula for the mineral. The complete study of a mineral involves a knowledge of many factors. The crystalline form is of paramount importance, and it is usually an easy matter to discover the particular crystal system to which a mineral belongs, and also in a majority of cases to find what crystal class is represented. The methods of doing this are essentially those involving the principles of crystallography (*q.v.*). Closely connected with this might be mentioned cleavage, or the facility of a crystal for breaking regularly along well-defined planes, which sometimes give indications of the symmetry underlying the building plan. Etch figures, caused by the action of various agencies, and surface markings are not infrequently of great assistance in finally determining the crystal class of a mineral. Thus iron pyrites is found in cubes, but striations on adjacent faces are so disposed that the full amount of cubic symmetry is impossible, in spite of the fact that the cubes are otherwise perfect. Twinning, or the conjunction of more than one individual according to a definite plan (*e.g.* in macles of diamond), is an important characteristic of some minerals. A number of purely physical characteristics are of the utmost use to the mineralogist, including hardness, elasticity, cohesion, pyroelectric effects, specific gravity, specific heat, structure, colour, tenacity, lustre, fusibility, electric and magnetic properties. It must be remembered that minerals do not by any means show perfect crystalline form. Some of them appear in crystalline conglomerations with no particular attempt at the presentation of even one or two perfect units, whilst many minerals are not even crystalline at all. A rich line of investigation for crystalline specimens in particular is that which makes use of the many optical properties of matter. Much information can be obtained by an examination of the effect of light on such specimens. Thus all cubic crystals are said to be optically isotropic, *i.e.* they behave like glass in presenting identical optical effects in all directions. For such crystals there is only one refractive index (*e.g.* with fluor spar). If the crystal belongs to either the tetragonal or the hexagonal system, there is one direction in the crystal, along the unique or optic axis (tetragonal in one case, hexagonal in the other) where the passage of light is perfectly normal, and one refractive index corresponds to it. In other directions there are two refractive indices to consider, corresponding to the splitting up of the light in two directions in the crystal. Crystals belonging to these two systems are said to be uniaxial. The double refraction is due to the presence of two plane-polarised rays whenever light passes through the crystal (except along the optic axis). The rhombic, monoclinic,

and anorthic crystals, which are often met, are biaxial, and there are three refractive indices to take into account. Again crystals can be examined in polarised light, when further information is afforded as to pleochroism and interference figures (*q.v.*). The minerals present in the most close-grained rocks can be determined upon examination of thin sections for the microscopic. (See *PETROLOGY*.) In recent years rapid advances have been made in the determination of the internal structure of the units composing the mineral crystals. It is possible to gain a very good idea of the plan underlying the building up of crystals by means of X-ray diffraction methods (*q.v.*), whereby not only the nature of the building groups can be found, but also their relative positions in the crystal. Other advances have been made, particularly in the study of radioactive properties of some minerals, and in the characteristic colour effects produced by ultra-violet light when allowed to impinge on many crystalline specimens. This effect alone often suffices to show up the presence of a particular mineral in a specimen. Still more recently the electron microscope (*q.v.*) has been usefully employed in mineral analysis or identification.

Minerals may be classified as metallic and non-metallic, but generally are classified into groups, the members of which show a certain unity chemically, physically, and crystallographically. A usual classification is to divide minerals into main groups based on chemical similarity and then to subdivide these again.

1. Native elements—including metals and non-metals, *e.g.* gold, silver, copper, sulphur, etc.

2. Halides—including fluorides (fluor spar, CaF_2), chlorides (salt, NaCl), more complicated bodies like cryolite ($3\text{NaF} \cdot \text{AlF}_6$).

3. Sulphides—galena (PbS), blende (ZnS), greenockite, cinnabar (HgS), pyrites (FeS_2), marcasite (FeS_2).

4. Oxides—cuprite (Cu_2O), cassiterite (SnO_2), corundum (Al_2O_3), rock crystal (SiO_2).

5. Sulpharsenites, etc.—tetrahedrite ($3\text{Cu}_2\text{S} \cdot \text{Sb}_2\text{S}_3$), tennantite ($3\text{Cu}_2\text{S} \cdot \text{As}_2\text{S}_3$), pyrrargyrite ($3\text{Ag}_2\text{S} \cdot \text{Sb}_2\text{S}_3$), proustite ($3\text{Ag}_2\text{S} \cdot \text{As}_2\text{S}_3$).

6. Carbonates—the calcite class, *e.g.* calcite (CaCO_3), rhombohedral. The aragonite class, rhombic.

7. The sulphates—the rhombic sulphates, *e.g.* barytes (BaSO_4). Others such as gypsum ($\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$).

8. The aluminates—spinel, MgAl_2O_4 .

9. Borates—borax ($\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$).

10. Phosphates—apatite ($\text{Ca}_5\text{F}(\text{PO}_4)_3$).

11. The tungstates and molybdates.

12. Niobates and tantalates.

13. The uranates.

14. The silicates—perhaps the most important group of all. This includes amphiboles (hornblende); pyroxenes (augite, monoclinic; enstatite, rhombic); the feldspar group (orthoclase, anorthite); mica; topaz; tourmaline; the zeolites; the garnets; and many others.

Minerals of analogous constitution often have the same crystalline form. This

isomorphism is well shown by the carbonates; calcite (CaCO_3); magnesite (MgCO_3); malachite (ZnCO_3); chalybite (FeCO_3); rhodochrosite (MnCO_3), which are similar in form, occurring in rhombohedral crystals, and show the same cleavage and optical properties. Substances having the same chemical composition may crystallise in two forms, i.e.

are so related that one is the mirror-image of the other. Many minerals, when found in good specimens, are utilised for the fashioning of gem stones. Amongst these a few may be quoted: diamond, ruby, sapphire, spinel, beryl and emerald, zircon, sphene, garnet, etc.

To the class of silicates belong the majority of rock-forming minerals, which

CRYSTALS OF SOME TYPICAL MINERALS

A. Orthoclase feldspar (monoclinic). Crystals common. Prismatic, made up of pinacoid, prism, and basal faces. Twinning very common on three laws: (1) Carlsbad, (2) Manbach, and (3) Baveno.

B. Mica (monoclinic). Usually in six-sided tabular crystals.

C. Garnet (cubic). Rhombohedra or trapezohedra, or a combination of these forms.

D. Hornblende (monoclinic). Crystals common. Prismatic, combination of clinopinacoid, prism, clinodome, and hemimorphodome.

E. Calcite (hexagonal, rhombohedral, calcite type). Three main types: (1) dog-tooth type, combination of prism and scalenohedron, (2) nail-head type, combination of prism and flat rhombohedron, and (3) prismatic crystals.

F. Quartz (hexagonal). Hexagonal prism bounded above and below by hexagonal pyramids.

they are dimorphous. Thus the carbonate of calcium occurs in the rhombohedral system as calcite and in the rhombic system as aragonite. The silicates, which form the largest class of all minerals, exhibit fully those phenomena of isomorphism, dimorphism, and polymorphism. Titanium dioxide is found in the forms rutile and anatase (which are both tetragonal, but differ in characteristic angles) and brookite, which is rhombic. A few minerals show the phenomenon of enantiomorphism, owing to peculiar structure of the particles building up the whole. Thus right- and left-handed quartz

are classified into families or groups, such as the amphiboles, pyroxenes, feldspars, micas, zeolites, etc., according to their similarity of chemical composition and crystalline properties. In their modes of occurrence minerals are essential or accessory, according as their absence would either alter the rock and make it fundamentally different or would not affect its petrographical species. Thus quartz is an essential constituent of granite, its removal altering the petrographical species to syenite. All essential minerals are original, but the converse is not true. Thus topaz and sphene may be original

constituents of granite, but are yet accessory minerals in that their absence does not alter the rock fundamentally. Accessory minerals frequently occur in cavities where they had room to crystallise out from the general mass, as, for example, the crystals which line the 'drusy' cavities in granite. Secondary minerals, the result of subsequent changes in rocks, are generally due to the chemical action of percolating waters and gases, either from above (as in the formation of kaolin) or from below (as in the formation of gneissen and tourmaline). Groups of minerals are found associated, indicating a significant paragenesis. It is observable that basic minerals tend to separate out together from rock magmas by the process of magmatic differentiation. In saline deposits calcite, gypsum, rock salt, carnallite, etc., are frequently found associated. The decomposition of minerals by the action of percolating waters frequently gives rise to pseudomorphs, i.e. the external form of a mineral is retained while being replaced by other minerals. Thus calcite organisms may become silicified, due to the interchange of silica for calcite, thus giving pseudomorphs of silica after calcite. As well as occurring in the crystalline form minerals assume a concretionary form, some being particularly prone to assume this form. Siderite is generally nodular, while calcite is often found in concretionary form. Silica often assumes this shape, as in the botryoidal form of chalcedony. Several hundred species of minerals have been described, and the number is constantly increasing by the addition of new ones. See also CLEAVAGE; CRYSTALLOGRAPHY; ISOMORPHISM; PETROLOGY. For text-books see E. S. Dana, *System of Mineralogy*, 1837 (ed. C. Palache, H. Berman, and O. Frowdell), 1944, and *Text-book of Mineralogy*, 1926; F. A. A. Lacroix, *Les Enclaves des roches volcaniques*, 1893, and other works on the M. of France and Fr. colonies; J. P. Iddings, *Rock Minerals*, 1911; A. de Lapport, *Précis de minéralogie*, 1921; A. E. Tuttle, *Crystallography*, 1924; H. A. Miers, *Mineralogy*, 1929; H. Louis, *Mineral Deposits*, 1931; W. H. Jones and D. Williams, *Minerals and Mineral Deposits*, 1948; H. H. Read, *Rutley's Elements of Mineralogy*, 1948; and Chambers' *Mineralogical Dictionary*, 1948.

Mineral Oil, see PETROLEUM.

Mineral Phosphates, mineral deposits containing phosphoric acid in combination. Some occur in coprolites as calcium phosphate. These are stony deposits found in conjunction with Jurassic rocks. They represent the fossilised excrements of animals. Other M. P. are apatite, $\text{Ca}_5(\text{CaF})(\text{PO}_4)_3$; wavellite, $2(\text{AlO}(\text{OH})(\text{PO}_4)_2 \cdot 9\text{H}_2\text{O})$; turquoise, $\text{Al}_2(\text{OH})_2\text{PO}_4 \cdot \text{H}_2\text{O}$; monazite, $(\text{Ce}, \text{La}, \text{Th})\text{PO}_4$; and pyromorphite, $\text{Pb}_4(\text{ClCl})(\text{PO}_4)_3$. The most important deposits of M. P. occur in N. Africa and Florida. See PHOSPHATES.

Mineral Rights, Taxation of, see LAND TAXES.

Mineral Waters, so called owing to the presence in them of mineral constituents derived from the rocks over which they

flow. The waters are sometimes cold, or may be warm or even boiling. As a general rule the thermal waters are more mineral than cold waters, although there is no relation between the temp. and the chemical composition. M. W. may be classified according to the prevailing mineral substance contained in them. Earthy M. W. generally contain carbonate or sulphate of calcium, and occur abundantly in limestone dists. Such are the hot springs of Bath. The waters of Baden and Contrexéville are also of this type, the waters generally being imbibed. Ferruginous or chalybeate waters contain a large proportion of ferrous carbonate, and are known by their 'inky' taste. Brine springs contain sodium chloride or salt. The brines worked as sources of salt are derived from borings into saliferous beds; such are the springs of Cheshire, Salzkammergut (Austria), and Bex (Switzerland). These springs also contain chlorides of potassium, magnesium, and calcium, sulphates of calcium and other metals, silica, phosphates, nitrates, and gases such as carbon dioxide, sulphuretted hydrogen, etc. The hot springs of volcanic dists. usually contain dissolved mineral matter, chiefly silica, with sulphates, carbonates, chlorides, etc. The oil springs of America are typical mineral springs. Medicinal springs are M. W. which are believed to have a curative effect on diseases. These medicinal waters may be (1) Alkaline, containing lime or soda and carbonic acid, as at Vichy and Saratoga. Some alkaline M. W. contain lithium carbonate (e.g. at Hill and Carlsbad). (2) Bitter waters with sulphates of magnesia and soda, as at Sedlitz and Kissingen and Epsom. These waters have aperient properties. (3) Salt, as at Wiesbaden, Cheltenham, Droitwich, and Homburg. (4) Earthy, as at Bath and Lucca. (5) Sulphurous, containing sulphur in the form of sulphides and sulphuretted hydrogen, as at Aachen, Harrogate, and Aix-les-Bains. (6) Special varieties. Thus arsenical waters are found in the S. Tyrol and in France, whilst barium-containing M. W. are represented in some places (e.g. Harrogate). The waters of these springs may be warm and acquire their medicinal reputation from their thermal qualities. In sulphurous waters the sulphuretted hydrogen and sulphurous acid are sometimes oxidised into sulphuric acid which remains free in the water. Waters containing carbon dioxide are used as table waters, e.g. Apollinaris. Helium is occasionally found in M. W., and also disintegration products from radium. It has been averred that the medicinal qualities of some of these 'cure waters' are due to the presence of radium in small quantities. Gouty and rheumatic ailments are most likely to benefit by M. W. Dyspepsia and kindred stomachic troubles benefit by the diet and general health regime, as well as by the waters. Skin diseases are best cured with sulphurous waters; anaemia improves with iron waters and purgatives, while hydrotherapeutic treatment benefits the obese and diabetics. (See also BALNEOLOGY *Balneotheapeutics*; HYDROTHERAPY).

Artificial Mineral Waters have been manufactured for many years; they were first prepared by the Rev. Joseph Priestley (q.v.). Originally attempts were made to copy exactly the composition of the natural M. W., but in recent years the tendency has been to incorporate substances of medicinal or palatable value which are not necessarily found in natural waters. In most artificial M. W. carbon dioxide is forced into the liquid under pressure.

Miner's Anemia, see ANKYLOSTOMIASIS.

Miners' Federation of Great Britain, formerly the federation of coal miners' trade unions of Great Britain. It was estab. in 1888, when its membership was 36,000. Its political power received an impetus from Fr. ideas before the First World War, though the leaders of the great coal strike of 1912 were not syndicalist. Before the First World War their programme was nationalisation and state administration of the mines, but after the First World War it was changed to a demand for national ownership coupled with democratic control by the workers. This programme of guild socialism was in fact presented before the Sankey Commission of 1919. In 1944 the unions affiliated with the M. F. of G. B. were amalgamated into the National Union of Mineworkers. See R. Page Arnot, *The Miners. A History of the Miners' Federation of Great Britain, 1888-1910, 1949*.

Minersville, coal-mining bor. of Pennsylvania, U.S.A. Pop. 8600.

Minerva, Rom. goddess, identified with the Gk. Athena. Her worship was celebrated with that of Jupiter and Juno in the temple on the Capitol. Her festival, called *quinquatus*, fell on March 19, and lasted five days. She was the goddess of wisdom and good counsel. A carved image of her, called the 'Palladium,' and supposed to have been carried from Troy by Aeneas, was preserved in the temple of Vesta. See A. Warde Fowler, *Roman Festivals*, 1908.

Mines, Military and Naval. Military mining belongs to the oldest application of engineering to the art of war. At least four centuries before the Christian era such warfare was known. Long before gunpowder was used places were captured by gaining access through mine galleries. Gunpowder was first used in mine-warfare in 1487, after which mining became more common. At the siege of Sebastopol over 5 m. of galleries were driven by the opposing armies. The First World War produced conditions similar to those of siege warfare, and special troops had to be trained for this. The Gers. were the first to use mines in Flanders in Dec. 1914. The great mining feat of the First World War was the blowing up of the Messines Ridge on June 7, 1917, by the Brit., who used 1,000,000 lb. of explosives on a 10-m. front. The effect of this attack was to put a stop to Ger. aggressive mining. With the improvements in the range and weight of field artillery and in bombing aircraft, the need for underground protection in future wars brought into being methods of mining to cope with these improvements.

In the Second World War, partly owing to its less static character, offensive mining of the classical type became virtually obsolete. The Gers. produced two models of remote-controlled tank, loaded with explosive and detonated by radio; these were intended to destroy enemy field-works, and were used against the Anzio bridge-head, without much success, in the role of the old sledge-mine. Defensive mining, on the other hand, increased in importance. In the W. desert, owing to the general absence of natural obstacles, minefields became the prin. feature of defensive positions, such as the perimeter of Tobruk and the Tel-el-Iessa-Qatara line. The mines used were of two types, anti-tank and anti-personnel. The former depended for their effect on blast alone, and required generally speaking a larger explosive charge (usually amatol) to break the tracks or damage the suspension of the tank. The Ger. *Tellermine* can be taken as the type of anti-tank mine as developed up to 1945. Anti-personnel M. can be either blast or fragmentation. Both were detonated by pressure on the cover, like the anti-tank M., or by means of a tripwire. Fragmentation M. caused damage either by the simple splintering of a metal container similar to the projectile casing of an H.E. shell, or by a shrapnel effect, as in the Ger. *S-mine*. This was in effect a short mortar buried upright in the ground with a very weak propelling charge. When detonated it projected a container into the air about the height of a man's waist; it then burst, scattering laterally a quantity of shrapnel bullets. The development of mine-detectors, which depended for their efficacy on 'echoes' rebounding from metal objects, caused a revolution in the design of land-M. These now tended more to rely on blast effect as the charge had to be housed in a non-metallic container such as wood, plastic, or even papier-mâché (*Pappmine*). Non-metallic fragmentation M. were, however, made with glass and pottery casings.

Naval M. were first used during the Amer. civil war; some were controlled from the shore by electrical means, while others were operated automatically. During the Russo-Jap. war an improved mine was used which could be arranged to take any depth of water between 50 and 70 fathoms. This was a 'non-controlled' type, and was the type generally in use throughout the First World War. The Gers. introduced a 'magnetic mine' in the Second World War, but one was washed up intact on the Brit. coast, and its secrets soon learned, with the result that all vessels were protected by a 'de-gaussing' girdle, which had the effect of de-magnetising or de-polarising the ship. Aircraft, too, were used in exploding magnetic mines by radio. Acoustic M. were also developed and used by both sides. Detonation was effected by the vibrations of a ship's propeller oscillating a contact arm within the mine. To sweep these an electrically driven hammer in a box fitted ahead of the bows was used; a Brit. type, however, was evolved which could distinguish the hammer vibrations

from those of a propeller, so proving almost impossible to sweep. M. are used in a variety of ways: minefields are laid to protect certain approaches, and estuaries of rivers, used by fleets are mined. A mine barrage consists of M. sunk at intervals of 10 ft. from just below the surface to a depth of about 90-100 ft. Such a barrage was designed in the First World War to catch capital ships on the surface and submarines down to a depth of 100 ft. Perhaps the most effective types of M. used during the First World War were the Amer. 'antennae' mine and the Vickers 'H' mine.

M. are laid from all kinds of vessels, including submarines. When the Ger. Navy in the First World War was kept confined to its own ports mine-laying by submarine was a possible counter-move, and in this the Gers. were very successful. Vessels designed for mine-laying have now been built and added to navies.

One of the most important and hazardous operations of war is that of mine-sweeping, carried out chiefly by trawlers. A single wire towed between two trawlers about 400-500 yds. apart is the usual method of sweeping. The Burney paravane came into use in 1917. It was a device which caught the mooring wire of the mine between steel teeth and cut it very quickly, thus releasing the mine to the surface, where it was exploded by fire at a safe distance from all craft. See J. Cowie, *Mines, Minelayers, and Mine-laying*.

Mines Rescue, see under RESCUE WORK. **Ming**, dynasty of China which reigned from 1368, after the Mongols were expelled, until 1644. Its founder was Chu Yuan-chang, who estab. the cap. at Peking. The M. period was notable, not so much for creative work in letters and art as for interest in and preservation of the work of the past. During this period the earliest contacts of the modern W. world with China were made by the Portuguese mariners, and by the Jesuit missionaries who followed them. The M. dynasty was eventually overthrown by the Manchurian dynasty. See further under CHINA, *Chinese Art*, on M. porcelain.

Minghetti, Marco (1818-86), It. statesman and economist, b. at Bologna. He entered the service of Pope Pius IX. after his election (1844), and was appointed member of the Consulta della Finanze. When Pius yielded to the demands of Austria, he resigned office and fought in the Sardinian Army in Lombardy. In 1859 Cavour appointed him secretary-general to the foreign office and subsequently minister of the interior (1861). After Cavour's death (1861) he succeeded to the premiership (1863), and concluded with Napoleon III. the Sept. Convention (1864). He was later minister of agriculture (1868) and Premier (1873-76). His writings include *Della economia pubblica* (1859); *La chiesa e lo Stato* (1878); and *Miei ricordi* (1885).

Miniature-painting, usually applied to portraits painted on a very small scale. M. is generally executed on ivory and is, as to composition, drawing, and finishing,

subject to the same process as any other kind of painting, but the colouring, at all events of the face, is dotted or stippled on. The term miniature (from Lat. *mino*, to colour with red ochre) was originally applied, not to a small portrait, but to the highly specialised art of illustrating MSS. Each of the 250 miniatures in illustration of the celebrated Cottonian Genesis was about 4 in. square. Later the miniature became merely a large initial letter containing on or around it a pictorial representation on a small scale of some incident or person spoken of in the text. From this fact it is possible that the term miniature when it became exclusively applied to small portrait-painting on enamel, ivory, or any other material had become erroneously associated with Lat. *mino*, to diminish. Ivory is commonly selected for M., because the peculiar hue of the better kinds presents great facilities for the imitation of human skin, and indeed ivory may be regarded as the chief elementary tint that goes to the formation of the colouring of flesh. Before being used the ivory has to be prepared by rubbing it on pumice powder and water with a glass muller, which gives it a 'ground' surface. The conversion of photographs into 'colour photographs' is, however, hardly the art of a Hans Holbein, for it consists in doing little more than add nature's colouring to what must perforce be regarded as nature's form; and most experts agree that to attempt to improve the photography by deepening shadows, or vice versa, usually detracts from the accuracy of the portraiture. Eng. artists have been conspicuous in the past as miniature painters, among the most notable being Isaac Oliver, whose miniatures are to be seen in practically every important portrait collection - he painted James I. and most of the contemporary court and nobility; Peter Oliver, his son, whose celebrated miniature, 'The Entombment of Christ,' was begun by his father and finished by the son; Richard Cosway (1740-1821), whose miniatures for snuff-box lids were famous; and Sir Wm. Ross (1791-1860), the king of Eng. miniaturists. See J. L. Probert, *History of Miniature Art*, 1887; G. C. Williamson, *Handbook of Portrait Miniatures*, 1897; J. J. Foster, *Chats on Old Miniatures*, 1908; F. R. Martin, *The Miniature Painting and Painters of Persia, India, and Turkey*, 1912; and O. E. Saunders, *English Illumination*, 1928.

Miniature Poodle, sub-variety of poodle (q.v.) which does not stand higher than 15 in. at the shoulder.

Minie, Claude Etienne (1814-79), Fr. inventor of the M. rifle, b. in Paris. He entered the army as private and rose to the rank of colonel (1853), having seen active service in Africa. The rifle bearing his name was invented in 1849.

Minieh (Minya), administrative div. of Upper Egypt, with an area of 782 sq. m., drained by the Nile. M. is the cap., situated on the Nile midway between Siut and Beni-Suef. It has manufs. of earthenware, and a gov. cotton factory. Pop. of div. 1,061,500; of tn. 70,000.

Minim, character or note in music, equal in duration to one-fourth of a breve, or two crotchets. Its name is derived from the fact that in ancient music this note was of the shortest duration (*nota minima*). A *M.* rest indicates silence for the duration of a *M.*

Minima, see MAXIMA AND MINIMA.

Minims, or **Minimi**, friars of the religious order founded by St. Francis of Paula. The rule is founded on that of St. Francis of Assisi. St. Francis of Paula founded his first convent in 1444, and the first rule was made in 1493. There are also second and third orders.

Minimum Wage. A *M. W.* is a rate of pay below which wages may not fall. It is fixed either by legislation or as a result of collective bargaining. To-day agitation to secure a *M. W.* is said to arise principally from the worker who seeks protection from parsimonious employers, but in the Middle Ages the employers sought protection from the excessive charges of craftsmen. Throughout the hist. of trade unions many disputes have a *M. W.* as their main object (see INDUSTRIAL DISPUTES), and trade boards (*q.v.*) have secured adjustments favourable to the worker. In 1524 there was municipal regulation of wages in large Eng. towns, and an Act of 1786 marked a definite step in the progress of the movement. Under the Trade Boards Act of 1918 a large number of trades were included in *M. W.* decisions, and hitherto sweated labour was placed on a more favourable footing. The United Nations, through the International Labour Organisation, has (following the League of Nations) a special dept. which considers the question, and practically in every part of the world there is a movement in favour of a *M. W.* Many employers pay more than a *M. W.*, and this fact tends to dispose of the suggestion that a *M. W.* is prone to become a maximum. In some trades the *M. W.* fluctuates according to the rise or fall in the cost of living, a sliding minimum scale being formulated.

There are in the U.S.A., where such scales are more numerous than in England, three methods of payment. The first gives an additional monthly percentage, increasing by 5 for every unit of rise according to the Bradstreet index number; the second calculates the proportionate increase of cost of living by a monthly comparison; while the third uses as a standard the average of the gov.'s index numbers for 1918. *M. W.* legislation was a part of the national recovery programme enacted under President Roosevelt in 1933. There are also *M. W.* ordinances in many Brit. colonies.

Mining. The term *M.*, in its broadest sense, is the art of extracting useful minerals from the crust of the earth. It embraces (a) prospecting, which means to search; (b) exploration, which determines the extent of mineral deposit; and (c) development or exploitation, which deals with the method of working the deposit. The prin. products mined include the metalliferous ores of gold, silver, zinc, copper, lead, tin, etc., and the non-

metalliferous minerals such as coal, peat, gypsum, limestone, kaolin, marble, granite, precious stones, mineral oil, and oil shales. These deposits occur in the earth in various ways. They may form (1) tabular or sheet-like deposits or (2) non-tabular or irregular masses. Further, a tabular deposit may occur as (a) a bed or layer, or (b) a vein or lode. Many of the most important mineral deposits occur as beds containing a valuable metal such as gold, copper, iron, or lead. The non-tabular deposits include the diamond-bearing 'nocks' of old volcanoes; large 'bosses' of granite or masses of hematite.

The prin. methods of working mineral deposits are (1) open-cast or surface workings; (2) open and underground workings combined; (3) alluvial or placer *M.*; (4) wells and boreholes; and (5) underground workings.

Open-cast *M.* is only possible where the mineral lies at or near the surface and is relatively flat. Among the minerals often worked by this method are coal, lignite, and the ores of gold, copper, iron, lead, and tin. Under favourable conditions the method is economical and reasonably safe. The first process is the removal of the overburden or rock covering the valuable bed of mineral. After this the mineral itself is excavated and removed. If the mineral is hard it will require blasting or breaking by machinery. Nowadays the overburden and mineral ore are worked by mechanical methods. Large power shovels, mounted on tractors and driven by electricity or steam, excavate and load the material into lorries, trucks, or conveyors. Dragline and bucket excavators are used for loose rock and alluvial and these can dig under water. The locomotive crane and bucket is also used for gravels and muds. The bulldozer is also used for clearing surface rubbish and for excavating earth. The removal of both overburden and mineral begins from the top downwards in successive horizontal slices, benches, or terraces, until the bottom is reached. In some cases the overburden is deposited in the trench previously occupied by the mineral. This is known as back-filling. In open-cast *M.* the ratio of overburden tonnage to mineral tonnage is a deciding factor in economical working.

A combination of open and underground workings is employed when the ore deposit is thick and pitches steeply from the surface. The actual workings are open but the ore is removed by underground levels and shafts. The so-called milling process is often adopted for working iron-ore deposits. While the overburden is being removed by shovels, etc., a shaft is sunk and cross-cuts driven into the deposit. At short distances along these levels small pits or rises are put up to the surface in the ore body. Workmen then excavate the ore around the top of each rise and shoot the ore into it. A door at the bottom of each rise enables large wagons to be loaded rapidly. These are then hoisted up the shaft. As the ore is worked each small pit takes the form of a funnel.

Alluvial or placer deposits are those filling up the floor of rivs., and consist of the sediment carried down by the water and deposited along parts where the current became sluggish. The material consists of layers of gravel, sand, and clay, and containing, perhaps, small quantities of gold, tin, or other metal. Practically all these are heavier than the sand and clay and can be separated by washing in sluices or by the more primitive methods of pan and rocker. The M. methods commonly used are dredging, sluicing, or

while the heavier and valuable metal settles to the bottom. Wood, stone, or iron riffles are fixed in the bottom of the sluices to collect the particles of metal. In the case of gold mercury is added to assist in trapping it. Washing tables are sometimes used instead of sluices. When a collection or clean-up is due the water is diverted into a parallel series of sluices, then the metal is collected and the mercury recovered and used again.

Hydraulic M. is used when the deposit is soft and lies under a loose overburden.

United States Information Service : American Embassy

OPEN-CAST MINING (IRON) IN MINNESOTA

At Mahoning mine at Hibbing, probably the world's largest iron producer. Men at the left are boring holes for dynamite charges with power-driven auger into the iron-bearing face of cliff. Such holes may also be bored vertically with different equipment. The men at the right are placing dynamite sticks in holes previously bored.

hydraulic. Dredging consists of a float or barge for supporting the plant for bringing up the alluvial from the riv. bed. Machinery plays an important part in alluvial M. Shovels, grabs, scrapers, or dragline excavators are used when the deposit is thick. These machines excavate and deliver the material to the sluices or other appliances for separating the valuable metal from waste material. Dredging operations can now be carried down to depths of 130 ft. below pond level.

Another method is to divert the course of the riv. and work the alluvial by streaming. Riv. alluvial containing valuable metal is often treated in long inclined troughs or sluices in which a stream of water is kept flowing. The lighter particles of waste sediment are carried away

In this method, known as hydraulicking, strong jets of water are projected against the bank of gravels and overburden, which are loosened and washed away by the action of the water. Beds of gold or tin-bearing gravels are often hydraulicked. The method requires an ample supply of water at a high pressure. Huge reservoirs are often constructed for storing water. When the fall of ground is not sufficient the washings of gravel are forced up to an elevated tank connected to sluices supported on trestles. Liquid, soluble, or gaseous minerals are often extracted from the ground by means of wells or boreholes. The prin. minerals obtained in this way are natural inflammable gas, petroleum, salt, and carbonic acid. When under pressure

mineral oil will rise to the surface or it may have to be sucked up by means of pumps. Natural accumulations of saline water or brine can be tapped by wells or boreholes. A borehole has been put down to a depth of over 3 m. in search of oil.

In underground M. the method of working depends on whether the deposit occurs as a bed, vein, or an irregular mass. A steep bed is generally worked on the same lines as a vein. In the case of a thin vein dipping steeply the deposit is generally reached by a vertical shaft. In hilly country an adit or horizontal tunnel may be used. From the shaft level cross-cuts are drawn to the vein, usually about 100 ft. apart, vertically. From these cross-cuts drives or levels are made along the vein in both directions. Each level is provided with facilities for loading and transporting ore. Winzes are drivages to the dip of the vein, and raises to the rise. These are driven to prove the vein, for ventilation, and for working purposes. A raise is driven to meet or 'hole through' to a winze from the level above, thus forming a connection between the two levels. The levels, winzes, and raises cut the mineral vein into a series of rectangular blocks or pillars, each of which forms a unit that is afterwards completely or partly removed by M. operations. If the deposit is thick it is divided into a number of horizontal slices, each slice being in turn divided into rectangular blocks. The miner tries to locate his drivages in the valuable portions of the vein and leaving the barren rock as buttresses or pillars to support the sides or roof.

When working away the blocks of ore there are two typical methods, i.e. working downwards or underhand stoping, or upwards known as overhand stoping. The term stoping means working away any deposit in a series of steps. In underhand stoping the miner begins in the floor of the level and excavates the ore in a series of steps. Any waste rock is deposited upon platforms of timber (stulls) and the metal is drawn up into the level by a windlass. The chief disadvantage of this method is the cost of winding up the metal and water by hand labour, although machinery is often used. A cheaper way of underhand stoping is to start from the upper end of a winze in a series of steps as before, but the ore is allowed to roll down the winze into wagons in the level below. In overhand stoping work is commenced from a raise or from two ends of a winze. When a sufficient height has been excavated timber supports (stemples, stull-pieces) are fixed from wall to wall and covered with boards on which the dirt is thrown.

In filling-up methods the mineral is removed completely and its place filled with waste rock. In top-slicing and caving the deposit is extracted from above downwards. The top slice is worked out from under the hanging wall or roof which is temporarily supported by timbers. Having worked a certain area of mineral the timbers are withdrawn and the roof

allowed to collapse or cave in. The process is repeated slice by slice right through the deposit. A form called sub-drift caving is used when working thick hard ore bodies. In this process the ore is removed in vertical slices, starting from one side to the other. Obviously the actual method of working a mineral deposit depends upon a large number of geological and other factors. See also COAL; COAL-MINING; LIGNITE.

Ministry (Church), see BENEFICE; CLERGY; ORDERS, HOLY. (Political), see CABINET; GOVERNMENT; and under names of Ms., e.g. AGRICULTURE AND FISHERIES.

Mink, name given to some species of the weasel family. The Amer. M., *Putorius vison*, is larger than a stoat, and the fur varies from yellow to dark brown in colour. It is aquatic in habit, feeding on fish and small mammals. When attacked it produces a very offensive secretion. The European M., or marsh otter (*P. lutreola*), closely resembles the other species, its white upper lip being its chief distinction. If taken young Ms. are easily tamed, and have been used as ferrets. For the manufacture of fur coats, ties, and trimmings, the most desirable types of wild M. are found in Canada and N. America. The fur varies in colour from light to dark brown. Ms. are also raised in captivity, and compare very favourably with the wild types. In recent years few varieties have been developed. They are known collectively as mutation M., of which the most valuable are silver blue, pastel, and white.

Minlaton, tn. of Fergusson co., on the Yorke Peninsula, S. Australia, 26 m. S. of Port Victoria. Pop. 2000.

Minmi, tn. of New S. Wales, Australia, in Northumberland co., 7 m. W.N.W. of Newcastle. There are coal-mines near. Pop. 1700.

Minneapolis, largest city of Minnesota, U.S.A., and co. seat of Hennepin co., is situated on both banks of the Mississippi, at the falls of St. Anthony, and covers an area of 53 sq. m. It is the great centre of the wheat and flour trade, the immense water-power of the falls of St. Anthony, increased by locks and dams, being used in flour-milling. There are extensive manufs. of machinery, carriages, furniture, boots, shoes, etc. M. contains one of the twelve federal reserve banks of the U.S.A. and is the seat of Minnesota

Univ.; owing to its picturesque neighbourhood it is a favourite holiday resort. The falls of Minnehaha, immortalised by Longfellow in his *Hiawatha*, are near the city. Pop. 493,000. See C. F. Schmidt, *Social Saga of Two Cities*, 1937.

Minnesingers (Ger. *Minnesänger*, love-singers), Ger. lyric poets who flourished about 1150 to about 1350. Their lays dealt not only with love, but also with other topics, such as country life, military adventure, and politics. The earliest M. were chiefly Austrian and Bavarian, and were often called the Swabian poets, because in their songs the Swabian dialect was prevalent. Their art spread rapidly throughout Germany, and in 1207 the famous *Sangerkrieg*, or 'Battle of the Bards' (celebrated in *Tannhäuser*), was held at the Wartburg in Thuringia, where the Landgrave Hermann I. held open court for all minstrel folk. Among the most famous M. were Friedrich von Hausen, Heinrich von Ofterdingen, Otto von Botenlaube, Heinrich von Morungen (the noble Moringer of the ballad), and above all Walter von der Vogelweide, whose songs were not only skillfully wrought but also imbued with strong national and political feeling. M. were generally of noble, sometimes princely, rank, but some were mere wandering minstrels. Rudiger von Manesse, burgo-master of Zürich (d. 1304), collected nearly 1500 *Minnelieder*. The best modern selection is by F. H. von der Hagen (4 vols., 1838). See H. Brinkmann, *Entstehungsgeschichte*, 1926, and J. Siebert, *Dichter Tannhäuser: Leben-Gedichte*, 1934.

Minnesota: 1. The 'gopher state,' a N. central state of the U.S.A., bounded on the N. by Canada, on the S. by Iowa, on the E. by Lake Superior and Wisconsin, and on the W. by N. and S. Dakota. It has a total area of 84,068 sq. m., of which 5637 sq. m. are water. Its extreme length is about 400 m., and breadth 354 m. The surface in the S.W. portion is an undulating plain, well watered with lakes and streams. In the N. central part is a highland, called the Height of Land, with an elevation of 1300 to 2000 ft. The land slopes in all directions from this central elevation, and in the N.E. corner the Mesquab hills reach an altitude of 2230 ft. Formerly the hills were entirely covered with immense forests; now the greater part of the saleable pines have been cut, though a large quantity of pines and hardwood still stands. The great rvs. of the state are the Mississippi, draining about two-thirds thereof, the Red R., forming the W., and the St. Croix, the E. boundary, and there are numerous minor streams, besides thousands of lakes, abounding in almost every kind of freshwater fish. The climate is particularly healthy, though there are wide extremes of temp. Average rainfall is 28½ in. per annum. Agriculture is the prin. industry, the long summer days being very favourable to the growth of grain, wheat, barley, oats, hay, rye, potatoes, etc., being the chief crops. M. usually ranks first in production of flax seed, and leads all states in production of creamery butter.

The chief fruits grown are apples and grapes. The iron ore deposits are the richest in the country. The prin. manufs. are flour and grain mill products, slaughtering and meat packing, butter, cheese, condensed and evaporated milk, motor vehicles, linseed oil, cake and meal, foundry and machine shop products, planing mill and timber products, paper and wood pulp, knitted goods, fur goods, agric. implements, boots and shoes, etc. The grain trade centre in Minneapolis ranks in the U.S.A. second after Chicago. Duluth is a great lake port for iron ore and cereals. It has enormous undeveloped water power, and productive fisheries of white fish and lake trout in Lake Superior.

History.—M. was explored by the Fr. as early as 1660; in 1686 Nicolas Perrot took possession of it in the name of the king of France. It was ceded to England in 1763, and became part of the U.S.A. after the revolution. It was first settled in the twenty years following the estab. of Fort Snelling (1819), was made a ter. in 1849 (with parts of N. and S. Dakota), and became a state of the Union (1858). There is a Senate of sixty-seven members and a House of Representatives of 131. Two senators and nine representatives are sent to Congress. It was largely settled in later years by Ger. and Scandinavian emigrants, descendants of the latter having often been elected to the highest posts in the state. M. has a most efficient system of public schools and the univ. of M., chartered in 1851 and opened in 1869, with an average enrolment of over 11,000 students, is among the best in the U.S.A. Other educational institutions include Hamline Univ., founded in 1854; St. John's (Rom. Catholic) Univ., at Collegeville; Carleton College, at Northfield; and St. Olaf College, also at Northfield. Pop. (1940) 2,792,300. (estimated 1944) 2,508,660, a decrease of over 10 per cent since 1940. Prin. tns.: Minneapolis, 492,370; St. Paul (the state cap.), 287,700; Duluth, 101,400; Winona, 21,000; St. Cloud, 21,000; Rochester, 20,000; Hibbing, 15,500. See W. W. Folwell, *A History of Minnesota*, 1921-26; T. C. Blegen, *Minnesota: its History and its People*, 1937; and Federal Writers' Project, *Minnesota: a State Guide*, 1938. 2. Riv. of U.S.A., rising in a series of lakes in M., and an affluent of the Mississippi. Its total length is 450 m. and it flows S.E. for about 320 m., the rest of its course being N.E.

Minnow (*Leuciscus phoxinus*), small fish common in most parts of Britain and throughout Europe. It is distinguished from other species of its genus by its small size, and by its brown and green colouring.

Minos, see under HERACLEIA.

Minosans, see under CRETE.

Minor, in Scots law a person under lawful age or majority. In Eng. law the term generally used is infant. As opposed to pupil it means a male over fourteen, or a female over twelve and under twenty-one. Ms. in this restricted sense are capable of consent, but are treated as persons of such inferior

discretion and judgment as to require legal protection. Pupillarity, on the other hand, is a state of total incapacity. A M. who has no curator (guardian) may validly enter into a contract to marry, or any other contract, lease his heritable lands, and give his movables to whom he will. But the acts of a M. who has a curator are, generally speaking, invalid without the latter's consent. Nevertheless he may, without such consent, do any act which does not affect the property under his curator's control.

Minor. In music. Intervals having two forms which are alike consonant or alike dissonant are distinguished as major (*g.r.*) and M., the M. form being always a semitone less than the corresponding major interval. M. scales or modes are so named because their main characteristic is their third being M. The M. scale is a slight adaptation for purposes of harmony of one of the later modes of the Pythagorean system of scales. M. tones are less than major by a comma.

Minorea (Sp. *Menorca*), second largest of the Balearic Is., area 293 sq. m., in the Mediterranean belonging to Spain. Cereals and fruits are produced; there are good pastures, and horse and cattle rearing is carried on. Marble, alabaster, slate, copper, lead, iron, &c. are mined. In winter the Is. is exposed to boisterous winds from the N. The cap. is Port Mahon, which has a splendid harbour. Pop. 45,700.

Minorities, Protection of. protection clauses in such treaties as the treaty of Berlin, 1878, and the treaties concluded after the First World War, have for their object the assurance of civil and political liberty to the minority subjects in newly created or newly recognised states, irrespective of the religious creeds of such subjects. By the treaty of Berlin the great powers recognised the four Balkan states *subject to a condition for the P. of M.*; but mutual suspicion and juristic difficulties prevented concerted action for the enforcement of the condition. The treaties after the First World War also contained provisions by which the new states, namely Czechoslovakia, Yugoslavia, and Poland, undertook to ensure to all their subjects equal civil and political privileges without distinction of race, language, or religion; and similar minority clauses were included in treaties entered into by Austria, Rumania, Hungary, Greece, and Turkey; while the obligations imposed by such clauses were voluntarily accepted by the Baltic states, Lithuania, Latvia, and Estonia, and also by Albania, on their admission to the League of Nations. The acceptance of such obligations implied some derogation from sovereign independence; hence to mitigate the implication and also to obviate the difficulty which rendered the analogous clauses in the Berlin Treaty nugatory, it was provided that the stipulations regarding M. 'constitute an obligation of international concern and shall be placed under the guarantee of the League.' The League referred alleged breaches to a special section of its secre-

tariat and legal difficulties to the Permanent Court of International Justice. This system was sound in so far as it might remove the excuse by an outside power of intervention on behalf of oppressed M., which is a frequent source of war; but its weakness lay in the fact that it was not calculated of itself to impress on M. the duty they owed to co-operate with majorities in the states to which they belonged or to which they had been assigned.

The growth of extreme nationalism, coupled with the development of authoritarian or totalitarian forms of gov., seriously compromised the position of M. in Europe in the decade preceding the Second World War. The M. which provided the chief source of international friction were the Jewish and Ukrainian M. in Poland, the Sudeten Gers. in Czechoslovakia, the Russian, Ger., and Polish in the Baltic states, the Ger., Magyar, and other M. in Yugoslavia, the Gers. in Alsace-Lorraine, and the Gks. in Albania. In 1938 Germany and Poland concluded an agreement which purported to give their respective M. a small measure of cultural and general rights, but this agreement meant no more on Germany's part than the beginning of a provocative claim every where in Europe, and indeed in the world, to control Ger. M. on the principle that *Folkstum* or personal nationality was the incontrovertible right of all their nationals. By that year the system of protection of M. had virtually collapsed owing to the wane of the League Council's political authority, a loss of authority which adversely affected the Jewish M. in Germany and Rumania (*See ANTI-SEMITISM*). The Ger. claim to act as the protector of all Ger. M. dwelling outside the Reich was nowhere more impudently asserted than in Czechoslovakia, where its development led directly to the absorption of the whole country in the Reich despite concessions by the Czechs which seriously encroached on the sovereign status of their state. (*See CZECHOSLOVAKIA*.) In 1939, when Russia availed herself of the European war to establish a protectorate over Estonia (as over the other Baltic States), the Ger. minority was removed to Germany.

As the result of the Second World War and subsequent political changes there has been a great change in the position of M. Some have ceased to exist as such (some Balkan states having deported their M.); some have become a dominant element; others have passed to new masters, and new ones have been created; but so far from being solved the problem they constitute is greater than ever. The rights of M. were formerly entrusted to a special section of the League of Nations. A large number of treaties and declarations relating to international engagements to prevent discrimination and protect M. were the outcome of League action in one form or another. In 1948 it was proposed that the United Nations should seek the advice of the International Court of Justice as to the rights and obligations still arising from them. In seeking to define, in a projected Bill of Human

Rights, more precisely such terms as the prevention of discrimination and the protection of M., the United Nations Commission on Human Rights realised that there were many different types of M. It is necessary to distinguish whether the groups affected by discriminatory measures are of recent or old formation and whether in the past they have constituted M. in active opposition. It is also necessary to distinguish between the true M., and those created for purposes of propaganda. A minority is not necessarily the smaller, but is simply the non-dominant group, and may or may not desire assimilation. There are sev. cases of M. who merely wish to be left alone to pursue their own mode of life; the Indians in S. Africa are a case in point. Again colonial administration has sometimes retarded native development merely from a desire not to interfere with the affairs of the native pop. The question of protection is equally complicated. Those that seem likely to need it in the near future are more in the nature of political M. than the traditional religious sects, which tend to disappear. 'Protection of minorities,' it has been ruled, 'is the protection of non-dominant groups which, while wishing in general for equality of treatment with the majority, wish for a measure of differential treatment in order to preserve basic characteristics which they possess, and which distinguish them from the majority of the pop. The characteristics meriting such protection are race, religion, and language.' To qualify for such protection a minority must owe undivided allegiance to the state in which it lives, and its members must be nationals of that state. The grievances of M. are usually brought to the public notice by means of petitions. In view of known examples of victimisation the United Nations Organisation has found it necessary to keep their secret. See Lord Birkenhead, *International Law*, 1927; League of Nations, *Protection of Linguistic, Racial, and Religious Minorities by the League of Nations*, 1927; O. Jungmann, *The Origin and Solution of the Problem of National Minorities*, 1929; A. N. Mandelstam, *La Protection internationale des minorités*, 1931; C. A. Macartney, *National States and National Minorities*, 1931; and E. Wiskemann, *Czechs and Germans*, 1938.

Minority, see REPRESENTATION.

Minos, anct. king of Crete regarding whom the legends were so contradictory, ascribing to him the most eminent virtues together with monstrous cruelty and tyranny, that poets and historians solved the difficulty by supposing two kings of the same name. One, a favourite of the gods, was after death appointed supreme judge in the realm of the shades; the other, connected with the story of the Minotaur (q.v.), was killed in Sicily, whither he had gone in pursuit of Daedalus. Anct. legends, once looked upon as entirely mythical, have been proved by Dr. Schliemann and others (see CRETE) to have their foundation in fact. There were sev. Minoan dynasties, and possibly M., like Pharaoh, was a dynastic title.

Minot, George Richards (b. 1885), Amer. physician, b. in Boston and educated at Harvard. Prof. of medicine at Harvard from 1928, before this he was physician-in-chief at the C. P. Huntington Memorial Hospital, Harvard, 1922-28; he was also director of the Thorncliffe Memorial Laboratory, and visiting physician at the Boston City Hospital from 1928. He was awarded, jointly with Wm. P. Murphy and George H. Whipple, the Nobel prize in medicine (1934) for researches on the liver treatment of pernicious anaemia. He has pub. sev. works on the blood and its disorders, and dietary deficiency.

Minot, Lawrence (c. 1300-52), Eng. poet, the author of eleven songs celebrating the triumphs of Edward III. They are written in the Northumbrian dialect, with a sprinkling of Midland forms, and were first pub. by Joseph Ritson in 1795 under the title *Poems on Interesting Events in the Reign of King Edward III*. See ed. by J. Hall (2nd ed., 1897) and T. Wright, *Political Poems and Songs*, 1859.

Minot, city of N. Dakota, U.S.A., in Ward co., 100 m. N.W. of Bismarck. It is a shipping port for coal and grain. Pop. 16,500.

Minotaur, fabulous monster, half bull and half man, said to have been confined by Minos II. in the labyrinth at Cnossus, and fed upon the flesh of young men and maidens sent as an enforced tribute from Athens. Among the ruins of Cnossus have been found Minoan wall-paintings of bull fights and figures of a similar monster.

Min River, riv. of China in the prov. of Fukien. It flows in a S.E. direction after leaving Yenping, and enters the sea about 30 m. below Foochow. It is navigable by small native boats for most of its course. Length 375 m.

Minshat, El, see MENSHEVET, EL.

Minsk: 1. Region of the Byelorussian S.S.R., with an area of 35,220 sq. m., two-thirds of which are composed of marshes, lakes, and marshy forests of stunted trees. The N. part of the region is higher and well timbered; through this area runs the railroad from Warsaw to Moscow, on which M., the cap., has an important station. The marshy dists. (called Polyesia) are extremely unhealthy, and have not much cultivation, the inhab. depending mainly on the timber trade, fishing, and hunting. The chief rivs. are the Beresina and the Pripiet, tribs. of the Dnieper. Pop. 3,071,000. 2. Cap. of the Byelorussian S.S.R., lies at the junction between important railway lines from Moscow and the Ukraine to Warsaw and Königsberg. It contains machine-building, wood-working, shoe, and leather factories. Also at M., as at Vitebsk, articles which require relatively small quantities of metal, lathes and needles, for example, are manufactured. The tn. is the seat of the White Russian State Univ., and the headquarters of the army of the W. Pop. 239,000 (1939). M. has suffered greatly from ravages wrought by various invaders. From the eleventh century it has repeatedly changed hands, and it has more recently suffered from the revolution of 1917 and the two

world wars. See further under EASTERN FRONT in SECOND WORLD WAR.

Minster (Lat. *monasterium*, Ger. *Münster*), church attached to a monastery or forming part of it. The name is now applied in England to certain large churches or cathedrals, such as those of Westminster and York.

Minster in Sheppey, vil. of Kent, England, in the Isle of Sheppey, near the N. shore. It is noted for its fossils, particularly fruit, from the London Clay. Pop. 2000.

Minster in Thanet, vil. of Kent, England, on the R. Stour, 4 m. W. of Ramsgate. It possesses an anc. par. church, which was attached to a nunnery founded in 670, and a monastic grange. Pop. 2800.

Minstrels, itinerant musicians and poets akin to the Fr. *jongleurs*, flourished from the tenth to the fourteenth centuries. It is suggested in Grove's *Dictionary of Music* that the term was derived from the Lat. *minister*, a servant, since minstrels were employed as such by the troubadours and minnesingers, many of whom were of noble birth. Their duties consisted chiefly in playing accompaniments for their masters. The original word seems to have been *minstreuer*, a term introduced in the fourteenth century to denote a higher class of musical entertainer than the older *trouwer*, and out of this word grew the word *menestrel* for a profession which had wide differences of social importance from humble wanderers to well-paid permanent servants of great nobles or of royalty (see P. Scholes, *Oxford Companion to Music*, 1911). Gradually the term came to embrace all travelling musicians and bards; they were welcomed by all classes, and by the end of the thirteenth century the chief houses had permanent staffs of M. Partly on this account and partly by reason of the spasmodic censure of the church, the itinerant class sank into disrepute, and were classed as ordinary beggars and rogues. The art received its final death-blow from the institution of play-houses and the introduction of printing. See also JONGLEURS; MINNEZINGERS; MINNESINGERS; TROUBADOURS; TROUVÈRES; MUSIC AND SONG. See J. J. Jusserand, *English Wayfaring Life in the Middle Ages* (Eng. trans.), 1891; E. K. Chambers, *Medieval Stage*, 1903; E. Duncan, *Story of Minstrelsy*, 1907; and G. Borrow, *Wild Bards*, 1924.

Mint (*Mentha*), large genus of aromatic plants (family Labiate). Spearmint (*M. viridis*) is grown for its shoots and leaves, which are utilised for culinary purposes. It can either be grown in the open garden in a moist rich soil and dried and stored for use, or it can be forced by placing the roots in boxes of rich soil in a temp. of about 60°, and keeping moist. The Brit. species are variable, and hybridise with one another rather freely. Among those with the whorls crowded into terminal spikes are round-leaved M. with sessile wrinkled leaves; horse M., which is much more agreeably scented and has ovate leaves; and the very common hairy M. Corn M. and the marsh-whorled M. have the whorls of flowers separate and occurring in the axils of leafy bracts. The cul-

mits form the genus *Nepeta*. See PEPPERMINT.

Mint. The twin pillars of the Brit. monetary system are the Bank of England and the Royal M. The bank furnishes the bank-notes and governs the quantity of bank-money; the M. mints, and supplies the metal coin. About A.D. 1000 there were some seventy Eng. Ms., but following the Norman Conquest and the improvement of communications their number dwindled. Ms. at Canterbury, Durham, and York survived into Tudor times; and during the Civil war Charles I. set up his own Ms. at Oxford and elsewhere, while Parliament continued in London to mint, and issue coin impressed with the royal head.

There were Ms. in Britain before the Romans came, and from Rom. times onwards there was always a M. on Tower Hill. In the tenth century King Athelstan made this his prin. M. In 1811, in order to enjoy the advantages of steam-power, the M. was removed from the Tower for its present home on Tower Hill. Boulton, of the engineering firm of Boulton & Watts, was responsible for the installation. The building, on the site of a Cistercian Abbey, was designed by John Johnson and erected by Sir Robert Smirke. The Tower M. had, in the seventeenth century, installed screw-presses and other machinery like that already in use in France. The new equipment enabled the M. to give coin the now familiar milled edge which was to prove so effective a handicap to the coin clipper, whose pernicious activities had for so long been a source of grave loss to the Crown. The nineteenth century saw the introduction of modern weighing machines and, in the eighties, a large building extension and the installation of modern presses. In 1850 the M. was 'nationalised,' and 1870 brought further changes; the Coinage Act of that year, besides consolidating the law regarding coinage, gave the title of Master of the M. to the chancellor of the exchequer and charge at the M. to a Deputy-Master and Comptroller. Prior to nationalisation the work had been done under contract, with severe penalties for the issue of coin that failed to meet statutory requirements. Contracting was profitable, Sir Isaac Newton, who was Master of the M. from 1699 to 1727, amassing a considerable fortune. Sir John Herschel was another famous Master.

The prin. operations of coining are: (1) melting the assayed metal into a prescribed composition and casting it into bars of suitable size for making the particular coin; (2) rolling the bars into 'billets' of coin thickness; although the rollers exert a pressure of many tons they have an accuracy of 1/10,000 in; (3) cutting blank disks of due diameter and weight for the coin required; (4) annealing the blanks in gas furnaces; (5) blanching them in dilute acid to remove the oxide acquired in the furnace; (6) impressing the (cold) blanks with the authorised designs (and milled edge) in 70-ton presses capable of stamping upwards of 100 coins a min.; (7) weighing (silver) coins on machines

which class them automatically as heavy, correct, or light. After being rung on an anvil and viewed by an overlooker the approved coins are ready for 'telling' (counting) and packing. Silver coins are sold to the Bank of England and bronze coins to the other banks. Gold coin is no longer made. Up to the First World War the right of individuals to bring gold to the M. to be coined into sovereigns was, though little exercised, a notable feature of the gold standard. The restored gold standard (1925-31) did not restore gold coin. The M. supplies coin to Brit. dominions and colonies; as well as to foreign countries. It still makes a coin dated as long ago as 1780, when Maria Theresa of Austria was empress of the Holy Rom. Empire. This is the Maria Theresa silver dollar which still enjoys a wide circulation in parts of N. Africa. Medals, seals of State, and revenue stamp plates are also made at the M. See also PYX, TRIAL OF THE.

Minto, Gilbert Elliot, first Earl of (1751-1814), was b. at Edinburgh. Educated in Paris, Edinburgh, and at Oxford, he was called to the Bar in 1767, and entered Parliament in 1776 as a Whig. He was an associate of Burke, and took part in the impeachment of Warren Hastings. In 1777 he succeeded to his father's baronetcy, and in 1797 was created Baron M.; became governor-general of India in 1806, and held that post with great ability. Returning home in 1813 he received an earldom, and at his death was buried in Westminster Abbey.

Minto, Gilbert John Elliot-Murray-Kynynmound, fourth Earl of (1847-1911), Brit. administrator, eldest son of third earl. Educated at Eton and Trinity College, Cambridge, he served three years in the Scots Guards. He was in Paris during the Commune and in Spain during the Carlist fighting. He was with the Turkish Army fighting Russia, 1877; with the Brit. in Afghanistan, 1879; and a volunteer, 1882, at Tel-el-Kebir. Military secretary to Lord Lansdowne, Canada, 1883-85, he succeeded to the earldom, 1891. Governor-general, Canada, 1898-1904. Viceroy, India, 1905-10. See also INDIA, History, and MOHLEY-MINTO REFORMS. See memoir by J. Buchan, 1924.

Minton, name given to a soft and hard paste porcelain ware first made by Thomas and Herbert M. at Stoke-on-Trent. Thomas M. began work as a potter there about 1790, at first devoting his efforts to Nankin blue-printed white ware. Later the firm, known as Campbell & Hollins from 1818 to 1868, produced della Robbia ware, Painsy ware, and beautiful encaustic tiles noted for their decoration and colouring. In 1871 the firm was joined by Carrier de Belleuse and Marc Louis Solon, and the artistic quality of M. ware was then markedly enhanced. Solon produced very fine *pâte-sur-pâte* work with very delicate effects. His pieces are mostly cups, vases, and plaques. M. majolica is noted for its bold modelling and excellent colouring. The name M. is impressed on earthenware and faience, with special marks for different ware.

Minucius, Felix Marcus, very early Christian apologist, remembered only for his *Octavius*, a dialogue between Cecilius, a pagan, and Octavius, a Christian, with Felix as arbiter. In the arguments for and against polytheism Octavius is declared victor.

Minuet (from It. *minuetto*, through Fr. *menuet*, small, dainty), graceful dance for two persons, supposed to have originated in Poitou, France. It was set to music in 3/4 time, and was performed slowly, and with much dignity. The name is also applied to the musical composition written to the time and rhythm of the dance, and is frequently introduced by Handel and Bach into suites. Beethoven developed it into the scherzo.

Minuscules, small letters developed from aet. uncial and cursive alphabets. Writing being used for business as well as literary purposes, two styles became distinct, the rapid cursive and the formal book-hand. In the ninth century the M., which had been gradually evolved during previous ages, practically superseded the uncial lettering for general use, though in scholastic and religious books much of the latter was retained. As time went on both Lat. and Gk. M. became still smaller and more flowing. Our present Eng. handwriting is mainly founded on the It. fifteenth-century style.

Minusinsk, tn. in the Krasnoyarsk Ter., R.S.F.S.R., near the Yenisei, 328 m. S. of Krasnoyarsk. The area is rich in coal; leather and tallow are produced. Pop. 10,500.

Minute (Lat. *minutus*, small): 1. Of time, being the sixtieth part of an hour. 2. Of an arc, being the sixtieth part of a degree in the measurement of a circle.

Minute Men was a popular title for the soldiers of the militia during the Amer. War of Independence, and refers to their hasty preparation for war (at a minute's notice). The first contest of the war was between M. M. and Brit. troops, at Lexington.

Minya, prov. of Upper Egypt, takes its name from a tn. 110 m. S. of Cairo, on the l. b. of the Nile. Area 782 sq. m. Pop. 1,061,400 (of tn. 51,000).

Minyæ were a Gk. race of heroes, celebrated in the aet. epics. Their founder was Minyas, the king of Boeotia, and their headquarters was Orchomenos, though Iolchos in Thessaly was a famous settlement. Their descendants, the Argonauts, who founded a colony in Lemnos, often called themselves M.

Miocene (Gk., less recent), geological name for the middle div. of the Tertiary strata lying between the Oligocene and the Pliocene, and the geological period it represents. It contains fossils of living species in intermediate ratio (25 per cent., 1 ycll). There are no large deposits of this age in the Brit. Isles, but small beds are found at Bovey Tracey and in the ls. of Mull. Elsewhere they are widely distributed over the world. They consist of sandstones, gravels, clays, limestone, marls, shales, and sands; and contain marine clays, mastodons, rhino-

ceroses, lions, apes, deinotheria, three-toed horses, camels, beavers, tapirs, etc., conifers, beeches, oaks, maples, walnuts, poplars, magnolias, etc. The Oeningen beds in Switzerland have contributed largely to our knowledge. In 1948, on Rusinga Is. in Lake Victoria, part of the fossilised skull of a M. ape was found, the study of which suggested that apes developed from the monkey group. Lamb bones found in the same region point to the fact that apes of the early M. had not an arboreal life. The period of formation, the *M. epoch*, was that of the final uplifting of

Associated Press

MIOCENE APE

Remains of the skull and jaw of an ape discovered in 1948 on Rusinga Island in Lake Victoria

the present great mt. chains. In Europe the formation is estuarine and lacustrine mainly, and indicates a configuration of shallow seas and large inlets very different from the present. The climate resembled that of India and Australia. Palms, magnolias, acacias, figs, evergreen oaks, were among the typical vegetation; insect life was larger and more varied. During this epoch Britain remained land subject to denudation, and the evidence of the removal of hundreds of feet of solid rock by this slow process gives some idea of the duration of the period. There are signs of a gradual cooling of the climate towards present conditions, but the more tropical times are represented by beds of coal in Greenland and Spitzbergen. In Britain the chalk hills remain as evidences of the earth movements of the time.

Miquelon, Great and Little, is, off the S. coast of Newfoundland, forming with the adjacent is. of St. Pierre a Fr. colony, and comprising a total area of 83 sq. m. G. and L. M. are connected by a narrow isthmus. The inhab. are almost entirely

occupied with the fisheries, the is. being barren and rocky and unfit for agriculture. Silver-fox breeding has been commenced. Cap. St. Pierre. Pop. 550.

Mir, name of a vil. community of old Russia. There were three classes of local elected bodies in Russia which had administrative functions, the *mir* and the *volost*, the *ciustros*, and the municipal *dumas*. The M. consisted exclusively of all the peasant householders of the vil. These elected a *starosta*, or head man, and a collector of taxes. A number of Ms. united formed a *volost*, or canton, with an assembly of delegates elected from the different Ms. The institution of the M. was of very great antiquity, but the patrimonial jurisdiction of the landowners was not withdrawn from it until the emancipation of the serfs in 1861.

Mira, see Omicron Ceti.

Mirabeau, Jean Baptiste (1675-1760), Fr. *libérateur*, b. in Paris. He first became a soldier, and later acted as tutor to the daughters of the duchess of Orleans. In 1734 he pub. a trans. of Tasso's *Jerusalem Delivered*, and two years later was elected a member of the Fr. Academy. He also wrote *Alphabet de la fée gracieuse*, trans. the *Orlando Furioso*, and pub. sev. philosophical and other treatises.

Mirabeau, André Boniface Riquetti, Vicomte de (1754-92), brother of the great statesman, joined the Fr. Army, where he distinguished himself mostly by insolence and extravagance. Taking part in the expedition which assisted the Amer. revolution in 1781, in 1789 he became a deputy to the States-General, where as a reactionary he bitterly opposed his brother. His corpulence and drunken habits won him the name of Mirabeau Tonneau (the Barrel). He emigrated to Germany in 1790.

Mirabeau, Honoré Gabriel, Comte de Riquetti (1749-91), one of the greatest figures of the Fr. Revolution, b. at Bignon, was a son of Victor, marquis de M. (q.v.). After a stormy youth, during which his father sev. times procured *lettres de cachet* for his imprisonment, he capped all former offences by running away with Mme de Monnier, he himself being already married. After a brief sojourn in Switzerland the two went to Holland, where M. earned a living by literary work. Having replied to his father's denunciations by some violent libels, he was arrested in defiance of international law and imprisoned at Vincennes for over three years. Here he wrote his famous *Lettres de cachet* in the blank leaves of books allowed him, and concealed the MS. in the lining of his clothes. Coming for a time to England, he subsequently obtained leave to return to Paris. In 1786 he was sent on a secret mission to Berlin. Soon after his return he wrote an essay on *La Monarchie prussienne*, and later pub. a full account of his mission, with all his private reports. This and other indiscretions led to his exile from Paris. But when the States-General were convened (1789), being rejected as a representative by the Provençal noblesse, he appealed to the people, and became deputy

for Aix. Then came the great period of his career. In spite of his wild character, he had strong practical views in politics, despising empty chatter, and deprecating extreme measures on either side. His power with the people was immense, yet he sought to use it not to overthrow but to remodel the monarchy somewhat on Eng. lines. Had he lived a few years longer, and had the court followed his advice, the Reign of Terror might have been averted.

In the many speeches which he delivered in the Constituent Assembly he revealed a remarkable power of improvisation, and an impetuousness of address and imagery exactly calculated to carry away his audience. He has been accused of bombast and of theatrical and commonplace metaphors but, even if he was guilty of such faults, correctness of form and literary polish would have been feeble substitutes for the style of oratory which was so effective in his day. A collection of his (*Œuvres oratoires*) was pub. in 1819. Besides his speeches there are many letters, among them *Lettres originales écrites du donjon de Vincennes (Lettres de cachet)* and the *Lettre de Mirabeau à un de ses amis en Allemagne*. See T. Carlyle, *French Revolution*, 1839; H. Reynald, *Mirabeau et la Constituante*, 1873; C. W. Warwick, *Mirabeau and the French Revolution*, 1903; and Antonina Vallentin, *Mirabeau: Voice of the Revolution*, 1949; also lives by L. Barthou (Eng. trans., 1913); H. de Jouvencel, 1930; and P. Nezelof, 1937.

Mirabeau, Victor Riquetti, Marquis de (1715-89), Fr. political economist, b. at Pertuis in Provence. As an author his *Théorie de l'impôt* brought him a term of imprisonment, and afterwards seclusion on his estate, but continuing to write he founded a school of political economy. His health and fortune were finally ruined by constant family quarrels and lawsuits. He was the father of the famous Honoré.

Mirabella: 1. Tn. of Italy in the prov. of Avellino, 13 m. S.E. by Benevento. Pop. 8000. 2. Tn. of Sicily in the prov. of Catania, 6 m. N.W. of Caltagirone. Pop. 5500.

Mirabilis, genus of perennial plants (family Nictaginaceae). *M. jalapa* is the Marvel of Peru, a fragrant garden plant with flowers of various colours.

Miracle Play, term used in England for the plays dealing with scriptural and sacred subjects from about the thirteenth century to the end of the sixteenth century. In France the term miracle was restricted to dramas dealing with the lives of the saints, while the scriptural plays were known as 'mysteries.' The origin of the M. P. must be sought in the dramatic representations of the great events of the Christian year rendered liturgically in churches, especially at Christmas and Easter. The earliest example we have of such a liturgical drama dates from the year 967 (see J. M. Manly, *Specimens of pre-Shakespearean Drama*, 1900-3), and from this time the development is steady, blending both Norman and

Saxon lines of growth. The stagecraft of the church dialogues became more and more elaborate, until they had to pass into the open. Here the clerical element diminished, and lay actors took the place of priests and cantors. During the eleventh and twelfth centuries the M. P. passed into the monastery schools for teaching purposes. Originally all these plays were in Lat., and were dedicated to St. Nicholas, the patron of youth, but in the twelfth century they were interspersed with Fr. The institution of the festival of Corpus Christi in 1264, but not commonly observed in England till a good many years later, gave a great impulse to pageantry, and the great 'cycles' of plays are nearly all connected with this feast. The 'cycle' consisted of a series of plays dealing with events from the Creation onwards, and each play was acted on a 'pageant' or stage of two storerooms on wheels, which was dragged from place to place for the repetition of the drama. There are four main cycles extant, all showing traces of continuous reaction. The York cycle (fifteenth-century MS.) consists of forty-nine plays, the Wakefield or Townley plays (MS. 1450) are thirty-two in number, the Chester cycle (MS. 1175) has twenty-five, to be acted not at Corpus Christi but at Whitsuntide. The Coventry cycle (with forty-two plays) dates from the latter half of the fifteenth century. The plays were acted by the city companies, each company or guild being responsible for the production and acting of one play. The miracles are marked by considerable dramatic skill, and show in a somewhat undeveloped form the treatment of all the main dramatic motives. A particular feature is their realism. See K. L. Bates, *English Religious Drama*, 1823; A. W. Pollard, *English Miracle Plays*, etc., 1895; E. K. Chambers, *The Medieval Stage*, 1903; E. H. Moore, *English Miracle Plays*, 1907; and in Everyman's Library series, *Everyman, with other Interludes*, 1909.

Miracles. According to the definition of St. Thomas Aquinas, 'a miracle is a happening outside the order of all created nature; therefore God alone can work miracles by His own proper power, since He alone is not a creature.' In the early and Middle Ages M. were considered as the most cogent proof possible of the truth of Christianity. Now, however, what was once one of the chief reasons for giving assent to the Christian faith has become one of the chief obstacles to its acceptance, and there has come into being a school of apologists, including some of the foremost churchmen of the time, who have done their best entirely to remove the element of mystery and the miraculous. The generality of critics, however, are not disposed longer to continue the task of removing the supernatural from the natural in the N.T. narratives. Spinoza was the first in modern times to make a vigorous attack on the credibility of M. His statement on the subject is that 'nothing happens in nature which is in contradiction with its universal laws,' and thence, since M. are a violation of the

laws of nature, he argues that they cannot happen. The logical force of this argument is vitiated by the initial pre-supposition that 'nature' does not include non-material concepts, which is really the point at issue. The Eng. doctrs. also denied the possibility of M. Hume accepts the argument from experience, and turns it against Christians by appealing to the 'firm and unalterable experience' which has estab. the laws of nature, and goes on: 'The consequence is that no testimony is sufficient to establish a miracle, unless the testimony be of such a kind that its falsehood would be more miraculous than the fact which it endeavours to establish. Or, briefly, it is contrary to experience that a miracle should be true, but not contrary to experience that testimony should be false.' Here again the point in question is taken for granted. As Paley pointed out - if by experience Hume means *all* experience, he begs the question; if he means general experience, he has merely proved what was never disputed, viz. that M. are uncommon. Strauss attempted to explain the N.T. M. as myths growing up in the minds of the disciples in accordance with their preconceived notions of the Messiah. The modern attitude to M. can briefly be summed up in the words of Matthew Arnold, 'miracles do not happen.' On the other hand, the position of a present-day apologist is well given in the words of Dr. Figgis (*Gospel and Human Needs*, ed. 1912, p. 12): 'Miracles are but the expression of God's freedom; the truth that He is above and not merely within the order of nature. Disbelief in them really leads on to pantheism.' The literature of the subject is enormous. See especially writings of Hume, Pascal, Butler, Paley, Trench, Mill, M. Arnold, Westcott, Bruce, Newman, and Illingworth. J. M. Thompson, *Miracles in the New Testament*, 1911; E. O. Davies, *The Miracles of Jesus*, 1913; A. Richardson, *Miracle Stories of the Bible*, 1913; and C. S. Lewis, *Miracles*, 1947.

Miraflores: 1. Tn. of Columbia, S. America, in the state of Boyaca. Pop. 14,000. 2. Seaside resort of Peru in the prov. of, and 4 m. S. of, Lima, of which is it one of the environs. It is becoming an important shopping centre. A motor road runs from Lima through M., Barranco, and Chorrillos to La Herradura, also a bathing resort.

Mirage, name given to various phenomena due to reflection and refraction of light in unusual states of the atmosphere; commonest and most striking in regions of calm subjected to great heat or cold, e.g. hot and cold deserts and polar regions. Generally speaking, two strata of different densities lying steadily one over the other give rise to two images, one direct and usual, the other an inverted reflection from the surface of contact. Thus clouds may be reflected from a thin stratum of denser air on the sand of deserts at sunset and after, giving the appearance of water; the convectional currents of air give a shimmering or wavy appearance, thus adding to the illusion. At sea the

layer of air on the water may in calm weather remain warmer for some height, giving an inverted reflection from above of ships below the horizon. In the early morning the latter effect occurs over deserts, the former at sea. It is quite possible to find Mts. over roads in England by placing the eye a few inches above the ground, e.g. in calm, hot weather, when the air is quivering. *Looming* is a form of M.; the object appears nearer and larger; it is well known at sea, when objects below the horizon are yet visible. Special instances are the 'Spectre of the Brocken' and the 'Fata Morgana' (q.v.). Owing to the rays of light coming over great distances, and the variation in density being gradual, they are curved, and the image will be seen along the tangent of the ray at the eye; this accounts for the displacement.

Miraj, state of Bombay Prov., India. Area 564 sq. m. Pop. 125,000. M., the cap., stands near the Kistna, 70 m. W. of Bijapur. Pop. 26,100.

Miramichi, riv. of Canada, rising in New Brunswick. Its course of 220 m. is generally N.E. It discharges into Miramichi Bay in the gulf of St. Lawrence. The port of (Chatham (q.v.) stands at its mouth, and in the upper part of the riv. much salmon and trout fishing is carried on.

Miranda, or **Sã de Miranda**, Francisco de (c. 1495 c. 1558), one of the earliest Portuguese poets, studied law at Lisbon. He wrote in the 'It. style' (using the metres of Dante and Petrarch), but mainly in Castilian. His poetical epistles and eclogues are his most noted works. He also wrote lyrics, sonnets, and comedies. See his *Collected Works* (ed. 1595), also M. Vasconcellos' ed. with biography, 1885.

Miranda, Francisco Antonio Gabriel (c. 1752 1816), Venezuelan patriot and general, descendant of the dukes of Miranda who, through their connections with the Caraccioli, came from the same line as St. Thomas Aquinas. He accompanied Bernardo Gálvez, Sp. governor of Louisiana, in the expedition against the Eng. in Pensacola. In 1787 he visited the court of the Empress Catherine of Russia, who invited him to remain as an officer of the Russian Army. His real ardour, however, was to become the liberator of Sp. America and he departed from Russia to seek an audience with Wm. Pitt, the Younger, who was not impressed with the practicability of his dreams of Sp.-Amer. independence. When the Fr. Revolution broke out he became a general in the Fr. army and, under Dumouriez, fought in the campaign against the Prussians which culminated in the battle of Valmy (1792). He besieged and captured Antwerp and, in the absence of Dumouriez, acted as commander-in-chief of the Fr. armies. At Neerwinden he was forced to retire, was arrested and tried before a revolutionary tribunal in Paris but was absolved and, later, fled to England where he again visited Pitt and resumed his activities on behalf of the independence of Lat.-America. He estab. secret societies, such

as the Gran Reunion Americana, with which the Lautaro Society was later (1812) affiliated and continued to have much influence with European statesmen. In 1805 he fitted out a ship, the *Leander*, and in 1806 set sail for the Caribbean in the hope of founding an independent state to be called Colombia. But he failed to gain expected support from Jefferson who, having just purchased the Louisiana Terr., had no mind to quarrel with Spain. When the *Leander* and its crew of filibusters reached Venezuela M. found the coastguards ready with cannon to resist him and he was obliged to sail away, baffled in his dream of throwing off the Sp. yoke from his native land. He returned to London, this time to discuss his plan of warring against Spain in America with Sir Arthur Wellesley, but to no purpose. He also discussed the problems of America with Bentham and received the delegates of Caracas, who had come to England to seek support. Among them was Simón Bolívar, then twenty-seven years old. M. later sailed to Caracas, where he was met by Bolívar, but the nation did not put its destiny unreservedly into his hands. When war broke out in Venezuela, however, M. marched at the head of the troops, a motley ill-trained mob of patriots, who met with decisive defeat at Puerto Cabello. M. being forced to sign a treaty yielding the country to the Sp. royalists (1812). Bolívar turned against him and advised handing him over to the victorious Spaniards, and M. spent six months in the prison of La Guayra and was finally taken to Cádiz, where he d. after more than three years' incarceration in the Caraca prison. Even if he failed in his life's purpose, he was the intellectual father of the revolution which was eventually undertaken successfully by Bolívar. See J. Biggs, *History of Miranda's Attempt to effect a Revolution in S. America*, 1809; C. Dumouriez, *Memoires*, 1822; R. Becerra, *Vida de Don Francisco Miranda*, 1896; W. S. Robertson, *Francisco de Miranda and the Revolution: King of Spanish America*, 1908, and *The Life of Miranda*, 1930; *Archivo del General Miranda* (Caracas) (15 vols.), 1929-38; and J. N. Sardi, *Aventura y tragedia de Don Francisco Miranda*, 1935.

Miranda, maritime state of N. Venezuela. Coffee is extensively grown. Cap. Los Teques. Area 3868 sq. m. Pop. 227,600.

Mirandola, Giovanni Pico, Count Della, see PICO DELLA MIRANDOLA.

Mirbeau, Octave Henri Marie (1850-1917), Fr. novelist and playwright, b. at Tréviers (Calvados). He was first a journalist; his first novel was *Jean Marcein* (1885). Other tales: *Le Calvaire* (1886); *La Famille Carmelles* (1888); *L'Abbé Jules* (1888); *Les Vingt-et-un Jours d'un neurasthénique* (1901); *Dans l'Antichambre* (1905); *Dingo* (1912). Plays, *Les Mauvais Bergers* (depicting the struggle between capital and labour, 1897); *Les Affaires sont les affaires* (a vigorous social play and one of the best plays of its time, 1903). See life by M. Renon, 1924.

Mireea (1386-1418), voivode or prince of Wallachia, styled himself 'count' of Severin, despot of the Dobruja and lord of Silistria, and was also master of Siatova and Vidin. As an ally of Sigismund of Hungary, his former rival, he was defeated in 1396 by the Turkish sultan, Bayazid I., but the following year he gained a victory over Bayazid at Craiova. In 1416 he lost Silistria to Sultan Mohammed I., and had to acknowledge Ottoman dominion.

Mirecourt, tn. in the dept. of Vosges, France, on the R. Madon, 27 m. S. of Nancy. Pop. 5200.

Mirfield, par. and tn. of W. Riding of Yorkshire, England, on the R. Calder, 4½ m. N.E. of Huddersfield. There are collieries and malting works near, and the chief manufs. are blankets, carpets, and cloth. There is an Anglican Theological College at M., its full name being the Community of the Resurrection. It was founded in 1892 at Pusey House by Charles Gore and moved eventually to M. in 1898. There are branches in Johannesburg and London. Pop. 13,000.

Miri, seaport of Sarawak, Brit. N. Borneo, 30 m. N.W. of Cludetown. The area is an important oilfield, and there are exports of petroleum.

Miro, Joan (b. 1899), Sp. painter, b. at Montroig, associated in Paris with Salvador Dalí as a leader in the school of surrealist painting.

Miropole, or **Miropolye**, tn. in the Kursk Region of the R.S.F.S.R., on the Psol R., 82 m. N.N.W. of Kharkoff, and 83 m. S.W. of Kursk, probably founded in the seventeenth century as a stronghold against Tartar incursions. It is an agric. centre and there are boot factories. Pop. 11,000.

Mirror (Fr. *miroir*) optical instrument of glass or metal, having a polished surface to reflect images. The use of Ms. is very ancient; they were known in the Early Iron Age, being then mostly thin plates of polished metal. Under the Caesars silver Ms. were common. The back of the M. was often handsomely adorned with chasing or repoussé. In the Middle Ages steel, silver, and glass Ms. were much used, the glass being backed with metal, especially lead. Modern silvered Ms. were first known as *Venetian*, having been first made on a large scale at Murano. Their manuf. was first introduced into England in the seventeenth century.

Mirs Bay, opening on the S. coast of China, E. of Hong Kong. Length 140 m., breadth 60 m. Great Britain leased the S. shore in 1898 for ninety-nine years.

Mir Turab Ali, see SALAR JUNG, SIR.

Mirza, contraction of the Persian 'Emir Zudah' (son of the prince), the usual title for scholars and officials, when it precedes the surname, and 'prince' when it follows it.

Mirzapur, tn. and dist. of the United Provs., India, on the r. b. of the Ganges, 30 m. from Benares. The dist. is traversed from E. to W. by the Vinudhya and Kaimur ranges which are connected by a jagged central plateau. The tn. is noted for its carpets and rugs. Until

comparatively recent years it was the chief mart in Upper India for cotton and grain, but its commercial importance declined owing to the estab. of railway communication with Bombay via Jubbalpore, and the development of Cawnpore as a mercantile centre. Other manufs. are shellac and metallic wares. Pop. 900,000 (tn. 70,900).

Misamis, prov. of the N. coast of Mindanao, Philippine Is., including Camiguin Is. Its irregular coastline contains Iligan Bay. There is much mt. and forest land. Rice, abaca, cacao, sugar, and cotton are produced. The tn. of the same name in N.W. Mindanao is 55 m. from Cagayan. Gold, sulphur, copper, and coal are found near. Pop. of prov. 180,000 (tn., 7000).

Misappropriation. The M. of property by any person who has been entrusted (solely or jointly with another) with or has received such property either for safe custody, or that he may apply, pay, or deliver the property or its proceeds for a particular purpose, or to a particular person, is a misdemeanour, punishable with penal servitude up to seven years (Larceny Act, 1901, replacing analogous sections in the Act of 1861). Bankers, merchants, brokers, and others guilty of M. are affected by this Act, while M. by trustees on an express trust created by deed or will, or by mortgages, or by factors, or agents generally, is similarly punishable under the Larceny Act of 1861 (see also LARCENY). It is difficult to see on what principle M. by the above kinds of bailees should be only a misdemeanour, while embezzlement by clerks or servants, i.e. persons usually much lower in the social scale, should be a felony, punishable with penal servitude up to fourteen years. See EMBEZZLEMENT.

Miscarriage, see ABORTION.

Misdemeanour, see CRIMINAL LAW.

Miseno Cape (unct. Misenum Promontory), promontory of S. Italy, at the N.W. extremity of the gulf of Naples, 9 m. from Naples. The ruins of the unct. Rom. port are near by. Under Augustus it was an important naval station. The Saracens destroyed the old tn. in A.D. 890.

Miserere: 1. Name under which Psalm li. (Vulg. li) is commonly known. Four psalms commence with the words *M. mei Deus*, but the pre-eminence of this psalm has led to the name being appropriated to it. M. is the greatest of the penitential psalms, and tradition states that it was called forth by the prophet Nathan's announcement to David of his sin. 2. Inaccurate form often found for *miserere*, a word derived from Lat. *miserere*, pity, and so applied to various relaxations of strict monastic rule. It is best known as the designation of a small ledge under the seats in the choir, which, when the seat was turned up, formed a projection on which the monk could rest when standing.

Misericordia, or **Brethren of Mercy**, most famous of the confraternities formed in Florence in 1240 for the seemly burial of the destitute. During the plague of 1348-49 they performed valuable work.

The members, when on duty, wear a dress covering all but the eyes.

Mishawaka, tn. of Indiana, U.S.A., in St. Joseph co., on St. Joseph R., 72 m. S.E. of Chicago, with manufs. of agric. implements, machinery, and paper pulp. Pop. 28,200.

Mishna, traditional commentary on the written Heb. law, handed down orally, until about the beginning of the third century A.D., when it was finally committed to writing. The M. consists chiefly of the discussions of rabbis between the year 70 and the time of writing. After 200 still further discussions on the law and the M. went on in the schools both of Babylon and of Palestine. These further discussions constitute the Gemara, which, with the M., forms the Talmud. See JEW.

Misiones, ter. in the N.E. Argentine Republic, with the Paraná R. separating it from Paraguay (N.W.), and the Uruguay R. separating it from Brazil (S.E.). There are tracts of forest and pasture land. Timber, *yerba mate* (Paraguay tea), wheat, tobacco, and sugar are produced, and cattle are raised. Posadas (pop. 20,000) is the chief tn. Area about 11,750 sq. m. Pop. 244,100.

Misiones, Las, name of a dept. in Paraguay; cap. San Juan Bautista. Pop. 46,700.

Miskolcz, tn. of Hungary in the prov. of Borsod in the valley of the Száva, 24 m. N.E. of Erlau. The manufs. include boots and shoes, porcelain, leather, snuff, etc., and in the vicinity are stone quarries and iron mines. There are large gov. iron and steel works at Dios-gyor 5 m. to the W. Pop. 73,500.

Mispickel, obsolete name for the mineral **Arsenopyrite**, from which arsenic is prepared by roasting, air being excluded; it is crystalline, orthorhombic, steel-grey, and hard; chemically, FeSAs. M. is chiefly obtained commercially from U.S.A. and Germany.

Misprision (literally, neglect or contempt) means concealment of a crime in the sense of keeping one's knowledge of its commission to oneself without participation in it either as prin. or accessory. M. of treason was formerly, but is not now, regarded as equivalent to the full offence. See CRIMINAL LAW.

Misrepresentation. In the law of contract a M. or false statement of some matter relating to the contract is ground for upsetting the contract if the M. was made before or at the time of entering into the contract. M. may be (i.) fraudulent, or (ii.) innocent. A M. to be fraudulent must amount to a misstatement of a material fact and not a mere expression of opinion; the person making it must have known it to be false, or have made it either without believing it to be true, or recklessly, without caring whether it were true or false; it must have been intended by the maker that the other party should act upon it; it must actually have deceived the other party; and finally, the other must actually have suffered damage by it. If all these conditions are fulfilled the defrauded party may either (1) sue

for rescission of the contract with or without claiming damages, or (2) adopt the contract and sue for damages, or (3) resist any action to enforce it and counter-claim for a declaration that the contract is void. If he elects to sue for rescission, he must do so within a reasonable time, so as not to involve loss to innocent third parties. The old common law gave no remedy for innocent M., but now all courts, conformably with equitable doctrines, will rescind a contract at the instance of a party who has been induced to enter into it by reason of a false though innocently made statement in a material particular; but the injured party is not entitled to claim damages, except: (1) For false statements in a company prospectus. But it is a good defence that the maker had good ground for believing his statement to be true. (2) Against an agent who holds himself out as being authorised to contract for another when he is not.

Misrule, Abbot or Lord of, see LORD OF MISRULE; REVELS, MASTER OF THE.

Missal, book containing all the prayers and official ritual required for the due celebration of mass throughout the year. The text of the mass consists of an invariable framework known as the Ordinarium, and a large number of prayers, etc., which change throughout the year. Formerly these variable portions were found in separate vols., such as the *Antiphonarium*, *Graduale*, *Epistolarium*, etc. The process of combining them into one vol. became general before A.D. 1000, probably arising about 900. At the Reformation the Anglican Prayer Book, 1549, superseded the old Sarum M. The Rom. M. revised in 1884, is universal in W. Catholicism, save for the local Ambrosian, Mozarabic, and various monastic rites.

Missel Thrush, Mistletoe Thrush, or Holm Thrush (*Turdus viscivorus*), common bird throughout England and most European countries. The male is 11 in. long, and is the largest of Brit. thrushes and also of Brit. song-birds. Its colour is greyer than the song-thrush, and in flight a white tail feather is shown upon each thigh. The song is not so varied and melodious as that of the song-thrush. The eggs are bluish-white, spotted with purplish-brown. The food consists principally of berries (particularly those of the mistletoe) and insects. It is sometimes called the storm cock.

Missenden, Great, vil. of Buckinghamshire, England, 29 m. from London, and 9 m. from Aylesbury on the E. Region and Metropolitan railways. It is a popular residential place for Londoners, near it is the vil. of Little M.

Missi Dominici, the supreme court of the Frankish kings. The system of M. D. is believed to have been introduced by Charlemagne who appointed them to act as a court of appeal from the courts of the Crown vassals. Later, however, the great vassals sought to avoid recourse to the royal courts by setting up their own order as a parliament of the nation or, in effect, a house of peers. The M. D. were also sent round the kingdom in Charlemagne's

time in order to report on the state of the various dists., to investigate grievances, and to proclaim the emperor's decrees.

Missing Link, see DARWINISM; EVOLUTION; MAN.

Mission, foreign legation, or, collectively, the members of an embassy, as, e.g. the Brit. M. at Peking. Secretaries and attachés are not, as a rule, employed in the same M. or embassy for more than two years, subject to the foreign secretary deciding to extend the term for public reasons. The duration of the appointments of heads of Ms. at foreign courts may not exceed five years, at the end of which time the appointment is renewable by the foreign secretary, if desirable on public grounds. Members of Ms. retire at seventy years of age. The chief of a M. is styled in the Foreign Office regulations 'minister,' whether his official title be that of ambas., minister, or *chargé d'affaires*.

Missions. The command given by Jesus to His disciples to preach the gospel throughout the world, baptising in the Triune Name, has been carried out by Christians in every age, though sometimes with but little vigour. During the first centuries the spread of the faith was exceedingly rapid. The Book of the Acts of the Apostles tells of the evangelisation of Asia Minor, and the introduction of the church into Europe. To the second century we may possibly assign the introduction of Christianity into England (Bede, *Historia Ecclesiastica*, cap. v.). N. Africa was early visited by missionaries, and during the early centuries the African church was one of the most vigorous and flourishing. The dates of the beginnings of missionary enterprise to the E. of Palestine are uncertain. By the third century there was a flourishing church in Persia and also in Armenia. During the fourth century Christianity continued to spread in Gaul, England, and Spain (all of which countries suffered under the persecution of Diocletian), and was introduced into Abyssinia and Switzerland. In the fifth century occurred the evangelisation of the Irish under St. Patrick, and of the Frankish peoples who had entered Gaul from beyond the Rhine. From Ireland missionaries passed to N. England and S. Scotland. This Celtic work is associated specially with the names of Columba, Aidan, and Cuthbert. But the A.-S. invaders reduced England to paganism again, and it was brought back to Christianity by Augustine and a band of monks, sent from Rome by Pope Gregory in 597. During the fifth and the three following centuries the Nestorian heretics were vigorous missionaries in the E. The eighth century was the time of the missionising of Germany by the Eng. monk, Winfrid or Boniface, and in the next century the faith was carried to the N. Scandinavian races by the monk Ansgar, the work being continued during the three following centuries among the Danes, Norwegians, Icelanders, Poles, Magyars, and the Slavs of E. Europe. By the eleventh century Russia was mainly converted by E. missionaries.

During the thirteenth and fourteenth centuries missionary enterprise slackened, though still carried on by the friars.

The discovery of a new continent opened fresh fields of vast extent for missionary enterprise. In the sixteenth century the work was mainly taken up by the Sp. Dominicans, Franciscans, and Jesuits. To the last named belonged the best known of the missionaries of this century, St. Francis Xavier, who preached throughout the E. from India to Japan. Thence the Jesuits made their way to China, where little progress was made till the time of Father Ricci (*q.v.*). In 1663 the *Séminaire des Missions Étrangères* was founded in Paris, and Rom. Catholic missionary work was carried on mainly in the Indo-Chinese peninsula. Among the most successful M. may be mentioned that of the Jesuits in Paraguay (1582-1767) which has been praised by all historians, and that of the Franciscans in California in the eighteenth century. In 1822 the Association for the Propagation of the Faith was founded to supply money for the various religious orders and missionary societies. Among these may be mentioned S. Joseph's College of the Sacred Heart for Foreign M. founded in England by the exertions of Cardinal Vaughan, for the education of missionaries. There are too many orders for separate mention, but well known are the White Fathers founded for Africa by Cardinal Lavigerie, and the Medical Missionaries of Mary, an order of nuns with 100 convents spread out over Africa, Asia, and Australia. All Rom. Catholic missionary organisations come finally under the jurisdiction of the Sacred Congregation of Propaganda at the city of Rome until such time as a native hierarchy of bishops is established. This is the aim of every mission field. A considerable degree of progress has been made in China, which now has a native Chinese cardinal, a hierarchy and a total communion of about 3,000,000. In India the number of converts is also large, but with the new independent commonwealth status acquired by India the future of the M. is a problem, since they are apt to be regarded as something introduced from the W. and alien to Hindu culture. Since the Second World War and the abandonment of divine claims by the Jap. emperor, great numbers of Jap. are seeking admission to Christianity, which seems likely to make great progress in that country after two and a half centuries of persecution. The total number of Christians in the Catholic M. (*i.e.* converts from pagan countries, or countries only evangelised since the Reformation) is upwards of 30,000,000.

The countries which broke away from the Rom. obedience at the time of the Reformation felt at first unable to undertake the charge of any M. The first government to take the work in hand was the council of Geneva, which in 1555 sent missionaries with a colony to Brazil on the advice of Coligny. But the colony was destroyed and the attempt failed. Little progress was made for over a century. In 1602 the Dutch E. India Company tried

to christianise the natives of its colonies, but the conversions were mostly conversions in name only. The attempt, however, was attended with success in Java and the surrounding is., for here the Scriptures had been made available in a translation. The question of foreign M. received the consideration of the Eng. Parliament during the protectorate of Cromwell, and as a result the Corporation for the Propagation of the Gospel in New England was founded in 1649. With this corporation was connected the famous missionary John Eliot, the first to translate the Bible into a heathen language in modern times. His Indian Bible was pub. in 1683. The Society for Promoting Christian Knowledge was founded within the Church of England in 1698, and since that date the scope of its activities has been ever widening. The work of the S.P.C.K. was supplemented in 1701 by the foundation of the Society for the Propagation of the Gospel in Foreign Parts.

In 1732 the Moravian Brethren sent out their first missionaries to St. Thomas in the W. Indies. They have now stations in Greenland, N. and S. America, S. Africa, Australia, and Tibet. The Baptist Missionary Society was founded in 1792 and Carey and Thomas were sent as its first representatives to India. The London Missionary Society was founded in 1795 and is now almost entirely in the hands of the Congregationalists. The first work undertaken by the L.M.S. was in the South Seas, and it has since extended to S. Africa, India, China, Madagascar, and New Guinea. In 1797 was founded the Church Missionary Society, which took its present name in 1812. The C.M.S. represents the Evangelical party in the Church, while the S.P.C.K. lays more stress on the Catholic aspect of Anglicanism. It is the greatest of the Church of England societies, with an income of nearly £500,000. Connected with it is the Church of England Zenana Missionary Society, founded in 1880. Other prominent Church of England M. are the Melanesian Mission, founded in 1841 by Bishop Selwyn in New Zealand; the Univs. Mission to Central Africa, founded in 1859, the Wesleyan Missionary Society, founded in 1817 in the W. Indies, which has worked with great success in Australia and Africa, and had a pre-war ann. income of about £500,000. Presbyterian missionary societies were founded by the Irish in 1840 and by the Eng. in 1817. The former have missionaries in India, the latter in China. All the Presbyterian M. are carried on by the churches as such and not by separate societies. The Friends' Foreign Missionary Society, organised in 1807, operates chiefly in Madagascar, but works also in India, Ceylon, Syria, and China; the name has recently been changed to the Friends' Service Council. The greatest of the undenominational M. is the China Inland Mission, founded by J. Hudson Taylor in 1865; connected with it is the Bible Christian Foreign Mission. The chief of the American M. societies are the Board of Commissioners for Foreign M., and the

societies of Baptist, Methodist and Presbyterian denominations. To all Protestant M. the Bible societies (especially the Brit. and Foreign Bible Society, 1801) are a most valuable auxiliary.

After the Edinburgh Conference (1910), the prin. M. societies, with the exception of the Rom. Catholics, adopted a plan of co-operative work. This produced such satisfactory results that, after the First World War, it became an international movement taking in mission societies of America and other countries. Moreover missionary work has changed in character;

and M. in general, see R. Lovell, *History of the London Missionary Society*, 1899; M. G. Guinness, *Story of China Inland Mission*, 1900; G. Warneck, *Outline of a History of Protestant Missions*, 1906; J. Richter, *Allgemeine evangelische Missionsgeschichte*, 1906-32; H. H. Montgomery, *Mankind and the Church*, 1907; E. M. MECHANICAL COTTON PICKING IN MISSISSIPPI

Two mechanical cotton pickers at work on a plantation in Mississippi. These cotton-picking machines are estimated to be capable of doing the work of fifty to eighty hand labourers.

instead of being essentially an overture of the people of one country to those of another, with consequent emphasis on differences of nationality, efforts are now directed chiefly to the development of indigenous churches, which, though continuing to receive assistance from Europe and America, have become as far as possible self-governed. A similar tendency to aim at self-government is discernible in the Rom. Catholic M. Statistics, which however should be treated with caution, may be found in *World Missionary Atlas* (2nd ed., 1925) for Protestant M., and *Little Atlas of Catholic Missions*, 1925, for Rom. Catholic M.

See for Rom. Catholic M.: M. R. A. Henrion, *Histoire générale des missions catholiques*, 1846-47; Durand, *Missions catholiques françaises*, 1874; and the publs. of the Propaganda. For Protestant M.

Mississippi, the Magnolia State, S. central state of the U.S.A., bounded on the N. by Tennessee, on the S. by the gulf of Mexico and Louisiana, on the E. by Alabama, and on the W. by the R. M. The general surface is low with a trend towards the S. and S.W. A few m. from the shore is a chain of low, sandy is., which forms the bay of St. Louis on the W. and Pascagoula Sound on the E. The delta

region and the littoral generally is sandy and unhealthy, but there are immense cotton, rice, and tobacco crops in the lowlands by the M. R. and its sluggish trib., the Yazoo. Farther N., on the uplands and bluffs, pine, oak, walnut, and magnolia trees abound, but in the is. and sandy S. dists., pine trees alone are plentiful. In fact one-third of the state is forest, chiefly yellow pine. The chief rivs. are the M., the Yazoo, the Big Black, the Pearl, and the Pascagoula. The climate is nearly subtropical, though frosts occur in severe winters even in the S., and fevers are frequent in the bottom lands. The soil is, on the whole, extremely fertile, and agriculture is a very important industry; the state is the third cotton-growing state in the Union after Texas and Arkansas. Indian corn, rice, wheat, rye, and oats are also grown in large quantities, and the sugar-cane is cultivated in the S. part of the state. The prin. vegetable is the sweet potato, but the common potato, peas, and beans, and most of the vegetables known to European countries, are also grown. Plums, peaches, figs, and oranges are abundant. Manufs. now equal in value the agric. products, and among the chief are lumber and timber, turpentine and resin, cotton-seed oil and cake, cotton goods, and fertilisers.

More than half the church going inhab. of M. are Baptists (Negro Baptists with 322,000, and S. Baptists 150,000). M. was settled in 1716, and ceded by the Fr. to Great Britain in 1763; in 1798 it was organised as the ter. of the M. In 1817 the ter. of Alabama was organised from the M. ter., and in the same year M. was admitted to the Union. There is a Senate of forty-nine members, and a House of Representatives of 140. M. sends two senators and seven representatives to Congress. Area 47,716 sq. m. Pop. 2,092,000, of whom 49 per cent are Negroes. Chief cities: Jackson (cap.), 62,100; Meridian, 35,500; Vicksburg, 24,500. See pub. of the M. Historical Society (19 vols.); *Encyclopedia of Mississippi History, 1510-1907*, 1907; D. Rowland, *History of Mississippi*, 1925; and Federal Writers' Project, *Mississippi: a Guide to the Magnolia State*, 1938.

Mississippi River, most important riv. of N. America, rises in the state of Minnesota in the basin of Lake Itasca, and flows into the gulf of Mexico. It is, with the Missouri, its chief trib., the longest riv. in the world (4221 m.), and drains an area of about 1,250,000 sq. m. Altogether the M. has forty-two trib. streams, and the navigable mileage is 12,798. Its chief tribs. are on the E., the Wisconsin, Illinois, Ohio, Yazoo; and on the W. the Minnesota, Des Moines, Missouri, St. Francis, White, Arkansas, and Red Rts. It is still important commercially, although a good deal of its traffic has been diverted to the railways, and has on its banks many important ins.: St. Paul, La Crosse, Prairie du Chien, Dubuque, Muscatine, Burlington, Quincy, and Hannibal on the upper riv., i.e. the M. from the source to the mouth of the Missouri; and St. Louis, Cairo, Memphis, Vicksburg, Natchez,

Baton-Rouge, and New Orleans on the main riv. A great disadvantage and drawback generally is the frequent occurrence of floods. Great damage was done by floods in 1927 and, ten years later, almost the worst floods in the hist. of the continent occurred through the overflowing of the M. and the Ohio. A million persons were made homeless, and the entire pop. of the M. valley between Cairo and New Orleans had to be evacuated. But the floods of 1917 broke every flood record since 1844. All that could be done was to reinforce the dykes with sandbags, but sev. dykes were broken and thousands of farmers had to take to the hills. The dykes are designed to keep the M. about 1 m. wide. Many of them were built by the Federal Gov. in 1936 as part of the New Deal (q.v.); but there are some sections protected by smaller, weaker dykes, which were built earlier by the local communities, and it was these that gave trouble in 1947, many of them having failed, either through not being high enough, or through breaking in some weak section. Over 100,000 ac. were flooded, and the damage was estimated at more than £3,000,000.

The actual discovery of the M. was made by a Fr. missionary, Jacques Marquette, about 130 years after an abortive attempt by Hernando de Soto. The comte de Frontenac, then governing in Canada in the name of Louis XIV., sent out Marquette to ascertain whether the riv. really existed. Early in 1673 Marquette, with a few men, proceeded westward from Quebec along the Great Lakes, made his way S.W. and S., and discovered the M. on May 17, 1673. On his return to Quebec Frontenac proposed that the riv. be given the name of Colbert, in tribute to Louis's great minister. Robert Cavalier de La Salle (q.v.) sought permission of Frontenac to undertake the conquest of the riv. and its region. Frontenac, deeming La Salle's plans to be beyond the purview of a governor of Canada, sent La Salle to France to discuss them with the king, who sent him back to Canada with full authorisation to carry out the expedition. With Father Marquette and an It. named Tonti (remembered in relation to the 'tontine' plan of life insurance by groups) and a party of twenty-three Frenchmen, twenty Indians, and ten Indian women, La Salle travelled across the lakes and began the descent of the riv. The party reached the point where, in the sixteenth century, Hernando de Soto had abandoned the attempt to discover the riv. Eventually the party reached the gulf of Mexico. La Salle took possession of the riv., and a notary drew up a legal record of the act, referring to the riv. as the Colbert. Back in France La Salle was honoured by the king, and a second expedition was fitted out. On the return trip, however, La Salle tried to enter through the gulf of Mexico, but was unable to find the riv.'s mouth. The captain of the fleet, growing impatient, sailed away without its leader. La Salle advanced into Texas, a small group accompanying him, and there he fell victim to an assassin's dagger. It

was the destiny of the three discoverers, de Soto, Marquette, and La Salle, to die obscure deaths just as they had the prize within their grasp. Thenceforward came the struggle to see who should carry out the conquest, but one of the earliest incidents in the hist. of the riv. subsequent to its discovery was the foundation of New Orleans by Jean Baptiste Lemoine, sieur de Bienville (q.v.) c. 1718. See also LOUISIANA. See further under FLOODS AND INUNDATIONS.

Mississippi Scheme, or Mississippi Bubble, financial scheme projected by John Law at Paris in 1717 for the colonisation and cultivation of the banks of the M. Shares were issued which rapidly rose in value owing to the report that there were gold and silver mines in those parts; and the company, which assumed the title of the *Compagnie des Indes*, undertook the management of the mint, and farmed the revenue from the gov., so that not only did the company control practically the whole colonial trade, but it had in its hands the management of the currency and the finance of France. By 1719 shares were selling at forty times their face value, and in 1720 Law made an attempt to amalgamate the company and the *Banque Royale*. Then came the crisis, people began to lose confidence, and a run was made on the bank, which eventually stopped payment. Law escaped from France in Dec. of the same year. See II. Montgomery Hyde, *The Amazing Story of John Law*, 1948.

Missive, Scots law, denotes documents the interchange of which between parties is effectual to conclude a binding sale or lease. A M., unless holograph (q.v.), must be witnessed and authenticated as a probative deed; if holograph, the acceptor prefixes in his own handwriting a copy of the offer made by the other party. No action can be brought on an unstamped M. Radical defects in a M. cannot be cured by oath.

Missolonghi, or Mesolonghi, fortified tn. on the Gk. coast, in the prov. of Acarnania and Etolia, situated in a marshy plain, covered with olive plantations, N. of the gulf of Patras. It is famous for having sustained three sieges by the Turks, in 1821, 1823, and 1825-26. Lord Byron d. here on April 19, 1824, and a monument was erected in his honour. Currents and valonia are exported. Pop. 9700.

Missoula, city of Montana, U.S.A., co. seat of Missoula co., on Clark Fork, Columbia R., 90 m. N.W. of Butte City. It is the seat of the Montana Univ. Lumber milling is carried on, and there are railway workshops. Pop. 18,450.

Missouri, central state of the U.S.A., lying midway between the Atlantic and the Rockies. It has an area of 69,770 sq. m. The Mississippi flows along its E. border. E. and W. the state is traversed by the M. R., into which flow the Grand, Chariton, Osage, and Gasconade. The St. Francis and Big Black are affluents of the Mississippi. The M. flows into the Mississippi above St. Louis. Northward of the M. are rolling prairies and forest lands, whilst to the S. is a region of

plateau, known as the Ozark Mts., and also much marshy and cultivated ter. The chief industry is agriculture; maize being the prin. crop; oats, wheat, potatoes, fruits, and cotton are also grown. Cattle rearing is important. M. is rich in minerals. Coal is produced over an area of 11,000 sq. m., especially in Bates, Lafayette, and Roy cos., and the outputs of zinc and lead are more than twice as valuable as that of coal. Limestone, Portland cement, hematite, iron, etc., are also produced. Meat-packing is the most valuable industry, and manufs. include boots and shoes.

M. was first settled in 1764, made into a ter. in 1812, and admitted to the Union in 1821. The General Assembly comprises thirty-four senators and 151 representatives; two senators and thirteen representatives are sent to Congress. The chief religious bodies are Catholic (440,000); S. Baptist (284,980); S. Methodist (209,890); and Disciples of Christ (129,420). Its chief colleges are the State Univ. at Columbia and St. Louis Univ. and Washington Univ., both at St. Louis. The largest cities are St. Louis (816,000); Kansas City (399,200); St. Joseph (75,700) Springfield (61,200); Joplin (37,100); and Univ. City (33,000). Jackson (24,300) is the cap. See W. B. Stevens, *Centennial History of Missouri* (4 vols.), 1921; P. S. Radev, *History of Missouri*, 1927; W. Williams and L. C. Shoemaker, *Missouri* (5 vols.), 1930; and Federal Writers' Project, *Missouri: a Guide to the 'Show Me' State*, 1941.

Missouri ('Big Muddy') River, largest trib. of the Mississippi, is 3017 m. long and 3000 ft. broad at its mouth. Rising among the Rockies in Wyoming and Montana, it passes northward through a wild gorge flanked with precipitous cliffs and known as 'the Gate of the Mountains.' Some 110 m. below this gorge and 40 m. above Fort Benton are the four Great Falls, the grandest of which is a sheer cataract of 87 ft. The M. is formed by the junction of the Madison, Jefferson, and Gallatin Rts., which all rise in the Rocky Mts., and unite at Gallatin City in Montana. After receiving the Milk and the Yellowstone (1152 m.) Rts., it flows S.E. through the Dakotas as far as Sioux City. It now separates Nebraska and Kansas on the W. and Iowa and Missouri on the E., and after traversing M. enters its main stream 20 m. above St. Louis. Other large tribs. are the Platte and Kansas. The riv. is navigable almost to the Great Falls (that is, within 2285 m. of the mouth).

Missouri Compromise. In 1817 the inhab. of the Missouri ter. petitioned for admission into the Union as a state; subsequently a Bill was introduced into Congress on Feb. 13, 1819. A question of the abolition of slavery in the ter. caused the Bill to be delayed until a compromise was agreed to, March 2, 1820; this, however, still led to much discussion, and it was not until Feb. 27, 1821, that a final compromise was adopted, which led to the admission of Missouri to the Union as a state. The Act of 1821 enacted that in all the

ter. ceded by France, known as Louisiana, N. of lat. 36° 30' N., excepting Missouri, slavery should be for ever prohibited, and on this concession by the pro-slavery party in Congress, Missouri was admitted as a slave state. The Act was abrogated by the passage of the Kansas-Nebraska Bill of 1854.

Mist, see Fog.

Mistake. As a general rule one party to a contract cannot escape liability to perform his part of it on the ground that he understood its terms in a different sense from that in which any reasonable person would have understood them. But if a mutual, as distinct from a merely unilateral, M. is proved to the satisfaction of the court, the contract may be set aside. On the other hand, unilateral error will afford ground for rescission if mistaken belief as to the real meaning of the agreement was induced by the conduct, innocent or otherwise, of the other party. If the offer and acceptance essential to the formation of a contract never agreed in terms, there never was a contract at all, not because either party has made a M., but because there was a want of mutuality. The net result is the same, however, as in the case of a genuine mutual M. Mutual error of intention (as distinct from error in expressing that intention, which, though ground for rectification, is not ground for upsetting a contract) practically arises only where parties contract for or about a thing which has never had, or has ceased to have, any existence, or are mistaken as to the identity of the particular thing about which they are contracting, or as to the identity of one another. A M. due to ignorance of a general rule or law, as distinct from ignorance of a particular right, affords no ground for relief. Where M. does excuse, the remedy of the mistaken party, where the contract (q.v.) is still executory, is to sue for a declaration that the contract be rescinded and any money paid under it refunded to him. Sometimes, in the case of unilateral error, the court will decree rectification of the terms instead where the mistaken party is willing to take such relief.

Mistassini lake, lake of Quebec, Canada, 120 m. in length and 20 m. in width. It drains into James Bay by Rupert R. The Little M. lake stretches parallel on the E. side of the greater lake.

Misti Mountain, Peru, see EL Mistri.

Mistletoe, or *Viscum album*, a shrubby evergreen (family Loranthaceae), parasitic on a large variety of fruit and forest trees, but principally on the apple. The berries are white, with a single seed invested by a glutinous pulp. The berries are eaten by birds, and the seeds become attached to the branches of trees by the agency of birds; and on germination the embryo pierces the bark and penetrates to the wood. Off its hosts the chief in Britain are black poplar and apple. M. may be easily established on a tree by rubbing the berries when ripe (at the end of Feb.) upon the under side of young, healthy branches. Growth is very slow at first, and male and female shrubs are produced separately; the former, of course, bear no berries.

The M. was revered by the Druids, figures much in European folklore, and is a feature of Christmas celebrations.

Mistletoe Thrush, see MISSEL THRUSH.
Mis Tor, Great and Little, are two hills of Devonshire, England, in Dartmoor forest, 16 m. E.S.E. of Launceston. The former reaches a height of 1767 ft., and the latter 1600 ft.

Mistra, city founded by the crusaders, a few miles from Sparta. It is a forsaken Byzantine tn., and was once the cap. of the Peloponnese. It was founded in the beginning of the thirteenth century by a Frankish prince, Guillaume de Villehardouin, on the spur of Mt. Taygetus for his stronghold and citadel. Half a century later it passed into Gk. hands. For nearly 200 years it was to be the cap. of the Byzantine prov. of the Morea (or Peloponnese) or, in fact, of Greece. A fortified city grew up, with splendid churches under the sheltering castle, a wealthy centre of European and Christian culture. In the fifteenth century Greece fell to the Ottoman Turks, but M. survived as a somewhat important place; and when the Eng. traveller Leake visited it over a century ago he found it still apparently well-to-do, with an export trade in silk and oil. But in 1834, after the war of Independence, M. declined into a dead city. To-day its chief buildings are the church of St. Demetrius and the monastery of the Pantanassa.

Mistral, Frederic Joseph Etienne (1830-1914), Provençal poet, son of a farmer in the Bouches du Rhône. On leaving school, M. tried farming, then law, and finally devoted himself to literature. In 1859 he, Roumanille, Mathieu, and others, founded the *Félibrige*, an association for the cultivation of Provençal literature. Among the most noteworthy of M.'s numerous works are *Mireille* (1859), a rustic tragedy; *Calendau* (1867), a mixture of legend and allegory; *Lis Iselo d'Or* (1876), a vol. of poems; his Rhône epic, *Lou Ponèmo dou Rouse* (1897); and *Lou Tresor des Félibrige* (1878-86), a collection of proverbs and folklore. In 1904 M. received one of the Nobel literary awards. See C. A. Downer, *Mistral*, 1901; and E. Lefèvre, *Bibliographie Mistralienne* 1903.

Mistral, Gabriela (pseudonym of Lucila Godoy y Alcayaga) (b. 1889), Chilean author and educationist, b. at Viñaña, in N. Chile, dedicated herself to teaching, and became director of the elementary school at Magallanes. Later appointed to the consular service, she represented Chile in Madrid and Lisbon, and is now (1949) consul at Rio de Janeiro. She acted as Chilean delegate to the dept. of intellectual co-operation of the League of Nations. Her literary reputation outside her own country was made in 1922, with the pub. by the Historical Institute of New York of a collection of prose and verse entitled *Desolación*. Awarded the Nobel prize for literature for 1945.

Mistral, strong, chilly wind blowing from the N. down the Rhône valley. 'Le Parlement, le Mistral et la Durançe sont les trois fleaux de la Provence.' Related

to the *bora* (see BOREAS) and *tramontana*, all winds blowing from the cold int. regions N. of the Mediterranean, often as the rear winds of a cyclone, and somewhat like the Eng. north-easters. It is dangerous to fishermen and destructive to fruit blossom.

Mitau, or Mitava, see JELGAVA.

Mitcham, auct. Surrey vil. and urban dist. situated on the Wandle. Its prin. feature is the common, which has an area of some 480 ac. Market gardening was formerly the prin. local industry, rhubarb, mint, liquorice, and other medicinal plants being a speciality. It has an excellent golf course and cricket club, and still maintains its ann. fair in August. Pop. 54,000.

Mitchel, John (1815-75), Irish Nationalist, b. near Dungiven, co. Londonderry. He abandoned his practice of solicitor for a place on the staff of the *Nation*. In 1848 he issued the first number of the *United Irishman*, and having in its pages incited his fellow countrymen to rebellion, he was sentenced to transportation for fourteen years in Van Dieman's Land, from which he escaped to the U.S.A. Here he pub. *The Citizen*, *The Southern Citizen*, *The Irish Citizen*, etc., but his popularity waned when he showed himself an advocate of slavery, and in 1871 he returned to Ireland. He wrote *The Life and Times of Aodh O'Neill* (1846); *Jail Journal, or Five Years in British Prisons* (1854); and *The History of Ireland, from the Treaty of Limerick to the Present Time* (1868).

Mitchell, Donald Grant (1822-1908), Amer. author, b. in Connecticut, graduated at Yale in 1841. He wrote on gardening and agriculture, and on his travels in Europe and America. He also wrote some literary studies, Eng. and Amer., but his best work, under the pseudonym of Ik Marvel, was contained in *Heracles of a Bachelor* (1850), and *Dream Life* (1851).

Mitchell, Margaret Mannerlyn (Mrs. John R. Marsh) (1900-49), Amer. novelist, b. at Atlanta, U.S.A., only daughter of Eugene Muse M. Educated at the Washington Seminary at Atlanta, she completed her studies at Smith College, Massachusetts. From 1921 to 1926 she was a reporter and feature writer on the *Atlanta Journal* and retired after her marriage to Mr. John R. Marsh, a newspaper editor, in 1925. She wrote only one book, a novel of the Civil war, entitled *Gone with the Wind*, but it quickly became perhaps the most celebrated best-seller among the many successful modern Amer. novels. M. M. began the book in 1930 and completed it in 1936. It was the choice of the Book of the Month Club, which brought the sales in June 1936 to 75,000 copies; early reviews aroused even greater interest, so that 100,000 copies were sold before actual publication. During the first six months a million copies were sold, as many as 50,000 being sold sometimes in a single day. It was awarded the Pulitzer prize in 1937. Its sale, maintained over sev. years, ran into 8,000,000. The story is said to have owed something of its

success to its title but more to the force of romantic conviction in the telling and the colourful background of slave-owning S. aristocrats. The two chief characters are Scarlett O'Hara, a hard, selfish, courageous young woman, whose faithful slaves are like lost souls when freedom comes to them, and the equally courageous smuggling adventurer, Rhett Butler, one of her lovers. But the real interest is not in the characters so much as in richness and variety of incident, which indeed disguises the fact that the story is but little concerned with the vital issues of the war. M. M. is recorded as saying that she began writing at the age of sixteen, and was deeply interested in the colonial hist. of the S. from childhood, having heard a number of war tales at an early age, all of which she had put into *Gone with the Wind*. She was a member of the Atlanta Historical Society and of the Huguenot Society of S. Carolina. In the lavish and highly emotional film adaptation of the novel, Vivien Leigh played the part of Scarlett O'Hara. M. M. was killed in a taxi-rab accident in Atlanta.

Mitchell, Sir Peter Chalmers (1861-1915), Brit. biologist and zoologist, b. at Dunfermline, Scotland, and educated at Aberdeen and Oxford Univs., and at Berlin and Leipzig. He was lecturer on biology at Charing Cross Hospital, 1892-1891; secretary to the Zoological Society of London, 1903-35; and examiner in zoology to the univ. of London, 1903. Pubs. include *Outlines of Biology* (1891); *Biological Problems of To-day* (1896); *Thomas Henry Huxley* (1900); *The Nature of Man* (1903); *The Childhood of Animals* (1912); *Evolution and the War* (1915); *Centenary History of the Zoological Society of London* (1929); *Materialism and Vitalism in Biology* (1930), and various papers in the *Anatomical Journal*, *Quarterly Journal of Microscopical Science*, and *Proceedings of the Zoological Society*.

Mitchell, Reginald John (1895-1937), Eng. aircraft-designer, was b. at Stoke-on-Trent. After serving an apprenticeship with Kerr, Stuart & Company, of Stoke-on-Trent, he joined the Supermarine Company at the age of twenty-one in 1916, was appointed chief engineer and chief designer by 1920, and became a director of the company in 1927. In that year he was awarded the silver medal of the Royal Aeronautical Society in recognition of his share in the Brit. Schneider Cup victory at Venice. In the public mind his name will always be associated with the hist. of the Schneider trophy (q.v.), which, by virtue of the backing given to competing teams by their respective govts., became a grim technical competition with national prestige deeply involved. Not the least of his services to the country was the stimulus that these victories gave to Brit. aeronautical technique. How well he succeeded in combining superb aeronautical design with an adventurous but always sound structural technique is witnessed by the firm's record of service types. There have been the early Seagull, an amphibian of which many went into

service in Spain and Australia; the Southampton, long the standard twin-engined flying-boat in the Royal Air Force; followed quickly by the Scapa and the Stranraer; all bearing upon them the 'Mitchell' mark of originality, coupled with thoroughly sound execution. With the revival of the amphibian idea in the Seagull V., there became available for the Naval Air Service, under the naval name of Walrus, a new amphibian for use with the Fleet Air Arm. Of the machines last completed by M., the Spitfire (*q.v.*) a single-seater fighter, reflected more closely the immense knowledge gained in high-speed work in his Schneider trophy days. M. left a record of almost continuous achievement which has not been equalled by any other individual designer in the short hist. of aviation.

Mitchell, Silas Weir (1830-1914), Amer. novelist and physician, b. at Philadelphia. He wrote juvenile and historical fiction, but is chiefly famous for his books, *Wear and Tear*, or *Hints for the Overworked* (1871); *Rest in the Treatment of Disease* (1875); *Fat and Blood* (1877); and *Clinical Lessons on Nervous Diseases* (1895). See also WEIR MITCHELL TREATMENT.

Mitchell, Sir Thomas Livingstone (1792-1855), Scottish explorer, b. at Craigend, Stirlingshire. Appointed governor-general of New S. Wales in 1828, in four expeditions between 1831 and 1847, he did much to explore E. Australia ('Australia Felix') and tropical Australia, particularly the Murray, Glenelg, and Barcoo Rrs. Pub. two vols. recounting his explorations, besides various technical works and a trans. of *The Lusitads* of Camoens.

Mitchell: 1. Co. sent of Davison co., S. Dakota, U.S.A., 65 m. N.W. of Yankton. Dakota Univ. (founded 1888, Methodist Episcopal) is situated here. There are machine and railroad shops, brick-yards, etc. Pop. 10,600. 2. Tn. of Perth co., Ontario, Canada, on the Thames R., 32 m. from London. It has numerous mills and factories. Pop. 2200. 3. Minor group of the Ellice Is., Pacific Ocean.

Mitchell. Amer. bomber, the B-25, a product of the N. Amer. company. A high-speed and heavily armed medium bomber, it was widely used both by the Amer. and Brit. air forces. Its two 17,000 h.p. engines gave a speed of 250 m.p.h.; the bomb-load was 3000 lb.

Mitchell Mount, highest mt. of the U.S.A. E. of the Rockies, is 6710 ft. high. It lies in the Black Mts., Yancey co., N. Carolina.

Mitchelstown, mkt. tn. of Cork co., Ire, 11 m. N. of Fermoy. It has a castle, and 7 m. away are M. caves, stalactite caverns, in Tipperary co. It was the scene of a riot between Home Rulers and the police (Sept. 1887). Pop. 2000.

Mitchison, Naomi Margaret (b. 1897), Scottish novelist, b. in Edinburgh, daughter of Prof. J. B. S. Haldane, and educated at the Dragon School, Oxford. The best known of her novels are *The Corn King and the Spring Queen* (1931) and *The Blood of the Martyrs* (1939); like most of her stories, they deal with the auct. world.

Other publs. include *Cloud Cuckoo Land* (1928); *The Laburnum Branch* (verse, 1926); *Barbarian Stories* (1929); *The Delicate Fire* (stories and poems, 1933); *The Fourth Pig* (1936); *Socrates* (with R. H. S. Crossman, 1937); *Moral Basis of Politics* (1938); and *The Bull Calves* (1947).

Mites, large number of small Arachnids comprising, with the ticks, the order Acarina. Many of them are parasitic on animals, and cause such well-known troubles as mange and sheep-scab. The harvest M. (*Microtrombidium autumnale*) is itself harmless, but in the larval stage, formerly called *Leptus autumnalis*, attacks man and animals, penetrating the thin skin, and setting up great irritation. *Dermanyssus gallinae*, commonly called red M., is an abundant parasite on poultry, pigeons, and cage birds. Another M. (*Tetranychus telarius*), usually but wrongly

MITES

A. (1) *Trombidium holosericeum*, female, $\times 74$
 (2) *Leptus autumnalis* - larva of Trombidium.
 B and C, *Sarcopes scabiei*: B, female, C, young form.

called red (or money) spider, is a troublesome pest in greenhouses, extracting the juices of plants. A number of M. live in cheese, flour, and other foodstuffs. They are conveyed from place to place in the larval stage by attaching themselves to flies. Some M. live entirely in the water, and many are parasitic on insects. In the aggregate, they exhibit almost infinite variety of structure. See also ITCHMITE.

Mitford, John Freeman, see REDFISDALE, BARON.

Mitford, Mary Russell (1787-1855), Eng. writer, b. at Alresford, Hampshire, daughter of a physician, without practice, selfish and extravagant, who squandered three fortunes, his own, his wife's, and his daughter's (£20,000 won in a lottery), and then lived on the industry of the last. Mary M. began her literary career by publishing a vol. of *Miscellaneous Poems* at the age of twenty-three. In 1823 Macready produced her tragedy, *Julian*, at Covent Garden. Of her sov. plays the best was *Rienzi* (1828). Others were *The Forsart* (1826) and *Charles I.* (1828). In 1819 Miss M. began to print

in a forgotten periodical the series of sketches known as *Our Village*, which deservedly caught the public fancy, and were collected in book form in five vols. between 1824 and 1832. They are a series of sketches of vil. scenes and characters, thoroughly original and spontaneous, though Washington Irving was her literary model. In 1852 she brought out *Recollections of a Literary Life, or Books, Places, and People*, which contains

MARY RUSSELL MITFORD

much autobiographical matter. See A. G. L'Estrange (ed.), *Life and Letters*, 1870; and W. Roberts, *Mary Russell Mitford, her Life and Friendship*, 1913.

Mitford, William (1714-1827), Eng. historian, b. in London, studied at Queen's College, Oxford, and law at the Middle Temple. In 1771 he pub. *Inquiry into the Principles of Harmony in Languages*, followed by a *Treatise on the Military Force*. In 1784 appeared the first vol. of his *History of Greece*, completed in 1818 in five vols. M.'s *History of Greece* held its supremacy until Connop Thirlwall (q.v.) pub. his abler and less biased work on the same subject between 1835 and 1844. See T. B. Macaulay, *Review of Mitford's History of Greece*, 1824.

Mithraism, cult of Mithra, or Mithras, an anc. Arvan god of light, whom the Zoroastrians conceived of as a champion of Ahura-Mazda in his eternal conflict with Ahriman, the prince of evil. M. was therefore a spurious development of Mazdaism (see ZOROASTRIANISM) which latter spread over most of Asia Minor, but through Gk. influences, the only part of the creed which was embraced by the people was the worship of Mithra, really a subordinate, if attractive, Zoroastrian spirit, yet chosen as an absolutely supreme god. Mithra was early identified with the sun-god, and as such was the

centre of a cult which, according to Pintarch, was introduced to Rome by Pompey's pirate-captives from Cilicia in 68 B.C. The monuments of this worship have been found wherever the Rom. legions went in Britain, thus showing how readily one religion supplants another which has not adapted itself to the developing needs of any race. On the monuments of his cult Mithra is represented as a beautiful youth driving a sword into the neck of a prostrate bull which latter at the same time is being devoured by a scorpion, a crab, and a dog; but no convincing solution has been offered to explain this symbolic representation, which was no doubt part of an elaborate dogmatic system. M. was also an ethical system and what is extant of its ritual suggests the existence of an organised hierarchy and a worship assimilated to the Gk. mysteries. M. finally ceased to exist in the fourth century, when it was superseded by Christianity. In the struggle of Paganism with Christianity, however, M. exercised a powerful attraction, being a pure and elevated religion, and though at first a form of sun-worship, it became modified by syncretism. Its most striking ceremony was the blood-baptism called Taurobolium. See F. Cumont, *Textes et monuments figurés relatifs aux mystères de Mithre*, 1896-99; and A. Schultze, *Mithraismystrien und Urchristentum*, 1937.

Mithridates, more properly Mithradates, being derived from Mithras, the sun-god; the name of sev. kings of Pontus, the best known being M. VI., surnamed Eupator or the Great (b. c. 132, reigned 120-63 B.C.), and celebrated for his wars against the Rom. The first Mithradatic war lasted from 88 to 84 B.C. M. drove Ariobarzanes out of Cappadocia (of which he was king) and Nicomedes out of his realm of Bithynia, and at length made himself master of the Rom. prov. of Asia (see ROMAN HISTORY), massacring some 80,000 Rom. and It. citizens there. Sulla then crossed over into Greece and defeated Archelaus, M.'s lieutenant, while M. was himself defeated in Asia by Fimbria and sued for peace, which was granted by Sulla (81 B.C.). The second Mithradatic war (83-82 B.C.), which arose from the aggression of Murena, Rom. governor in Asia, ended in the latter's defeat by M. The third war lasted from 74 B.C. to M.'s death in 63, and arose out of M.'s seizure of Bithynia, which had been left by Nicomedes III. to the Rom. people. Lucullus was in command against M. and in the ensuing two years drove M. out of Pontus, and, marching into Armenia, defeated Tigranes and M. in two battles in 69 and 68 B.C. M., however, recovered Pontus owing to the mutinies of the Rom. armies and in 66 B.C. Pompey superseded Lucullus and defeated M. M., however, who was a man of remarkable energy and ability, would not yet admit defeat; but conceived the daring project of marching round the Euxine coasts, through the tribal lands of the Sarmatians and Getæ and invading Italy at the head of these

tribes. But his followers rebelled, including his son, Pharnaces, who was soon joined by the whole army and the citizens of Panticapaeum, who proclaimed Pharnaces king. M., determined not to become a Roman prisoner, and took his own life at the age of about sixty-eight, after a reign of fifty-seven years. See study by T. Reinach, 1890.

Mitla, picturesque Zapotecan vil., 26 m. from Oaxaca (q.v.), Mexico, and the anct. Zapotecan cap. It lies in a valley near the old tn. of Tlacolula (q.v.), and long before the Sp. era it was known as Mictlan, or City of the Dead, and was the religious centre of an anct. civilization. The famous ruins which lie in the vil. as if still a part of it are unique in the elaborate quality of their design. The stone walls of temples and subterranean tombs are covered with a profusion of geometric pattern and the huge stones that form the buildings are so perfectly adjusted that the joints are hardly visible. Underground chambers and cruciform tombs honeycomb the soil beneath the ruined palaces. The 'hall of monoliths' has eight enormous columns, each a single stone. The Spaniards built a massive church with three red domes, which has the appearance of a medieval fortress. It was built in the court of an Indian temple, but the latter was not destroyed and its carved walls and painted lintels may be seen below the domes.

Mito, see MYTHO.

Mitrailleuse, see MACHINE GUN.

Mitraria coccinea, evergreen flowering shrub of the family Gesneraceae, sometimes grown in cold greenhouses and sheltered borders and rockeries.

Mitre, ordinary head-dress of bishops of the W. Church when vested. It exists in many shapes, of which it is generally agreed that the later medieval form is the most beautiful. It consists of two stiff parts united by soft material, so that they can lie flat on each other when the M. is not in use. It is worn by bishops, cardinals, and mitred abbots.

Mitscher, Marc Andrew (1887-1947). Amer. admiral, entered the naval academy at Annapolis in 1906. He joined the naval air station at Pensacola, Florida, and from then until the end of the Second World War in 1945, served continuously in naval aviation. In 1919 he was pilot of the aircraft which made the first U.S. Navy transatlantic flight from Newfoundland to the Azores, for which he was awarded the Navy Cross; later he controlled the organization of the naval team for international air competitions, including the Schneider cup race at Baltimore (1925). M. commanded the aircraft carrier *Saratoga* as head of the air dept., and later was appointed chief of staff of aircraft, Base Force, comprising the navy's land-based aircraft. In 1941, he was captain of the carrier *Hornet* from which the first air raid on Tokyo was launched under General Doolittle, and he also commanded the *Hornet* in the battle of Midway Is. In 1943 he commanded the Amer. Air Forces in the Solomon Is. campaign, and then com-

manded the aircraft carriers in the force under Adm. Spruance which evolved into the famous Task Force 58, perhaps the most powerful sea-borne air force of all time and the chief instrument in the crushing of the Jap. fleet in the Sulu and Surigao Seas off the Philippines. M. continued in the command during the subsequent campaign against Japan until July 1945 when, in accord with Amer. policy of automatic relief, he was made deputy chief of operations for air at Washington.

Mitscherlich, Eilhard (1791-1863), Ger. chemist, b. at Neuende, Oldenburg, and educated at Heidelberg Univ. He then studied chem. at Göttingen and Berlin. His work in crystallography led to the theory of isomorphism, communicated to the Berlin Academy (1819), for which he received the gold medal of the Royal Society of London. Pub. *Lehrbuch der Chemie* (1829), also papers to be found in *Abhandlungen*, Berlin Academy; *Poppendorf's Annalen*; *Annales de chimie et de physique*. His collected works were pub. by his son (1896), who wrote *Erinnerungen an Eilhard Mitscherlich* (1894).

Mittweida, tn. of Saxony, Germany. 12 m. N.E. of Chemnitz. Manufs. include textile fabrics and earthenware, and there are dyeworks, engineering works, and an electro-technical institute. Pop. 20,000.

Mitylene, see LESBOS and MYTILINI.

Mivart, St. George Jackson (1827-1900), Eng. biologist, educated at Harrow, King's College, London, and afterwards at St. Mary's, Ossett, since his conversion to Catholicism prevented his going to Oxford. He wrote *Lessons in Elementary Anatomy* (1873); *The Common Frog* (1874); and was elected prot. of botany and zoology at Kensington Rom. Catholic Univ. College. His researches on carnivora and insectivora much increased our knowledge of the anatomy of these groups. In his *Genesis of Species* (1871), which brought him into the controversies then raging on Darwinism and natural selection, M., while supporting evolution generally, denied that it had any application to the human intellect. His views on the relationship subsisting between human nature and intellect and animal nature in general are expounded in *Nature and Thought* (1882) and in the *Origin of Human Reason* (1899). He received the degree of Ph.D. from the pope in 1876, and M.D. from Univ. of Louvain, Belgium, 1884, and occupied the chair of the philosophy of natural hist. at Louvain, 1890-93. M.'s articles in the *Nineteenth Century*, advocating the claims of science even where they seemed to be in conflict with religion, were placed on the *Index Expurgatorius* and just before his death he was excommunicated by the Rom. Catholic Church. Other works: *Man and Apes* (1877) and *Introduction générale à l'étude de la nature* (1882), etc.

Miveru, Lake, see MOKRO.

Mix, Tom (1880-1940). Amer. film actor, b. in El Paso co., Texas, U.S.A. Serving with the Amer. forces in the Philippines in the Sp.-Amer. war, and in the Boxer trouble in China, he fought with

the Brit. forces in the S. African war and was at the siege of Ladysmith. Sheriff in Kansas and Oklahoma, and deputy U.S. marshal in E. dist. of Oklahoma, he later was with the Texan rangers for three years, and livestock foreman on a ranch in Bliss, Oklahoma, 1906-9. He won the national riding and roping contest at Prescott, Arizona, 1909 and at Canyon City, Colorado, 1911. From 1910 he used these experiences in motion pictures, of which he wrote sev. scenarios himself. For years he appeared as the typical cowboy hero of wild W. pictures.

Mixtecs, or **Mixtecas** (Fr. *Mistèques*, Mexican *mixtla*, dweller in the land of clouds), anct. civilised Indian race who migrated from the N. to S. Mexico, settling in the states of Oajaca, Guerrero, and Puebla, Central America. They were agriculturists and peaceably inclined, but brave warriors. Tepascalutla, Yanhuistlan, and Huajuapán are their chief cities. Both Mayan and Mexican characteristics are embodied in their culture. They number about 150,000.

Mixtures. If molecules of different kinds, whether elements or compounds, be brought together with the result that they merely mingle without losing their identity, then we have what is termed a mechanical M. in contradistinction to the term chemical compound. In such a mechanical M. the properties will be intermediate between those of the constituents, while these constituents can frequently be separated by purely mechanical means, and, further, the proportions of these constituents can be varied and are not fixed. Thus, gunpowder, a dark-grey solid, is composed of black charcoal, yellow sulphur, and white nitre, all of which are solid. The M. evidently possesses a colour intermediate between the three given colours, and, further, it possesses the saline taste of the nitre. By making use of the solvent properties of the constituents, the M. can be separated again into its component parts. Thus, since nitre is the only one soluble in water, it can be dissolved away in water, leaving the charcoal and sulphur behind. Then, since charcoal is soluble in carbon disulphide, it can be dissolved out in this liquid, leaving the sulphur behind. Besides separation in this manner by solubility differences, other qualities can be made use of in separation. Thus, iron can always be separated out of a mechanical M. by magnetic means. Again, because of differences in density, gaseous M. can be separated by diffusion (*q.v.*), and light and heavy solids by washing; because of difference of volatility, liquid M. can be separated by fractional distillation (*q.v.*); and because of difference in size of particles, solids can be separated by sifting and filtering. The basic difference between a mixture and a compound is that the latter consists of one kind of molecule only, while a mixture must consist of at least two different kinds of molecule.

Mizar (ζ Ursæ Majoris) has a faint companion near it, named Alcor, not physically connected with M., distance $11'' 50''$,

which can be seen with the naked eye, and when a small telescope is used M. is seen to be a double star, the brighter magnitude 2.4 and the fainter magnitude 4.0, combined magnitude 2.2. Observations over many years show that their distance apart remains about $14''$ and that one does not alter its position with reference to the other. Hence M. is an *optical double*, no physical connection existing between the two stars which merely happen to lie nearly in the same line of sight. But in addition, it has been found that M. is a spectroscopic binary and the most recent results given by Russell and Moore in *The Masses of the Stars*, with a *General Catalogue of Dynamical Parallaxes* are as follows: dynamical parallax $0''.044$ indicating a distance of seventy-four light-years; distance between the components 24,000 m.m.; period of revolution round their common centre of gravity 20 days 10 $\frac{1}{2}$ hrs.; combined mass of the two bodies, the mass of each being nearly the same, 6.5 times the sun's mass. These figures must be regarded as only approximate.

Mizpeh, or **Mizpah** (watch tower), name of sev. cities mentioned in the O.T. It is thought that the modern tns. of Sh'afat, near Jerusalem, and Suf, which is 36 m. from the anct. Heshbon, have grown up on the ruins of former Ms. (1) M. of Benjamin was the scene of the gathering of the Hebs. after the slaughter of the Benjamites (Judges xx.); of Samuel's ministrations (1 Sam. vii.); and of Gedaliah's assassination (2 Kings xxv.). It was the scene of fighting between the Turkish and Brit. forces in the First World War. (2) Jacob made his peace with Laban (Gen. xxxi.) and Jephthah took his vow (Judges xi.) at M. of Gilead, and (3) David met the Moabite king at M. of Moab (1 Sam. xxv.).

Mjosen, or **Miosen**, largest lake of Norway, situated in Hamar and Christiana. Its length is 35 m., and the greatest width 12 m.; it has an area of 150 sq. m.

Mijet, see **MELENA**.

Mnemon, see **ARTAXENXES II.**

Mnemonics, method or device constructed to assist the memory in difficult matters, e.g. dates in hist., mathematical constants, facts in geography, etc. Beyond the utilisation of association of ideas there is no scientific basis. The art was cultivated among the Gks. and Romans, Simonides among the former (fifth century B.C.), a poet famous for his memory, being generally credited with the first systematic device: this consisted in localising facts, so to speak. Each was associated with objects in the rooms of a house; when this was 'full' other houses, streets, dists., had to be associated. The system, so far as it was popular, relied on the rhetorical art so much cultivated. With the revival of learning, the subject again claimed attention, Roger Bacon writing *De Arte Memorativa*. A new system sprang up, in which letters of the alphabet were used for figures. The typical instance is the system of Feltraigo, pub. in 1812. The figures 0 to 9 were represented by letters, s, i, n, m, r, l, d, k,

b, p. These are chosen specially, *e.g.* $m=3$ because of three strokes. To remember 1760 yds. = 1 m., 1760 is represented by *i, k, d, s*, from which letters some word is invented by using further letters other than those in the system, *e.g.* 'thickheads,' which has the further advantage of being associated with poor memory. Dr. Edward Peck's *Memory and the Rational Means of Improving It* (1890) gives a system that has had some vogue. Numbers may similarly be represented by sentences, each word containing the corresponding number of letters. The device of rhyming is used, *e.g.* for the genders of Lat. nouns; in weather lore, 'evening red, and morning grey, two sure signs of one fine day.' Mention may be made of the Lat. tag, used for remembering syllogisms in logic, beginning 'Barbara Celarent.' For the hist. of the subject, see C. F. von Arstin, *Systematische Anleitung zur Theorie und Praxis der Mnemonik*, 1810.

Mnemosyne, Gk. goddess of memory, the daughter of Heaven and Earth (Cœlus and Terra) and the mother of the nine muses by Zeus.

Moa, native name for members of the extinct genus (*Dinornis*) of flightless birds of New Zealand. *D. giganteus* stood from 10 to 12 ft. high, had its legs enormously developed, and was probably capable of running at great speed; the head was very small. Other species included *D. struthiandra*, about the size of an average ostrich, and *D. didiformis*, which was only about 4 ft. tall. They apparently existed in considerable numbers, and their complete extinction is believed to have been of very recent date. It would seem that they were hunted by a race inhabiting New Zealand before the advent of the Maoris between 900 and 1300. Signs of these people have been found on the Waitaki R. banks in S. Is. Possibly the birds were caught by lassoes and floated down the riv. to vills. The genus was closely related to the genus *Appornis*, of

which huge remains are found in Madagascar.

Moab, anct. kingdom to the S.E. of Israel, occupying the high plateau to the E. of the Dead Sea. Some account of the hist. of Moab is given in the biblical narrative (Exodus, Numbers, Deuteronomy, etc.). In the reign of David, Moab became subject to Israel, but later regained her independence for a certain period.

Moabites, inhabs. of Moab. The M. were closely connected with the Hebs., and the Moabite language, is a dialect of the Heb. The Moabite deity was Kemosh.

Moabite Stone, famous victory-stele of Mesha', king of Moab (middle ninth century B.C.), is a record of historical relations between Moab and Israel, which are glossed over or omitted from the Bible (2 Kings iii. 4-27). Until the discovery, in 1823 of the Akhiram inscription of Byblos (N. Syria), the M.S. was regarded as the earliest inscription in alphabetic writing. This monument was discovered in 1868 at Dibon by the Ger. missionary F. A. Klein, but while the negotiations for its removal were going on, it was broken up by the Bedouins of the place to get more money for it. Later it was partly restored and the missing parts have been reconstructed. It is now deposited at the Louvre Museum in Paris.

Moallakat, or **Mo'allaqât**, collection of seven Arabic poems, so called, according to popular tradition, because they were suspended by the Arabs in the Kaaba at Mecca.

Moawiya (661-680), see CALIPH.

Mobangi River, see UBANGI.

Moberly, city of Missouri, U.S.A., in Randolph co., 59 A. N.W. of Jefferson City. There are lumber and flour mills and foundries. Pop. 14,000.

Mobile, city and port, co. seat of M. co., Alabama, U.S.A., on M. Bay. Raw cotton, timber, lumber, cereals, cattle, rosin, and oil are exported; bananas, sisal grass, coffee, manganese ores, etc., are the staple imports. The industries are saw-milling, shipbuilding, and the manuf. of cotton, veneers and machine-shop products. Pop. 79,000.

Mobile Bay, Battle of, naval victory, 1864, gained by the Federals under Farragut over the Confederates under Buchanan.

Mobilisation (Army), setting in motion of the standing army. It consists in carrying out all the necessary arrangements for putting the army on a war footing. All orders, warrants, stores, etc., are kept ready for immediate issue, so that the mere order to mobilise is sufficient. Each unit is inspected fully, and the numbers of reservists required 'called up.' While these are assembling at the regimental depot or other assigned place, outfit and equipment for war are drawn from stores. Reservists are then equipped and join their unit. To facilitate rapidity, private firms are under contract for transport and rapid supply of food, clothing, etc. In addition railway facilities and shipping accommodation, previously arranged in the scheme, are secured and transport etc., impressed under the authority of the Army Act. In

1917, consequent upon the estab. of the Air Ministry, the power to impress aircraft was transferred from the military to the air-force authorities.

Mocassin, shoe of the N. Amer. Indian. Originally, an ingenious covering for the foot made all in one piece of untanned skin. Its advantage for the hunter or scout is obvious. The form and style differed with different tribes and individual fancy, but it was usually made of raw hide, with uppers of soft deerskin, and often embroidered with beadwork or decorated with porcupine quills. It has given place largely to similar articles made in leather and in sev. pieces.

Mocassin-snake, see COPPERHEAD.

Mocha, or **Mokha**, fort, seaport and the former cap. of Yemen, Arabia, on the Red Sea, 3.5 m. N.W. of the strait of Babel-Mandeb. It was formerly important for its trade in coffee, most of which now passes through Hodeida. Pop. 5000.

ministry, but particularly of *Mimus polyglottus*, an Amer. bird, allied to the thrushes, which it resembles. It imitates a great variety of bird songs. The wings and tail are black, marked with white.

Mock Orange, or *Philadelphus coronarius*, hardy shrub (family Saxifragaceae) with large creamy-white flowers, possessing a fragrance rather like that of orange blossoms.

Mock Suns and Moons, or *Parhelia* and *Paraselenae*, development of halos of the sun and moon respectively. Added luminous circles, concentric, tangent, and intersecting are seen, some complete, others represented by arcs only; they often have straight lines or bands of light, sometimes forming a cross. For theory see HALO.

Mocrum, see MACARESCA.

Mod, Gaelic word said to be derived from the Norse and equivalent to the A.-S. *moot* (as moot-hill, a place of meeting). It

FOUR EXAMPLES OF THE MODE

There were twelve fundamental ecclesiastical modes: *left*, examples of the Authentic forms (1) Ionian (2) Dorian; and Lydian, Phrygian, Aeolian, Mixolydian; and *right*, examples of the Plagal forms (3) Hypoionian, (4) Hypodorian.

Mocha, or **Mecca**, **Stones**, are agates of which the colours are due to visible impurities. The M. stones or moss agates are filled with brown moss-like or dendritic markings distributed throughout the mass. They are obtained chiefly in Arabia, and are used as brooch stones.

Mock-heroic Poetry. From very early times burlesque has been a popular form of literature. The *Batrachomyomachia* was even attributed to Homer himself, and many anc. authors besides Aristophanes delighted in handling trivial themes with mock solemnity. Among the moderns the absurdities of medieval romanticists provoked in retort *Don Quixote* in prose, and in verse Pulci's *Morgante Maggiore* (1481) and Folengo's *Orlando* (1526), besides other burlesques. Among the best mock-heroes in Eng. are Chaucer's *Sir Thopas*, Butler's *Hudibras*, Pope's *Rape of the Lock*; W. B. Rhodes's *Bombastes Furioso*; and Shaw's *Admirable Bushville*; the duke of Buckingham's *Rehearsal* and Sheridan's *Critic* also contain good specimens. See F. Brie, *Englische Rokoko-Epik*, 1927; A. H. West, *L'Influence française dans la poésie burlesque en Angleterre entre 1660 et 1700*, 1930; and G. Kitchin, *A Survey of Burlesque and Parody in English*, 1931.

Mocking-bird, popular name of a number of birds, with exceptional powers of

was in old times specially connected with the holding of judiciary courts. The name was revived by an association called *An Commun Gaidhealach*, formed towards the end of the last century to promote the study of the Gaelic language, literature, and music. A M., similar to the Welsh Eisteddfod, is held in the autumn at some place in Scotland, and prizes are awarded for Gaelic compositions, both literary and musical, recitation, singing, and playing.

Modder River, l. b. trib. of the Vaal, Orange Free State, S. Africa. It is 186 m. long, and flows into the Vaal some 30 m. above that riv.'s confluence with the Orange R. In 1899 the Brit. under Methuen were defeated here by the Boers. See SOUTH AFRICA, *History*.

Mode, in music, the grouping of intervals within the space of an octave, known also as octave scale, or species. Various Ms. have been, and are, in use in different parts of the world; e.g. Hindu music divides an octave into seven intervals, or twenty-two part-intervals; and Mohammedan music divides an octave into seventeen part-intervals, from which it derives nearly twenty different Ms. of seven primary intervals, which differ according to the relative position of the short steps. The Ms. familiar to W. civilisation are derived from the Gk. and eccles. diatonic Ms. (see HARMONY); they

are therefore known as diatonic, respectively major and minor, and are in theory the most correct (see HARMONICS). In the major diatonic M., the octave has its semitone intervals between the third and fourth, and between the seventh and eighth; the other intervals being whole tones; in the minor, the semitone intervals are between the second and third, and between the fifth and sixth. Some modern composers, chiefly Fr. and Russian, have made use of a 'tonal' mode, consisting of six whole tones. Ms. were named after the old Gk. provs., and after sev. complicated changes, the system settled down so that, e.g., the Lydian M. started at G on the piano keyboard, the Phrygian at F, the Dorian at E; in medieval Ms. the Phrygian began at E, the Dorian at D, and the Lydian at F. A few appearances of the M. occur in more modern times, as in Beethoven's *Adagio* 'in the Lydian Mode' in his A minor posthumous string quartet, op. 132, and by Vaughan Williams and other recent composers.

Modelling, art of making representations of things in wax, clay, stone, cardboard, etc., more particularly applied to the making of a sculptor's model. This is the original design from which the actual sculpture is made. Potter's clay, mixed with finely powdered sandstone to make it work easily, is the material used. Models of various kinds are used for an infinite variety of purposes, educational not less than artistic.

For the purpose of figure or other complex sculptural work 'in the round,' clay models of all sizes, including life-size and over-life-size, are mounted on to an armature, consisting of iron supports and lengths of flexible metal tubing or, in the case of very large works, iron rods. These are shaped into the basic structural shape of the part to be modelled. A plaster mould is then taken of the model of which the bronze or plaster cast is made. An exact clay mould is also usually made for stone and marble statuary, reduced or full-size, of which a replica is then carved from the stone block. Terra-cotta sculpture is often modelled out of a solid piece of clay and the original work is fired in the kiln. See A. Toft, *Modelling and Sculpture*, 1905; F. J. Glass, *Modelling and Sculpture, with a brief History of the Art*, 1929; S. W. Anthonies, *Pottery and Modelling*, 1931; and S. Jagger, *Modelling and Sculpture in the Making*, 1933.

Modena or Mutina, Tommaso Barisini da, also known as Tommaso da Rabisino (fl. fourteenth century), painter of M. Nothing is known of his life. His chief works are a 'Madonna' in the chapel of the castle at Karlstein; another in the gallery at Modena; and a 'Madonna with Saints' in the Belvedere, Vienna.

Modena: 1. (Anci. *Mutina*.) Prov. of Italy, in Emilia. Area 1002 sq. m. Pop. 373,000. 2. Cap. of the above, situated between the Panaro and Secchia, 23 m. N.W. of Bologna. The chief objects of interest are the Romanesque cathedral of St. Geminianus, dating back to the

eleventh century; the ducal palace; the Albergo Arti, with its priceless library, the Biblioteca Estense, and picture gallery, including works of many of the great It. masters; and the univ., founded in 1678. The chief manufs. are silk, hats, glass, and leather. From 1288 the tn. was under the rule of the family of Este. Its dukes were expelled in 1860, when Modena was incorporated in the kingdom of Italy.

The Allies took M. on April 24, 1915. The prin. damage to the city was sustained in an air-raid on May 13, 1944, but more than half the chief monuments are intact and the rest relatively lightly damaged. Some five churches were hit, but only that of S. Vincenzo suffered grave damage. The archiepiscopal palace was slightly damaged, but the palazzi del Collegio S. Carlo and della Congregazione di Carità were severely damaged. Pop. (com.) 112,800. See also CITTANOVA.

Moderator, the presiding minister in the courts of the Presbyterian Church, i.e. the presbytery, synod, and ann. general assembly. The Ms. are elected from the elders, and hold office for one year. In the Assemblies they have only a casting, not a deliberative, vote.

'**Modern Churchman, The**,' quarterly magazine, pub. by Blackwell of Oxford; editor, Dr. Major. Founded in 1911 to maintain the ideals of Broad, Liberal, and Modernist members of the Church of England, particularly in relation to modern Biblical criticism and modern science, its motto is 'By identifying the new learning with heresy, you make orthodoxy synonymous with ignorance' (Erasmus).

Modernism, comprehensive term denoting a number of separate religious movements which arose within the Rom. Catholic Church in the nineteenth and early twentieth centuries, largely as the counterpart of the movement towards social freedom. It has been well defined by G. Tyrrell, one of its prin. exponents, as 'the desire and effort to found a new theological synthesis consistent with the data of historic-critical research.' M. was directed towards: (a) A new apologetic in which the traditional scholastic method should be abandoned and the cardinal points of Christian faith estab. through a modern evolutionary and dynamic theory of the universe; (b) Historical criticism. This set out to distinguish the spirit and form of dogmatic formulae and to reconcile the truth-value of dogma with its historical development; (c) Ecclesiastical reform. No detailed programme, however, was put forward by the modernists. Among the leading exponents of M. were: in France, E. Le Roy and A. Loisy; in Germany, J. Schmitt; in Italy, R. Murri and U. Fracassini; and in England, Baron F. von Hügel and Father G. Tyrrell. During the pontificate of Leo XIII. (1878-1904) none of the new teaching was condemned, though the Holy See took various steps to discourage and reprove them. But with the accession of Pius X. immediate steps were taken of a more drastic nature. Various modernist works were placed on the Index, a number of leading eccles. authors were suspended,

FIG. 1 (left). A, MODULATING VOLTAGE; B, AMPLITUDE-MODULATED CARRIER; C, FREQUENCY-MODULATED CARRIER

FIG. 2 (right). PLATE-MODULATED AMPLIFIER

and finally on Sept. 3, 1907, the whole body of modernist doctrine was solemnly condemned by the celebrated encyclical *Pascendi Dominici gregis*. All Rom. Catholic priests are still required immediately after ordination to take an oath against M. See, besides the works of those mentioned above, A. Houtin, *Histoire du modernisme catholique*, 1912, and M. Petre, *Autobiography and Life of George Tyrrell*, 1912.

Modestinus, Herennius, famous Rom. jurist, a pupil of Ulpian, and one of the counsellors of the Emperor Alexander Severus (c. 250). In the *Digests* of the Justinian Code he is classed as one of the highest legal authorities, and a large number of his dicta are cited.

Modica, tn. of Sicily, 32 m. W.S.W. of Syracuse. Oil, wine, and grain are the chief products. There are remains of megalithic buildings. Pop. 56,000.

Modigliani, Amadeo (1884-1920), It. painter and sculptor, b. at Leghorn, part Jew, part It., studied in the Lat. quarter, Paris, in which city he settled. He made a special study of primitive art, and as a young man produced some sculptures which showed the influence of Negro masks. His work classifies him as one of the real leaders in modernism in art. It is highly original, and his paintings are remarkable for the curiously elongated heads of their subjects. In his time he seems to have been the idol of the Lat. quarter, but drink and consumption killed him at an early age. See lives by A. Salmon, 1926; E. Schaub-Koch, 1933; also F. Carco, *L'Ami des peintres*, 1944.

Modillion, in architecture, a Fr. word of Lat. derivation, signifying the large oblong projections bearing a leaf or scroll on their under side which are arranged beneath the cornice in Corinthian entablature. A fine example is found in the choragic monument of Lysicrates, Athens.

Modjeska, Helena (1844-1909), Polish actress, was the daughter of a musician, Michael Opido. She first made a reputation for herself in Cracow, and afterwards in Warsaw, where she played leading roles in 1868-76. In the latter year she sailed for California with her second husband, Count Chlapowski. Their attempt to live on a ranch failed, and Madame M. returned to the stage, making a sensation at

San Francisco with *Adrienne Lecocqeur*. She was famous for her highly coloured interpretations of Ophelia, Desdemona, Juliet, Beatrice, and other Shakespearian heroines, and acted also in the plays of de Musset, Sardou, Dumas, and Schiller.

Modlin, see NOVO-GEORGIEVSK.

Modocs, N. Amer. tribe of a warlike and aggressive nature, formerly dwelling on the extreme N.E. frontier of California. Originally they formed one tribe with their N. neighbours, the Klamath, and, on seceding from this tribe, estab. themselves on Lost It. Most of them perished in the revolt of 1873, and some of the survivors were transported to the Nuapaw reservation in Indian ter.

Modulation. A simple radio wave or 'Carrier,' as it is called, conveys no intelligence apart from the fact that a transmitter is in operation. In order that communication may take place changes must be made to this carrier depending upon the information to be conveyed; perhaps the simplest example of this is the way in which the carrier may be keyed on and off in accordance with the symbols of the international code. If, however, speech, music, or pictures are to be transmitted a more complex process must be employed, and the action of impressing such forms of intelligence on the carrier is known as M. It can be carried out by causing changes to be made to any one of the characteristics of a carrier, namely, its amplitude, frequency, or phase, and while it is emphasised that ideally only one of these should carry the M., in practice small amounts of M. do often occur in one or both of the remaining two, leading to different forms of distortion at the receiver. M. in a form other than that intended is undesirable as, in addition to receiver distortion, it results in dissipation of transmitter power in unwanted directions.

Amplitude Modulation.—The method generally employed for medium, long, and short wave broadcasting is amplitude modulation (A.M.), which was, in fact, adopted from the earliest days as it has the advantage of being economical in channel space. As the name implies, the carrier amplitude is made to vary in sympathy with the electrical impulses which have been generated by the speech or

FIG. 3.

A SUPERHETERODYNE RECEIVER

FIG. 4. F.M. RECEIVER AND LIMITER VALVE

music to be transmitted, and reference to Fig. 1 will enable this to be more easily understood. If the modulating voltage is increased to a point where the carrier amplitude at the point X becomes infinitely small, without actually reaching zero, then the depth of M. is said to be 100 per cent, and the carrier is fully modulated. When this occurs the amplitude at the point Y is just twice that of the unmodulated carrier Z. The production of an A.M. carrier at high efficiency involves the use of considerable modulating power, and the modulator must be designed to deliver an output equal to half the input power to the amplifier to be modulated. Fig. 2 shows an arrangement for a plate-modulated amplifier. Receivers for A.M. are relatively simpler than those required for other systems since it is only necessary to convert the amplitude-modulated carrier into the audio-frequency voltage, which also varies in amplitude. Fig. 3 shows a typical detector circuit as used in a superheterodyne receiver.

Frequency modulation (F.M.) has only come into prominence since 1939, largely owing to the work of E. H. Armstrong in his paper 'A Method of Reducing Disturbances in Radio Signalling by a System of Frequency Modulation,' and also to the development of very high frequency (V.H.F.) broadcasting. Transmitters for F.M. are, in general, simpler than their A.M. counterparts, and the modulating power required is in all cases small, use often being made of a reactance valve in conjunction with the oscillator controlling the transmitter frequency. The modulating voltage is applied to this first valve in such a way as to vary its reactance so that the oscillator frequency is made to swing about a mean value at a rate corresponding to the audio-frequency being transmitted and by an amount proportional to this voltage. This deviation, as it is called, is expressed in kilocycles per second. As has been stated, an F.M. receiver is more complex than that for A.M., and the process of detection is carried out by means of a 'discriminator,' whose output voltage is, within limits, linear for a given deviation of the radio-frequency input. A typical circuit is illustrated in Fig. 4, which also shows the limiter valve which precedes it. The latter is most important if the full advantages of F.M. are to be realised for it limits the A.M. components which may result from natural or man-made inter-

ference, and prevents them reaching the discriminator. In passing, it is interesting to note that the limiter acts similarly to a 'leaky-grid' detector so that, if the receiver is to be used both for F.M. and A.M., the A.M. output is obtained across C_1 and R_1 .

Phase Modulation (P.M.), whilst different in principle to F.M., is nevertheless similar when the resulting carrier and sidebands are examined and, at the same time, the receiver is on the same lines as that for F.M. M. is effected by causing the speech wave to shift the phase of carrier to its sidebands.

It can be said that the advantages of F.M. and, to a certain extent P.M., over A.M. are: (1) Improved signal to noise ratio for a given field strength, as it discriminates against noise which is A.M. in character. (2) Simplicity of M. equipment at the transmitter and low modulator power. (3) Better intelligibility at the edge of the service area by virtue of an inherent 'capture' effect which tends to make the receiver hold the wanted signal. (4) Greater volume range for music which obviates much volume compression. The disadvantages are: (1) F.M. and P.M. require a wide band of frequencies for their transmission, thus restricting their use to the V.H.F. region of the radio spectrum. (2) The receivers are more complex than those required for A.M. (3) F.M. is more susceptible to selective fading than A.M.

Modulation, in music, signifies a change of tonality or key, and is in one of three classes: diatonic (natural), chromatic, or enharmonic (both artificial). The term is also used to express gradation as regards quantity of sound. See also HARMONY. See C. Zoller, *The Art of Modulation*, 1930.

Modulus, in physics, a constant quantity depending on the properties of matter, when these properties are expressed by means of mathematical equations. The chief moduli occur in questions of elasticity. Thus when an elastic string is stretched Hooke's law states that the strain produced is proportional to the extending force. Now, if a constant k is introduced which converts this statement into an equality, k is called a modulus of elasticity. Expressed symbolically, if T = extending force in lb. per square inch, l = the normal length of the string, and

$$P = \text{extended length, then } T = \frac{kP \cdot l}{l'}$$

Clearly then, if $\mu = 2l$ then $T = k$, thus k is equal to the tension in the string when extended to twice its normal length; k in this case of simple extension is called Young's modulus. A body subjected to a force may be altered in shape or in size, or may be altered in both shape and size. When the force merely produces a change in vol. the equation stress = $k \times$ strain is still true, and in this case k is called the modulus of bulk. If the force, or stress as it is most frequently called, produces a change of shape, then k is called the modulus of rigidity. The term modulus has some significance in mathematics. In the theory and practice of logarithms it is the number by which the logarithm of a number to a given base is multiplied in order to convert it into its logarithm to a different base. The symbol $\{\vee 16\}$ means plus +, and shows the value of the magnitude without regard to sign. This symbol is termed *M*.

Moe, Jørgen Ingebrektsen (1813-82), Norwegian author, b. on the Moe estate, Ringerike, Norway, of peasant parents. He studied theology at Christiania, and became a clergyman in 1853. He was ultimately appointed bishop of Christiania (1875), where he d. *M.*'s first pub. was *Samling af Sange, Folkeser og Steri Norske Almuedialeter*, a collection of folk-songs (1840). Two years later, in collaboration with Christen Asbjørnsen, he pub. Norwegian folk-tales, *Norske Folke-Eeventyr* (2 series, 1842-44 and 1871). As a poet, *M.* is best known by his *At Lange paa Juletraet* (1855). His *Samlede Skrifter* appeared in 2 vols. (1877).

Moehringia, genus of perennial plants (family Caryophyllaceae) now incorporated in the genus *Arenaria*.

Moen, is. of Denmark, lying between Zealand and Falster. It is divided from the former by Ulv Sound and from the latter by Grov Sound. It is 20 m. long and has an area of 86 sq. m. It actually consists of seven is. gradually joined together by the receding of the sea, and nine centuries ago it was still divided into three is. It is the highest is. of Denmark after Bornholm, with precipitous limestone cliffs (500 ft. high) on its E. extremity, which is called Moensklint. The soil is chalky and fertile. Its chief tn. is Stege. It has a lighthouse visible for 14 m. Pop. 16,000.

Moeran, Ernest John, Eng. composer, b. 1894 in London, of Irish descent. He was educated at Uppingham School and afterwards studied at the Royal College of Music in London. His studies were continued with John Ireland, after service in the First World War. He first came to public notice in 1923 with a London concert. His works include *Magnificat* and *Nunc Dimittis*, *T. Deum* and *Jubilate*, two anthems, a symphony in G minor, concertos, trios, etc., and a number of songs, including the cycles *Ludlow Town* (from A. E. Housman) and *Seven Poems by James Joyce*, *Songs of Springtime*, and arrangements of folk-songs of Norfolk, Suffolk, etc.

Moeris, Lake, 35 m. long and 4½ m.

broad, situated in the prov. of Fayum, Central Egypt. It is now known as Birket-el-Karun. Once much larger, on its banks was the labyrinth described by Herodotus; Amenemhat III. was responsible for the embankment of the lake. See R. H. Brown, *The Fayum and Lake Moeris*, 1892.

Moeritherium, extinct animal found in the Middle Eocene beds of Egypt, not larger than a tapir, and undoubtedly the earliest form yet discovered of the proboscidean group of mammals. This, with others recently discovered in Egypt, affords a most important link between existing elephants, which some authorities regard as properly belonging to a distinct order, and other ungulates. The second pair of incisors in each jaw exhibit an enlargement which is accepted as a stage from which the four-tusked mastodons (*Trilophodon* or *Tetrablodon*), with a snout-like muzzle instead of a trunk, evolved.

Moero, or Mweru, Lake, 76 m. long and 25 m. broad, was discovered by David Livingstone in 1867, and further explored by Sharpe in 1890; it lies 90 m. S.W. of Lake Tanganyika in Central Africa.

Moesia, anct. Rom. prov. occupying the ter. S. of the Danube, and corresponding to Bulgaria and Serbia. It was first inhabited by Thracians, then by Celts, and was conquered by the Romans, in 29 B.C. The Emperor Domitian divided it into two provs., *M. Superior* and *M. Inferior*. See *Moeso-Goths*.

Moeskroon, see *MOUSCROON*.

Moeso-Goths, name given to certain Visigoths who settled in Lower Moesia (q.v.), at the mouth of the Danube, in the third and fifth centuries. They were converted to Christianity by Ulfilas, who trans. the Bible for them.

Moffat, James (1870-1944), Scottish theologian and translator of the Bible, educated at Glasgow Academy and Univ. Ordained in 1896, he was Yates prof. of Gk. and the N.T. at Mansfield College, Oxford, 1911-15. He will be chiefly remembered for his new trans. of the Bible. In 1924 he revised an earlier version of the N.T. which he had pub. in 1899, and in this new version he used modern and colloquial phraseology. He subsequently made a similar version of the O.T., publishing Genesis and Esther in 1924, and the remainder in the succeeding year. His trans. did not escape hostile criticism, some regarding his colloquialisms as vulgar, while others took exception to the Scottish vernacular terms. *M.* was prof. in the college of the United Free Church of Scotland for some years, and was prof. of church hist. in the United Theological Seminary, New York, where he d. His pub. also include *Introduction to the Literature of the New Testament* (1911); *Hebrews—International Critical Commentary* (1924); and *Everyman's Life of Jesus* (1924).

Moffat, Robert (1795-1883), one of the pioneers of missionary work in Africa, and father-in-law of David Livingstone, was a native of Haddingtonshire. In 1814 he offered his services to the London Miss

slonary Society, and in 1816 he was sent out to S. Africa, where he worked with great success in Namaqualand, converting the chief, Afrikaner. Afterwards, having married (1819), he and his wife spent nearly fifty years mainly among the Griquas and Bechnanias. His *Missionary Labours and Scenes in South Africa* appeared in 1842. See J. S. Moffat, *Lives of Robert and Mary Moffat*, 1885.

Moffat, police burgh, burgh of barony (1635), and par. of Dumfriesshire, Scotland, on the Annan, 20 m. N.E. of Dumfries. It is noted as a health resort. Pop. 3400.

Mogadishu, or **Mogadiscio**, cap. of It. Somaliland. The old Arab tn. is interesting. The modern tn. is well laid out, the main artery being particularly fine. There is good communication by road with Nairobi. A breakwater of 3000 ft. was in process of extension so as to enclose a sheltered harbour, when war broke out. The tn. was captured by imperial forces under Gen. Cunningham in 1941 in the campaign which resulted in the fall of the whole of It. E. and N.E. Africa. Pop. 35,000, including 8000 It.

Mogador, or **Es-Sueira**, chief seaport of Morocco on the Atlantic, and next in importance to the city of Morocco. Its exports include gum, wax, olive oil, and skins. Pop. about 28,600.

Mogila, **Peter** (c. 1596-1647), Russian prelate, belonging to a Wallachian family of rank. He was metropolitan of Kiev from 1632 until his death. He drew up a *Catechism* (1645), and the famous *Confession of Faith of the Orthodox Greek Church in the East* (1643), accepted by the synod of Jerusalem in 1672.

Mogilev, or **Mohilev**: 1. Region of the Byelorussian S.S.R., bounded on the N. by Vitebsk, E. and S. by Smolensk and Tchernikov, and W. by Minsk. The chief riv. is the Dniester, which enters M. in the N.E., runs westward as far as Orsha, and then flows S. to its junction with the Beresina. The prin. occupations are agriculture and cattle breeding. Corn, rye, oats, and barley are grown. The chief tns. are M., Chausy, Orsha, etc. Area 18,700 sq. m. Pop. 2,560,000. 2. Cap. of the above region, stands on the Dnieper, 94 m. S.W. of Smolensk. Its cathedral was founded in 1780. It has artificial silk works, tanneries, and ironware factories. Pop. (1939) 99,500. It was occupied by the Gers. soon after the launching of the invasion of 1941 and remained in Ger. hands until the middle of 1944. The Russian advance of 1943 took their forces within 25 m. of M. by the end of the year, but Ger. resistance was tenacious and no further progress was made for some time. It was the breaking of the 'Fatherland line', a string of bastions from Vitebsk to Zidobin whose defences had withstood repeated Russian assaults through the winter, that brought about the fall, to Gen. Chermnyakovsky, of Vitebsk, one of the strongest focal points of the line, and with it that of M. fell to Gen. Zakharov, who forced the Dnieper above the tn. and captured it in a frontal assault after a day of street

fighting (June 28, 1944). 3. Or **Mogilev-Podolski**, tn. in the Ukraine S.S.R. on the l. b. of the Dniester, named after the Moldavian hospodar, Mohila. It has flour-mills and sugar refineries. It was long contested between the Poles and Cossacks, but was finally taken by the Russians at the end of the eighteenth century. Pop. 30,000.

Mogul, **Moghal**, or **Mughal**, Arabic and Persian forms of Mongol, is usually applied to the Mohammedan empire in India, founded by Baber, a descendant of Tamerlane, in 1526. The emperors of Delhi were usually styled the Great Moguls. The M. Empire crumbled after the death of Aurungzebe (1707) and the rule of the Ms. came to an end after the Indian mutiny in 1858, the last of the line dying in imprisonment at Rangoon in 1862. See also ARAB; INDIA, *History*.

Mogul Painting, see INDIA, *Indian Art*. **Mohács**, tn. in the prov. of Baranya, Hungary, on the Danube, 25 m. E.S.E. of Fünfkirchen, otherwise Pécs. Two famous battles were fought at M. On Aug. 29, 1656, the Turkish forces of Soliman the Magnificent annihilated those of Louis II. of Hungary, and went on to capture Buda. On Aug. 12, 1687, Charles of Lorraine defeated the Turks, in a campaign which drove them out of Christian Europe. Pop. 17,300.

Mohair, see WOOL.

Mohammed, or **Mahomet** (properly **Muhammad**, 'the praised' or 'the desired'), also **Mohammad** (c. 571-632), the founder of Mohammedanism, or the faith of Islam. He named his religious system Islam or *Hanif*, apparently 'devoted.' M. himself was of the Banu Hashim, who are said to have claimed the position actually enjoyed by the Banu Ommaya, but this assertion seems to have originated in the claims to the caliphate which the Hashimites (the house of Ali and the Abbasids) subsequently opposed to those of the Ommayyads. His father, Abdallah, came of good Arab stock, and was a member of the tribe of Koreish. M. was a posthumous child, and his mother, Anna, lived only till his seventh year; on her death his grandfather, Abd-al-Muttalib, took charge of him, and on his death at the end of only one year, M. was adopted by his uncle, Abu Talib. The child was an epileptic, and was of a melancholy, thoughtful disposition. Most of his early life was passed in tending flocks of sheep and herds of camels; he had little or no education, and as a lad could neither write nor read. His grandfather had been a man of considerable standing, and had taken charge of the Temple and the Holy Well in Mecca, so that the boy must have seen and known many pilgrims and holy people. His uncle was a poor man, and until twenty-six years of age M. worked hard for his living like any other young Arab. In his twenty-sixth year a wealthy widow, named Khadija, fell in love with him and married him; she was fifteen years older than M., and appears to have been a woman of great good sense and patience, with a whole-hearted belief in her young husband

that materially helped him in his subsequent career. As a young man he naturally worshipped at the Kaaba, the great sanctuary of Mecca, originally a local sanctuary of the Koreish tribe. The Kaaba contained the image of Hobal, their tribal god, also sev. other deities belonging to other tribes, and, more sacred than all, it held the famous 'black stone' of Mecca (q.r.). 6 to 7 in. square, built into the walls of the Kaaba, traditionally held to be a stone from Paradise brought down by the angel Gabriel.

M.'s first battle took place when he was quite a young man, in a blood-feud between his tribe and the tribe of Hazaiz, in which he did not distinguish himself or show any of his later military spirit. After his marriage with Khadija he seems to have been a partner in a produce-shop. During his thirty-fifth year the Kaaba was wrecked by a great storm. No person could be found who would venture to replace the sacred stone in the wrecked shrine, and it was finally decided that the first man who entered the court by chance should be the chosen one. To M. fell the honour. All his life the prophet had been interested in theology, and he had been slowly forming his new belief in one God, but as yet he had not proclaimed himself a prophet. His first revelations came to him in a cave in Mt. Hira, where he had retired with his wife for meditation. Here he appears to have had visions and religious ecstasies. Khadija, at first alarmed about his health, later, when he declared the angel Gabriel had appeared and spoken with him, at once believed him to be a prophet. He now put his new doctrine into the famous formula, 'There is no God but God, and Mohammed is the apostle of God.'

Among the people of Arabia the early Semitic religion had survived with little change save deterioration. It had many deities, of whom Allah was chief, but scarcely worshipped. The worship of natural objects, of stones, like the Kaaba, and of images, was practised. Debased forms of Judaism and Christianity also flourished. Many Arabs, known as Hanafites, rejected these, as well as the native faith, held a simple monotheism and absolute submission to Allah, and practised asceticism and meditation. M. came in contact with all these faiths, and his doctrine developed out of them, particularly from Hanafism. His originality lay in his putting monotheism on a firm foundation, proclaiming it as an absolute revelation, and making it the centre of a definite creed and worship.

For the first few years his faithful wife, his friend Abu Bekr, and his adopted slave Zaid worked in secret, converting only a few. Meanwhile the revelations became more frequent, and during his trances he uttered messages which were carefully remembered and written down. They varied in subject, from hist. and magic to religious teaching, and formed the beginning of the Koran (q.v.). His friends were aware that as a boy he was subject to fits, but they believed these later seizures to be inspirations from God. His attitude

to Jews and Christians at this period was friendly and conciliatory. The first religious meetings were held on Mt. Safa, where M. boldly proclaimed himself to be the prophet of Arabia. From here he preached his doctrine to the people of Mecca, denouncing idolatry, preaching heaven and hell, and declaring Allah to be the only God.

His followers were named Muslim (Moslems), which, as apparently meaning 'traitor,' 'surrenderers,' remains difficult to understand. The fury of the tribe of Koreish, who had charge of the holy shrine, merely added energy and fervour to his preachings, and he threatened the non-believers with awful tortures in hell, and petrified Mecca with his furious eloquence. He estab. himself in the house of a rich convert in the centre of the tn., and held frequent meetings. The Moslems now began to be cruelly persecuted by the Meccans, and the prophet was blockaded in his own house, for though persons might be starved to death, no blood must be shed in the sacred city. After a revelation that the goddesses of Mecca existed as well as Allah, the siege was raised, but once free M. asserted that the revelation came from the devil, and the trouble was renewed. Khadija d. about this time, and also Abu Talib, and his strongest influence for good and his protectors were thus removed. The prophet was forced to flee from the wrath of the Meccans to Yathrib, afterwards called Medina. This is the *Hijra* (Hegira), Sept. 22, A.D. 622, from which Moslem chronology dates as A.H. 1.

From the hour of the *Hijra* Islam began its career of conquest, and M. his role of statesman, lawgiver, soldier, and king. With success came the weaknesses which stained his career, and the revelations by which he excused them. The divine sanction claimed by M. for wholesale slaughter, and his love of women, cannot be excused. M., in trying to realise a great idea, came into contact with the world, and had to place himself on a level with it, and thus rendered himself liable to deterioration. In this respect he compares unfavourably with Buddha; and his weaknesses reacted on his religion, and became its most dominant notes. M. bound his followers to himself by the strongest ties, and caused both helpers and followers to intermarry. He contracted sev. marriages himself, one wife being Ayesha, aged nine, the infant daughter of Abu Bekr.

The first Moslem mosque was built at Medina, and an arranged code of laws estab., dealing with ceremonial washing, praying five times a day with the face turned towards Mecca, abstinence from the drinking of wine, and the abolition of infanticide. Prayers were formerly directed to Jerusalem, until the prophet found that no compromise could be made with the Jews. He also estab. the call to prayers, *muezzin*, and Friday as the sacred day of the week. He enforced the 'fast of Ramadan,' a period when no food may be eaten from sunrise to sunset. The prophet next began his series of campaigns,

the first successfully directed against the Meccan caravans. The second resulted in the victory of Badr (Badr) (A.D. 629). The prophet's plundering expeditions added great wealth to Medina, while his army rapidly grew strong, and in A.H. 8 (A.D. 630) he marched on Mecca with 10,000 well-disciplined men, easily conquering the most sacred city of Arabia. The next year the great pilgrimage was managed by the Moslems, and very quickly Mecca itself was a Moslem town. M. no longer showed mercy; all unbelievers were to be slain, his soldiers became fierce religious zealots, who died cheerfully for the faith and the promise of Paradise held out by the prophet. The conquest of Mecca brought thousands of converts to the white standard of the prophet, and in one year his army grew from 10,000 to 30,000 men. The subjugation of Arabia was assured.

The last years of M.'s life were spent in a succession of victories, especially that of the 'Day of Hain' against a confederacy of tribes. He died of some fever at the age of sixty-three or sixty-five. The date of his death was 12 *Rabi*, A.H. 11, the A.D. equivalent of which is June 7, 632. His beloved wife Ayesha was with him, and he was buried on the spot where he died in Medina. The tradition of the appearance of M. seems to have been that of a middle-aged, heavily built man with a large head and big, thick hands and feet, with long hair and dense beard; his eyes were said to be tinged with red. He left no son to succeed him.

After his death the sayings of his revelations were collected, and being bound together formed the Koran. These sayings were scratched on bones, written on palm leaves, and some on parchment, and there could at the time be no proof that some were not spurious. M.'s revelations during twenty-three years form the contents of the Koran, but their final arrangement, arbitrary, and inconsecutive, was made long after his death. M. had given his world a new religion, and a new code of laws, many of which he was the first to violate, though always excused by a special revelation. For the effect of his teaching and its far-reaching influence see MOHAMMEDANISM, and for the succession after his death see CALIPHATE; see also ISLAM; SHIITES and SUNNITES.

Mohammed II. (1430-81), sultan of Turkey, called the Conqueror, *b.* at Adrianople, succeeded his father, Amurath II., in 1451. Taking Constantinople in 1453, he next fortified the Balcans, conquered Greece and most of the Balkan territories, while at sea he became the terror of

S. Europe. He died in an expedition against Persia.

Mohammed V. (1844-1918), penultimate sultan of Turkey, *b.* at Constantinople. When the Turkish revolution occurred in 1909 at the instigation of the 'Young Turks' committee, the army under Shevket Pasha (assassinated 1913) took possession of Constantinople, deposed and exiled the Sultan Abdul Hamid, and replaced him by his brother, M. Reshid. M. V. died in 1918 and was succeeded by his brother Vahid-ed-Din, who was declared deposed in 1922 and was the last Turkish Sultan.

Mohammed Ahmed, see under MAHDI.

Mohammedan Art. After the death of Mohammed, in the seventh century, many countries came under the conquering influence of the Arabs, and there grew up a distinct form of M. A. and culture, to be found principally in Syria from A.D. 650 to 1400, in Persia and Egypt from 700 to 1900, and in India from 1556 to 1800, while it is also traceable in Turkey and some parts of Africa. The chief arts practised by the Muslims are architecture and miniature painting. There is little Mohammedan sculpture except in the form of ornamental carving, but metal and bronze work is common. Mohammedan crafts include ceramics, fabric and carpet-weaving, enamelling, tile-making and mosaic work, and the manufacture of weapons, glass and crystal ware.

The chief form of Mohammedan architecture is the mosque. Originally the mosque was a room in which Mohammedans could gather together for worship; the room contained no idols, was open to the sky, and had a niche to indicate the direction of Mecca. Later the architecture of the mosque became more elaborate. Mohammedans were called to prayer by a loud call which was uttered from the top of a high tower built for this purpose. These towers or minarets were either attached or built close to the mosque. The most distinctive features of Mohammedan architecture are the domes and radiating arches. This style is common to all Mohammedan buildings, and that of the mosques in India can be traced to the mosques built in Bagdad in the time of the Abbasid caliphs during the eighth and ninth centuries. Subsequent to that period is the vaulted architecture of Mesopotamia. The M. A. of India is to be found chiefly in the mosques and tombs and in painting. The mosque of Mahafiz Khan (fifteenth century), the Small Golden Mosque in Gaur, built of basalt in A.D. 1500, and the Pearl Mosque of Agra (1653) are among the most representative of Mohammedan mosques in India, while other famous Mohammedan buildings are the palace of Delhi, begun in 1638, and the memorial tomb, the Taj Mahal, the inscription of which was set up in 1646. In these Indian mosques much lattice work curving in wood and stone has been executed, the designs being of varied conventional pattern. Mosaic and inlay work were also used for decoration together with enamelled tiles, but this latter reached a greater perfection as an art in Persia.

There are sev. fine examples of Mohammedan architecture in Spain. The Alcázar and Giralda at Seville are notable in a city which is more prominently Moorish than any other Sp. tn.; the former, of the fourteenth century, and the latter, the bell-tower of an old mosque, show features such as arches, slender shafts, and open trellis work, which evolved from It. originals through Byzantine practice. Stucco decoration is well represented in the Alcázar, and in the Alhambra at Granada. The early period of the mosque is illustrated by that at Cordova (perhaps the finest specimen of Mohammedan architecture in Europe), of the eighth to tenth centuries.

design, and among other things coins were decorated in this manner.

Arnold, *Painting in Islam: a Study of the Place of Pictorial Art in Muslim Culture*, 1928; E. D. Ross, *Persian Art*, 1930; V. Smith, *History of Fine Art in India and Ceylon*, 1930; M. Dimand, *A Handbook of Mohammedan Decorative Art*, 1930; and K. A. C. Creswell, *Early Muslim Architecture*, 1932.

Mohammedanism, faith of Islam, the religion preached by the prophet Mohammed (q.v.). The sacred book of the faith

THE COURT OF THE MYRTLES THE ALHAMBRA, GRANADA

All M. A. is conventional in design, as the Mohammedan religion forbade the representation of animal or plant life or human portraiture. Some Mohammedan artists, however, broke away from this tradition, for leaves and flowers are to be found in Persian designs. In miniature painting also and in illuminated MSS. plant, animal, and human forms appear, but never with the same freedom as, for instance, in Chinese paintings. The portrait in M. A. is also conventionalised. Persian paintings are most notable for their combination of line and colour, while in the paintings of India it was as colourists that the Mohammedan artists most excelled. The flower design in Mohammedan ceramics derives from the early Persian period; the colours, design, and glaze of this pottery are extremely harmonious. Examples of M. A. as applied to weapons and armour are found especially in Turkey and Persia. The Turkish helmets were conical and beautifully engraved with arabesque designs with gold and silver decorations. Owing to the religious restrictions laid upon the arts, calligraphy was always a great source of

is the Quran (Koran), compiled after the death of the prophet, who, as far as we know, wrote nothing himself. The original creed was founded on Mohammed's belief in the one God, a loving Father who rules the universe with mercy; later, God was transformed into a hard, unforgiving despot who demanded the eternal destruction of all unbelievers. The creed is simple: 'There is no God but God, and Mohammed is the apostle of God.' However vile a Muslim may be, he can be saved, and however excellent an unbeliever may be, he must be damned for ever. The teaching of the faithful about women is a grave wrong in so great a faith; it destroys at once the sanctity of marriage and of motherhood, and the purity of the man's home.

Mohammed lifted Arabia from its ignorant worship of degraded gods, and he enforced strict laws of prayer, abstinence from wine, fasting, and cleanliness. The Koran embraces the whole teaching of Islam; the four prin. laws regarding the individual are first, worship, i.e. prayers to Allah five times a day, preferably in a mosque, but otherwise with the face

turned to Mecca; secondly, fasting during the month of Ramadan from sunrise to sunset, including abstinence from smoking as well as food and drink (this month may occur at any season of the year, as the ceremonial year depends on twelve lunations unconnected with the seasons); thirdly, pilgrimage, to travel once at least during a lifetime to Mecca, and perhaps once to Medina; fourth, the giving of alms for the support of the faithful poor. Women are not compelled strictly to observe these laws; those who can are naturally expected to fulfil their duty, but fasts and pilgrimages are not asked of them unless health and circumstances make it possible. Women pray in the mosques apart from the men, closely veiled as the Mohammedan law compels, but they may not lead the prayer, nor is it considered desirable that they should often offer public prayer.

No other sacred book is exactly parallel to the Koran in the influence it exerts over all parts of life, in the intense realization of the unseen, in its promises of future sensual joys, and in the stupendous but absurd claims made for it. The value of its more crude beliefs must not be judged too absolutely, for they are infinitely superior to many pagan systems, and when compared with many of the grossly superstitious faiths which M. supplanted, its doctrines have their positive value. But with the advance of the world M. cannot remain as the final form of religion and ethics for the races which now it sways. 'It hides more than it reveals God, and it makes men virtuous by outward precept rather than out of real love of noble conduct' (J. A. Macculloch, *Religion: its Origin and Forms*). Besides the Koran three other books contain foundations of the faith of Islam, the *Sunna*, or traditional law, the *Umma*, and the *Kias* (*Kiyas*). The *Umma* are authoritative opinions on points of Mohammedan law delivered by those who were actual companions of the prophet. The *Kias* are the argument from analogy to support a legal rule for which there is no direct authority. These four comprise the whole religion of the Moslem.

The fact of the prophet being in possession of Mecca, the Arabian sanctuary, and the promise of a paradise which fulfilled all the material desires of the Arab, aided largely to increase the mass of converts. The prophet left no son, and after his death Abu Bekr succeeded as caliph (successor), or religious head of the Mohammedan empire. Each succeeding caliph was to be a direct lineal descendant of the prophet (see CALIPH). In 654 the third caliph was murdered, and Ali, cousin of Mohammed, and husband of Fatima the prophet's daughter, succeeded as religious head of the empire. This was the beginning of the two great factions in the Moslem church, namely the Sunnites and the Shiites. Orthodox Muslims are known as Sunnites, because they accept the traditional teaching of Mohammed, or *Sunna*. These traditions, like those of the Jewish rabbis, have grown to an enormous

number, and regulate every detail of life. But even among Sunnites there are schools called after their respective founders, who interpreted the Koran and the mass of traditions in different ways. The Shiites reject the *Sunna* of the orthodox, though they have evolved a *Sunna* of their own, and in general apply an allegorical method to the Quran. The Sunnites refused the belief of divine succession, and the Shiites regarded the first caliphs as usurpers, and Ali as the divine leader. Ali was murdered; Hassan, his son, took his place and was poisoned by his wife; then Hussein, his youngest brother, succeeded him, and he was slain at Kerbela and buried there; the place has since become a second Mecca to the Shiites. Only one of Hussein's children survived the massacre, named Zayn-ul-Abidin, and through him the Orthodox Mussulman Church claims the divine succession. The Shiites flourish chiefly in Persia. The Sunnites and the Shiites are often opposed to one another, both in points of law and in the sanctity of their leaders. The sect of the Wahabis (*q.v.*) had their origin in Arabia in the eighteenth century, when Mohammed Wahab tried to restore the primitive form of Islam and to remove abuses that had gathered round the faith. An interesting attempt to engraft on M. principles wholly foreign to it is found in Sufism (*q.v.*) a movement within Islam, rather than a separate sect, having for its purpose a mystical union with God.

At the death of the prophet, the Mohammedan empire consisted of Arabia only, but close on a hundred years afterwards the faithful re'd from the Indus to the Pyrenees, compelling all subjects to accept the faith or die. The grandfather of Charlemagne finally drove them from France (A.D. 732). Egypt and Moslem Asia united and placed their cap. at Bagdad. The Turks (Asiatic people from Turkestan) formed the bodyguard of the caliphs in Bagdad, and becoming stronger than their leaders conquered Asia Minor in 1299; it was then the title of sultan ('victorious') came to be used. The Turks invaded Europe, 1355, and besieged Constantinople in 1356, 1422 and 1453, in which last year they captured it, and it remained their cap. until 1923, when Angora (now Ankara) was declared the cap. Through the eleventh and twelfth centuries the Muslims gradually spread into India and crossed the Punjab into the Deccan, where the prophet's creed remains one of the prin. faiths of that part of the country to-day. From this brief survey it can be seen how far and wide the teaching of the prophet has been carried; it has borne its fierce followers to win empires, but has not taught them to govern them. The consensus of W. opinion is that the laws of this great faith militate against progress, and destroy the main road to real civilisation: it recognises slavery, and degrades its mothers and daughters, but there is much simple truth and wonderful strength in the creed. See K. H. Becker, *Islam Studien*, 1924 ff.; R. Levy, *An Introduction to the Sociology of*

Islam, 1931-33; A. J. Arberry and R. Landau, *Islam To-day*, 1943; and H. A. R. Gibb, *Mohammedanism*, 1919.

Mohammed Riza Shah Pahlavi (Persian **Mohammed Riza Pálavé**) (b. 1919), shah of Persia. He succeeded to the throne in 1941 upon the abdication of his father, Riza Shah Pahlavi.

Mohammed Zahir Shah (Afghan **Mohammed Zā-her Shāh**) (b. 1914), king of Afghanistan. Succeeded his father, Mohammed Nadir, on the throne in Nov. 1933, on the latter's assassination.

Mohammera, Mohammerah, Muhamrah or **Khorramshahr**, tn. in the prov. of Khuzistan, Persia, between the Euphrates (Shat-el-Arab) and Karun Rs. It exports wheat, wool, horses, and opium. The tn. has increased in importance since the opening of the Karun canal in 1889. Pop. 30,000.

Moharram, first month of the Mohammedan year, which, consisting of twelve lunar months, contains only 354 days, to which, in what are called intercalary years, one more is added. Thus their New Year's Day falls continually eleven days earlier than in the preceding year. It is a time of mourning for the Shiites, to commemorate the deaths of Hassan and Hussein. In India it is a festival of rejoicing for Shiites, Sunnites, and Hindus, particularly Marathas.

Mohave, Amer. tribe of the Yuman linguistic stock. They inhabit both sides of the Lower and Middle Colorado R., and number a few thousands.

Mohave or Mojave Desert, elevated sandy plateau in San Bernardino co., California, U.S.A.

Mohawk, trib. of the Hudson R. in New York, U.S.A.; it rises in the co. of Oneida, and joins the Hudson a few miles above Troy. Length 160 m.

Mohawks, tribe of Amer. Indians which belonged to the Confederacy of the Five Nations. Their ter. reached from the St. Lawrence down to the Catskills. After the war of Independence they removed to Canada, where they were assigned a location on the Grand R.

Mohawks, or Mohocks, lawless band who infested London about 1711 and 1712. Their practice was to parade the streets of London at night, and under cover of the darkness to commit many outrages upon harmless citizens.

Mohenjo Dara, anct. city of Sind, India, see under INDUS VALLEY CULTURE.

Mohicans (Wolf Indians), branch of the Algonquin stock, who originally inhabited the Hudson valley, but were driven eastward by the Mohawks. They sided with the colonists during the revolutionary war, and are now practically extinct.

Mohilev, see MOGILEV.

Mohl, Hugo von (1805-72), Ger. botanist, brother of Julius von M., b. at Stuttgart in Württemberg. He studied at Tübingen, where he became prof. of botany (1835). It was M. who suggested the name *protoplast* for the vegetable cell, the conception of which he clearly defined in 1846, showing the true relationship between the nucleus and the rest of the cellular system (see CELL). His prin-

work is *Grundzüge der Anatomie und Physiologie der Vegetabilischen Zelle* (1851, Eng. trans., 1852).

Möhler, Johann Adam (1796-1838), Ger. Rom. Catholic theologian, b. at Igersheim, Württemberg. He is principally remembered as the author of *Symbolik oder Darstellung der dogmatischen Gegensätze zwischen dem Katholiken und Protestanten* (1832). His miscellaneous works were ed. by Dr. Dollinger (2 vols.), 1839-40. See K. Eschweiler, *Möhlers Kirchenbegriff*, 1930.

Mohmand, powerful Pathan tribe inhabiting the wild mountainous dist. of the N.W. frontier of Pakistan. Once hostile, they are now engaged in trade in the Peshawar valley, and number about 100,000 in Pakistan. See W. S. Churchill, *The Malakand Campaign*, 1898.

Möhne, trib. of the Ruhr R., 43 m. long, in Westphalia, Germany. It rises near Brilon and joins the Ruhr at Neteln. The M. dam in the Arnsberg forest, built 1908-13, was breached by mines dropped by R.A.F. aircraft on May 18, 1943.

Mohocks, see MOHAWKS.

Mohr, Karl Friedrich (1806-79), Ger. physicist, son of a chemist of Koblenz, educated at Heidelberg, Berlin, and Bonn univs. It is claimed by some that he was the first to enunciate the principle of what is now called the conservation of energy. His chief work is *Lehrbuch der chemisch-analytischen Titrimethode* (1855) and in 1866 he produced his *Geschichte der Erde, eine Geologie auf neuer Grundlage*.

Mohs's Scale, graduated scale of hardness of minerals, based on a classification of ten minerals arranged in such an order that each of them scratches all those below it, but cannot scratch any of those above it. The order is (1) diamond, (2) corundum and sapphire, (3) topaz, (4) quartz, (5) orthoclase, (6) apatite, (7) fluorite, (8) calcite, (9) gypsum, (10) talc.

Mohun, Charles, fourth Baron (c. 1675-1712), son of the third Lord M. by Lady Philippa Annesley, daughter of the first Earl Anglesey. A notorious duellist of violent temperament, he was twice charged with murder, but was acquitted each time. His last duel was with the duke of Hamilton over a quarrel regarding the estates bequeathed to the duke by Charles, second earl of Macclesfield. Both combatants lost their lives, M. by the hand of his adversary and the duke by the treachery of M.'s second, Gen. Macartney. (See Thackeray's *Henry Esmond*.) Having no issue, the barony expired with his death. See J. Burke, *Extinct Baronetries*, 1836.

Mohur (Persian *mohr*, seal, seal ring), gold coin, originally Persian, used in India from the sixteenth century, and introduced in that country by Akbar, being at first a stamped gold token rather than coin. The M. was legal tender in Brit. India up to about 1860, its nominal value being 16 rupees in Calcutta and 15 rupees in Bombay and Madras, where it was minted. Its weight was 180 grammes (troy) and it contained 165 grammes of pure gold. There were also

half and quarter gold M^s of proportionate nominal value. In 1899 when a gold standard was established in India the Brit. sovereign was declared legal tender and the M^s was accordingly superseded.

Moidore, Moyodore, Moedor, or Lisbonne, former gold coin of Portugal (*moeda d'ouro* gold coin) worth 4800 reis and current in England in the early eighteenth century. Later it was the name used for 27s its approximate value.

Moine, Sir James Macpherson, Le, see LI MOINE

Moine Schists, or Series, thick series of micaceous and granulitic gneisses of Pre Cambrian age which form the greater part of the Scottish Highlands from the Pentland Firth in the N. to the S. edge of the Highlands in the dist. of Loch Leven and from the great overthrust fault on the W. to the Firth valley on the E. They have been variously named by different geologists such as Caledonian gneisses or Illegay schists but the commonly accepted name to day is the M^s or series so named from the typical granulitic gneiss of the M^s Lomond in N.W. Sutherland. This is composed of a granulitic quartz felspar schist or gneiss mainly consisting of grains of equal size of quartz and alkali felspar.

Moir, David Macbet' 1798-1831 Scottish physician and writer. At Musselburgh. He early contributed to *Comptable* and *Blackwood's Magazine* often under the pseudonym of A. (Delta). His works include besides poems the *Autobiography of Manie Buchanan* (1828-1839) and *Outlines of the Ancient History of Medicine* (1831). The authorship of the *Canadian Boat Song* is attributed by some to M^r. See Sir C. Douglas *The Blackwood Group* 1897.

Moiræ, or Parcæ, Grk. and Lat. names respectively for the three goddesses of Fate represented by Hesiod as the daughters of Nox and Erebus. Clotho the youngest presides over mortals at the moment of their birth. She is represented with a distaff in her hand and is robed like Lachesis in variegated raiment. Lachesis is bespangled with stars and always holds a spindle to spin the thread of life and plot futurity. Atropos the eldest and most inexorable of all is garbed in black and continually employed in cutting short the thread of man's existence irrespective of age, quality or sex. Some poets spoke of them as all powerful even over Zeus.

Moiré (fr. *moiré* watered silk) now used exclusively to denote watered or clouded silk though the actual process of calendering can be applied to any material, whether woollen and silk stuffs or linen. Formerly the term was interchangeable with mohair (see under Wool). The calendering process whatever the particular fabric used consists in wetting and folding in a particular manner and then subjecting it to hydraulic pressure of about 100 tons between cylinders or rollers. This removes the nap makes the material smooth and imparts a wavy appearance.

Mois, name given by the Annamites

to the uncivilised peoples dwelling in the Indo Chinese mts. They are called *Khas* by the Siamese and *Penongs* by the Cambodians.

Moisewitch, Benno, pianist b. 1890 at Odessa. He was at the Imperial School of Music there and at the age of nine he won the Rubinstein prize. In England since 1908 he was granted his certificate of naturalisation in 1937. He made his debut at Queen's Hall London, in 1909 and gained immediate success. He has travelled extensively giving recitals and gave concerts for Mrs. Churchill's Aid to Russia Fund during the Second World War.

Moissac, tn. in the dept. of Tarn et Garonne France on the Tarn, 15 m. W.N.W. of Montauban. Standing on the Canal d'Artois M^s is a trade centre for wine and agric. produce. Pop. 7800.

Moissan, Henri (1852-1907), Fr. chemist b. in Paris. He became a doctor of science in 1885, prof. of toxicology at the Collège de France in 1886 and prof. at the Sorbonne in 1900. He is celebrated for his valuable experiments with fluorine being the first to isolate and liquefy it. He also made some interesting experiments in diamonds and succeeded in manufacturing them artificially. He likewise simplified the production of acetylene gas. His publs. include *L'Isolément du fluor*, *Reproduction du diamant*, *Carbure de diamant*, *Le fluor électrique* (1897), *Le fluor et ses composés* (1900) and articles on manganic iron, chromium etc.

Motte, Jean Guillaume (c. 1746-1810), Fr. sculptor. His statue of the 'Sacrificateur' won his election to the Académie des Beaux-Arts (1783). He executed the fine bas-relief of the front of the Panthéon, *L'Alliance entourée des Vertus*. He has relief in the Luxembourg vestibule and a bronze equestrian statue of Bonaparte. See *Q. de Quincy 'Eloge'* in the *Mémorial* 1810.

Moirve Abraham de see DE MOIRVE ABRAHAM

Mojaisk tn. in the Moscow Region of the R.S.F.S.R. in S.W. of Moscow. It was of considerable strategic importance during the Second World War. The city fell in 1941 and made it a strong point and when it was recaptured in Jan. 1942 the threat to Moscow was ended.

Moji, seaport tn. of Japan on Kim-shiu Is. facing Shimonoseki. It has coal mines. Pop. 121,000.

Mokaddasi Shams ed-Din al (*Mukaddasi* from Jerusalem), b. A.D. 946, an Arab (Mohammedan) geographer. He travelled widely and wrote an account of various countries under Moslem rule. See *Description l'Empire Moslem* (de Geop.) in *Bibliotheca Geographorum Arabicorum* (1877) *Syria and Palestine* (Tr. Strongs ed. Palestine Pilgrims' Text Society in 1886). See also A. Kremer *Kulturgeschichte des Orients* ii, 1877 and G. Le Strange *Palestine under Moslems* 1890.

Mokalla, see MAKALLA

Mokanna Al (the veiled one) see AL-HAKIM BEN OTTO

Mokha, see MOCHA.

Moko, see under MAORIS.

Moksha, riv. of Russia, flowing through the Voronezh and Moscow Regions, a l. b. trib. of the Oka. Length 350 m.

Mokshani, or Mokshansk, tn. in the Voronezh Region of the R.S.F.S.R., on the Moksha R. Pop. about 10,000.

Mol, most extensive com. of Belgium, situated 32 m. E. of Antwerp. It has an area of about 14 sq. m. and is engaged in agriculture, cattle breeding, and manufs. of textiles, glass, zinc, and tobacco. Pop. 19,000.

Mola, Emilio (1887-1937), Sp. soldier, b. in Cuba. Chief of the Moroccan forces 1926-31, director-general of the Sp. police 1931-35, he returned to Morocco until dismissed in 1936. When the Civil war broke out he joined Franco, being second-in-command until his death in an air accident.

Mola, Giambattista (1620-61), painter and etcher of It. origin, b. at Besançon. He excelled as a landscape painter, and had a bold and vigorous style. His etchings include Judith with the Head of Holofernes, 'Atalanta,' etc., and he painted 'A Landscape with the History of Hagar and Ishmael.' See L. Lanzi, *History of Painting in Italy*, 1792.

Mola, Pierfrancesco (c. 1620-66), It. painter, b. at Caltore. He is noted chiefly as a landscape painter, but also painted sev. historical pictures. Among his masterpieces are 'St. John in the Desert,' 'History of Joseph,' 'Hero and Leander,' 'Dido,' 'Landscape with the Temptation of Christ,' etc.

Molainville, Barthélemy d'Herbelot de, see HERBELLOT.

Molasses, or Treacle, by-product of sugar manuf. M. from cane sugar is utilised as human food, M. from beet sugar is bitter and unpleasantly flavoured, though much is used in Germany for mixing with dry food for live-stock as a substitute for roots. In France M. is employed in the production of alcohol. See J. G. Davies, *The Principles of Cane Sugar Manufacture*, 1938.

Molassians, see EPIRUS.

Molay (Molai), Jacques de (1228-1314), last of the grand masters of the Templars. Descended from the family of the lords of Longwy and Raon, early in life became attached to the order of the Templars and was sent to the chapel at Beaune. Later, he distinguished himself in Palestine against the infidels. When in Cyprus he was summoned by Pope Clement V. to Paris when all the Templars there were arrested. De Molay was imprisoned and put on trial, but stoutly refused to save his own life by admitting any charges against the order. For this he was condemned to death and burned at the stake. The site of his execution was at the little île de la Seine, at the spot where a statue to Henry IV. was erected. See P. Dupuy, *L'Histoire de la condamnation des Templiers*, 1781; F. J. Raynouard, *Monuments historiques relatifs à la condamnation des chevaliers du Temple et à l'abolition de leur ordre*, 1813; C. G. Addison, *The Knights Templars* (3rd edn.), 1854; H. de

Curzon, *La Règle du Temple*, 1886; M. Lavoat, *Procès des frères et de l'ordre du Temple*, 1888; and Marquis d'Albon, *Cartulaire général de l'ordre du Temple*, 1922.

Molbech, Christian (1783-1857), Dan. lexicographer and historian. He was prof. of hist. and literature at the Copenhagen Univ. (1823-43). His chief works are *Historie om Dithmarsker Krigen* (1813); *Kong Erik Ploggenings Historie* (1821); *Dansk Ordbog* (1833); *Dansk Dialekt-Lexikon* (1833 41); *Danish Glossary* (1857, 1866); and *Idea of a Scandinavian Union* (1857).

Molbech, Christian Knud Frederik (1821-1883), Dan. poet and playwright, son of the preceding, b. at Copenhagen. His chief poems are *Digtninger* (1845); *Fra Danatidernes Kar* (1873); and *Efterladte Digte* (1888). Among his plays *Amrosius* (1878) and *Dante* are the best. He also produced an excellent trans. of the *Dirina Commedia*.

Mold, mkt. tn. of Flintshire, Wales, 12 m. S.W. of Chester, with limestone quarries and coal and lead mines near. Pop. about 6000.

Moldau, or **Vltava**, riv. of Czechoslovakia, rises in the Bohmerwald Mts., flows past Prague, and after a course of 270 m. joins the Elbe near Melnik.

Moldavia, N.E. portion of Rumania, formerly one of the Danubian principalities. See RUMANIA.

Moldavian S.S.R., constituent republic of the U.S.S.R., formed in 1940 by the union of part of the former M. A.S.S.R., which was formerly included in the Ukraine S.S.R., and areas of Bessarabia with a predominantly M. pop., ceded by Rumania to Russia in 1940. The Black Sea lies to the S., Rumania to the W., and the Ukraine to the N. and E. Agriculture is extensively carried on, the area being famous for fruit and grapes; sugar-beet, maize, and tobacco are amongst other crops. Industries include food conservation, and wood, leather, and textile manufs. Fish are plentiful, including mackerel and sturgeon. Phosphorites, lignite, gypsum, building materials, and possibly oil are to be found. Electric power is supplied from generating plants on the Dniester. Cap. Kishinev. Area 13,200 sq. m. Pop. 2,200,000.

Molè, Mathieu (1584-1656), Fr. magistrate, b. in Paris. He became attorney-general in 1611, and was appointed by Richelieu first president of the parlement (1611-33), becoming keeper of the Great Seal (1651). His *Mémoires* were pub. by the Société de l'Histoire de France (1855). See P. de Pansey, *Éloge*, 1775; also life by Baron A. G. P. de Barante, 1859.

Mole, or *Talpa europæa*, common Brit. burrowing mammal, about 6 in. in length, with a cylindrical body, long pointed muzzle, short tail, broad, powerful five-clawed fore-limbs, and long, narrow hind-limbs. The fur is soft and velvety, and normally greyish black, but frequently of other colours. Although one of the Insectivora, the M.'s food is chiefly earth-worms, but insects are eaten in large numbers, and evidence goes to show that a proportion of vegetation forms part of

the dietary. Ms. are very voracious, and are unable to live more than a few hours without food. The nest, with its system of galleries and approaches, is a wonderful work, made usually under banks or among the roots of trees. The M. hills are formed as the animal excavates, and on lawns and pastures they cause disfigurement and inconvenience, but the soil is always rich, for the animal avoids poor land where food is likely to be scarce. Ms. are usually caught by means of spring traps or by nooses fixed on bent twigs and placed in the runs.

Mole, see under PIER.

Molech, or **Moloch**, originally **Melek** (king), was intentionally mispointed in the Heb. on the analogy of 'Gosheth' in order to discredit it. The title is found widely spread throughout the Semitic races as a divine name, but in the O.T. it is especially connected with the religion of Ammon, e.g. 1 Kings xii. 7, 'the abomination of the children of Ammon.' The evidence, indeed, seems to show that M., or Milcom (1 Kings xi. 5; 2 Kings xxiii. 13, etc.), was the special tribal god of the Ammonites, standing to them in the same relation as did Chemosh to the Moabites. The particular rite connected with his worship was the sacrifice of children by fire, and it is certain that this practice, though vigorously opposed by the prophets, was also introduced into the worship of Jehovah during the last period of the kingdom (Is. lvii. 5; Jer. xix. 5). Solomon is said to have built a sanctuary to M. at Topheth.

Mole Cricket, orthopteron insect, highly elaborated for a burrowing life in the ground, where, like the mole, it lives on worms and insects. It is from 1½ in. to 2 in. long, dark brown, and covered with soft hair. The tibiae of the fore-legs are flattened and terminated much like the fore-legs of the mole. The M. C. retains its power of flight, though it goes above ground only at night. The larvae are white, and mature very slowly.

Molecule, denotes in chem. the smallest particle of an element or compound exhibiting the chemical properties of the individual; any further div. completely alters its properties, so that it gives rise to new products. Most Ms. are ultra-microscopic and are investigated by the indirect methods of physics and chem. It was the study of gases in which Ms. are most free to move that gave rise to the molecular theory. The physical laws common to all gases are Boyle's, Charles's, and Dalton's, whilst Avogadro's hypothesis has been particularly useful in the study of gases (see GASES AND GASES). Based on these is the kinetic theory of gases (q.v.), which, briefly, asserts the laws to be due to kinetic energy of Ms. rather than to any potential forces acting between them. The further study of the physical nature of Ms. proceeds in general in the direction of diffusion, viscosity, and internal friction of gases.

It is in chem. that success has been most attained. Analysis determines the elements of which any substance is composed, and which must be present in the

M. All the Ms. are found to be similarly constituted, and the atomic proportions of elements present are generally easily determined. Thus, analysis shows that methane contains the elements carbon and hydrogen in the proportion of 12 to 4 by weight. Now, if we divide each of these numbers by the atomic weights of carbon and hydrogen respectively (12 and 1), we find that the ratio of the number of atoms of carbon to the number of atoms of hydrogen present in methane is 1:4, giving as the simplest or empirical formula CH_4 . Moreover, the hydrogen in methane can be replaced in four stages by the action of chlorine to give the products methyl chloride (CH_3Cl), methylidene chloride (CH_2Cl_2), chloroform (CHCl_3), and finally carbon tetrachloride (CCl_4), indicating that the formula is probably CH_4 , and not C_2H_8 , C_3H_{12} , etc. The chemist may then proceed to assign proportional molecular weights to substances. These determinations depend on the hypothesis of Avogadro that equal volumes of gases at the same temp. and pressure contain an equal number of Ms., an hypothesis steadily confirmed in the kinetic theory. The chemist adopts the simple formula, or the simplest multiple which allows his reactions. In a very large number of cases, the methods of physics corroborate the simple chemical formula. The molecular weight in grammes of any gas occupies a volume of 22.4 litres at 0 °C. and 760 mm. pressure. To return to methane, one litre of the gas at 0 °C. and 760 mm. weighs 0.717 gm. Thus 22.4 litres would weigh 22.4×0.717 or 16.06 gms. This settles the formula for methane, CH_4 ($\text{C} = 12$, $\text{H} = 1$). The other formulae mentioned, e.g. C_2H_8 ($12 \times 2 + 8 \times 1 = 32$), would not fit in at all. It must be remembered that for computing accurate M. weights, the standard taken is $\text{O} = 16$ or $\text{H} = 1.0076$, and that the density determinations merely serve to fix the approximate value. The accurate result is then obtained from analytical data. (In the case of the rare gases, however, density has to be obtained accurately, as analytical data are impossible.) So far the method is limited to gases. Van t'Hoff showed that Avogadro's hypothesis may be applied to substances in dilute solution; results may thus be obtained from consideration of osmotic pressure, and its effect on vapour pressure, boiling and freezing point of the solvent. These methods are useful for non-electrolytes like cane sugar, but for electrolytes ionisation complicates matters.

Information as to molecular weight in the liquid state can be obtained from surface tension methods (see PARACHOR, SURFACE TENSION, etc.), but for solids the position is unsatisfactory, and little real information is possible. In crystalline electrolytes each crystal is really an individual M.

A further study by chemists reveals the structure or architecture of the M. itself. Groups of the constituents of Ms. may be removed, and tend to remain associated, indicating possibly a closer or stronger structure of those constituents within the

M. Substances show the same elements united to form Ms. of different substances, yet in the same proportion, the Ms. not only presenting different properties but splitting into different groups of atoms in the course of chemical reactions. This, with the aid of the theory of valency (*q.v.*), enables the chemist to picture the probable architecture of the Ms. These and allied cases occur under the form of isomerism, polymerism, and metamorphism (*q.v.*). For example, the M. for caffeine is represented thus:

Van t'Hoff examined these structures and propounded geometrical theories. For example, fumaric and maleic acid are both represented by:

Wislicenus explains this difference in properties by geometrical formulae thus:

The presence in the M. of an asymmetric carbon atom gives rise to the possibility of optical activity, where two Ms. related to each other as the right hand is to the left, are able in solution to rotate the plane of polarisation of light in opposite directions (*see* OPTICAL ACTIVITY). Many instances are known, and they are not confined to the carbon atom. The actual size of an average M. is of no interest beside its physical structure and chemical properties. It was investigated by Lord Kelvin, who expressed it by stating that if a drop of water were magnified to the size of the earth, its Ms. would be somewhere in size between those of a small shot and a cricket ball. In recent years, however, the study of giant or 'macro' Ms. has made great advances, and is rapidly becoming a specialised subject. Among substances with macro-Ms. may be mentioned rubber, proteins, natural and artificial fibres, various plastics, and antibodies—possibly also viruses.

Mole-rat (*Spalax* or *Aspalax*), genus of blind rodent quadrupeds of the family Muridae, having teeth almost like those of rats, but in many respects resembling moles. One species inhabits the S. of Russia. Another, found in the Malayan Archipelago, is as large as a rabbit.

Moleschott, Jakob (1822-93), Dutch physiologist and metaphysician, b. at Hertogenbosch. He held the chair of physiology successively at Zürich, Turin, and Rome. In metaphysics he denied any vital principle, regarded life as metabolism between the organic and inorganic worlds, and enclosed his materialism in the formula 'Without matter no force; without force no matter.' His views were developed in *Der Kreislauf des Lebens* (1852). Among his numerous scientific treatises was a *Natural History of Man and Animals* (1855). He wrote a biography of J. G. Forster (*q.v.*).

Molesley, East and West, two adjacent parcs, in the co. of Surrey, on the r. b. of the Thames. Combined pop. 9000.

Moleskin, kind of silk fabric having a thick soft shag similar to the fur of a mole; also a kind of shaggy cotton fabric which is used for workmen's trousers by reason of its good wearing qualities.

Molesworth, Sir William (1810-55), Eng. politician, b. in London. He entered Parliament in 1832. Except during the years 1841-43 he retained a seat all his life, and was one of the most prominent 'philosophic radicals.' For many years he controlled the *Westminster Review* with John Stuart Mill. He held the office of secretary of state for the colonies for a few months before his death. It was he more than any other who exposed the evils associated with the transportation of convicts, and he did much to arouse interest in colonial problems generally, placing his wealth and capacity for hard work at the disposal of the colonial reform movement. He favoured greater powers for the colonial legislatures as against the veto of the imperial gov.

Molfetta, seaport of Italy, in the prov. of Bari. It has a cathedral, and its harbour is partly formed by a natural breakwater. Olive oil, wine, nitre, and almonds are exported. Pop. 46,000.

Molière (1622-73), name assumed by Jean Baptiste Poquelin, the greatest comic dramatist of France. He was b. (probably on Jan. 15), in Paris, the son of a rich upholsterer, who was also *rueur de chambre du roi*, *avec survivance*, thus M. was born king's *rueur de chambre* presumptive. His father gave him the education of a gentleman, first at the Collège de Clermont (now the Lycée Louis le Grand), where he was the schoolfellow of the prince de Conti, and then, as one of a group of gentlemen's sons, he followed a course of instruction under the celebrated philosopher and astronomer, Gassendi. From 1645 to 1647 he studied law at the univ. of Orléans. But the career of lawyer was not congenial to Jean Poquelin, while the theatre attracted him irresistibly, though he was even more attracted by a particular actress, Madeleine Béjart, who, later, returned his love. As a Parisian he must often have witnessed the popular burlesques and farces of Turlupin, Gros-Guillaume, Gaultier-Garguille, the Goguenus, the Tabarins, and the Rodomonts on the Pont-Neuf, in the Place Dauphiné, and at the fairs, as well as the farces, which had begun to be much more popular than

pastorals and tragedies, performed at the Hôtel de Bourgogne. For people had come to wish 'to be made to laugh for their money,' and Corneille was losing power. Poquelin, with Madeleine Béjart's co-operation, got together a little troupe, founded the 'Illustre Théâtre' (merely a grandiloquent name for a company which opened in a converted tennis-court), and took the name of Molière. After a few months of struggle and want in Paris, the company ended in bankruptcy. M. was jailed for debt, but his father bailed him out and provided sums, totalling nearly 2000 livres, which, in more

turgid tragedy *Nicomède* in the old guard-room of the Louvre before the youthful Louis XIV., but the reception was tepid, largely because M. thought that the characters, though they were kings and queens, should use the diction of people in real life. But M. saved the situation with his now vanished farce, *Le Docteur amoureux*. As *pièce de début* before the Parisian public he gave *Les Précieuses ridicules* (1659), the first satire on Fr. cultivated society, or, more strictly, on would-be cultivated society, especially as seen in the provs., and this performance taught M. his true medium of dramatic expression. Its truthfulness to life, its gaiety and good humour, secured for M. the public favour for ever. It may be noted here that when the guard-room of the Louvre was pulled down to effect improvements to the Louvre, M.'s troupe moved to Richelieu's theatre in the Palais Royal, where they remained until his death. They subsequently amalgamated with their rivals, the Hôtel de Bourgogne, and so formed a company which, housed in different premises at various times, has preserved throughout the historic name of the Comédie Française.

Comedy after comedy followed with remarkable rapidity for thirteen years. M. endeavoured to bring comedy up to the standard of tragedy, even to surpass it if possible, but he was obliged for financial reasons to provide also conventional and extravagant farces and, to satisfy the taste of the court, operatic comedies or comedy-ballets, such as *Les Fâcheux*, in which the words are only a pretext for music and dancing. *Sganarelle, ou le Cocu imaginaire*, was produced in 1660; *Don Garcie de Navarre*, an unsuccessful tragedy, in 1661; *L'Ecole des maris* (suggested by a comedy of Terence), and *Les Fâcheux*, both highly successful, also in 1661. Sganarelle, who figures with varying characteristics in many of M.'s plays, is a laughable figure in *L'Ecole des maris* and, what is more important, emerges for the first time in Fr. comedy, as a character completely rounded off. *L'Ecole des femmes*, in which, as in *L'Ecole des maris*, M. shows what happens when people's natural tendencies are ignored, was a brilliant success, but it brought upon its author those jealousies and bitter attacks which were to pursue him to the end of his life. Those attacks he replied to (1663) in the mordant *Critique de l'Ecole des femmes* and *L'Impromptu de Versailles*. The first-named of these pieces is important as an expression of M.'s own views on the true use of rules and the whole duty of a dramatist.

In 1664 *Le Mariage forcé*, *La Princesse d'Élide*, and the first three acts of *Tartuffe* were performed. *Tartuffe* was an attack upon hypocrisy in religion, as it may come to flourish in the house of a bourgeois d'érôt. But the religious community, Jesuits and Jansenists alike, feared the satire was, or would be thought to be, of more general application, and they prevailed upon Louis XIV. to suppress it. M.'s enemies redoubled their attacks. Only after five years was the whole play

MOLIÈRE

Engraving after the original picture of the school of Lebrun in the Musée Royal, Paris.

prosperous times, were duly repaid. Undaunted, M. and his troupe left Paris for the provs., and for the next twelve or thirteen years they went from tn. to tn. playing. M. led a very strenuous life, for he was not only the manager of the troupe, and an actor, but the adapter of the plays they represented and, soon, an author himself. At first he wrote farces after the orthodox It. type, with its stock characters. Some of these he afterwards recast, and developed into real comedies, as, for instance, *Le Fagotier*, which became *Le Médecin malgré lui*, *Gorgibus dans le sac*, which became *Les Fourberies de Scapin*, and *La Jalousie du Barbouillé*, the later *George Dandin*. Two works of comedy proper mark this period, *L'Étourdi* and *Le Dépit amoureux*. With the help of a reputation won in the provs., and the patronage of the prince de Conti, who introduced him through Monsieur, the king's brother, to the king and queen, M. launched his troupe in Paris under the title 'Troupe de Monsieur.'

In 1658 his company acted Corneille's

authorised and played with extraordinary success (1669). *Don Juan* (1665) was another play in which hypocrisy was attacked; in *L'Amour médecin*, *Le Médecin malgré lui*, and *Le Malade imaginaire*, the doctors of the day are pilloried and quackery exposed; sincerity and coquetry come to close quarters in *Le Misanthrope*; the mortifications of the man who marries into a superior social rank are depicted in *George Dandin*; *L'Avare* shows that distrust comes to be the essential characteristic of the miser, and the immortal *Bourgeois Gentilhomme* makes fun of the bourgeois who would quit his native sphere and become a *gentilhomme*. As in other 'command' plays, M. introduced the ballet into this piece, but whereas previously the ballet had been only an interlude, here it was ingeniously worked into the play itself.

The man M. was kind, gentle, affectionate, and magnanimous, beloved of his troupe, very charitable, and always ready to help others. If at times he became bitter and irritable, it was only when he was smarting under the cruel attacks of his enemies and feeling at the same time the pressure of his most strenuous life. He married Armande Béjart, a *comédienne* of his troupe and a coquette; with her he led a very unhappy domestic life. The venomous tongue of Montfleury of the Hôtel de Bourgogne suggested that Armande was not the younger sister but the daughter of Madeleine Béjart, but the king did his utmost to rebut the calumny by standing godfather to M.'s child. It seems conceivable that Armande was an illegitimate child of Madeleine by a certain chevalier de Modène, but it is far more probable that she was his sister. That the union was unhappy is undeniable, but Armande was more than twenty years younger than M. and her temperament utterly different.

M.'s art marked an epoch in the development of the Fr. drama; it brought about a new dramatic ideal. The ideal hero of classic tragedy gave place in M.'s comedies to the real man with all his foibles and his duality of character—'On peut être intelligent en son entendement et sot en son caractère.' M. shows the man in his surroundings, not more or less detached from them as was the classic hero, and thus incidentally throws a clear light on the whole group to which he belongs. His chief aim seems to have been to amuse by depicting things as they actually were, in strict truthfulness to life. Whether he had the deliberate moral aim to cure men of their foibles and vices is a moot point. The many opinions expressed by M. which seem to show that he had this aim should, according to Faguet, be looked upon as constituting his *apologia* rather than his set purpose. There is little room for sympathy in the amusement evoked by M.'s characters; the laughter they cause is the critical laughter of the intelligence—Gallo laughter, that of Bergson's book on the subject. 'Leur rire est un jugement,' may be said of M.'s audience, a point in which it differs from that of Shakespeare. M. set

the fashion for Fr. comic writers after him, but his influence extended far beyond his own country. Accuracy of observation, sincerity of purpose, facility of style, abundance of wit, deep humanity, and solid good sense were his greatest gifts. He wrote for his own age, but his appeal is universal' (Searly Wilson). See lives by H. M. Trollope, 1905; H. C. Chatfield-Taylor, 1906; A. A. Tilley, 1921; and J. Palmer, 1930; and an interesting study by E. Faguet in *Études littéraires*, XVII^e siècle, 1887. See also H. Davignon, *Molière et la vie*, 1904; P. Kohler, *L'Esprit classique et la comédie*, 1925; and M. Turnell, *The Classical Moment*, 1947. There is a trans. of his *Comedies* in Everyman's Library.

Molina, Luis (1535–1600), Sp. Jesuit, whom Pascal's *Lettres provinciales* have rendered memorable, b. at Cuenca, in New Castile. He entered the Jesuit order at an early age, and for some time taught theology at the college of Coimbra in Portugal. Later, he was appointed prof. of theology at Evora in Portugal, and remained there twenty years, then returning to Spain. Shortly before his death he was appointed prof. of theology in Madrid. His chief work is his *Concordia Liberi Arbitrii cum Gratia Donis*, pub. 1588. He also wrote commentaries on the first part of the *Summa* of Aquinas, and *De Justitia et Jure*. M.'s doctrine is an attempt to reconcile the free will of man with predestination, and gave rise to protracted disputes with the Thomist school of theology, headed by the Dominicans. To-day Molinism is either abandoned or much modified by the chief Jesuit theologians. See F. Stegmüller, *Geschichte des Molinismus*, 1935.

Mollinæ, see MOULINS.

Molinari, Stefano, sr. MULINARI.

Moline, city of Rock Is. co., Illinois, U.S.A., on the Mississippi R., 4 m. from Davenport, Iowa, on the opposite bank. There are iron foundries, steel works, mills, machine shops, and manufs. of ploughs, pumps, scales, wagons, etc. Pop. 34,600.

Molinia, genus of grasses common on damp moors. The long stiff stems of *M. caerulea* are gathered and sold for form cleaning tobacco pipes. A variegated is grown in the garden as an edging plant.

Molinier, Guillem, Provençal poet and prose writer of the fourteenth century. He took a prominent part in the foundation and administration of the literary academy of Toulouse in 1324, and was nominated chancellor. He wrote a treatise entitled *Las Leys d'Amors*, invaluable as a guide to young poets and for the knowledge of troubadour poetry contained therein. This work was pub. by Gatien-Arnoult in 1841–43 and trans. by d'Aguiar and d'Esconloubre.

Molinos, Miguel de (1640–c. 1696), Sp. mystic and ascetic, b. of noble parents at Patadina, Aragon. He was ordained priest, and went to Rome in 1669, where he became acquainted with many distinguished people. In 1675 he pub. his *Spiritual Guide*, an ascetical treatise which roused the antagonism of the Jesuits.

His system of Quietism taught absolute neutrality of the will after a single act of self-consecration, thus opening the door to acquiescence in moral evil of any form. It was finally condemned by Pope Innocent XI. in 1667, and M. was sentenced to life imprisonment. He died in communion with the Church. See J. Bigelow, *Mollinos the Quietist*, 1882.

Molique, Wilhelm Bernhard (1802-69), Ger. violinist and composer, b. at Nuremberg. Hewas director of the royal band at Stuttgart from 1826 to 1849. Some of his compositions, in particular his violin concertos, are still in use.

Mollah, Mullah, Mowla, or Muhla (Arab. *maula*), title of respect given among Mohammedans to one learned in theology and law, and to other prominent personages. It is especially used for one of the higher order of Turkish Judges, who expounds both civil and criminal law and the religion of the state. Beneath him is the cadi who administers the law. In Somaliland leaders called 'Mad Mullahs' have on sev. occasions raised rebellions. See SOMALILAND, BRITISH.

Mollendo, port of Peru, S. America, in the dept. of Arequipa. It is the terminus of the S. railway, and the port of the city of Arequipa, from which it is 107 m. distant. It is one of the chief gates for Bolivian exports and imports (another being the new port of Matarani). Its roadstead, however, is an open one and exposed to storms. The prin. export is wool. Pop. 15,000.

Möller, Peter Ludwig (1814-65), Dan. poet and critic, b. at Alalborg. He wrote *Lyrice Poems* (1840); *Lofvold* (The Fall of the Leaves) (1855), and the critical work entitled *Det nyere Lystspil i Frankrig og Danmark* (1858).

Möller, Poul Martin (1791-1838), Dan. writer, b. near Velle, son of a par. priest who subsequently became a bishop. After studying theology and being ordained he visited China as a ship's chaplain (1819) during the voyage writing his poem *Glede over Danmark*. In 1826 he became prof. of philosophy at Christiania; prof. extraordinary at Copenhagen (1830). His works include the romance, *En dansk Students Eventyr* (1824) and also the play, *Kyndt Skaldaspiller*. His *Efterladte Skrifter* appeared in 1839-1856. See also collected works, ed. by F. E. Olsen, 1848-50, and V. R. A. Andersen, 1896. See *Poul Martin Möller*, by F. V. V. Rönning, 1893, and V. Andersen, 1895, 1896.

Mollison, James Allan (b. 1905), Brit. airman, b. in Glasgow. He served for some years in the R.A.F. and in 1931 he flew from Australia to England in eight days, 14 hrs. 25 min.; in 1932, from Croydon to the Cape in four days 12 hrs. 30 min. In the same year he flew the N. Atlantic from Ireland to New Brunswick in 30 hrs. 15 min.; and also flew the Atlantic to Brazil. In Oct. 1936, he beat the Atlantic crossing record by flying from Harbour Grace, Newfoundland, to Croydon in 13 hrs. 16 min. He married the famous airwoman Amy Johnson (q.v.) in 1932.

Molluscs (*Mollusca*) or Shell Fish, constitute one of the chief divs. (phyla) of the animal kingdom, and were evolved at a very remote period in its hist. The great majority live in the sea, some of them at very low depths (a few below 2,900 fathoms); others occur in shallow water, and many above low-tide mark. A considerable proportion inhabit rivs. and lakes, and very large numbers have adapted themselves to a terrestrial life, some even contriving to exist in deserts, though most terrestrial M. are very dependent on moisture. The diet is much varied; carnivorous M. prey chiefly upon other members of the phylum. Many feed exclusively on minute lowly organisms, and others are entirely vegetarian. A few M. have long been valued as food, or as bait for other animals, some yield dyes (e.g. *Murex*, formerly used as a source of Tyrian purple) and others secrete pearls and pearly shells which have been and are employed for great diversity of ornament. The modern systematic arrangement of M. is in five classes, as follows: Class 1, Aplousneura, comprises two orders. The first, Polyplacophora or Isopleura, includes the coat-of-mail shells, or sea woodlice (*Chiton*). These differ in many respects from other M., having points in common with crustaceans and annelids, but after investigation of their life hist., there is no doubt as to their association with M. The other order, Aplousneura or Solenogastres, includes a few worm-like creatures which, instead of a shell, bear on the dorsal surface minute calcareous spines. Class 2, Gastropoda, is divided into two sections: Streptoneura (with a twisted nerve loop), the members of which are bisexual, furnished with a shell and generally with an operculum; and Euthyneura (in which the visceral loop is untwisted), which are hermaphrodite M., scarcely any with an operculum in the adult state. The first section contains two orders, Aspidobranchia or Diotocardia, of which the limpets, top-shells and ear-shells are typical, and Pectinibranchia, typified by rock snails, whelks, harp shells, cones, wing shells and periwinkles. The first order (Opisthobranchia) of the other section are all marine, e.g. bubble shells, sea hares, and umbrella shells. The second order (Pulmonata) comprises the true snails, and slugs, and the false limpets. Class 3, Scaphopoda, includes only the tooth shells (Dentaliidae), which are a very distinct group of sand burrowers, tubular shells resembling the tubes constructed by some marine worms. Class 4, Lamellibranchia, or Pelecypoda, comprises the bivalves. All the members of this class, unlike other M., have no head, nor cephalic eyes, nor jaws or tongue. All are aquatic and most of them marine. They are classified in four orders: (i.) Protobranchia (e.g. *Nucula*), (ii.) Filibranchia (e.g. common mussel, pearl oyster, scallops), (iii.) Eulamellibranchia (e.g. freshwater mussel, cockle, razor shell, oyster, shipworms), (iv.) Septibranchia (e.g. *Poromya*). Class 5, Cephalopoda, is arranged in two sub-classes, Tetrabranchia

and Dibranchia. Of the former, the pearly nautilus is the solitary living example, but with it have been classified all the oldest fossil forms (the Ammonites). *Nautilus* itself has been found in the

HALF SHELL OF WHELK

C, columella; S, spiral cavity inhabited by whelk.

oldest Paleozoic formations. It differs from all other Cephalopods in having four instead of two gills, and a number of small retractile feelers instead of eight or ten arms with suckers or hooks. The

INTERNAL SHELL OF CUTTLEFISH

(Sepia)
L, laminae.

sub-class Dibranchia consists of two orders: (i.) the *Octopoda*, in which are the octopus, the argonaut and other forms with eight similar arms; (ii.) the *Decapoda*, including the squids, cuttlefish and other M. with eight similar arms and two longer ones that can be retracted. In all

cases, M. reproduce by means of eggs, but in the freshwater snails (*Vivipara*), and other instances, the young are hatched within the parent's oviduct. Some bivalves produce eggs in enormous numbers, e.g. the common oyster, a million or more, and the Amer. oyster, ten or fifty times as many. Terrestrial M., on the other hand, deposit very few eggs, and these are enveloped, in some cases, in a gelatinous mass, in others, in a thin soft skin, and in a few are protected by a hardened calcareous shell. Many M. deposit their ova in capsules (e.g. common whelk), others produce them in spiral ribbonlike structures. The ova of most M. develop into free-swimming larvae (*Trochophore* and *Veliger*), but in a few cases there is no metamorphosis. No mollusc has an internal body skeleton, and hence their name, from the Lat. *mollis*, soft. In most of them the external shell, which is

SURFACE OF SECTION OF AMMONITE
(FOSSIL SHELL)

S. Siphuncle, through this passed an organic cord connecting the first chamber, C₁, with the visceral hump in the last chamber, C_n

secreted by the mantle or outer covering, affords adequate protection. In the shell, a vast variety of structures and arrangement occurs, but it is of minor importance to systematic zoologists compared with the structural features of the animal. The shell may be single as in the limpet and snail, or be formed of two valves as in the mussel or oyster, or it may consist of a series of plates as in the Chitons. In the squid it is quite internal, and from a number of M. it is altogether absent. The foot is a modification of the ventral surface, and in the Cephalopods part of it is elaborated into the so-called arms, the other part forming a funnel through which water is ejected to cause the animal to move in the opposite direction. In the cockles it is evolved for leaping, in the limpet for clinging, in the razor shells for burrowing, and in the pond snails for gliding. The operculum is the flat hard structure with which the snail closes its shell. It also is subject to much elaboration. Breathing is accomplished in aquatic

forms by means of gills, the ctenidia, which show a variety of form and arrangement in the different orders. In most M. the mantle, which secretes and lines the shell, is folded in such a way that it encloses part of the vascular system, and in aquatic forms the gills also are enclosed within the mantle cavity. In land M. the cavity forms an air chamber, sometimes termed a lung, with an opening through which air is inhaled and exhaled at very irregular intervals. This arrangement facilitates the interchange of gases between the vascular system and the air. *Eustace*, a Brazilian mollusc, has a gill, and a respiratory chamber, and is thus intermediate between wholly aquatic and terrestrial M. Some M. have paired gills; others have a single gill. The octopus

upper surface is covered with spiny out-growths, and with this the limpet rasps the rocks for food, and carnivorous M. penetrate the shells of other M. From complete absence in some species to the wonderful eye of the cuttles, organs of vision are to be found in all stages of development. A sense of hearing, and also a sense of smell, are undoubtedly present in the more highly specialised M. As an instance of the tenacity of life in many M., a desert snail in the Brit. Museum was found to be alive after having been fixed to a tablet for four years, where, of course, it could not obtain food or water. See J. Sowerby, *English Botany*, 1790-1814; *The Cambridge Natural History*, vol. iii., 1895-1909; A. H. Cooke, *Molluscs, Brachiopoda*, 1895; Sir E. R.

SCHEMATIC TRANSVERSE SECTION OF A BILATERAL MOLLUSCO
The structure of all Molluscs may be considered as derived by modification of such an arrangement.

and cuttlefish have one pair, *Nautilus* two pairs, and *Chiton* many pairs of gills. Considerable variation occurs in the form of the gills; some are filamentous, others are formed of a series of thin, overlapping plates or leaves, others are reduced to a single septum. In the Scaphopoda there are no special breathing organs, but exchange of gases takes place over the whole surface.

The vascular system, too, shows great differences in development in various M. In some, the heart is very reduced; in others, a single auricle and ventricle are present, whereas in others there are two auricles and a ventricle. Forms with the best developed vascular systems have occasional sinuses or spaces into which the walls of the blood vessels do not extend. Blood flows through the sinuses and into other vessels. In poorly developed vascular systems of certain M. the actual vessels are comparatively short, and the blood passes into an extensive hæmocoel. The odontophore or radula, which occurs in all M. except the Lamelli-branchia, is a remarkable structure; its

Verrill, *Strange Sea Shells*, 1936. Mollwitz, vil. of Silesia, 3m. W. of Brieg Frederick the Great routed the Austrians under Neipperg here in 1741. Frederick's own share in the victory was negligible, for when his cavalry, under Schülenburg, were hurled from the field by Römer, the Austrian cavalry leader, Frederick, who was involved in their rout, fled from the field of battle. It was the Prussian infantry under Schwerin who won the victory by their steadiness and rapid fire. Molly Maguires, name of a Ribbon society which flourished in Ireland between 1835 and 1855, and harassed the landlords and their supporters. It was also the name of a more notorious Irish secret society which terrorised the coal dists. of Pennsylvania, U.S.A., for some

fifteen years before 1877. In that year many of the ringleaders were convicted and hanged, and the society was broken up.

Moloch, see **MOLKCH**.

Molodechno, Region of the Byelorussian S.S.R., in the N.W. of the republic. The tn. of M. is the cap.

Molotov, Vyatcheslav Mikhailovich (b. 1890), Russian statesman, b. at Kukardi in the government of Viatka, his real name being Skryabin. He was a political writer before joining the Bolshevik party, or the predecessors of that party, in 1907. He assumed the name of M. in 1909. Prominent in the October revolution of 1917, he was then as closely associated with Lenin, as, later, he was with Stalin. Becoming secretary of the Central committee of the Communist party in the Ukraine, 1920, and of the Central party, U.S.S.R., 1921, he acquired much influence in the executive and legislative powers of the Soviet. A member of the all-powerful political bureau of the Communist party in 1924, he was appointed president of the council of peoples commissars of the U.S.S.R. in 1930, in which capacity he introduced the amended Russian constitution, which came into operation in 1937. M. succeeded Litvinov (q.v.) as commissar for foreign affairs in 1939, still retaining the presidency of the people's council. He played a leading part in the conclusion of the Soviet-Ger. non-aggression pact of Aug. 1939, which he declared had 'put an end to the abnormal relations that had existed for a number of years between Russia and Germany.' In this statement, made on Oct. 31, he hinted that 'the ruling classes of Great Britain and France wanted to drag Russia back to the Middle Ages, to the days of religious wars, superstition and cultural deterioration.' Yet in fact M., conformably with his instructions from the Kremlin, was playing a double game—conducting tentative and secret conversations with Ribbentrop while Moscow, in reply to the Brit. and Fr. request to underwrite their guarantees to Poland and Rumania, was asking for a triple alliance of mutual assistance. Chamberlain hesitated, thinking such a step might precipitate rather than delay war. Moscow grew tired of waiting and M.—who had in the meantime succeeded Litvinov as foreign commissar—on May 20 (1939) told the Ger. ambas. that Russia would reopen trade talks with Germany, though only if 'the necessary political bases' had been constructed. Ribbentrop, in pursuance of Hitler's intention to clear the way at all costs for an attack on Poland, replied that he was ready for such a pact. In the sequel, following the speed of the Ger. conquest of Poland, Moscow demanded bases in the Baltic states and Germany was acquiescent. In the next few months large quantities of food and oil were sent regularly to Germany under the pact and Russia also let supplies pass through to Germany from other countries, thus weakening the allied blockade; in return Russia received much-needed manufac-

tured goods and war material. But thereafter both nations grew ever more suspicious of the other's real intentions, and late in 1940 M. was protesting to Ribbentrop that he had violated the pact by giving Transylvania to Hungary and guaranteeing the rest of Rumanian ter. against any aggression (see on this the Ger. documents on Nazi-Soviet dealings pub. after the war by the U.S. State Dept.). In 1940 M. reaffirmed Russian neutrality, when he sought to justify the extension of the Soviet frontiers westward by the incorporation of the Baltic states and Bessarabia. In June 1911, in a broadcast following the Ger. invasion of Russia, he described the attack as 'without example in the hist. of civilised nations.' In the same month he visited London and concluded an Anglo-Russian treaty of military alliance and post-war collaboration; and, at President Roosevelt's invitation, he visited Washington. After the war he represented Russia at conferences of foreign ministers in Paris and at the United Nations. In 1919 he was succeeded as minister of foreign affairs by Vyshinsky, who had represented Russia at the meetings of the United Nations' Security Council.

Throughout his career M. has been the cool and business-like revolutionary, a born chief-of-staff, as Stalin recognised. Through all the changes, troubles, and purges he held his position, an opponent of all attempts at amelioration of the official Soviet policy as enunciated by Lenin and Stalin. Latterly his work was to extend and consolidate and defend the revolution in face of the chaos which he believes will accompany an inevitable breakdown of W. civilisation. In a Russia noted for untidiness he stood for precision and order. With an infinite capacity for unvaried and tonaceous organisation, backed by unwavering and fanatical devotion to Stalin, to Russia, and to Communism, he wore down his opponents by the sheer force of tedium, and achieved a place second only to Stalin.

Molotov: 1. Region of the R.S.F.S.R., in the central Urals, on both sides of the Kama R., producing copper, potash, etc., and having iron industries. Pop. 2,082,000. 2. Formerly Perm. Cap. of the above, formerly cap. of the old prov. of Perm. It is situated on the R. Kama, near the point where the R. Chusovaya flows into it. 240 m. N.W. of Sverdlovsk. It has a univ., founded before the revolution. It was the see of a bishop until the disestablishment of the Church in 1918, and has a cathedral. M. is an important riv. port for reloading the Siberian grain and metals from the Urals from the railway for shipment down the Kama, and for loading the oil and manufactured goods which come down the Kama on to the railway. The shipping of timber, the timber industry, flour mills, and leather works are the chief activities of this city, and the metal works near by, at Motovilikha, are also a big industrial concern. Copper was discovered in the seventeenth century. Other industries are the build-

ing of ships for riv. traffic, the manuf. of phosphatic fertilisers, and non-ferrous metallurgy. Before the First World War the pop. was 63,000; to-day it is upwards of 255,000.

Molteno, Sir John Charles (1814-86), S. African statesman, of Milanese extraction, b. in London. In 1831 he sailed for S. Africa, in 1854 became first member for Beaufort in the legislative assembly, and in 1872 was appointed first Cape Premier. In 1878 he retired from public life, being opposed in every respect to Sir Bartle Frere's policy. *The Life and Times of Sir J. C. Molteno* by his son, Percy A. M., gives an account of the Cape colonists' struggle to obtain a liberal and workable constitution.

Moltke, Adam Gottlob, Count von (1710-1792), court marshal and privy councillor to the Dan. king, Frederick V., over whom he exercised great influence. While he was averse from liberating the serfs, he introduced considerable scientific improvements into Dan. agriculture. His *Memoirs*, pub. in Ger. in 1870, are valued as a record of his times. See H. H. Langhorn, *Historische Nachricht über die dänischen Moltkes*, 1871. His grandson, Count Adam Wilhelm von M. (1785-1864), headed the democratic ministry which introduced the constitution of June, 1819.

Moltke, Helmuth Carl Bernhard, Baron von (1800-91), Prussian general and statesman, b. at Parchim, son of a Dan. general. In 1822 he left the Dan. for the Prussian military service, becoming staff-major in 1832. In 1839 he took part in the Syrian campaign as adviser to the Turkish commander-in-chief. Becoming chief of the general staff in 1849, he took an important part in the conduct of operations in the Dan. war (1864) and in the subsequent peace negotiations. He was sent to Florence in Feb. 1866 to negotiate an alliance with Italy against Austria. In the ensuing war with Austria he again displayed astounding precision and rapidity in formulating the general plan of campaign. With the Prussian king he defeated the Austrians at Sadowna (1866). His foresight had much to do with the success of Germany in the Franco-Ger. war of 1871, the details of the plan of campaign being prepared by him as early as the winter of 1867. He concentrated his armies on Metz with extreme caution, and in less than three weeks actually reached the walls of Paris. On his return to Prussia M. was created field-marshal. In 1873 M., with Baryatinski and the emperors of Germany and Russia, signed a treaty with Russia, a treaty ominous of the growing importance of Germany in the constellation of powers. M. pub. many works, among which were *The Italian Campaign of 1859*; *The Franco-German War* (1872); and *The German Army* (1871).

Moltke, Helmuth Johannes Ludwig von (1848-1916), Ger. general, native of Gersdorf, Mecklenburg, son of a minor Prussian official, and nephew of the famous F.-M. von M. A lieutenant in the campaign of 1870, in 1882 he became personal aide-de-camp to his uncle, on

whose death in 1891 he became aide to the emperor. Major-general, 1899, he was promoted lieutenant-general, 1902, with command of an infantry div. of Prussian Guards. Chief of general staff from 1906, in 1914 he was superseded by Falkenhayn and became deputy-chief.

Moluccas, or Spice Islands, sev. groups of is. of the Malay Archipelago, lying between New Guinea and Celebes, belonging to the Dutch. They include Ternate and Halmahera; Buru and Ceram (in the Amboyna group); the Banda Is.; Timor-Laut, Larat, and other of the S.E. is.; and the Bachian, Obi, Kel, Aru, Babar, Leti, and Wetar groups. The M. are mountainous and volcanic, and the soil is very fertile, the chief products of commerce being all kinds of spices, sago, rice, and coffee. The climate is fairly healthy, though hot and moist. Amboyna is the chief tn. and most important commercial centre. The inhab. of the M. are mainly Polynesians, Papuans, and Malaysians.

The Eng. were in possession of the M. in the early seventeenth century, when there were frequent battles with the Dutch; but later in that century the Dutch, by securing their base in Java, became masters of the archipelago. Van Diemen, having conquered Ceylon, isolated Malacca, with the result that the M. fell to the Dutch in 1642. According to Raffles (q.v.) desolation and ruin tracked the steps of the Dutch power, and in the outer is., especially in the M. and Celebes, his summary condemnation was not unwarranted. Amboyna was occupied by the Jap. in Feb. 1942, but the is. reverted to the Dutch in 1945. In 1946 they were recognised as part of the new state of E. Indonesia (q.v.). The area of Amboyna is 75,000 sq. in., and pop. 401,000; Ternate 115,900 sq. in., pop. 194,000. See H. M. Tomlinson, *Tridemarks*, 1924; J. Verken, *Moluccas—Reise*, 1607-12, 1930; J. J. Saar, *Reise an Banda, 1614-60*, 1930; and R. H. Giffon, *Paragon of the Spice Islands*, 1936.

Moluccella, genus of hardy and half-hardy annuals (family Labiate), with flowers in axillary whorls. *M. lewis*, *Moluccella bahn*, is grown in the garden.

Molybdenum (symbol Mo, atomic number 42, atomic weight 95.95, first obtained in the metallic state by Hjelms, 1782), a silvery-white, brittle metal, occurs in the mineral molybdenite, MoS₂, the disulphide of M., which resembles graphite in appearance, but which can be distinguished from it by the green tinge which it gives to the Bunsen flame. It also occurs in wulfenite, PbMoO₄, or lead molybdate, and in a rare form as M. ochre, MoO₃, the most important of the three oxides of M. The metal is obtained by heating the oxide with charcoal, or in a current of hydrogen, or by heating with aluminium. Molybdenite when roasted oxidises form the oxide, which is soluble in ammonia, forming ammonium molybdate, a reagent used to test for phosphates. M. is used in the production of high-speed steels; 90 per cent of the global production of M. comes from the U.S.A.

Molyneux, William (1656-98), Irish mathematician and philosophical writer, b. in Dublin. A fellow of the Royal Society, and at one time president of the Dublin Philosophical Society, he was returned to the Irish Parliament in 1692, and created a sir by his plea for the legislative independence of his country in *The Case for Ireland* (1698). He wrote the first Eng. treatise on optics, *Dioptrica Nova* (1692), a subject suggested, perhaps, by his wife's tragic loss of sight.

Molyneux River, see CLUTHA.

Molza, Francesco Maria (1489-1544), It. poet, b. at Modena. There he married, but most of his years were spent free from domestic ties at Rome and at Bologna, amid a brilliant and admiring literary band. His *Ninfa Tiberina* has been described as a glowing pastoral mosaic, but most of his poetry seems but a frigid, if finished, paraphrase of Gk. and Lat. verse. Edmund Gardner, however, speaks of his 'noble sonnets' on the sack of Rome and the condition of Italy.

Mombasa, seaport and tn. of Brit. E. Africa on the E. coast of Mombasa Is. The is. of M. is 3 m. long and 2 m. wide, and has an area of $5\frac{1}{2}$ sq. m. It is separated from the mainland by a narrow channel, the N. part of which leads from the Indian Ocean to M. Old Port, while the S. part leads to Kilindini Quay and railhead. All about the is. are groups of huts occupied by Swahilis, Indians, and members of the different tribes resident on this part of the coast. Kilindini, the chief port of the is., is thoroughly modern, with spacious sheds along the quay. M. Old Port has been used for centuries and is situated on the N. side of the is., where it is dominated by the old Arab tn. It is now used exclusively for dhows. At M'Baraki on the is. of M. is a slipway and anchorage for yachts.

The Portuguese sailed into M. in 1498, when Vasco da Gama had an unfriendly reception. The tn. was sacked by Pedro Cabral in 1500 and in 1505 by Francesco de Almeida, the first Portuguese viceroy of India. In 1698 the Arabs entered the port after the garrison had held out until only eleven men and two women were left, these being murdered by the Arabs before the Portuguese fleet could reach the place. In 1729 the Portuguese were driven out of E. Africa for all time. In the early nineteenth century an abortive attempt was made to set up a Brit. protectorate. After the suppression of the Mazrui rebellion in 1896, the limits of the E. Africa Protectorate were proclaimed, since when the inhab. of M. have ceased to be in a state of petty warfare. A great stride forward was the construction of the railway from M. to Kampala, Uganda (1895-1901), later extended to Lake Magadi (opened in 1913). For many years the hist. of M. has been merely a tale of commercial development. A detailed account of early settlements by the Arabs will be found in *The History of the Imams and Seyyids of Oman* by Sallih-Razik, which has been trans. into Eng. Pop. 102,500 (of is.).

Momein, or Teng-yuah-ting, tn. of Tün-

nan, China, 135 m. E.N.E. of Bhamo (Burma). It has important cattle markets. Pop. 6000.

Moments. The moment of a force about a given point is the product of the force and perpendicular drawn from the given point upon the line of action of the force. The moment is zero when either the force is zero or its line of action passes through the given point. Moments may be represented graphically by the area of a

FIG. 1

triangle. If P (Fig. 1) is the given point, AB represents the force in magnitude and direction, PN is drawn perpendicularly to AB, then the moment of the force about P = $AB \times PN$ which is equal to twice the area of the triangle PAB. From considerations of such areas, it may be deduced that the algebraical sum of the moments of a system of forces about a point is equal to the moment of their resultant about that point, paying due regard to sign. The common convention of signs is that the moment is positive if

FIG. 2

the force tends to turn the body about the point in a counter-clockwise direction, negative when the body tends to turn in the opposite direction.

Moment of Inertia.—A constant of a body which is most important in the mathematics of the rotation of a rigid body. Consider a rigid body divided up into very small particles, the moment of inertia of the body about a given axis is defined as the sum of the products obtained by multiplying the mass of each

element by the square of its distance from the given axis. A few simple cases are noticed here. The easiest method of calculating the moment of inertia is by means of the integral calculus. A uniform rod of length $2l$ and line density ρ rotates about an axis perpendicular to it through its centre C (Fig. 2). Take an element

FIG. 3

of length δx at distance x from C . Its mass = $\rho \delta x$, its moment of inertia = $\rho \delta x x^2$, therefore total moment of inertia of the rod
$$= \int_{-l}^l \rho x^2 \delta x = \frac{\rho}{3} x^3 \Big|_{-l}^l = \frac{2}{3} \rho l^3 = \frac{M^2}{3},$$
 where $M =$ total mass = $2l\rho$. The moment of inertia of a rectangle, sides $2a$ and $2b$, is found by dividing it up into thin rods parallel to one

FIG. 4

side, e.g. side of length $2b$. Then the moment of inertia of the rectangle about a line through its centre parallel to the side $2a = \frac{M^2}{3}$, where M is the total mass of the rectangle. A circular plate (Fig. 3) is divided up into annular rings. If O is the centre, take the ring, the radii of whose boundaries are r and $r + \delta r$. Its

mass = $2\pi r \cdot \rho \delta r$, where $\rho =$ density. Its moment of inertia about an axis through O perpendicular to the plane of the plate = $2\pi \cdot \rho \cdot r \delta r \times r^2$. Total moment of

inertia of the plate = $\int_0^R 2\pi \rho r^3 \delta r$, where a is the radius. Therefore moment of

inertia = $\frac{Ma^2}{2}$, where $M =$ mass of the plate. Two very important theorems in connection with the theory are the following: (1) If we take three perpendicular axes ox, oy, oz (Fig. 4), and consider the

moment of inertia of a particle of mass m about these axes, the position of the particle being in the xy plane and having co-ordinates (x, y) , i.e. $OM = x$, $MP = y$, then $I_x = my^2$, $I_y = mx^2$, $I_z = mr^2$, where I denotes the moment of inertia, and the suffix the axis about which the moment of inertia is taken. Then $I_x + I_y = m(x^2 + y^2) = mr^2 = I_z$. (2) Again, if $I_1 =$ moment of inertia of the body about an axis through the centre of gravity and $I_2 =$ moment of inertia about a parallel axis at a distance h from it, then $I_2 = I_1 + Mh^2$, where $M =$ mass of the body. Thus the moment of inertia of a circular plate about an axis perpendicular to its plane = $\frac{Ma^2}{2}$, and

the moment of inertia about a diameter = $\frac{Ma^2}{4}$, since the first axis is perpendicular to the diameter and, from the symmetry of the figure, the moment of inertia about any diameter is the same. Any two perpendicular diameters may be taken, the result following by the first theorem. The moment of inertia about a tangent

= $\frac{Ma^2}{4} + Ma^2$ by the second theorem.

Bending Moment.—Consider a beam fixed at one end, a load can be applied to the other greater than it can bear. The beam may bend to such an extent that rupture takes place or one part slides over the other. If the beam does not break the load still tends to produce the above results which tendency is resisted by stresses called into play in the beam itself. Clearly when the beam bends, the upper surface is elongated and the lower surface is compressed, and the stresses generated are obviously equal and opposite in direction, thus constituting a couple. This couple resists the bending which necessarily must be caused by an external couple, which is called the bending moment at the section of the beam under consideration, and is equal to the moments of the external forces on the part of the beam on one side of the section about the section.

Examples: (1) *Cantilever with a load at the free end* (Fig. 5).—Take section AB , whose distance from the free end = x . Then the bending moment at this section = Wx . If the bending moment is represented graphically by y the bending moment is represented by the triangle, since $y = Wx$. (2) *Cantilever with uniformly distributed load* (Fig. 6).—Let $w = \frac{W}{l}$ = weight per unit length. Then

load on part DC is considered as acting at its centre of gravity. Bending moment at AB = $\frac{1}{2}wx^2$. The bending moment

FIG. 5

diagram in this case is a parabola and the bending moment is represented by y . (3) *Beam uniformly loaded and supported at both ends* (Fig. 7).—Let R_1 be the reactions.

FIG. 6

w = weight per unit length. Then bending moment at AB = $R_1x - \frac{1}{2}wx^2 = \frac{1}{2}wx(L-x)$, where L = length of the beam. Bending moment diagram is a parabola. The

FIG. 7

bending moment is clearly greatest at the middle point = $\frac{1}{2}w \cdot \frac{L}{2} \cdot \left(\frac{L}{2}\right) = \frac{wL^2}{8}$. The more complicated questions of rolling loads, and

loads unevenly distributed, admit of similar solutions.

Turning Moments.—A flywheel of an engine acting against a friction brake is an example of this. The wheel rotates against a force, and thus there is a turning moment which in the steady state of motion is equal to the moment of the frictional force about the axis.

Momentum, quantity in dynamics obtained by multiplying the mass of a body by its velocity. It is a directed quantity, and the M. of a system of particles is obtained by adding together the M. of the sev. component particles according to the vector law. The impulse of a force on a particle is measured by the change of M. it produces in it. By Newton's third law the total M. of a system cannot be altered by any action between its component parts. This principle is known as the conservation of M.

Momerie, Alfred Williams (1818–1900). Eng. divine, b. in London. He was ordained priest in 1879. In 1880 he was appointed prof. of logic and mental philosophy at King's College, London, and in 1883 chosen morning preacher at the Foundling Hospital. He pub. sermons and works on the philosophy of Christianity.

Mommmsen, Theodor (1817–1903). Ger. classical scholar and historian, b. at Garding in Schleswig-Holstein. His detailed knowledge of Rom. hist. and critical methods of procedure attracted the attention of the Berlin Academy, who commissioned him to examine Rom. inscriptions in France and Italy. In 1818 M. became prof. of jurisprudence at Leipzig, but he was compelled to retire from this office in 1850 owing to his revolutionary tendencies in politics. In 1852 he was appointed to the chair of Rom. law at Zürich, and in 1854 he became prof. of the same subject at Breslau. In 1858 he became prof. of ant. hist. at Berlin, and during his professorship he compiled the famous *Corpus Inscriptionum Latinarum* and assisted in the compilation of the *Monumenta Germaniae Historica*. From 1873 to 1895 he held the position of secretary to the Berlin Academy of Sciences. From 1873 to 1882 he was a member of the Prussian House of Representatives, and was consistently democratic in his views. His chief works, beside those mentioned are *Oskische Studien* (1845); *Die Unteritalischen Dialekte* (1850); *Corpus Inscriptionum Neapolitanarum* (1851); *Die Rechtsfrage zwischen Cäsar und dem Senat* (1857); *Geschichte des römischen Münzwesens* (1860); *Res Gestae Divi Augusti*; and an ed. of the famous *Monumentum Ancyranum*. But it is for his *History of Rome* (1853–56) (see Everyman's Library, Eng. trans.) that the name of M. will chiefly be remembered. The author's extensive knowledge and critical insight place the work in the forefront of Rom. hist. See studies by C. Bardt, 1903; L. M. Hartmann, 1908; U. von Wilamowitz-Moellendorf, 1918; and W. Weber, 1929.

Momordica, genus of tropical climbing

plants (family Cucurbitaceae), with white or yellow flowers and ornamental gourds of various shapes, sometimes called balsam apples. *M. Balsamica* is the balsam apple, *M. Charentia* the balsam pear.

Mompos, old tn. in the dept. of Bolívar, Colombia, S. America, on the Magdalena R., 110 m. S.E. of Cartagena. It is reached by riv. steamer from the latter city or Barranquilla. The chief industries are cattle-farming and tobacco-growing. The Colegio de Pinillos is noted throughout Colombia as a seat of learning. Pop. 20,000.

Mona, name used by Tacitus for the isle of Anglesey.

Monaco, small It. principality, bounded on the S. by the Mediterranean and surrounded on all its other sides by the Fr. dept. of Alpes-Maritimes. Area 8 sq. m. The small harbour, absolutely sheltered, has an area of nearly 50 ac., with a depth of 90 ft. at the entrance. M. came into the hands of the Grimaldi family in 968. In 1715 it passed into the female line, and on the death of Louise Hippolyte, her husband, count of Thorigny, succeeded under the name of Jacques I. It was annexed by France in 1793, and was ceded to Sardinia in 1846. It then came into the possession of King Victor Emmanuel, who sold it to France in 1861. The principality is still under the protection of France. Until 1911 the prince was an absolute ruler, but in that year a constitution was estab. providing for a national council elected by universal suffrage. In 1819 the gov. adopted a code based on the Fr. codes and a court of first instance, as well as a juge de paix's court. The principality issues its own separate postage stamps, and has its own flag. M. is the seat of a Rom. Catholic bishop (since 1887). The cap. is M. (pop. 2500), where there is an international hydrographic bureau, other tns. being La Condamine (12,000), and Monte Carlo (12,000) where a motor rally is held. The principality flourishes chiefly on the famous casino and gardens. The climate is temperate and pleasant. Palms, olives, oranges, citrons, and aloes grow abundantly. The cap. has a fine palace, cathedral, college, museum, etc. Perfumery, spirits, and pottery are the chief manufs. Prince Louis II. (1870-1949) became ruler in 1922. Normally the succession would have passed to his daughter, the comtesse de Polignac, but she renounced her rights in favour of her son Prince Rainier (b. 1923). Pop. of principality, 19,200. See A. Smith, *Monaco and Monte Carlo*, 1912; L. H. Labande, *Histoire de la principauté de Monaco*, 1934; and F. W. Picard, *Monaco and the French Riviera*, 1937.

Monad and Monadism. The philosophy of Leibniz (q.v.), which is included in these terms, is intermediary between that of Spinoza (q.v.) or monism, and that of Descartes (q.v.) or dualism. A monad may be said to be the ultimate constituent of all substance; monads are simple and similar in constitution; they differ only qualitatively; each is a self-contained individuality, and a monad has two

qualities, perception, or capacity to mirror the universe, and appetite, or striving. From the highest monad, which is God, to the very lowest all are constituted so that at all moments they are all in harmony, although each works out its own development under its own laws independently of all the others. Man is built up of a complexity of monads, while his soul is a single monad, the centre of his being. See G. W. Leibnitz, *Monadologie* (trans. by R. Latta), 1898, and *Nouveaux Essais* (trans. by A. G. Langley), 1896.

Monadnock, Mount, or **Grand Monadnock**, isolated mt. in Cheshire co., S.W. of New Hampshire, U.S.A. Altitude 3186 ft.

Monagas, state of N.E. Venezuela, with the gulf of Paria on the E., Sacre to the N., Anzoategui to the W., and having the R. Orinoco as its S. boundary. The state slopes from the W. to the E., is fertile, and has a number of lakes. The cap. is Maturín. Area, 11,155 sq. m. Pop. 122,900.

Monaghan: 1. Inland co. in the prov. of Ulster, Eire. The N. is watered by the Blackwater, the S. by the Fane and Glyde, and the W. by the Erne. The surface generally is hilly, the Slieve Beagh range, 1250 ft. at its highest point, extending along the whole N.W. boundary into Fermanagh. None of the rvs. are navigable. The Ulster Canal, which unites loughs Neagh and Erne, traverses the co. near M. and Clones. The S. contains rich and productive land, but the most fertile part is the central, including the baronies of M., Crenmore, and Dartree. Agriculture is the main occupation, flax and wheat being the chief products. Linen is the chief manuf. The area is 500 sq. m. Pop. 58,000. 2. The co. tn., 15 m. W.S.W. of Armagh, contains the college of Macartan and a Rom. Catholic chapel. The bor. obtained its charter from James I. Pop. 4700.

Monandry, see under FAMILY.

Monapia, see MAN, ISLE OF.

Monarchianism. The term applied derisively by Tertullian to those heretics of the second and third centuries who denied the doctrine of the Trinity and constituted themselves the defenders of the monarchy of God or Christian unitarianism. Latter-day historians classify monarchians into the Adoptionist (from the view that Christ was the Son of God by adoption only) or Dynamistic sect, who held Christ to be a human being endowed with divine powers, and the Modalistic sect, who regarded Christ as the incarnation of God the Father, and maintained generally that the Trinity was really reducible to different conceptions under which the One Divine Being might be viewed. It seems that one Theodotus, a shoemaker, was the first to teach that Jesus was mere man, and incurred excommunication for his views. Artemon, who belonged to the ante-Nicene Monarchians (or Adoptionists), declared the doctrine of the Trinity to be an innovation dating from Zephyrinus and a relapse into heathen polytheism. He also asserted that Christ was a mere man, but born of a

virgin, and superior in virtue to the prophets. His views, for which he, too, incurred excommunication, were developed by Paul of Samosata (see Eusebius, *Historia Ecclesiastica*). The dynamistic heretics are largely associated with the Alogians, or deriders of the Logos *q.v.*, the term Alogians or Alogi being invented to emphasise their rejection of the divine Word preached by John. The name mainly associated with the Modalistic M. is that of Praxeas, against whom Tertullian especially hurled his fulminations. Praxeas was both Monarchian and Patripassian (the W. name for the heresy of Sabellius, viz. that God the Father became incarnate and suffered (*passus est*), the Son being only a form or modality of the same Person). They were widely spread than the Adoptionists, but both sects belong only to the early centuries. See L. J. Texeront, *Histoire des dogmes*, i., Paris, 1905; L. Duchesne, *Early Christians of the Christian Church*, i., 1909; and P. Hughes, *History of the Church*, i., 1931.

Monarchy, see SOVEREIGNTY.

Monarda, genus of N. Amer. perennials (family Labiatae). *M. didyma*, the sweet bergamot, or Oswego tea, bears whorls of fragrant scarlet flowers from June to Aug.

Monash, Sir John (1865-1931), Australian soldier, b. at Melbourne, of Jewish descent and educated at the Scotch College and Melbourne Univ. M. has been styled the greatest Jewish soldier since Masséna; he was certainly the only one to rise to the command of an army corps during the First World War, and reached higher rank as an officer in the Brit. Army than any previous Jewish soldier. In Gallipoli he showed tactical perception and powers of organisation, and in 1918 he succeeded Gen. Birdwood (*q.v.*) in charge of the Australian Corps. After the Armistice he organised the repatriation of the Australians.

Monastery, abbey, priory, or convent for monks or nuns dedicated to the religious life. An abbey (as the name implies) is under the rule of an abbot or abbess; similarly a priory is ruled by a prior or prioress. In cathedral Ms. the bishop was the abbot, and the superior of the estab. was a cathedral prior. In its early stages, when monasticism was practised in the eremitical form, the Ms. were merely groups of cells or huts. St. Pachomius, the founder of cenobite Ms., built his first M. in the form of a vil., with rows of huts large enough to accommodate three monks in each, and with a common refectory and a church. Under his rule the monks worked at different trades such as tailoring, carpentering, etc., so that workshops formed part of the buildings, the produce being shipped to Alexandria and sold to support the community. As time went on and the number of convents grew, experience led to the formation of a regular plan; the estabs. were made more compact, which also helped to guard them from outside attack, and were encompassed with means of defence, the monks erecting massive buildings, containing all

the necessary accommodation and surrounded with high walls as a protection against a possible enemy.

The E. or oriental Ms. differed in their architectural plan from those of the W. That of Santa Laura (*i.e.* Holy M.), Mt. Athos, may be taken as a typical E. M. It is enclosed within high stone walls, and occupies between 3 and 4 ac. of ground. The main entrance, which is composed of three iron doors, is on the N. side, and is guarded by a tower, the only other entrance being a small postern on the S. side. On entering there is an outer courtyard with a chapel immediately facing, and to the left the guest-house with a cloister running along the front. The refectory, kitchens, storerooms, etc., are also in this courtyard, which thus becomes the centre of the material life of the community, while the inner courtyard forms the centre of the religious life. As one enters, the church at once arrests attention as the chief feature of the whole building. It is placed almost in the middle of the courtyard, which is surrounded by cloisters on to which open the cells of the monks, and in front of it there is a marble fountain. Although the refectory stands in the outer courtyard, the entrance is effected from the inner courtyard; it is a large cruciform building, and is decorated with frescoes representing various saints. In the E. M. this building is usually found sited near the church, in the place of a chapter-house; meals are often taken in solitude in the cells.

The Coptic Ms. adopted a different plan of architecture, the courtyards being absent. The church occupies the N. side of the building, and alongside it runs an immense gallery with the cells opening out on either side. During the great monastic epoch that followed St. Benedict (see MONASTICISM) a great number of beautiful Ms. were built. The Benedictine Ms. all followed one architectural plan, which was, of course, modified according to the site. The buildings were erected in a series of groups; the church, as the centre of the religious life of the community, formed one side of a square cloister, round the other sides of which were other buildings forming a necessary part of the monastic life, the chapter-house, the dormitory, the common room, and the refectory. Another group was formed by the infirmary, with its garden and the school for the novices, while beyond the convent enclosure lay the abbot's house and the outer school, with the guest-house for distinguished visitors not far distant. In large Ms. there were sometimes three guest-houses: the one already mentioned, the other two being for monks and poor travellers and placed on either side of the main entrance. The buildings connected with the material wants of the community lay to the S. and W. of the church, the kitchen, buttery, bakehouse, brewhouse, etc., the refectory being reached by a passage from the kitchen, and beyond these again were ranged the workshop, stables, and farm buildings. The great Swiss M. of St. Gall (A.D. 820) was a typical Benedictine M., and the same plan is

followed out more or less faithfully in most of their buildings, with slight variations due to the locality. So, for instance, at Canterbury the cloister and monastic buildings are situated to the N. of the church instead of the S. as is usual, and at Worcester and Durham the dormitories show a slight difference in arrangement. At Westminster Abbey and St. Mary's Abbey, York, the normal Benedictine plan is adhered to. Buckfast Abbey is another example of the Benedictine style.

The Cluniacs grouped their buildings somewhat differently, and in the plan of the abbey of Cluny, founded by Wm., duke of Aquitaine, the cloister is placed considerably further W. than is usual, and the monastic buildings do not open out of it, but are placed in a separate group.

BUCKFAST ABBEY

John H. Stone

Moreover Cluniac Ms., except Cluny itself were ruled by priors, not abbots, so that the abbot's estab. is lacking. There were not a great number of Cluniac houses in England; the one at Lewes was the first, but the best preserved are at Castle Acre and Wenlock.

Following on the Cluniac Ms. came those of the Cistercians, the chief characteristic of which was their plainness and simplicity, the outward expression of the rigid rule they adopted. Unnecessary decoration of any sort was forbidden, such as turrets, pinnacles, or stained glass, and the sites chosen were usually wild and desolate. The effect of these regulations was the production of a definite Cistercian style of monastic building, of which Fountains is a good example. The first of their houses was the abbey of Cîteaux. They followed out a particular plan. The buildings were divided into two wards, separated by a wall. In the outer were the barns, granaries, stables, workshops, etc., and in the inner the monastic buildings proper, with the church occupying the central position. At Clairvaux (A.D. 1116) there are two cloisters, and on the E. side beyond the monastic buildings

there are gardens, orchards, and fishponds placed outside the convent walls. The church was also built on a slightly different plan from those of other communities, with a very short E. limb, which was, as a rule, square. It also invariably had two square chapels on the E. side of the transepts, which were divided off with solid walls, and at Clairvaux there are nine chapels radiating round the apse, also divided by solid walls. In the Cistercian Ms. the chapter-house was always quadrangular, and was divided into two or three aisles by pillars and arches. The position of the refectory is also a characteristic; in the Benedictine houses it was placed parallel to the nave of the church on the side of the cloister furthest removed from it, and it ran E. and W., but in the Cistercian houses it was placed at right angles to the church, and ran N. and S. The buildings may be placed in five groups: (1) The outer ward containing all the buildings connected with labour of all kinds. (2) Those connected with hospitality and the material requirements of the community placed just within the inner ward. (3) The church and monastic buildings. (4) The inner cloister, with the library, lecture-hall, and literary requirements. (5) The infirmary and novices' quarters. The first Cistercian house to be founded in England was that of Waverley Abbey, near Farnham, of which but little now remains. That of Fountains Abbey, York-shire, is the best preserved, others being at Rievaulx, Kirkstall, Tintern, Netley, etc.

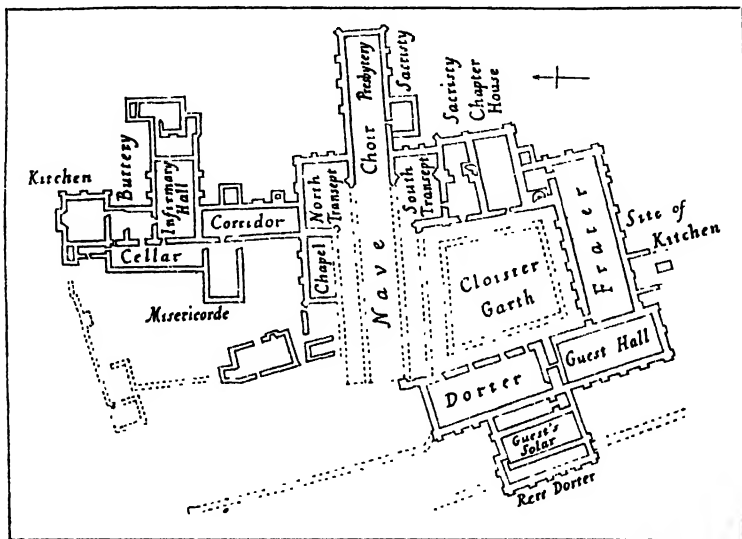

The Augustinian Ms. followed the Benedictine plan more or less, but a leading characteristic of their buildings is the immense length of their churches, which were devised to accommodate large congregations. At Llanthony and Christ Church (Twynham) the choir is shut off from the aisles. Sometimes there are no aisles at all, as at Bolton and Kirkham, while at Brinkburn and Lanercost there are only N. aisles. The abbey of St. Augustine at Bristol was typical of the Austin canons, their church now being used as the cathedral.

The Premonstratensians (so called from their first abbey at Premontre in France), in building, followed the plan of the Austin canons, of which they were a branch. The first Eng. estab. was at Newhouse in Lincolnshire (A.D. 1140), but the best preserved are those of Easby, York-shire, and Bayham, Sussex.

The Carthusian monks departed from all the other communities in their architectural plan, owing to a wide difference in their rule. Their order sprang up as a revival of the eremitical life, and as solitude and silence were enjoined by their founder, St. Bruno, it was necessary to build in such a manner that this could be carried out. The M. was therefore arranged in a series of detached cells or small cottages, each containing a living-room, sleeping-room, etc., with a small garden surrounded by a wall, and opening on to a corridor, which in its turn opened on to a cloister connecting the whole. At the great Carthusian M. of Clermont these

cells occupy three sides of the cloister, and on the W. lie the church, the chapter-house, and refectory, with the other necessary offices. This arrangement is invariably found throughout the charter-houses, as they were called in England, of which there were never more than nine. The best preserved is that of Mt. Grace in Yorkshire, though that of Witham in Somersetshire is the earliest. Others were at Sheen, Richmond, and the famous Charter House in London. The modern charterhouse at Parkminster, Sussex, is built according to the old plan.

necessity adapted to the sites chosen, so that there was seldom any regularity in the buildings, and their best efforts were concentrated on their churches, which were built with a view to accommodating large congregations. These were generally long-shaped buildings without any transepts, the nave being divided into two parts, one for the brotherhood and the other for the congregation. The E. end was as a rule square. One of the best preserved Eng. friaries is that of the Dominicans at Gloucester, where there is also a Franciscan convent. The Dominicans'

PLAN OF RASBY ABBEY

Marie Hartley

The above sketch plan is reproduced, by permission of the Ministry of Works, from a measured plan.

A medieval experiment which has never been revived is that of double *Ms.*, the first examples of which occur in Gaul in the seventh century. In these two separate communities of monks and nuns occupied adjacent buildings and often worshipped in the same church. The nuns' convent was the more important as a rule because the monks (or canons) were instituted primarily to administer sacraments and instruct the nuns; of such were the abbeys of Whitby and Ely in A.-S. days. The orders of Gilbertines (1146) and Bridgettines (1346) were composed on this plan, and in the Bridgettine houses the abbess ruled the whole double *M.*, the prior of the monks being subordinate to her.

A word must be said about the monastic buildings of the Mendicant orders, which formed a distinct class. They were usually planted in large *tns.*, and were of

house at Norwich may also be mentioned. Of the Carmelite or White Friars, the best example is the abbey of Hulne near Alnwick, which was their first foundation in England (A.D. 1240). Of the Black Friars (Dominicans) and Grey Friars in London, only the names remain, but the nave of the church of the Austin Friars has been preserved. The destruction of the beautiful *Ms.* in England was the work of Henry VIII. and his adviser, Thomas Cromwell. They saw in the monastic property vast possibilities of wealth. The Act of Dissolution passed in 1536 suppressed all *Ms.* with an income of less than £200 a year, but though this still left the larger *Ms.* free, they fell into the king's hands in 1539 through the Act of Suppression and the attainder of individual abbots. The properties were acquired by nobles who often used them as quarries for materials for building their own houses. *See A.*

Thompson, *Abbeys*, 1923; F. H. Crossley, *The English Abbey*, 1935, 1945; C. Baskerville, *English Monks and the Suppression of the Monasteries*, 1947; and H. E. Roberts, *Notes on the Medieval Monasteries and Ministers of England and Wales*, 1949. For a list of Eng. houses see D. Knowles, *The Religious Houses of Medieval England*, 1940. See also R. E. Swartwout, *The Monastic Craftsman*, 1932.

Monasticism (from Lat. *monachus*, a monk; Gk. *μοναχός*, solitary), general name descriptive of a mode of religious life which has prevailed in the Church from almost the earliest ages, and which, during many periods of its hist., has formed the most characteristic and powerful expression of its activity. It sprang into settled existence during the third century, and was the natural product of many influences then moving the Church. Previously to this period, indeed, a system of solitary and ascetic devotion is found prevailing among the Jews both in Palestine and in Alexandria. And a life of dedication or consecration of persons, who, however, continued to live with their own families was known in the first Christian centuries. This was the germ out of which the monastic life grew; a stimulating factor may be found in those hardships and persecutions which oppressed the Church, and the spirit which these persecutions naturally quickened and fostered. During the severities which followed the edict of Decius in the year 250, many Christians were driven from their homes in search of shelter from the relentless vengeance which pursued them. It is not easy to estimate how far this contributed to the growth of monastic life, the key idea of which, both inside and outside Christianity, is the seeking of seclusion and the withdrawal of all material comforts in order to obtain complete concentration on the contemplation of divine things. In fact, these two ideas, mysticism and asceticism, are universals which appear in all intense religious movements, and we should not overstress the importance of persecutions in the origin of Christian M. Recent scholarship has also shown that the idea of doing solitary battle with the devils in the wilderness was present in the minds of the early solitaries. Egypt was the fruitful soil in which such thoughts germinated and sprang to maturity.

The prin. names in the E. in the origin and growth of these ideas are Pachomius (q.v.), Antony (q.v.), and Basil (q.v.), the last of whom may be regarded as the first in point of time to give to the monastic life a fixed and permanent form; but it was Pachomius and Antony who drew such attention to the monastic life as to spread abroad its fame and attract many to its adoption. Pachomius was born about the year 292, and estab. the first actually organised monastery at Tabennae (Tabennisi), an is. in the Nile, near Dendera, and later founded the first nunnery under the presidency of his sister.

At his death there were nine cenobitic institutions and 6000 monks and nuns. Antony was born on the borders of upper Egypt, in the vil. of Coma (Koma), in the prov. of Hieracleopolis, about the year 251. A spirit of simple and earnest piety animated him from his youth. Losing both his parents about his twentieth year, the care of a young sister and of considerable property devolved upon him. Setting aside the ordinary Christian obligations arising out of this position, he disposed of his property, and embraced a life of voluntary poverty in which he might without impediment give himself to spiritual duties. He sought a distant retirement, where he remained for twenty years, maturing a saintly renown which spread abroad his fame. Followers gathered around him despite his efforts to maintain his privacy; and the first rudiments of a monastery grew up in this wilderness. The life of Antony was prolonged to upwards of a hundred years, and his fame grew with his years. He distinguished himself as the warm friend of Athanasius in his contest with Arianism; and it is to this circumstance that we probably owe the record of his life from the pen of Athanasius. Hardly less famous were Paul the Hermit and the older and younger Macarius. The movement thus stimulated by Antony speedily spread into Syria and Palestine. Hilarion, a disciple of Antony, was chiefly instrumental in the promotion of M. in Palestine; while the great Basil of Caesarea, the fellow student and friend of Gregory Nazianzus, warmly embraced its spirit, and more than any other contributed to its progress throughout Syria and to the shore of the Black Sea. The rule of Basil was to the E. what that of Benedict was to the W. in that it absorbed or supplanted all previous methods, while unlike the great W. rule it has had no competitors, and remains to this day the single monastic code of the oriental Church. This rule is embodied in the *Ascetic Sermons* of Basil and in his recensions notable for their lofty piety. The development of oriental M. thus in effect ceases with the Basilian rule, apart from the institution of the Akometoi or 'sleepless' monks in the fifth century, for the purpose of maintaining in relays unbroken prayer, a system initiated in the W. and known as the *laus perennis*. It survives to-day in communities founded for perpetual adoration. Gregory Nazianzus never assumed, like Basil, the monastic vows; but the triumph of the ascetical bent was scarcely less complete in him than in his friend. While the institution of M. thus extended itself, from the example of Antony, not only in Egypt, but throughout the E., its more complete organisation is associated with the name of Pachomius, another Egyptian ascetic. To him is attributed the foundation of the cloister life according to a regular system and the beginnings of monastic organisation. The monastery of S. Pachomius was a halfway stage between the scattered hermits without organisation and the strictly organised monasteries of SS. Basil and

Benedict which developed later. It was known as a *laura*. The earlier Anchorites, who lived in single cells, with only a casual combination and without submitting to any definite rule, for the most part died out or were absorbed into the more regular establs., though some remained. The most various results, as may be imagined, spring from an institution like E. M. In some cases there was formed a pure spirit of devotion, such as that which animated its great founder Antony. A ready and generous hospitality distinguished the cloisters. The traveller was offered with an ungrudging spirit maintenance and lodgings. Perhaps the most astounding phenomenon among these E. solitaries is that of the famous Simeon Stylites, who passed thirty years on the top of a pillar 60 ft. from the ground. Athanasius was partly responsible for extending M. into the W. During his compulsory sojourn in Rome in 341 he brought with him certain Egyptian monks, whose austerities and devotion attracted interest and at length admiration. His *Life of Antony*, moreover, which was speedily trans. into Lat., gave a great impulse to the monastic spirit. All the most illustrious of the W. teachers contributed by their approval to this result. Ambrose of Milan, Martin of Tours (the first notable monk in the W.), and Augustine were drawn within its influence, and lent it their encouragement. Amongst many documents attributed to Augustine, the only one resembling a monastic code is his epistle (109th) censuring the nuns of a convent which he had founded at Hippo but which had fallen away from discipline. But his personal example gave rise to a new sort of common life, in that he formed a kind of college of priests, this being the origin of the institute afterwards so well known as the Austin canons, and the pattern of certain eleventh-century foundations. Another contribution of Augustine to the hist. of the common life is his *De Opere Monachorum*, a treatise in which he emphasises the need of making hard work an invariable factor of the monastic profession. The restless activity of Jerome during his residence in Rome was exerted in its behalf, and under his influence rich and noble ladies were led to retire from the world and consecrate themselves, amid the solitudes of Palestine, to a life of devotion. The labours of Martin of Tours, and of Cassian at Marseilles, were especially successful until, in the course of the fifth century, thousands of devotees spread themselves through France into Britain and Ireland.

As a permanent form and organisation had been provided in the E., so in the W., a rule was written by Benedict of Nursia, characterised rather by its simplicity and order than by any special severity. And this rule rapidly spread through Europe, and took the place of earlier models of monastic life, among which the Celtic ones had been widely accepted. St. Benedict (c. 480-c. 543) began life as a hermit in a cave at Subiaco (near Rome). Chosen abbot of a convent near Subiaco his rule proved too exacting for his new subjects.

He accordingly resigned his abbacy and returned to his cave at Subiaco, around which he soon built twelve monasteries, each under an abbot, and containing a few monks. Attempts on his life and on the discipline of his society drove him out again, and in the year 528 he repaired to Monte Cassino, where he drafted his famous rule (529), and which has ever since held its place as the cradle of the Benedictine order, and the first abbey of W. Christendom. Rigorous as were the personal austerities of St. Benedict, he was convinced by experience that an undue severity of fasting and mortification was unsuitable for the ordinary man who wished to take up the monastic life. Two hours after midnight the monks were aroused to vigils (or Matins), and the time between this and daybreak, when Lauds was sung, was consumed in learning the psalms by heart, or some other study. These early services were followed throughout the day by manual labour and reading with regular periods for the Divine Office. During summer the day was so divided that seven hours were given to the former occupation and at least two to the latter; during winter more time was given to study, but no alteration appears to have been made in the hours of labour. Sunday was entirely given to reading, and prayer. The rule thus written by Benedict extended itself, as we have said, throughout the W., and for many years was instrumental in preserving the integrity and simplicity of devotion in its cloisters. With the gradual increase of riches, however, many Benedictine monasteries lost their primitive character, discipline varied, and standards fell considerably. Many attempts were made to revive the first fervour of the rule, and still more successfully to apply it in new forms, each of which in its turn achieved a great reputation, and powerfully helped the cause of the papacy in the different countries into which they spread. In this manner arose the congregation of Cluny, and the Cistercian and in a lesser degree the Carthusian order, all branches, as it has been said, from the stem of St. Benedict. Popes were sometimes elected from the monastic body, the most famous of them being Hildebrand, known to hist. as Gregory VII. The immortal name of St. Bernard is associated with the Cistercian order, of which the abbey of Clairvaux was a dependent. The simple purity of the Carthusians acquired for them a great reputation. Alone of the monastic orders they have never needed reform.

In the meantime, however, other forms of monasticism had arisen, the most notable and distinguished of which, dating from an early period, was the order of St. Augustine (or Austin canons). Whereas the monks had not originally been priests, this order was chiefly composed of ecclesiastics; later, however, the monks also were regularly ordained to the priesthood. There are still two further developments of the monastic system that claim notice. These are the rise and estab. of the Military and the Mendicant or Preaching orders. The former had its origin in the

close union subsisting between the eccles. and the military professions in the Middle Ages, and especially out of the crusading spirit of the twelfth century. They are well known under the historical names of the Knights of the Hospital, the Knights Templar, and the Teutonic order. They took their rise in Palestine, and disappeared about the time of the Reformation. They consisted entirely of laymen who bound themselves by vow to certain services. While the Military orders arose out of the external necessities of the Church, and the warlike spirit kindled by the advance of Mohammedanism, the Mendicant orders originated in the internal dangers of the Church from the encroaching spirit of worldliness and free opinion. St. Dominic (1191) acquired his fame as a preacher against the heresy of the Albigenses and framed the bold idea of establishing an order of Mendicant preachers whose vow should specially bind them to the interests of the Holy See and the extirpation of heresy. Innocent III. at first looked coldly on the project, but its obvious policy soon gained it papal recognition. St. Francis of Assisi was a contemporary of St. Dominic, who was led to start a fraternity marked by the greatest simplicity and poverty; this was a reaction against the wealth acquired by the older orders, including now the Cistercians. The story of his interview with Innocent III., when he first appeared before him with his plan, is well known. The pope had just decided that no new orders were to be recognised in the Church, but a dream aroused him to his mistake, and led him to approve the new order. While preaching was the characteristic feature of the Dominican rule, poverty was the chief distinction of that of St. Francis; but the two orders tended to become organised on similar lines, and perform similar tasks, so that they both were noted for their mendicancy and preaching, though in different proportions. The hist. of these orders, as well as that of the Jesuits, and other clerks regular, which may be said to be a development of the monastic spirit, but in such a distinct shape as to require separate notice, is inseparably bound up with that of the papacy. Since the reformation the older monastic orders were largely thrown into the shade by these newer orders of a more active type. The learned work of the Maurist Congregation in France is, however, famous, as also the Cistercian reform of La Trappe, which produced the strictest of all the orders of the Rom. Catholic Church to-day—the Trappists. The nineteenth century was characterised by a notable revival of M. in Europe and its spread to America. After the Fr. Revolution Eng. monks returned from abroad and re-established themselves in England. Dom Guéranger in France and the brothers Wolter in Germany refounded M. in their respective countries. It. M. revived especially by the energies of Abbot Casaretto of Genoa and Subiaco; the Austrian monastic orders flourished anew, relieved of the old Imperial despotism of the eighteenth century, while Swiss and

Bavarian monasteries were able to send out missionaries to the U.S.A. and elsewhere to set up M. in countries which hitherto had not known it. To-day the Black Monks of Saint Benedict form a federation containing 11,000 men and 15,000 women. The Cistercians and Trappists are organised apart. The Dominicans and Franciscans are considered as friars rather than as monks. Among modern Eng. Benedictine houses may be mentioned Downside, Ampleforth, Buckfast, and Prinknash. This article has considered only the Christian aspects of M., but it should be remembered that M. is widespread in the E. outside the Christian faith. The monasteries of Tibet are particularly famous (see LAMAISM). See for a comprehensive sketch I. C. Hannan, *Christian Monasticism*, 1924; see also J. H. Newman, *Historical Sketches*, 1873; J. Hannan, *The Spirit and Origin of Monasticism*, 1903; F. Gasquet, *English Monastic Life*, 1904; F. Butler, *Benedictine Monachism*, 1919; G. Morin, *L'Idéal monastique* (4th ed.), 1929; especially D. Knowles, *The Monastic Order in England*, 1940, and *The Religious Orders in England*, 1948; and H. C. von Balthasar, *Die grossen Ordensregeln*, 1947.

Monastir, or Bitollj, cap. of the vilayet of M., in Serbian Macedonia, 136 m. by rail W.N.W. of Salonika. During the Balkan war a Turkish army surrendered to the Serbians here in Oct. 1912. Bulgaria vainly demanded the cession of M. in 1915 as part of the price of espousing the allied cause, it being the Bulgarian view that it formed part of the country of which her Balkan neighbours had robbed her in the Balkan war of 1913. M. surrendered to Gen. Mackensen on Dec. 2, 1915, in the Ger. invasion of Serbia, but was later retaken by the Serbs. M. was captured by Ger. forces in the course of the invasion of Yugoslavia, in April 1941. There are exports of grain, tobacco, wool, and skins, and manufs. of gold and silver filigree work, and carpets. M. has been identified with the anc. Heraclea Lyncestis. Pop. 33,000.

Monazite, the orthophosphate of cerium, $Ce(PO_4)_3$, which is found naturally as a crystalline mineral. It contains, in addition to cerium, lanthanum, didymium, other rare earths, and a little thorium. M. crystallises in the monoclinic system, and its colour is from red to brown; hardness about 5, and density 5.2. It gives a characteristic absorption spectrum, and is radioactive because of the contained thorium. It is found in India, Indonesia, Norway (Arendal), Ceylon, Brazil, and in U.S.A., usually associated with granites, gneisses, and pegmatites. Good crystals of the mineral in bulk are rare, but M. is widely distributed in M. sand, found largely in Brazil. The main importance of M. is in the manuf. of gas mantles. The mineral contains enough thorium to make it worth while to obtain thorium, which is the main basis of gas mantles. The percentage of thorium in M. may be as much as 10, but it is usually less.

Monbodo, James Burnett, Lord (1714-1799), Scottish Judge and metaphysician

practised as a barrister till 1767, when he was made judge in the court of session. Among his contemporaries he had the reputation of an eccentric because he gave learned suppers, rode on horseback after the manner of the ancients, and because in his *Origin and Progress of Language* (1773), and his *Ancient Metaphysics* (1779-99), he exposed man's affinity to the orang-outang, thus in a measure anticipating the Darwinian theory. See T. L. Peacock, *Melincourt* (1856), where the idea is ludicrously developed. Boswell describes, in his *Tour of the Hebrides*, an interview between Lord M. and Dr. Johnson.

Moncayo, mt. on the boundaries of Aragon and Castile, Spain. 55 m. W. of Saragossa. Altitude 7600 ft.

Monceau-sur-Sambre, Belgian tn. in the prov. of Hainaut, 3 m. W. of Charleroi, on the R. Sambre. It has coal-mines, blast furnaces, iron foundries, plating mills, and manufs. of fireproof products. Pop. 9700.

Mönch, peak in the Bernese Alps, Switzerland, 3 m. N.E. of the Jungfrau. Altitude 13,168 ft.

Monok, Sir Charles Stanley, fourth Viscount (1819-94), first governor-general of Canada. *b.* at Templemore, Tipperary. He entered Parliament in 1852 as member for Portsmouth. He was appointed captain-general and governor of Canada and Brit. N. America in 1861. M. was the chief promoter of the federal constitution of Canada (1867).

Monok, George, first Duke of Albemarle (1608-70). Brit. general and admiral, *b.* at Potheridge, Devonshire. He fought at Cádiz (1625) and Rhé (1627). He was a colonel under Charles I. in the Scottish war (1639). In 1644 he was taken prisoner by Fairfax at Nantwich, and imprisoned for two years in the Tower (1644-1646). He became lieutenant-general under Cromwell, and fought with distinction at Dunbar (1650). In 1654 he became commander in Scotland, and took Edinburgh in 1659. In 1660 he restored Charles II. As admiral of the fleet in 1664 he won a decisive victory over the Dutch. Lives of M. have been written by T. Gumble, 1671; F. Guizot 1838; and J. Corbett, 1889.

Monclova, tn. of Mexico, in the state of Coahuila, on the National Railways. 120 m. from Saltillo. There are large copper, zinc, lead, and silver mines in the vicinity. In the tn. are the shops of the National Railways of Mexico, steel furnaces, a rolling mill, and an iron tube factory. The tn. is the centre of an agric. country. A railway is being built to Chihuahua. Pop. 7000.

Moncrieff, Sir Alexander (1829-1906). Brit. soldier and inventor, *b.* in Perthshire. He invented in 1868 the 'M. pit,' or 'disappearing system,' a method of mounting the heavy ordnance in coast batteries. A shelter receives the gun after firing, the energy of the recoil being stored and subsequently utilised to carry the gun into firing position when required.

Moncton, city and port of entry, Westmorland co., New Brunswick, Canada, on

the Petitcodiac R., 89 m. N.E. of St. John. It is the regional headquarters of the Canadian National railways (including Newfoundland railways) with large and well-equipped locomotive and car shops; it has a well-developed airport, sited in an area possessing highly favourable atmospheric conditions, used regularly by Trans-Canada Airlines and Maritime Central Airways, and as an alternate airport by overseas airlines flying the N. route. Possessing ideal transportation facilities M. has become a preferred distribution centre for the Maritime Provs. and Newfoundland. Manufs. include woollens, cotton goods, foundries, wood-working, biscuits. Water supply is plentiful, electricity ample. Natural gas and oil wells are located within 11 m. Pop. (city) 28,000; (suburbs) 19,000.

Mond, Sir Alfred Montz, see MELCHETT, VISCOUNT.

Mond, Ludwig (1839-1909). Eng. chemist, *b.* at Kassel, Germany. Educated at the univs. of Marburg and Heidelberg, where he studied under Bunsen. He came to England in 1862, and introduced the process for recovering sulphur from waste products of the Leblanc soda process. In partnership with J. T. Brunner (1873) he estab. the ammonia-soda process (Solvay) at works in Cheshire, now the largest alkali works in the world. He manufactured chlorine as a by-product, and produced gas from waste products, recovering ammonia. He evolved a new process for the manuf. of pure nickel, in conjunction with Lange and Quincke, from nickel carbonyl, also his own discovery. He founded and endowed the Davy-Faraday Research Laboratory of the Royal Institution, 1906. A portion of his collection of early lt. painters, etc., he left to the nation. Pub. papers in *Transactions and Proceedings of the Royal Society*, *Royal Institution*, *Brit. Association*, *Chemical Society*, and *Society of Chemical Industry*.

Mond, Sir Robert Ludwig (1867-1938). Eng. chemist and archaeologist, *b.* at Farnworth, Lancashire, son of the preceding. He was educated at Cheltenham College, Cambridge Univ., Zürich Polytechnicum, and Edinburgh and Glasgow Univs. He collaborated with his father in the discovery of the gaseous compound, nickel carbonyl. He perfected the industrial production of iron carbonyl, and discovered the first derivative of a metallic carbonyl (cobalt nitroso-carbonyl) and a new ruthenium carbonyl. His thirty years of archaeological work was carried out in Egypt, Palestine, and Brittany.

Monday, second day of the week. The word is derived from the O.E. *Monandæg* (Moonday).

Mondonedo, tn. in the prov. and 30 m. N.N.E. of the city of Lugo, Galicia, Spain. It has a cathedral (thirteenth-century). Pop. 12,000.

Mondovi, tn. in the prov. of Cuneo, Piedmont, Italy. 42 m. S. of Turin. It had a univ. (1560-1719). The church of S. Maria Maggiore and the cappella di S. Rocco were partly destroyed in the Second World War. Its manufs. include paper,

pottery, machinery, and textiles. Pop. 13,000.

Monel Metal, one of the prin. alloys of nickel; contains 65 per cent of nickel, 32 per cent of copper, with small amounts of manganese, iron, carbon, sulphur, and silicon. It is essentially a solid solution of copper in nickel, has great tensile strength, is not seriously weakened even at 400° C., can be cold-worked without becoming brittle, is not appreciably corroded by the air, and withstands the action of sea-water, alkalis, and ammonia. It is therefore used in a great variety of industries, for castings, chemical, textile, and laundry equipment, and for power plant components such as turbine-blading, valves, pumps, etc. *See also* under **NICKEL**.

Monera, classification of atoms of proto-plasma destitute of any structural features. *See* **PROTOZOA**.

Monessen, tn. in Westmoreland co., Pennsylvania, U.S.A., on the Pittsburg and Lake Erie railroad, 1½ m. from Charleroi. It has foundries, and manufs. steel and wire-fencing. Pop. 20,300.

Monet, Claude (1840-1926), Fr. artist, b. at Paris. M. was one of the most important artists within living memory, and a leader, if not the leader, of the Impressionists. Essentially the painter of light with all its possibilities, his efforts to analyse light pictorially into its component spectral colours greatly influenced the post-Impressionists. But it was the æsthetic value and the poetry, rather than the mere realisation of light, that inspired his talent. He was a pioneer in the discovery of 'colour in shadow' and a decorative colourist by intention, painting colour for the sake of light rather than light for the sake of colour. He visited England in 1870-71, during the siege of Paris, and then made the close acquaintance of Turner and Constable, a meeting which undoubtedly influenced M.'s whole subsequent outlook on his art, and taught him the possibilities of atmosphere. In connection with this visit, his two paintings, 'Waterloo Bridge' (1891) and 'Houses of Parliament' (1901), should not be forgotten; and two other notable pictures of his in England are the 'Plage de Trouville,' painted in 1870, and 'Vertueil: Sunshine and Snow' (1881) (included in the Lane bequest), both in the Tate Gallery. Good as are M.'s cathedrals, railway stations, and Venetian scenes, his aims and methods were better adapted to other and more characteristic subjects; he is perhaps happiest in such lovely riv. scenes as the 'Poplars on the Epte,' now in the National Gallery of Scotland. 'Views of Argenteuil' (1872), 'Cathedrals' (1874 and 1894), 'Les Meules' (1891), and 'Le Bassin des Nympheas' (1900) are some of his most famous works. *See* C. Geoffroy, *Claude Monet*, 1922; N. Latham, *Claude Monet*, 1931; and S. Gwynn, *Claude Monet and his Garden*, 1934.

Money, Outside primitive, slave, religious, or military communities and the like M. commands economic activities. When its commands are inadequate there is unemployment. After the two world wars the difficulties of a M. economy as

against a military economy were often seen to the former's disadvantage. Another doubt of man's mastery of his M. economy arose from the spectacle of the nations exporting luxuries to one another when, immediately after a devastating war, they would have preferred to concentrate on first essentials. But the fact that the monetary economy has not solved all its problems of adaptation is no reason for seeking to exchange its manifest benefits for the limited advantages of a barter or slave economy.

Between the wars the importance of M. forced itself more and more on public attention. The illusion and reality of well-being induced by war spending gave rise to Utopian projects based on the magic of M. creation, while at the same time millions of people had first-hand evidence of the dangers of high inflation. The sceptical were convinced that no good could come of 'tinkering with the M. system,' and that 'sound M.' was an essential of modern society. For most people sound M. was gold, or at least gold-backed M. In the article **CURRENCY** the emergence of gold is shown as the M. metal *par excellence*, a metal whose portability, divisibility, durability, and intrinsic value guaranteed its immediate acceptability as a medium of exchange, first as M.-by-weight and then as stamped coin. Besides being a medium of exchange, M. is a means of credit and a measure of value. It may also be regarded as a store of value, or liquid asset; but perhaps the most useful approach is to regard M. as a claim on goods and services which will be promptly honoured. Legal tender M. is by definition a means of settling debts. The legal tender currency of the United Kingdom consists of Bank of England notes of 10s. and £1, together with subsidiary token metal coins which are legal tender for limited amounts. Paper notes are of limited durability and fail entirely to meet the intrinsic value requirement, but are honoured promptly as a claim to goods and services. Gov. paper M. is at once a mere auxiliary of bank-M. and the base upon which bank-M. is built. Bank of England notes represent a claim on the community; bank-M., now the prin. M., represents a claim on a bank.

The Nature of Bank-money.—How is bank-M. created? If a man opens his first banking account by placing M. (say £100) on current account with a banker he exchanges one kind of M. for another, notes and coin for bank-M. (an entry in his favour in the bank's books). Bank-M. may be transferred from account to account by cheque, or withdrawn as notes and coin 'on demand.' Bank-M. has no intrinsic value but is of high durability, and for the larger transaction is more acceptable than currency. The banker, then, takes the customer's £100 notes and coin and gives him £100 bank-M. He keeps 10 per cent of the notes and coin in his till, leaving 20% free for lending (or the purchase of securities). The customer's action in becoming a bank depositor (keeping an average 'demand' deposit

of £100) thus increases the effective currency by £90. When this is lent out a part will return to the banking system (the customer's bank or another) and permit further loans; and so on. Ultimately the greater part of the customer's original £100 notes and coin will be outside the banking system, the £10 will (still) be in his bank supporting his £100 bank-M.; the remainder will also be inside the banking system supporting further deposits ten times their value. It is important to note that the whole of the original deposit of £100 is not multiplied by ten but only the original £10 till-M., and such till-M. as is retained against further resultant deposits. This explanation is oversimplified. Apart from the 10 per cent being a round conventional figure there are (e.g.) the following points: (a) about a third of bank deposits are time deposits as distinct from demand deposits, so that only some two-thirds of the 'further resultant deposits' are bank-M.; (b) the banker does not actually keep so much as £10 notes and coin in the till; but only some £3.5, the £6.5 representing deposits at 'the banker's bank' (the Bank of England) supported in turn by some £1.3 notes and coin ($\frac{1}{3} \times 20 = 13$ per cent, but the percentage varies considerably). This gives a steeper multiplication factor and an effective currency increase of over £95 rather than £90. When a banker lends, say £10,000, he increases both sides of his balance sheet by £10,000, his loans are up £10,000 and his deposits (bank-M.) are also up by £10,000; £10,000 has thus been created 'by a stroke of the pen.' Nevertheless bank-M. creation resides essentially in the deposit, not the loan: if bankers handed over the loan in notes the borrowers would normally deposit them forthwith.

It is seen that the banker and his customers do create M. and that there are two limiting factors: (a) the banker's notes and coin, and (b) the 10 per cent or other ratio he thinks proper to maintain between his cash and his deposits. If this ratio were raised to 100 per cent (if deposits had always to be backed £ for £ by notes and coin) then banking would suffer a profound change; the profit of bank-M. creation would, like that of the Bank of England note, pass to the State; the gov. and other borrowers would have to pay higher rates of interest; and the depositor would have to pay the full cost of the convenient cheque system. There are sev. books by Prof. Soddy in favour of such a £ for £ system and a later book, *100% Money*, by Prof. I. Fisher. It is claimed that the system would facilitate control of inflation and deflation.

For the individual banker bank-M. is based on notes and coin, but for the monetary authorities notes and coin are based on bank-M. When it is decided that more M. is needed the Bank of England increases its deposits by lending more freely and/or buying more gov. securities by 'open market operations.' As M. is paid away to customers of the other (commercial) banks their 'cash' is swollen with increased deposits at the

Bank of England; and with increased cash they are in turn in a position to expand their loans and deposits. Increased deposits mean increased demands on notes and coins centring on the Bank of England, and since the authorities knew beforehand that 'who wills the bank-M. wills the notes and coins,' the latter will be forthcoming; the Bank of England will transfer securities to its issue dept. against newly printed notes; and coin may be bought from the Mint. Here is the answer to the frequent question; why, if more M. is the cause of higher prices, does the gov. not cancel some of the paper M.? If and when the fruits of gov. policy have made it possible to reduce the country's M., the Bank of England will reduce its deposits by reducing its loans and selling securities. Less deposits in the Bank of England will mean less deposits in the other banks and less need for notes and coin. Under gold standard procedure Bank action comes first.

The Bank of England Note is 'a claim on the community.' In the days of gold coin the holder of a £5 note had a claim on the Bank of England for five golden sovereigns, which when new contained £5 worth of metal. To-day the Bank of England is a state bank, but the holder can no longer get gold for his note. Gold indeed was never his ultimate objective. Bank-notes or golden sovereigns bought him goods and services and that his 'inconvertible' bank-note will still do. How much it will buy depends on how many there are, exactly as in the case of golden sovereigns. This idea of the limitation in the amount of M. is of the first importance. A gold currency enjoys a natural limitation in amount. There is a limited amount of gold in the world, and the rate of increase is limited by the number and size of mines and the profitability of working them. There is no such limit on paper M. and its proper limitation must be sought elsewhere. Meantime 'how much . . . depends on . . . how many' (the Quantity Theory in its crudest form) needs qualification. Faster spending will heighten the effect of more M. and slower spending offset or reverse it. The expectation of (still) more M. (or less) will also heighten the effect. More goods and services on the other hand, or the expectation of them, allow more spending without increase of price.

Price Level Policy.—It has been seen that, apart from the growth of the banking habit, the country's M. varies in amount when the banker's cash is varied by an increase or decrease of deposits at the Bank of England (assuming he lends fully on the 10 per cent basis) and that the Bank of England (in accord with the Treasury) can vary its deposits as may be thought desirable. It is clear that for the proper limitation of bank-M. and of paper M. we must look to gov. policy. As to the aim in regulating the M. total, many think the question admits of only one answer; justice and expediency alike call for a stable price level. Given a suitable composite price index, based on a selected list of commodities and ser-

vices, the monetary authority would inflate or deflate as necessary in order to make deviations in the purchasing power of the £ (as shown by the index figure) as small and short-lived as possible. (See COST OF LIVING). One effect of this arrangement is that if some prices fall the offsetting inflation will cause a rise in other prices. Unnecessary price variation is bad and there is much to be said for aiming at a minimum of disturbance of individual prices. There is also something to be said for the view that the secular advance in productive efficiency should be expressed in lower price rather than higher income. It would, however, be useless to attempt to settle the ideal price-level policy for Britain without reference to her foreign trade.

Exchange Rates.—M. is not international. Despite exceptions M. should be regarded as stopping at frontiers. In the absence of special arrangements, if country A wants to buy goods in country B, and conversely, then M. of country A can be bartered for M. of country B and a rate of exchange estab. What country A exports will exchange for what country B exports and there will be a running balance of payments, and no 'gap.' Any currency unit, e.g. the £, will with such a free exchange establish an open market price in terms of any other unit, a price which will reflect the relative demands of the countries concerned. If of course country A for any reason doubles its M. without increasing its production, then its M. will tend to lose half its exchange value. There will at all times be a 'natural' rate and no room for a black market.

In practice, however, special arrangements are made. Prior to the First World War the trading nations of the world were almost all on the gold standard. The £, the dollar, the franc, etc., were each composed of specified weights of gold, so that the ounce of gold commanded a fixed amount of M. of each and every country. The Bank of England and other central banks not only exchanged gold for M. at the fixed rate but also M. for gold. (The Mint indeed would make any holder's gold into sovereigns.) Whether it was desired to exchange the £ for gold or for dollars, francs, etc., there was no need to seek a black market, since the market and official prices for gold and currencies coincided. If new mines or new processes made gold more plentiful the central banks of the gold standard countries were ready buyers and, if there was inflation, all countries kept step. A tendency to inflation in a single country, on the other hand, would reduce exports and raise imports and thus cause a loss of gold and a fall of the exchange rate to 'gold point,' which was the signal for a rise in bank rate and the deflationary counter-action which was the essence of the gold standard.

'At home people can continue to buy as long as they have £s to spend. A discredited gov. in charge of the M. machine can continue spending indefinitely, at a price—the price paid by the citizens, the value of whose M. and

savings dwindles to nothing. Abroad the foreigner is not bound to that gov. or its £ and nationals can go on buying just as long as their £ makes it worth the foreigner's while. If a country fixes the value of its £, what it sells abroad will determine what it can buy abroad. If it has substantial reserves of gold (or foreign M. or securities) it can live beyond its earnings for a time, but a continuing loss of gold, etc., must be regarded as an urgent danger signal long before reserves are exhausted. If exports are insufficient to maintain the accustomed standard of living, the country must either adapt its buying and selling to its £ or adapt its £ to its buying and selling. The gold standard employed the first of these methods, the free exchange the second. With a free exchange there is a running balance; with the gold standard there is either a balance or a persistent approach to it. With a fixed (non-gold-standard) exchange adjustment is not 'automatic,' but dwindling reserves demonstrate the need for action. If the gold standard was automatic it was in the prompt 'calling of the tune,' e.g. the tune of temporary deflation and unemployment. The country could still refuse to 'dance' and, indeed, owing to the increasing rigidity of the United Kingdom wage and price structure before 1914, the working of the gold standard—towards prosperity as distinct from mere exchange stability

—left much to be desired. After the Second World War exchange rates were fixed and the International Monetary Fund (see BRETON WOODS AGREEMENTS; ECONOMIC) estab. to advise and assist member-countries to maintain these rates and, if change (beyond 10 per cent) proved inevitable, then to agree such changes with the country concerned. One I.M.F. (and Havana) Charter feature is specially notable, namely the provision that each country should ensure full employment within its own borders. If carried out vigorously this should mean a great steadying of world trade at a high level. It is rather a method of avoiding the need for adjustment than a method of adjustment. It represents a root and branch departure from gold standard ideas.

M. stops at frontiers. The United Kingdom exporter is paid by the United Kingdom importer. With a free exchange the £ changes size, so that what Britain sells buys what she buys. With the gold standard any gap not covered by loan or foreign M. or securities is filled by the universally acceptable import, gold. The payment for the gold makes a balance of payments but not a balance of trade. Gold (not being new production) tends to mark unemployment in the country exporting it, and a persistent export of gold leads to deflation and unemployment to adjust price structures downwards, to increase exports and diminish imports. The exporter is paid by the importer. The bill of exchange, the typical means employed to finance foreign trade, itself provides a good illustration of the operation of this principle. Importers in this

country are continually paying out £s on bills of exchange drawn abroad, and exporters are continually getting £s on bills of exchange drawn here (see EXCHANGES, FOREIGN).

Question of an International Currency.—M. is not international. Gold has some claim to the status of international M. but at most is mere 'M.-by-weight' and not true M. Serious proposals have, however, been made for an international currency, not a world M. to begin with but a single currency for the nations of W. Europe. The advantages of such a currency seem obvious, but there are disadvantages. A single currency would involve essential financial unity and a common budget could hardly be avoided. Again a single currency and no tariff or other barriers would allow, even drive, workers to go where most profit lay. To realise something of what is involved it is perhaps worth while to consider what might be done, short of a single currency. Suppose a new gold standard with all the world's currencies containing each an ounce of gold, and that, despite the rise in value, each unit retains its present name, i.e. £=dollar, franc, etc., or, if preferred, New-£ = New-dollar = New-franc, etc.. Then the Englishman going abroad would get practically a dollar or a franc (actually a fraction less) for his £. Similarly a Frenchman going abroad would get a £ or a dollar for his franc and would know that an article marked £10 in a London shop or \$10 in a New York shop was a 10-franc article. Universal M. would of course go further than this and abolish all M.-changing at the frontier. The difference would be that whereas with separate Ms. each country would be striving to make ends meet, failure being exposed by loss of exchange parity, a single M. would enable any one country to lean on its neighbours for assistance in this unpleasant task. M. makes us 'members one of another', and national M. is a bond providing effective if invisible frontiers. Neither the Eng. wage-earner in 1913, nor perhaps his neighbour enjoying foreign dividends, realised that the benefit of these was far from being an exclusive perquisite and helped in fact to make possible the wage-earner's improved standard of living and his employment on more lucrative work. The 1949 tourist with his £50 allowance was made to see that what one Englishman spent abroad affected the interests of all Englishmen.

Savings in Relation to Employment.—A high degree of specialisation and world trade and travel became possible when barter was superseded by M. But this advance brought its own problems. Barter was a complete mutual transaction. But with the advent of M. the complete barter transaction is replaced by two half-transactions. The seller sells his product for M., holds his M. for a longer or shorter interval, and then completes the transaction by making his purchase. For the poor man the interval is necessarily short, but the half-transaction allows the wealthier to save and devote M. to the production of capital. It also

allows the wealthier man to postpone much of his buying indefinitely. The first weakness in the U.S. economy is that more people have a choice between spending now or waiting than has ever been the case in any other country' (*Economic Digest*, Aug. 1949, quoting, Monthly Letter of the National City Bank of New York, June 1949). The highly developed modern world with its enormous capital wealth, owes its existence to savings collected from many sources and spent collectively in enterprise. At the same time the heavy unemployment of recent times is a reminder that there is no automatic regulator which ensures that the saving and the investment-spending keep step. Nowadays moreover M. saved may be spent in enterprise or it may buy secondhand stocks and shares, e.g. gov. stocks representing expenditure on past wars. In the first case the M. goes into the industrial circulation, as wages, etc., giving £ for £ employment; in the second case the M. goes into the financial circulation, giving employment only in a minor way. There is ample money for both purposes, but it is important to mark the distinction since it used to be assumed that the purchase of secondhand stock, either direct or through a savings bank, put M. into industry as surely as direct investment in enterprise.

In times of slump it is true that public opinion had misgivings whether saving did not tend to create unemployment. The advance of monetary science between the wars, for which Lord Keynes was so largely responsible, confirmed these misgivings and at the same time indicated the remedy. Savings can cause unemployment, but the duty of ensuring adequate spending in the interest of employment has now been accepted at the national, not to say the international, level (see ECONOMICS). We need no longer hesitate to save for fear of throwing our neighbour out of employment. The advantage to the State of a growing number of citizens with 'M. in the bank' requires no emphasis. Saving is the perfect antidote to inflation. The advantage to the individual is manifest: savings in the bank yield a real dividend year by year in sense of security, apart altogether from the monetary interest earned. For that security to be unassailable the value of M. itself must be guaranteed against depreciation, and that guarantee (as shown above) resides essentially in the limitation of its amount.

The more savings the more debt; but debt, subject to proper safeguards, is recognised as an essential part of the modern business structure. The more savings the more debt; except that the shareholder of a company is really a partner and only technically a debt-holder. The shareholder, as distinct from the debt-holder, has always escaped the stigma of usury and the censure of the Church.

The more debt the more savings. During the two world wars individuals grew richer and richer, with more and more M. in war loan, and at the same time

found themselves collectively getting poorer and poorer as the State sank deeper into debt. But it is here especially that 'perhaps the most useful approach is to regard M. as a claim.' It is manifestly easier to multiply claims, albeit perfectly good claims, than to multiply goods. It is important to note that, while to increase M. faster than production tends to inflation, there is nothing inflationary in an increase in the national debt which is matched by the will to save, although not by increased physical wealth.

Money Market.—If a bank is to be always in a position to meet its depositors' demands for notes and coin with so small a cash reserve as 10 per cent or so, it must be able to lend a good part of its M. where it can get it back at very short notice. The bill of exchange, maturing for settlement within a few months, and saleable at a discount at any time, has long met this requirement of the commercial banks; directly by the banks themselves buying bills of exchange, and indirectly by the banks lending their M. in the M. market, the short-term market for M. which comprises, besides the banks, the bill brokers and discount houses, together with the accepting houses or merchant bankers. The M. market buys and sells M. tomorrow for M. to day, the price being interest or discount. With the assistance of the M. market a bank endeavours to arrange its portfolio of bills so that dates of maturity are suitably spaced. Short M. is also lent to the Stock Exchange. The bill of exchange finances overseas trade. By buying (discounting) bills of exchange the bill brokers, discount houses, etc., lend the M. which enables the exporter to obtain payment for his goods without waiting for the date when the foreign buyer has to settle the bill. Accepting houses and banks not only buy bills, but also for a consideration lend their names to first-class trade bills and so make them a safer and more valuable security commanding a finer rate of discount. Such bills are known as 'bank' bills.

Besides borrowing from the commercial banks, M. market funds are derived from direct deposits and from London branches of foreign and colonial banks, which often have considerable sums to spare for short periods. When the commercial banks are short of funds they obtain M. from the Bank of England not by direct borrowing but by calling in loans to the M. market and so forcing the market to borrow from the bank, at a higher rate.

Two wars have left their mark on the great London M. market, on 'Lombard Street,' to use the name by which it is known the world over. The scarcity of commercial bills of exchange made the market operators ready buyers not only of the Treasury Bill (a three-months' Bill, now the chief instrument of gov. short-term borrowing) but also of gov. securities nearing their dates of maturity.

The commercial banks' loans to the M. market (M. at call and short notice) may amount to some 7 per cent of their deposits, bills discounted (including Treasury bills) to say 12 per cent, and

Treasury deposit receipts (which date from the Second World War) to upwards of 20 per cent; a total of 'quick assets' amounting, with cash and balances with other banks, to over 50 per cent of deposits. The greater part of these 'quick assets' bring the banks little more than 1 per cent interest. Reference to *The Times* 'M. Market' report will show that M. market rates of interest and discount are low generally. The advantages to international trade of such low-cost financing are obvious; they would be lost under the '100 % M.' proposals mentioned above. *See also* BANKS AND BANKING; BILLS OF EXCHANGE; BIMETALLISM; CURRENCY; ECONOMICS; EXCHANGES; FOREIGN MONIES AND EXCHANGE RATES; MERCANTILE SYSTEM; PAPER MONEY; NUMISMATICS.

Money-Fossils, see NUMMULITES.

Moneylender. With certain exceptions, any one who acts as a M. must (a) register his name and address or addresses; (b) carry on his business only in his registered name and at his registered address or addresses; and (c) supply the borrower on request and on tender of expenses copies of all documents relating to the loan. Non-compliance with these statutory requirements (Moneylenders Act, 1900) renders a M. liable to fine, and, on a second conviction, to imprisonment with hard labour. The exceptions are banks, registered friendly societies (q.v.), pawnbrokers, building societies, insurance offices, and indeed any business the prin. object of which is not the lending of money. A borrower who, not being an infant (*see* INFANCY), enters into a money-lending transaction must not expect that he will necessarily get the sympathy of a court of law. The Act of 1900 merely provides that a court may reopen a transaction and relieve the borrower from the necessity of paying more than a certain

sum of interest, fines, expenses, premiums, renewals, or other incidental items, where the transaction is 'harsh and unconscionable' or the interest, etc., excessive, having regard to the M.'s risk and all the circumstances of the case. The Moneylenders Act, 1927, prohibits the exaction of compound interest in loans by Ms. and any increase of the rate of interest by reason of any default on the part of the borrower (*see further under INTEREST*). This Act also provides that a M. shall take out an ann. licence—called 'a M.'s excise licence'—in respect of every address at which he carries on business, the duty on such licence being £15. Penalties are provided for taking out a licence in any name other than his true name or for other infringements of the statute. A licence will be granted only to a person who holds the necessary certificate from the petty sessional court of the div. in which the M.'s business is carried on, and the grounds on which a certificate may be refused are specified in the Act. They relate chiefly to character. Conviction for any offence under the Betting and Loans (Infants) Act, 1892, or the Moneylenders Act, 1900, may entail suspension or forfeiture of a certificate. This Act also imposes various restrictions on moneylending advertisements, the chief of these being that circulars may only be sent to persons in response to a written request for the same, and that newspaper advertisements or posters, etc., containing invitations to do business with a M. may be pub. only under the conditions prescribed by the Act. Legal proceedings in respect of money lent by Ms. may not be brought after the expiration of twelve months from the date on which the cause of action accrued. The Act exempts pawnbrokers' loans from the provisions as to certificates and limitation of actions. The Companies Act, 1929, provides that every company licensed under the Act of 1927, whenever it was registered or estab. as a place of business, must, in all its trade catalogues, circulars, showcards, or business letters, give specified particulars as to the names and nationalities of the directors. A borrower could, however, always count on getting relief or avoiding a transaction altogether if induced to enter into it by a false or fraudulent misstatement, and indeed a M. so acting is liable also to criminal proceedings. In the U.S.A. the law relating to the lending of money varies in the different states. All states have a legal rate, and a rate allowed by contract; the first varies from 5 per cent to 8 per cent; the second from 6 per cent to 12 per cent, while in this second case some states allow any rate. The penalty for usury varies also from fines to loss of principal and in some cases imprisonment.

Moneywort, name given to two distinct plants: (1) order Primulaceae, creeping jenny or loosestrife (*Lysimachia nummularia*), has creeping stem, heart-shaped leaves, short one-flowered stalks, and bright yellow flowers; (2) Cornish M., *see* PENNYWORT.

Mongolia (the country of the Mongols)

embraces a vast and indefinite extent of country in the interior of Asia between 38° and 53° N. lat., 84° and 124° E. long. Its length from E. to W. exceeds 1700 m. and its width from N. to S. 1000 m. Area 1,875,000 sq. m. Bounded N. and W. by Siberia, E. by Manchuria, S. by China proper and Sinkiang. It is divided into two parts, Outer M. in the N., now a republic under Soviet domination, and Inner M. in the S. and E. Inner M., with the exception of Jehol and parts of Chohar which have been forcibly occupied by the Jap. troops, is under Chinese control. Frontier incidents occurred in the 1930s, but in 1936 the Soviet Gov. of Russia agreed to the appointment of a boundary commission. The central portion is occupied by the Great Gobi, a vast tract of sand, small stones, and sparse vegetation. The country to the S.E. of the Gobi is more elevated and terminates in a high mt. range, which, beginning near the Hoang-Ho, runs N. for 500 m. then turns at right angles to the E., whence under the name of the Iushan Mts. it extends for some 600 m. until it turns N. again. The dist. S. of the Iushan Mts. contains fertile valleys, but further W., where it is surrounded by the great N. bend of the Hwang-Ho, it is again either arid like the Gobi or only fit for pasture ground. The E. part, extending nearly to the Yellow Sea, contains to the S. of the Leah-Ho rich meadow-land. The slopes of the Kinkhan Mts., a spur of which extends in a S.-easterly direction to the Hoang-hai, are well watered and in the S. part overgrown with pine, fir, oak, lime, and walnut trees. N.W. M. is also well watered but poorly wooded; near the boundary between M. and Siberia the country rises into the Altai M. chain. Rain is rare except near the great mt. ranges. The wealth of the Mongols consists in their great herds of horses and sheep, and, in the hilly tracts, of cattle. The Mongols proper voluntarily submitted to China to avoid destruction in their unsuccessful war with the Kalmyks in 1689, which cession has resulted in some development of resources and a transport trade with China and Siberia along the great caravan routes, the chief of which run from Kalgan and Kwei-chwang to Maimachin via Urga, and from Kalgan again through Kobdo to W. Siberia. Railways are projected from Urga to Kiakhta (170 m.) and to Kalgan in China (530 m.). Since 1917 motor-car services have been running across the Gobi during the summer, from Urga to Kalgan.

Under the provisional republican gov. of China (1912) a separate dept. was formed for the administration of M. and Tibet. The Russo-Mongolian agreement of 1912 resulted from a series of revolutions consequent on excessive Chinese interference. In 1915 the treaty of Kiakhta between China, Russia, and M. was signed, by which the Hutukhta Lama was recognised as the ruler of Outer M., under Chinese suzerainty. In 1924, however, it became an independent republic in alliance with the Soviet Federation.

Chinese immigration has recently greatly increased in Inner M., resulting in a much greater degree of productivity; by means of irrigation even the fringe of the Gobi desert has been made to yield crops. So great was this immigration, that when in 1924 Outer M. became a republic, Inner M. became a part of China, administered by Manchuria. In that year, on the death of the last theocratic ruler of Outer M., there was a revolution, as a result of which the Mongolian People's Revolutionary Gov., organised on Soviet lines, was estab. The highest power is vested in a parliament (the Great Hural) which is elected by universal suffrage.

E.N.A.

A MONGOLIAN MATRON

The pop. is estimated at 550,000. In 1937 the Jap. set up a new autonomous gov. of Inner M., with its seat at Kalgan. The area dominated by this gov. is estimated to be 304,510 sq. km. and the pop. 2,136,000, of whom some 60 per cent are Chinese and the remainder Mongols. Japan secured exclusive mining rights in K. M., and rights to build railways in M. and Manchuria. Of Outer M. Urga (pop. 100,000), known since 1924 as Ulan Bator Hoto, is the chief centre of pop. and commerce, and here dwells the Kutukhta Lama, the third highest pontiff of the Buddhists. Other tns. are Uliassutai and Kobdo. The Mongols do not practise agriculture, but rear great herds of horses, cattle, sheep, and camels; hides, furs, wool, and horns are the chief exports. The country is rich in minerals, including gold and silver, but they are little exploited. A new independent republic was proclaimed in the dist. of Burga in 1929. Hailar being the cap. Tannu-Tuva (formerly Uryanhai) in the N.W. (cap. Krasny) is regarded by Russia as a separate protectorate. Its area is 64,000

sq. m. and its pop. 65,000. The Tuvinians are a Turkish people, mainly herdsmen, and cattle farmers. There are deposits of gold and asbestos. N. of M., between it and Lake Balkal, is the Buryat-Mongolian autonomous S.S.R. Area about 1,360,000 sq. m. Pop. 7,677,000. This, however, is a part of Russia proper.

M. has long been considered the world's chief theatre of evolution, and recent discoveries, especially those made in 1922, 1923, and 1925 by the Central Asiatic Expeditions, under Roy Chapman Andrews, have confirmed this opinion. These expeditions, sent by the Amer. Museum of Natural Hist., travelled over the Gobi desert in cars supported by camel caravan. Important discoveries in the W. Gobi included the fossil remains of various species of dinosaur, including the small Protoceratops, a 9-ft. species which is considered to be the ancestor of the giant Triceratops of Montana; nests of fossilised eggs of this dinosaur were also found. In the same strata, Lower Cretaceous or Upper Jurassic, were found skulls of a tiny mammal, the earliest mammal known. Other finds included fossil bones of the Baluchitherium, a giant rhinoceros of the Miocene period, when M. was probably fertile grassland, with a clement climate, the mastodon, amblypod, titanotheres, etc. Evidence was also found of late palaeolithic man, in the shape of chipped flints, egg-shell ornaments, etc. In the E. Gobi, in Inner M., fossils of mammals of the Upper Eocene period were discovered, also graves and worked copper mines of early historical times. Another expedition found, in 1923, Moustertian implements in the Ordos desert of Inner M. Discoveries made in N. M., by a mining engineer, 1912, led to a Russian expedition under P. K. Kozlov, 1924-25, which excavated burial mounds about 70 m. N. of Urga. The tombs showed Hellenic, Hanian, Scythian, Chinese, Siberian and Sarmatian influences. Skulls found seemed Aryan rather than Mongolian in shape. The tombs are believed to date from the Tang dynasty, about 2000 years ago. See also MONGOLS.

Mongolian Languages, see under URAL-ALTAIC LINGUISTIC FAMILY.

Mongols, people of Central Asia, living

chiefly in Mongolia (*q.v.*), and also in Sinkiang and Manchuria. They may be divided into the W. M. or Kalmucks and the E. M., and are a sturdy people with high cheek-bones, flat faces, straight black hair, and a characteristic 'mongolian fold' of skin over the inner angle of the eye. They are nomad herdsmen and dwell in tents, or *yurts*, taking unkindly to any other way of life. Formerly an energetic and warlike people, their acceptance of Lamaism has been largely responsible for their present pacific torpor. They emerge into hist. with the coming of Genghis Khan. He was occupied in conquests in the E. from 1206 to 1227, and it was his genius which for a time built up the fabric of a great Mongolian empire. At his death he divided his ters, between his sons; Otogai received the country between the Irtysh and Lake Baikal, Jagatal the country between Bokhara, the Irtysh and Gobi; Tuli the land S. of the Baikal; and his grandsons Orda and Batu, Khwarezm, the region drained by the Jaxartes, Ural, and Oxus. Otogai, with the help of Tuli, became emperor of China and put an end to the Kin and Sung dynasties (1234). Batu, after occupying Russia, seized the Hungarian cities of Pesh and Gran (1241), and in 1256 Mongolian troops overran Georgia and Armenia. Hulagu (Hulagoo, Hulaku) Tuli's son, defeated the Persian assassins, crushed the caliphate of Bagdad, and took possession of Syria, together with Aleppo and Damascus, whilst the great Kublai Khan, another of Tuli's sons, estab. a line of emperors in China, which lasted from about 1275 to the final expulsion of his race in 1368. Meanwhile the M., or, to give them a more generic name, the Tartars, were establishing (about the year 1224) the Kipchak empire in S. E. Russia under Batu. The khانات of Astrakhan, the Crimea, and Kazan, and in Turkestan the khانات of Bokhara and Samarcand, were all held by M. Though the power of the Golden Horde or W. Kipchaks waned, that of the White Horde or E. Kipchaks—the inheritance of Orda, Batu's brother—grew apace, and in 1378 Toktunisli, an E. Kipchak, became ruler of both hordes. But he had no sooner completed his Russian conquests than he was plunged into a bitter struggle with Timur, or Tamerlane, a Mongol chieftain, who had estab. a supremacy in Samarcand (1369). A wider meaning is sometimes given to the word when the term Mongolian or Mongoloid is used to include the whole yellow race, the N. M. including the Koreans and Jap., the Finno-Ugrians, E. Siberian Eskimos, and even the Amer. Indians, while the S. M. include the Chinese and Indo-Chinese, Tibetans and Malays, all of which races are believed to have had a common derivation. The word Tungus has been introduced to replace this use of M. For bibliography see under MONGOLIA.

Mongoose, or Mungoose, or Ichneumon (from native *manyus* (*Herpestes griseus*), genus of small weasel-like animals, common in many parts of Asia, especially India, and in Africa. They form a sub-

family of the civet tribe. The largest species is the Egyptian Ichneumon. The common Indian M. is tawny or grey in colour, and about 17 in. long, excluding the tail, which is about 14 in. long. It is very voracious, and fights and kills even large and poisonous snakes with the utmost agility and daring, and for this service has been introduced into the W. Indies and other countries. It is readily tamed and makes a delightful though mischievous pet. Observers do not confirm the popular notion that the M. visits certain plants to counteract the effects of poisonous snake bites, which indeed are as fatal to it as to other animals.

Monica (332-87) was the mother of St. Augustine. She was the wife of Patricius, a pagan citizen of Tagaste, and converted both her husband and son to Christianity.

Monier-Williams, Sir Monier (1819-99), Eng. orientalist, b. in Bombay. He was educated at King's College, London, and Balliol College, Oxford. Prof. of Sanskrit at Oxford, he was chiefly responsible for the foundation of the Indian Institute. His publs. include *Hinduism* (1877); *Buddhism* (1890); *Brahmanism* (1891); and a *Sanskrit-English Dictionary* (1899).

Monifeth, burgh of Angus, Scotland, on the N. side of the firth of Tay. There are jute mills and machinery works. Pop. 3200.

Monism, philosophic system which attempts to reduce the universe to a single principle. It is thus directly opposed to dualism, between which and M. stands the monadism of Leibnitz. M. tends to reduce the universe either to a material principle, thus developing into a form of materialism, or into a mental principle leading to idealism and pantheism. The early Gk. philosophers were monists of the materialist school, postulating the sev. elements as the material cause of all things. Thus Thales took water as the first principle and Heraclitus fire. An important advance was made by the Eleatic philosopher Parmenides, who invented the epigrammatic formula, 'the *ent (ἐν)* is, the *nonent (μὴ ὂν)* is not,' thus distinguishing the one which is from the many which become and are not. This theory was supported by Zeno, who sought to disprove plurality by his paradoxes of space, time, and number. In the stoic philosophy M. was a fundamental doctrine.

M. has been conspicuous in the thought of sev. modern philosophers, most of whom tend to the idealistic school. Spinoza, 'the classic type of pantheist,' attempted to reconcile the dualism of Descartes by relating mind and matter to one infinite, all-embracing substance, God, and by regarding all else as but modes of that infinity. Hegel is perhaps the most distinguished of the idealistic school. Proceeding from the idealism of Kant, Fichte, and Schelling, he arrived at an explanation of matter, individuality, sensation, and will as forms of thought. Hegel's teaching was developed into positivism and the atheism of Strauss, Feuerbach, and Bruno Baur. Schopenhauer and von Hartmann merge all finite

existence in the cosmic will. *See also* MATERIALISM. *See* A. Schopenhauer, *The World as Will and Idea*, 1844; K. R. E. von Hartmann, *The Philosophy of the Unconscious*, 1869; G. W. F. Hegel, *Philosophy of Mind* (trans.), 1894; T. Gomperz, *History of Ancient Philosophy* (trans.), 1901-12; and R. McKeon, *The Philosophy of Spinoza*, 1928.

Monitor, name for a number of lizards which include some of the largest forms. They are widely distributed throughout the E. hemisphere, and their habitat varies from dry sandy spots far away from the water to the marshy banks of rivers. The Nile M. (*Varanus niloticus*) is about 6 ft. long, with a long head and small rounded nostrils. An even larger species is the Ocellated M. of China and Siam. It preys on birds and smaller lizards, and, if attacked, defends itself fiercely.

Monitor, famous Amer. battleship, built by Ericsson, which on March 9, 1862, defeated the formidable *Merrimac* in Hampton roads. The essential and original feature was a circular turret, protected with 8 in. of iron, and revolving by steam on a central spindle. Two 11-in. smooth-bore guns pointed through the turret's port-holes with deadly effect. This device was applied in the R.N. to the *Royal Sovereign*, etc. The *M* sank in a hurricane off Cape Hatteras.

The shallow draught of such vessels enables them to approach close in-shore and attack definite points on the coast. During the early days of the First World War a number of Brit. *Ms.* were employed off the coast of Belgium harassing the Ger. advance and prevented their taking Dunkirk and Calais. During that war *Ms.* were built to carry guns up to 15 in. These did great damage to Ger. shipping and largely rendered Ostend and Zeebrugge ineffective for offensive work. They were equipped for anti-aircraft work and threw shells as large as 12-in. *Ms.* were present at the famous attack on Zeebrugge, April 23, 1918. In the Second World War Brit. *Ms.* were used against enemy forces in Libya, and supported the invasion of the Normandy coast.

Monk, George, see MONCK.

Monk, Maria (c. 1817-50), woman of bad character who pub. *The Awful Disclosures of Maria Monk* in 1836 in New York, in which she alleged that she had escaped from the Montreal nunnery of the Hôtel Dieu. The book had a huge sale. She was eventually exposed and her story proved to be false.

Monk, see MONASTICISM; MONASTERY.

Monkey, unscientific name usually applied to primates, excluding man, the anthropoid apes, the marmosets, and also, as a rule, the baboons. *Ms.* are arboreal in habit, and are rarely found away from the warmer parts of Africa, Asia, and America. It is usual to classify the *Ms.* into two great families, the Cercopithecoidea of the old world and the Cebidoidea of the new. There are many points of difference between those of the old world and those of the new. An important distinction is in the div. between the nostrils, which is invariably broad in new-

world *Ms.*, while the nostrils open almost sideways. In the old-world *Ms.* the div. is thin and the openings of the nostrils tend downwards. No new-world *Ms.* have cheek-pouches, and the thumbs differ less from the other fingers; but of old-world *Ms.* some have cheek-pouches and others are without them. Most have a laryngeal or air pouch, and these are rare in the Amer. genera. But in many of these prehensile tails are highly specialised, though in some the tails are short or feeble. All old-world *Ms.* have the ischial callosities or pads, where the animal sits; these are always absent from the new-world *Ms.* *See also* CHIMPANZEE; ENTELLUS MONKEY, etc.

Monkey Flower, see MIMULUS.

Monkey-pot, see LECYTHUS.

Monkey Puzzle (*Araucaria imbricaria*), hardy evergreen conifer, native of Chile, and varying from a few feet to 150 ft. in height. There is a variety with golden-tinted foliage.

Monk-fish, see ANGEL-FISH.

Mon-Khmer Language, see LINGUISTIC FAMILIES, Austro-Asiatic Linguistic Family.

Monkhouse, Allan (1859-1936), Eng. journalist, dramatist, and novelist, b. in Durham. He became a dramatic critic and leader writer for the *Manchester Guardian*, and later contributed to that jour. a weekly article, 'A Bookman's Notes.' He wrote a number of plays, most of which were produced at the repertory theatres in Manchester, Liverpool, and Birmingham. The two best were *Reaping the Whirlwind* (1908) and *The Conquering Hero* (Aldwych Theatre, 1924)—this latter being a pacifist study. His novels, which included *My Daughter Helen* (1922) and *Farewell, Manchester* (1931), reflected the conflict between belief in business and sentimental Socialism.

Monkhouse, William Cosmo (1840-1901), Eng. poet and art critic, b. in London. His working life was spent in the offices of the Board of Trade, where he rose to assistant secretary in the financial dept. His poems include *Corn and Poppies* (1890), the *Dead March*, and *The Christ upon the Hill* (1895). As an art critic his independence is estab. by his *Life of Turner* (1879), *The Italian Pre-Raphaelites* (1887), *Leigh Hunt* (1887), and *British Contemporary Artists* (1899).

Monkland, New and Old, two adjoining pars. in N.E. Lanarkshire, Scotland, 14 in. N.N.W. of Airdrie, with coal and iron-mines. Pop. (Old M.) 61,000; (New M.) 38,000.

Monk Seal (*Monachus albiventer*), true seal, common in the Mediterranean, and on account of its tractability easily trained to perform tricks.

Monkshead, see ACONITUM.

Monkswell, Robert Porrett Collier, first Baron (1817-86), Eng. judge, was called to the Bar in 1843. In 1852 he was returned to Parliament as a Liberal by Plymouth, his native city. Created attorney-general in 1863, he successfully engineered a bankruptcy bill in 1869, and two years later was appointed under Gladstone to the judicial committee of the

privy council. He was created a baron in 1885.

Monkwearmouth, par. in Durham co., England, partly in the bor. of Sunderland (q.v.). The church is famous for remains of Saxon architecture.

Monluc, Blaise de, see **MONTLUC**.

Monmouth, James Scott, Duke of (1649-85), leader of a rebellion against James II., was the natural son of Charles II. by Lucy Walters, b. at Rotterdam during his father's exile. The king loved the boy, and put him in the hands of Lord Crofts, and afterwards of the queen-dowager. In 1663 he was made duke of M., and two years later, on his marriage with the wealthy Scottish heiress, Anne of Buccleuch, was granted the dukedom also of Buccleuch. In 1673 he became captain-general of the forces. His beauty and engaging manner, his clemency towards

JAMES, DUKE OF MONMOUTH

the Covenanters at Bothwell Bridge (1679), his almost royal progresses through the W. and N.W. of England, and above all his Protestantism, a point in his favour of which Shaftesbury made full use, secured him a wide popularity. Yet when, yielding to Argyll's persuasion, he landed at Lyme Regis to raise an insurrection against James II., his appeal met with faint response. His undisciplined forces were hopelessly routed at Sedgemoor (1685), and nine days later he was beheaded (in a bungling manner) on Tower Hill. See E. D'Oyley, *James, Duke of Monmouth*, 1938.

Monmouth: 1. Municipal and (in conjunction with Newport and Usk), par. bor., and co. tn. of Monmouthshire, England, at the confluence of the Monnow and the Wye, 17 m. S. of Hereford. It has smelting and tin-plate works. There is a well-known M. School (q.v.). Pop. 5000. 2. City and the co. seat of Warren co., Illinois, U.S.A., 27 m. E.N.E. of Burlington (Iowa); has manufs. of ploughs, pottery, soap, and cigars. Centre of a coal-mining and horse-breeding dist. Pop. 9100.

Monmouth, Battle of, victory gained in

1778 at M. Court House by the Amers. under Washington over the Brit. under Clinton.

Monmouth Beach, summer resort of M. co., New Jersey, U.S.A., on the Atlantic coast, 3 m. N. of Long Branch.

Monmouth School, founded in 1615 by Wm. Jones, at M. The Worshipful Company of Haberdashers is represented on the governing body. There are four leaving exhibitions awarded each year for Oxford, Cambridge, etc., and pupils are also eligible for the Meyricke scholarships to Oxford.

Monmouthshire, maritime Eng. co. lying on the Welsh border with a coastline of 22 m. along the estuary of the Severn and that part of the Bristol Channel that lies between the Wye and the Rumney. The coast is exposed to remarkably high spring tides, which rush up the Severn in a 'bore' from the Bristol Channel, rising at Chepstow sometimes to 60 ft. The S. part E. and W. of the Usk comprises the Caldecot and Wentloog levels, which are protected from the sea by sea-walls. N. of the Caldecot Level, between the Usk and Wye, the surface is undulating, rising here and there into bold bluffs and varied by knolls and dells, which have rendered the co. famous for its scenery, set off as it is by mts. to the N. and W., primitive churches, ruins of old feudal strongholds, such as Chepstow, Caldecot, and Raglan Castles, and grand eccles. ruins, such as Tintern Abbey and the Cistercian abbey at Llanthony. About 4 m. from Abergavenny is the remarkable peaked mt. called Pen-y-Val or Sugar Loaf (1856 ft.). Coed-y-Bwnydd, comprising woodland between Abergavenny and Usk; Skirrid Fawr, known locally as the Holy Mt., highest point 1596 ft. above sea level, with fine views of the Black Mts., the Usk Valley, and the Sugar Loaf; and over 2000 ac. of the latter have been recently presented to the public. Chief rivs.: Wye, Usk, Rumney, Ebbw, Avon-Idwyd, and Monnow, the first two being famous for salmon and trout fishing. The Crumlin Canal branches from the canal connecting Newport with Brecon, at a point between Newport and Malpas, and skirts the Ebbw to Crumlin. The co. is rich in coal, and mining is the chief industry. There are numerous iron works, and limestone is burnt extensively, both for building purposes and for use in the iron works. There is a large aluminium factory at Rogerstone. Wheat is plentiful in the vales of the Usk and Wye and in the N. and E. Newport, the chief port, is connected by canals with the mining centres. M. is treated for many purposes as part of Wales, e.g. as far as the Anglican Church is concerned; but not for the assize courts. M. is divided into six hundreds and five parl. divs. (Abertillery, Bedwelty, Ebbw Vale, Monmouth, and Pontypool), each returning one member, and Newport one member. Medieval M. (formerly called Gwent) was undoubtedly Welsh. The Act of Union of 1536 created the present co. out of 'divers Lordships Marchers within the

said Country or Dominion of Wales,' just as it did with Breconshire and Radnorshire, saying nothing whatever about taking it out of Wales. Because, however, M. was 'the nearest parts of Wales to London' (George Owen, the Tudor historian), it was brought under the jurisdiction of the courts of Westminster in certain matters, while separate courts were provided for the rest of Wales. Hence originated the use in official documents of the term 'Wales and M.'—a misleading term perpetuated in some modern Acts, though without logical justification, since in fact they treat M. as part of Wales. M. is in practice legislatively included in Wales for almost every purpose, from education to coal-mining. An old Act of 1649 explicitly includes M. among the Welsh cos. Though reduced by compulsory (Eng.) education, the percentage of Welsh speakers in 1931 (the last census) was higher in M. than in Radnorshire. The recent report of the Local Government Boundary Commission suggests no boundary changes for M., but lists it among the Eng. cos. Its justification for doing so is that M. was so listed in the schedule to the Local Government Act of 1933 (though the Act of 1929 included it with Wales). Area 546 sq. m. Pop. 434,800. T. Richards, *South Wales and Monmouthshire*, 1949.

Monnikendam, fishing vil. in the prov. of N. Holland, Netherlands, on the IJsselmeer, 12 m. N.E. of Amsterdam. Its old bell-tower and weigh-house and the church of St. Nicholas are notable. Pop. 3000.

Monnoyer, Jean Baptiste (1635-99), Fr. painter *b.* at Lille, who specialised in the painting of fruit and flowers. He was employed by the famous garden architect, Le Brun, to decorate the palace of Versailles, invited to England by the duke of Montague to embellish his house (the former Brit. museum) with examples of his art. The very striking decorations were, however, destroyed when the mansion was demolished to allow of the erection of the present building. M. also decorated sev. other historic mansions of England. There are sev. of his flower pieces in Hampton Court Palace. He etched a collection of his own designs which was pub. in a folio vol.

Monochaetum, genus of the evergreen flowering shrubs (family Melastomaceae) bearing large panicles of rose, red, mauve, or purple flowers.

Monochord, appliance invented by Pythagoras for studying musical intervals by means of a movable bridge under a single string stretched over a sound-board by a weight. From it the musical instrument of the same name, a sort of one-stringed guitar, was evolved, and also the 'nun's fiddle.' The clavierchord was an application of the same principle, manipulated by a keyboard.

Monochrome, painting executed in imitation of bas-reliefs, in tints of one colour only, relieved by light and shade. In photography, isochromatic plates are used for the correct rendering of colours in M., and there is a simple means of

ascertaining what light-filter should be used for each brand of plate.

Monocotyledon, plant with one cotyledon (*q.v.*) or seed leaf (*e.g.* wheat, tulip), as distinguished from a Dicotyledon (*q.v.*) (*e.g.* bean, carrot, dandelion). This distinction is the main basis of two great divs. of the Angiosperms, the group which comprises the majority of all flowering plants. In the M. the radicle or rudimentary root usually remains undeveloped, but throws out roots from its crown. In the Dicotyledon it usually elongates and forms a primary root or tap. The stem of Ms. has no central pith or separate bark, and the whorls of the perianth occur in threes. But, as a rule, the most visible and easily recognised distinction is that the leaves are parallel veined except in a very few cases, notably the black bryony, arum, and herb-Paris. Ms. are separated into three main divs.: (1) Spadiciflorae, flowers arranged on a spadix and frequently enclosed by a large spathe (*e.g.* arum); (2) Petaloideae, with petaloid perianth (*e.g.* lily or daffodil); (3) Glumiferae, perianth absent and flowers borne in spikelets in the axils of scales or glumes (*e.g.* sedges and grasses).

Monod, Adolphe (1802-56), Fr. Protestant divine, *b.* in Copenhagen. He studied at Paris and Geneva, and in 1825 founded a Protestant church in Naples, of which he was pastor until he went to Lyons in 1827. He was prof. in the theological college of Montauban in 1836, whence he removed to Paris in 1847 to preach at the Oratoire. He pub. various vols. of sermons, one of which, *La Crédulité de l'incrédite*, appeared in 1844. See life by P. Stapfer, 1898.

Monod, Gabriel (1844-1912), Fr. historian, *b.* at Ingouville near Le Havre. He studied at Havre and Paris, and afterwards visited Italy and Germany for research work. In 1868 he returned to France, and was appointed director of the École des Hautes Études, and in 1880 entered the École Normale, where he became prof., a post which he held till 1901. Wrote on medieval hist., and a bibliography of Fr. hist. (1888). He founded the *Revue historique* in 1876.

Monodon-Monoceros (sea unicorn), see **NARWHAL**.

Monogenetism, see under **LANGUAGE**. **ORIGIN OF.**

Monogenism, generally accepted theory in ethnology (*q.v.*) which regards man as having sprung from one primary form, as opposed to polygenist views. Monogenists may be divided into three schools: (1) *Adamitic*, which accepts the Mosaic doctrine literally, with a measure of evolution to explain the existing varieties; (2) *Rational*, which applies evolution and biological laws generally to man as to other organisms; and (3) *Intermediale*, which tries to harmonise the first two.

Monogram (Gk. *μονος*, sole, and *γραμμα*, a letter), cipher or character formed by an interlacing of letters, and intended as an abbreviation of a name. Ms. were not uncommon on Gk. and Rom. coins, and also appear on A.-S. coins, especially those of King Alfred, and upon seals. In

later times Ms. were often used by printers and engravers on the title pages of books.

Monohydroxysuccinic Acid, see MALIC ACID.

Monolith (Gk. *monos*, single; *lithos*, stone), stone block or column, usually a pillar of great size and monumental in purpose. Some, however, are natural stones, e.g. the Buck Stone, Staunton, in the Forest of Dean, while others are the sole remaining stones of megalithic monuments; others are hewn obelisks, such as may be seen in Egypt. Those in Egypt are dated approximately to 3000 years B.C., or like those of Peru are of the twelfth century or even later. Certain Ms. are boundary marks. Some in Britain are associated with burials of the Bronze Age. In most instances there is no indication of date or purpose. Often the worship of stones persisted in Europe into the Christian period. (See also MENHIR). In Baalbek (q.v.), an anet. Syrian city, is the largest cut stone in the world, weighing 1500 tons. The great statues of Pharaoh Akhenaton at Karnak may be regarded as Ms. Ms. of considerable size were common to both the Inca and pre-Inca architecture of Peru (see also PERU, *Ancient Civilisation of the Incas*). One of those at Cuzco is 27 ft. long, 15 ft. wide, and 12 ft. thick. The stones in Peru vary as to their geological composition, according to the region. Among the beautiful ruins of Mitla (q.v.), Mexico, are some great monolithic columns. Prin. among the sculptured stone objects preserved in the national museum of the city of Mexico is a famous calendar stone of the Aztecs or sun-stone, a beautiful and massive M. of carved basalt, circular in form and 12 ft. in diameter. The stone was both a sun-dial and a calendar, such as the Egyptians and the Chaldeans used, and the procession of cyclical animals carved on it has given rise to the supposition that the chronological system which produced the stone may have had some connection with Chinese and Indian astronomical systems. See R. Enock, *The Republics of Central and South America*, 1922.

Monongahela: 1. Riv. of U.S.A., in Virginia and Pennsylvania. It is a trib. of the Allegheny, which it joins at Pittsburgh to form the Ohio R., and is navigable as far as Morgantown. Length 300 m. 2. City on the M. R., in Washington co., Pennsylvania, U.S.A., 23 m. S. of Pittsburgh. It lies in a fertile region rich in coal, the mining of which is the prin. industry. Pop. 8900.

Monophysitism, heresy which arose in the fifth century as a reaction against Nestorianism, teaching that in Christ there was but one nature. Its effect was to deny the humanity of Jesus. It was anathematised at the council of Chalcedon (451), but the decisions caused a great schism. Nearly the whole of Egypt refused to accept the decisions of Chalcedon, and has remained heretical to the present time.

Monoplane, see under AEROPLANE.

Monopoli, tn. in the prov. and 25 m.

S.E. of the city of Bari, Italy, on the Adriatic. It has a cathedral and a fortress built in 1552. It exports wine and olive oil, and manufs. woollen and cotton goods. Pop. 23,000.

Monopolies. The term monopoly literally means single or sole selling, and is so used in Aristotle's *Politica*, where a monopolist signified one who bought up the whole of a commodity so as to be the sole holder of it, and have the power of selling it at his own price. In this specialised sense it is clearly the same thing as a modern trust or combination to 'corner' an article. This is the root principle of all M. at all periods, though it may not be in accordance with the precision of economic language to speak to the owner of urb. rents as being in the enjoyment of the sole right to sell tenancies, or a railway company (before nationalisation) of the exclusive right to sell transit or travelling facilities. Again, though the effect of all M. is the same in point of exclusive right of commercial dealing, modern writers always distinguish between natural and artificial or legal M., a distinction detailed below.

Most anet. and civilised legal systems have endeavoured in one way or another, however ineffectually, to put some kind of a veto on M., e.g. the code of Zeno punished the monopolist by confiscating his goods and sending him into perpetual exile. In England legislation against M. goes back to the reign of Elizabeth, and so great was the abuse of the royal power of granting M. that in 1639, after quarrels between Parliament and the king, they were finally abolished by statute. The problem in England was always aggravated by the conflict between public utility and the anet. prerogative of the Crown (q.v.) to regulate all matters of trade. The privileges and exclusive rights of trade granted for a pecuniary consideration to merchants by the Norman kings, and abused by later monarchs (especially the Stuarts, who used them as convenient levers of political favouritism), furnish the most obvious example of the artificial or legal M., or M. which do not arise from the free play of economic forces. It was against artificial M. that past legislation in England was always directed, though with the advance in social ideas it became evident that the evils of natural M.—i.e. where a variety of circumstances of economic significance combine to nullify the ordinary effects of competition—were hardly less real, with the result that modern legislation has been active in securing monopoly values to the community, partly by facilitating the municipalisation of certain utility services (see MUNICIPAL TRADE), and by nationalisation of industries such as coal, gas, and electricity. Queen Elizabeth frequently granted M. to her favourites for dealing in the universal necessities of life, e.g. coal, salt, vinegar, and leather; but it was not till the last year of her reign that a Bill, introduced by Lawrence Hyde, received such great support from an otherwise pusillanimous House that the queen was obliged to yield. Yet notwithstanding

her concessions many M. still existed or were newly granted. Prior to these concessions the matter came before the courts (*The Case of Monopolies*), which were disposed to declare M. void on the common law ground that they were in restraint of trade, for in the above case (royal grant of sole right to sell playing cards) it was said that every monopoly had three inseparable incidents, the raising of the price, the deterioration of the commodity, and the impoverishment of workers and others. The only exception which the courts were inclined to make was in favour of the royal grant of letters patent for the exclusive privilege of trading in things introduced or invented by the grantee himself, or where the grant was apparently beneficial to the community. The Act of 1622, however, declared all M. void except those granted by letters patent for the sole working, for fourteen years, of any new manuf. to the 'true and first inventor thereof,' and this statutory provision is still the foundation of the present law as to patents for invention. Finally, in 1630, as a result of the ineffectiveness of the above Act to check the royal grant of M. to corporations, all legal M. (except patents for inventions) were abolished. Analogous to patents for inventions is the monopoly conferred by copyright, a right which has recently been considerably strengthened (see COPYRIGHT) in favour of authors.

If in the past England has not been immune from the evils of legal M., she has at least been free from one notoriously oppressive form of artificial monopoly, that of the revenue farmers or middle men to whom in various countries at various periods was leased, in return for a fixed sum, the right of collecting for their own use certain of the ordinary taxes. The system prevailed in ant. Rome, e.g. when the prov. of Asia fell to the Romans, C. Gracchus enacted that the most exorbitant direct and indirect taxes should be put up to auction for that prov. as a whole, the consequence being the rise of an association of capitalists of colossal magnitude (T. Mommsen, *History of Rome*, 1854). In its way no less oppressive was the monopoly under the old monarchical regime of France, by which the 'farmers-general' obtained from the gov., in return for a fixed payment into the Treasury, the right of collecting certain branches of the revenue.

Natural M. are divided into three classes by Prof. Bohm-Bucher: (1) Land M.; (2) M. valued from industries in which competition is inapplicable, e.g. gas (which is now a monopoly of the state) and water supply, tramway service, etc.; and (3) state M., e.g. the licence to deal in intoxicating liquors (see LICENSING LAWS). To this classification might be added those partial M. noticed by Mill, where a kind of monopoly price in the shape of 'superiority of reward' is obtained by workers in trades or professions where an uncommon degree of integrity is requisite, or a high degree of confidence reposed in the workers, e.g. goldsmiths, physicians, lawyers, etc. Mill's assertion that the superiority of

reward 'is not the consequence of competition but of its absence' is only a paradoxical way of saying that the demand is great but the supply small.

As to how far legislation has endeavoured to mitigate land M. see INCREMENT VALUE DUTY; LAND; LAND LAWS; LAND TAXES; LIBERALISM. However serious the blows Liberal or Socialistic legislation has dealt to private M. and individualism, a still more serious blow, in the opinion of anti-Socialists, is threatened by the mere substitution of a state monopoly, and nowhere more so than in the sphere of municipal trade (q.v.). Nevertheless the anti-Socialist and anti-municipal trader finds himself confronted by the dilemma of the 'trust' or huge combination of capital, whether national or international, which is designed to secure control of a trade or manuf. with the double object of economy in production and arbitrary profits.

Modern Tendencies—Regulation of Industry in the United States.—The control of monopoly and quasi-monopoly assumes crucial importance in periods of economic depression, or in periods of inflation no less than in wartime. Monopoly has flourished more conspicuously in the U.S.A. than in most other countries; but even Amer. experience of control is inconclusive. The Sherman and Clayton anti-trust laws (q.v.) were failures. M. continued to spread, and the sphere of 'free competition' to narrow. The Acts almost fell into disuse or were revived to check some especially large and menacing combine. Roosevelt's 'New Deal' ended this nerveless 'trust-busting' when the gov., accepting the large corporations, began to intervene, not with penalties, but by creating a permanent machinery for the regulation of industry by the administration. But the National Industrial Recovery Administration (N.I.R.A.) lasted only two years, during which time there was a distinct increase in monopolistic practices and restraint of trade. Almost all the N.I.R.A. codes provided for the control of prices and, generally, such provisions were evaded. The increase of prices and the hostility of consumers would probably have brought N.I.R.A. to an end even had it not been declared unconstitutional by the court. Criticism of the Act emphasised the antithesis between the desire for 'free enterprise' professed by the manufacturers, and the enormous pressure towards restrictive regulation exerted when they acted as a group. It is therefore to be inferred that if all industries pursue restrictive policies all suffer in the long run; and that the advantage derived if a single industry pursues a monopolistic restrictive policy is lost if all do so. Even while N.I.R.A. was in operation other Acts were being passed to give the administration greater power to intervene in the internal affairs of companies. The Public Utility Holding Company Act was carried against strenuous opposition in 1935. By that Act all companies in the public utility and steel industries had to register with the Securities and Exchange Committee.

which was empowered to simplify their structure so as to restrict each to a single integrated process. This Act was followed by an experiment in an entirely different method of state control—gov. ownership and public corporations in competition with private enterprise. With the Tennessee Valley Authority, and similar hydro-electric schemes, the gov. entered the industrial field proper in a big way, one of the main reasons advanced being that such schemes would promote employment. The reaction from N.I.R.A. was shown by a campaign for a new trial of the old anti-trust laws. The Temporary National Economic Committee, the so-called monopoly investigation, reporting in 1938, revealed the widespread growth of combination in the U.S.A. The view was taken that a less corrupt application of the existing anti-trust laws might provide a solution. Little, however, was done up to the entry of the U.S.A. into the Second World War. The Amer. type of war control was developed from the industrial and political experience of the preceding decade. In Britain the war controls were almost exclusively in the hands of former directors of the largest firms, and little was done to limit the power of the larger combines. In the U.S.A., on the other hand, a direct attack was made on various trusts, and wartime controls were used to reduce monopoly rather than to strengthen it. But the development of control in America was not founded on any clear theory. The solutions formulated and the measures adopted were empirical, even opportunist, though the broad line of development from the attempted distant control by the early anti-trust laws to the direct participation by the administration in the industrial field is clear enough.

Monopolies and Restrictive Practices (Inquiry and Control) Act, 1948.—For the purpose of checking M. and restrictive arrangements in industry and trade, which are held to be detrimental to the public interest, the gov. introduced legislation in 1948 to set up an independent monopoly commission to determine whether monopolistic conditions exist in particular industries referred to it for investigation by the Board of Trade and, if asked to do so, to decide whether the conditions investigated are against the public interest. When this second and more searching inquiry is made the report of the commission must be pub., and various ministers will be empowered to make orders protecting the public interest when a report concludes that harm is being done. The Act, however, excludes all the restrictive organisations of trade unions and nationalised industries. The commission is empowered, when investigating conditions in connection with particular classes of goods, to report on such restrictive practices as price maintenance arrangements, boycotting of particular retailers, or output quotas. The Board of Trade may order the omission from the commission's pub. reports of information, e.g. trade secrets, or the location of minerals, which might damage traders' interests. See also

Triffin, *Monopolistic Competition and General Equilibrium Theory*, 1941.

Monorail, or runway, is the name given to a device which has wheels running upon a single rail and is used to carry relatively light loads, generally about a warehouse or the depts. of a factory. Often a lifting tackle is incorporated. In some instances the wheels run on an ordinary type of light, bulb-headed rail, and in others they are arranged to travel on both sides of the bottom flange of an I section beam, the rail in each case being overhead. When the machine is operated by electricity it is known as a telfer, a name devised by the inventor, Prof. Fleeming Jenkin, in 1882, from the Gk. words *tele*, far, and *phero*, to carry. An up-to-date model consists of a bogie, running on an overhead rail, and driven by an electric motor which takes its current from a live rail running alongside the track. Attached to the trolley is a receptacle to carry the load, which may be as much as five tons. Telfers can be controlled by an attendant, or they may be entirely automatic; their operating costs per ton m. are extremely low. Mechanically propelled vehicles to run on a single line laid on the ground and to carry passengers have been considered by inventors, but, so far, have not become a practical proposition. This type of M. relies for its lateral stability upon some form of gyroscope included in its design. On the other hand, passenger cars having streamlined bodies suspended from a single overhead rail have passed somewhat beyond the experimental stage in one or two instances on the Continent.

Monotheism (Gk. *monos*, only, and *theos*, God), belief in one only God as the ruler of the universe. Opposed to polytheism, which worships many gods, manifested in physical, human, or animal forms, it claims distinction from systems of moral dualism by asserting the ultimate supremacy of good over evil. It differs from deism (*q.v.*), for whereas the latter has come to mean a belief in one God accompanied by a rejection of revealed religion, this is not so with M., which is invariably associated with revelation. Many hold that revelation teaches that primitive man was monotheistic. The Jewish and Mohammedan religions are strictly so. Anti-Trinitarians insist that the doctrine of the Trinity prevents Christianity from being monotheistic, though the creeds lay much stress on M. See A. Lang, *The Making of Religion*, 1898, and *Myth, Ritual, and Religion*, 1906; N. Soderblom, *Das Werden des Götterglaubens* (2nd ed.), 1926; and W. F. Albright, *From the Stone Age to Christianity* (2nd ed.), 1946.

Monotheletism (Gk. *μονοθεληται*), heresy which arose in the seventh century. M. taught that Christ had but one will, whereas the Catholics held that though

Christ's personality was one, yet He had two wills (according with His twofold nature, human and divine), which were, however, always in perfect harmony. The hist. of this heresy shows that it arose out of Monophysitism (q.v.). For when the Emperor Heraclius asked Sergius, the Monophysite patriarch of Constantinople, how that sect could be reconciled to the Church, Sergius said it could be held, without prejudice to the authority of the council of Chalcedon, which had condemned the Monophysites, that, after the union of the two natures in Christ, there was but one will and one operation of will (M.). In 630 Heraclius accordingly issued an edict requiring acceptance of this tenet, but in 636 Sophronius, patriarch of Jerusalem, ascribed a council and condemned M. Sergius adhered to his old opinion, and in 639 drew up a formula of faith. The same year Pope John IV. in a council at Rome, rejected the formula, and condemned M. M. was again condemned in the Sixth General Council, at Constantinople (680). The Lebanese Maronites embraced M., but were reconciled to the Church in the late twelfth century. For full particulars of the conflicts of the seventh century see article 'Monothelitism' in *The Catholic Encyclopedia*.

Monotremata, order or sub-class of mammals, and containing only three species, the *Ornithorhynchus* and the *Echidna* and *Præchidna*, spiny ant-eaters. The young are hatched from eggs and are fed on milk secreted not by mammae, but on a bare patch of the mother's skin. They have features which seem to make them intermediate between reptiles and the higher mammals. They have only one aperture for the urinary, genital, and intestinal canals. The mammary glands are well developed. Teeth, if present, consist of four horny plates. In various respects they approach birds and to a certain extent connect mammals with reptiles. Darwin thought that the earliest mammals in some respects resembled M. See MAMMALS.

'**Monotype**,' see TYPE-CASTING AND TYPESETTING MACHINES.

Monreale, city in the prov. and 5 m. S.W. of the city of Palermo, Sicily. It is an archiepiscopal see, and its fine cathedral dates from the twelfth century. It has a large trade in corn, oil, fruit, and almonds. The massacre known as the 'Sicilian Vespers' (1282) began on the road between Monreale and Palermo. Pop. 24,000.

Monro, Sir Charles Carmichael (1860-1929), Brit. soldier, youngest son of Henry M., of M. family of Craiglockhart. In 1879 he joined 2nd Foot (W. Surrey regiment). He commanded the 13th Infantry Brigade, Ireland, 1907-12, and became major-general, 1910. With London territorial units till 1914, he went with 2nd Div. to France. Lieutenant-general 1915. In 1915 he was given command of the First Corps, and when the Third Army was formed he was its commander. Soon after this he succeeded Sir Ian Hamilton as commander-in-chief in Gallipoli and

conducted the evacuation. From 1916 to 1920 he commanded the Indian Army, being made a general in 1917. He became a baronet in 1921, and was governor of Gibraltar from 1923 to 1928.

Monroe, James (1758-1831), fifth president of the U.S.A., son of a carpenter and mason, was b. in Westmoreland co., Virginia. He was educated at William and Mary College, but had hardly finished his education when, in 1776, he entered the army. Soon afterwards he joined Washington's army as lieutenant, taking part in the engagements at Harlem Heights, White Plains, and the attack on Trenton. He then became a captain of infantry (1777-78), fighting at Brandywine, Germantown, and Monmouth. He then temporarily abandoned a military career for law studies under the direction of Jefferson. In 1780 he was nominated military commissioner for Virginia, in 1782 elected to the Virginia Legislative Assembly, and in 1789 became a member of Congress. In 1790 he became a senator of the U.S.A., and four years later was sent by Washington to Paris as Amer. plenipotentiary. President Washington recalled him in 1796, as a result of his observations on the Jay Treaty negotiations over Amer. vessels. In 1799 he was made governor of Virginia. In 1803 he was sent by Jefferson as envoy-extraordinary to negotiate the purchase of Louisiana. The next four years he was at London and in Spain. In 1811 he became secretary of state for foreign affairs, secretary of war 1814-15, and on March 4, 1817, president in place of Madison. His affability and moderation rendered him highly popular with both Democrat and Federal, and in 1820 when he ran for President again he lost only one vote in the electoral college. The chief event of his administration was the controversy over the admission of Missouri to the states at a time when the question of slavery agitated the whole country. In 1822 M. declared in his ann. message that the independence of the Hispano-Amer. republics, which for sev. years had been endeavouring to shake off the European yoke, must be maintained at any price, a declaration which has since become celebrated as the 'Monroe Doctrine' (q.v.). He retired into private life in 1825, but subsequently served as a member of the Virginia Constitutional Convention until ill health compelled him to retire in 1829. See S. M. Hamilton (ed.), *The Writings of James Monroe Inclusive: a Collection of his Public and Private Papers and Correspondence*, 1898-1903, and G. Morgan, *The Life of James Monroe*, 1921.

Monroe: 1. Co. seat of Onachita par., Louisiana, U.S.A., on the Onachita R., 76 m. W. of Vicksburg, Missouri. It has a large trade in cotton, and manufs. cotton compresses and cotton-seed oil. Pop. 28,300. 2. City and co. seat of M. co., Michigan, U.S.A., on the Raisin R., 2 m. from Lake Erie; 35 m. S.S.W. of Detroit. It has flour, lumber, and paper mills, canning, factories, furniture and box factories, and extensive nurseries. Pop.

18,500. 3. City and co. seat of Green co., Wisconsin, U.S.A., 37 m. S.W. of Madison; has manufs. of dairy products, lumber, and iron goods. Pop. 6200.

Monroe Doctrine, one of the most important political declarations in modern times, is remarkable in that it is not embodied in an Act of the U.S. Congress, is not part of the U.S. Constitution, and is not part of the body of international law. President Wilson epitomised it thus: 'The Monroe Doctrine was proclaimed by the U.S.A. on her own authority. It always has been maintained and always will be maintained upon her own responsibility.' In brief, the M. D., backed by all the resources of the U.S.A., says to all the rest of the world: 'Hands off the Amer. hemisphere.' It was adumbrated in the farewell speech of George Washington, the first President of the U.S.A., and by Thomas Jefferson, the third, but really came to a head during the administration of President James Monroe. The young republic had always feared that powerful European nations might establish colonies in the W. hemisphere, and so prove dangerous neighbours. This was especially marked during Monroe's service.

Under the leadership of patriots like Simón Bolívar and José de San Martín, one after the other of the Sp. colonies in S. America revolted and set up as independent nations. Most of them were republics, which were quickly given recognition by the U.S.A. The Portuguese colony of Brazil also revolted and set up an imperial regime. This gov. also was recognised by the U.S.A. But in Europe the Holy Alliance of Austria, Russia, and Prussia viewed with misgivings these popular risings, and even discussed the advisability of helping Spain to subdue her former colonies in America. George Canning, Brit. foreign minister, unwilling to see these colonies go back to Spain, made a proposal to James Rush, Amer. minister in London, to the effect that he wanted the U.S.A. and Great Britain to issue a joint declaration against any interference with the new Lat.-Amer. republics. President Monroe, advised by former Presidents Madison and Jefferson, was willing to join Great Britain in this, but changed his mind, on the advice of his secretary of state, John Quincy Adams, afterwards himself a president of the U.S.A., and insisted that the U.S.A. should act alone. One reason for this was that the Russian tsar had issued a ukase warning foreign vessels not to come within a hundred m. of a part of the Pacific Coast of the N. Amer. continent which Russia did not possess, although at that time it did own Alaska, which was afterwards sold to the U.S.A. Adams wrote to the Russians that the Amer. continents were henceforth not to be considered as subjects for future colonisation by European powers. In Dec. 1823, therefore, President Monroe signed a message largely written by Adams, which has since become known as the M. D. He not only set forth the view expressed above to Russia, but with an eye on S.

America he declared that the U.S.A. had no interest in European wars, but warned European powers that any attempt on their part to extend their system to any portion of the W. hemisphere would be considered as dangerous to the peace and safety of the U.S.A. His gov. would not seek to interfere with any existing colonies or dependencies of European countries now held in the W. continent, but could not allow any interposition of European powers for the purpose of oppressing or controlling any of the newly set-up Lat.-Amer. govts. This plainly told the members of the Holy Alliance that they would not be allowed to make war on Spain's lost colonies, and, further, that no European or extra-Amer. power would be allowed to secure Amer. ter. in the future, either by conquest, purchase, or treaty. Since that time in every international agreement made with the U.S.A. that country has always incorporated a reservation that nothing in the treaty of paper shall be considered as infringing or revoking or weakening the M. D. This doctrine has been reiterated in set terms by nearly every president who has succeeded Monroe.

It was strongly invoked against France in 1865. Taking advantage of the Amer. civil war the Emperor Napoleon III. sent Fr. troops to Mexico and set up a Mexican empire, with Prince Maximilian of Austria as ruler. As soon as the civil war was ended the U.S. Gov. sent a sharp message to France, and was prepared to use its armies and navy to enforce it. But the Fr. withdrew their troops, the people revolted, Maximilian was shot, and the Mexicans once more ruled Mexico. In 1895 it was again invoked in the boundary dispute between Venezuela and Great Britain. The serious situation thus created was ended by the wise statesmanship of Lord Salisbury. The general respect for the M. D. in the nineteenth century was due less to fear of offending the U.S.A. than from the realisation that Great Britain, with its immense naval strength, was a powerful if silent supporter of the Monroe principles; though, in the reaction after 1918, there grew up a feeling that the policy would gradually lose significance in the U.S.A., because there was no longer any possibility of a serious threat from an exhausted and supposedly democratised Europe. The doctrine underwent a marked extension in the first quarter-century preceding the First World War, a period which seemed to indicate the development of Amer. imperialism through intervention in the internal affairs of the Lat.-Amer. states. The so-called Roosevelt corollary to the M. D. was first enunciated in 1904 and was exemplified by that president's action against Colombia over the Panama Canal and his intervention in Cuba to keep internal order; and Lat.-Amer. fears of Amer. imperialism were only lessened, though by no means dispelled, when the U.S. Gov. supported their proposal at The Hague in 1907 that creditor states should intervene in the affairs of debtor states only if the latter

declined arbitration. This expanded interpretation of the M. D. was not repudiated by Taft or Wilson, as was shown by Amer. intervention in Haiti. It became evident, however, that something had to be done to reassure the Lat.-Amer. states that the U.S.A. did not intend to use their powers so as in effect to create any kind of hemispheric protectorate, and during the centenary of the Monroe message secretary of state Hughes formally stated that the U.S.A. had no such intention and that it was 'part of our policy to respect the territorial integrity of the Latin-American republics.' In a memorandum prepared by under-secretary Clark of the Hoover administration referring to the Roosevelt corollary, the author said that the corollary was 'not justified by the terms of the Monroe Doctrine, however much it may be justified by the application of the doctrine of self-preservation'; and point was given to this repudiation by the withdrawal of Amer. marines from Nicaragua and refusal to send them back when disorder threatened. But the U.S. Gov. declined to convert the doctrine into a multilateral pact among all the N. and S. Amer. states on the ground that such a change amounted to a treaty of alliance which was inconsistent with Amer. diplomatic traditions. President Franklin Roosevelt withdrew the last detachment of marines from Haiti, abrogated the Platt Amendment which purported to legalise the right of intervention in that state—by mutual agreement with Cuba, and entered into a new treaty with Panama, relinquishing the right of intervention in that state. In his 'good neighbour' policy, Franklin Roosevelt's course of action was a radical departure from the 'big stick' policy of Theodore Roosevelt, and at the Buenos Aires Inter-Amer. Conference in 1936 a declaration was drawn up prescribing the principles which were thenceforth to govern the relations of all the states of the Amer. continents. These principles proscribed all territorial conquest, or intervention in each other's affairs, internal or external; and provided for the peaceful settlement of debt collection or of other disputes. At a conference in Lima in 1938 provision was made for inter-governmental consultation in the event of a threat to the peace of the Americas. All these developments represented a tremendous departure from the past, and in effect they meant that the U.S.A. had internationalised virtually every phase of the M. D. At the outbreak of the Second World War the gov. of Panama convened a meeting of all the foreign ministers in order to decide on a common neutrality policy, and at this conference the delegates agreed upon the famous 300-m. neutrality zone. In July 1940 the Havana Conference had to meet the first serious possibility in many years of a direct challenge to the M. D., namely the possibility that Fr. and Dutch colonial possessions in the W. might be occupied by or ceded to Germany. The conference approved the U.S.A.'s uncompromising attitude of the previous month, when the state dept. had

warned the belligerents that the U.S. Gov. would neither recognise nor acquiesce in any transfer of ter. in the Amer. hemisphere from one non-Amer. power to another. The conference also authorised the U.S. Gov. to intervene and to assume temporarily all administrative power over any European possessions in their hemisphere when a threat to the safety of the Amer. continents warranted such action. One indirect result of these developments has been to bring Canada into the orbit of inter-Amer. relationships much more closely than in the past, and in 1940 President Roosevelt took the decisive step of concluding a joint defence pact between the U.S.A. and Canada. See J. A. Kasson, *The Evolution of the U.S.A. and History of the Monroe Doctrine*, 1904; W. P. Crosson, *The Italy Alliance: the European Backgrounds of the Monroe Doctrine*, 1922; and G. Kirk, *The Monroe Doctrine To-day*, 1941.

Monrovia, cap. of Liberia, W. Africa, at the mouth of the St. Paul R., on the Atlantic coast. It exports coffee, palm-oil, and palm-nuts, dye-woods, and rubber. It has a pop. of about 10,000, and is administered as a commonwealth dist. by a municipal board appointed by the president of Liberia. The gov. has a college, Liberia College, at M. A harbour development has been planned for M., and the port works have been constructed under lend-lease terms, through the U.S. Gov. A wireless station is maintained there by the gov.

Mons (Flem. **Bergen**), cap. of the prov. of Hainaut, Belgium, 32 m. S.W. of Brussels. The city is situated between two important coal-mining dists., the Borinage to the W. and the Centre to the E. Its importance is mainly commercial. It has manufs. of cotton goods, paper, porcelain, oil, chocolate, soap, and tobacco. It is the most important coal market of Belgium. M. stands on the site of a Rom. camp, and has sev. interesting buildings, including the tn. hall (1443-67) and the collegiate church of Ste.-Waudru (1150-1621), with its belfry. There are also three museums. Pop. 25,600. See E. Hubbard, *Mons dans le passé et dans le présent*.

Mons, Battle of. At the outbreak of the First World War the small Brit. expeditionary force, under Gen. Sir John French (later Lord Ypres), was rushed across to France and took up a position to the left of the Fr. line about M., a small Belgian tn. near the Fr. border, about 32 m. S.W. of Brussels. On Aug. 22, 1914, the Gers. gained a victory over the Fr. at Nanur, and threw them back, thus making a breach in the Entente line with the Brit. isolated on the left. The Gers. under von Kluck and von Bülow (total four corps) now attacked the two Brit. corps on Aug. 23. A frontal attack was launched. This proved an admirable target for the Brit. infantry, which poured in a sustained, well-aimed, rapid fire with rifles and machine guns. The Gers. fought well, but the accuracy and the rapidity of the Brit. fire took a heavy toll, and their attack was of no avail. Von Bülow now

made a flank attack on the right of the Brit., who had not been informed of the full details of the Fr. withdrawal. As soon as Sir J. French was informed of the vastly numerically superior forces to which he was opposed, he gave orders for a withdrawal in order to escape complete envelopment and annihilation. *See also* FRANCE AND FLANDERS, FIRST WORLD WAR CAMPAIGNS IN.

Mons Capitolinus, *see* CAPITOL.

Monselice, com. of Italy, on the canal of M., 13 m. S.W. of Padua; has manufs. of textiles. Pop. 12,300.

Montserrat, or **Montserrat**, mt. mass in the prov. of and 23 m. N.W. of the city of Barcelona, Spain, on the r. b. of the

deflected to the S. and S.E. in the equatorial belt, and accompanied by violent typhoons in the neighbourhoods of the E. Indies and Madagascar. The M. is best known where contrast of air is very great—between air from the Sahara and the gulf of Guinea in W. Africa, between air from the Sudan and the Indian Ocean in E. Africa, as well as the classical Indian case. The term M. was originally brought to England from the E. Indies by Portuguese traders in Elizabethan times, but accounts of the winds were chronicled by Pliny and Aristotle, as well as by the Arab historian, Sidi Ali, in 1554. *See* Prof. Ferrel, *A Treatise on the Winds*, 1889. *See also* WIND.

MONSERRAT: THE BENEDICTINE MONASTERY

Llobregat. Its highest point is 4070 ft. At a height of 2910 ft. on the E. side is the Benedictine monastery, dating from the ninth century and containing a famous small, black, wooden image of the Virgin.

Monsignore, title of honour given to prelates in the Rom. Catholic Church, and to officers of the papal court.

Monsoon (from the Arabic *mawsim*, a season), term used generally for any wind which blows regularly at fixed seasons, but especially applied to those winds which blow over the Indian Ocean to India. From April till Oct. they blow from the S.W. (N.E. in Bengal), from Oct. to April they blow from the N.E. Their regularity is caused by the regular change of the seasons; during the winter the cold air from the interior of Asia flows outward in a general S.-westerly direction towards the warmer sea; when the land, on the contrary, becomes more heated than the sea, the direction of the current of air changes and flows inwards in a N.-easterly direction. The change to the S.W. M. is accompanied in parts of India by violent thunderstorms and torrential rains. It sometimes happens that the M. fails to bring the expected rains, and the result is such a famine as occurred in 1895 and again in 1899. The S.W. M. is

Mons Palatinus, *see* PALATINE HILL.

Monstrance (Lat. *monstrare*, to show), or **Ostensory**, instrument used in the Rom. Catholic Church for holding the Sacred Host in benedictions, processions, and expositions of the Blessed Sacrament. It stands on a circular base, and the upper part is now almost invariably made circular with rays extending on all sides from the centre. The Host is itself held in a small crescent-shaped *lunula*, or *lunette*.

Monstrelet, Enguerrand de (1390–1453), Fr. chronicler, probably b. in Ponten. He was attached to the service of John of Luxembourg, and was at Compiègne when Joan of Arc was captured by the Burgundians. He was provost at Cambrai and a bailiff of Wallincourt (1414). His *Chronique*, covering the years 1400–41, continued Froissart's *Chronicle*, and is a clear and accurate account of current events. There is an Eng. trans. by Thomas Johns (1810), and the most recent Fr. ed. is that of Douet d'Areq (1857–62).

Monstrosity, *see* DEFORMITY; TERATOLOGY.

Montacute, Thomas de, *see* SALISBURY, EARL OF.

Montacute House, 4 m. from Yeovil, a

magnificent building, was begun in 1580 by Thomas Phelps, and completed by about 1600 by his son, Sir Edward Phelps, Speaker of the House of Commons and master of the rolls under James I. It has curvilinear and finialled gables, open balustraded parapet, carved statues of the nine worthies standing in niches in the E. front, and fluted angle columns. The property, including St. Michael's Hill (the Mons Acutus) was presented to the public through the Society for the Protection of Anc. Buildings in 1931. A museum of fine period furniture, pictures, and tapestries is being formed in the house.

MONSTRANCE

Montagna, Bartolomeo (1450-1523). It. painter, *b.* at Orzinuovi, near Brescia. According to Vasari he was a pupil of Andrea Mantegna. He is regarded as the most eminent master of the school of Vicenza. His masterpiece is the altarpiece of San Michele at Vicenza (1499), later removed to Milan. His earliest known picture still extant is the 'Virgin and Child' (1487) at Bergamo. At Verona he painted the frescoes in the chapel of San Biagio.

Montagnana, walled tn. in the prov. of Padua, Italy, 22 m. S.W. of Padua. It has a fifteenth-century Gothic cathedral. Pop. 10,000.

Montagnards, or **Montagne**, name given to the extreme Democratic party in the first Fr. revolution. They were so called because they occupied the highest benches in the National Convention, while their opponents, the Girondists, sat on the floor of the house. The party included both Jacobins and Cordeliers, and its prin.

members were Danton, Marat, Robespierre, St. Just, and Collot d'Herbois, the men of the 'Reign of Terror.' See J. M. Thompson, *The French Revolution*, 1943.

Montagu, Charles and George, see HALIFAX, EARL OF.

Montagu, Edmund and John, see SANDWICH, EARL OF.

Montagu, Edward, see MANCHESTER, EARL OF.

Montagu, Edwin Samuel (1879-1921), Jewish-Brit. statesman, second son of first Baron Swaythling. He was educated at City of London School and Trinity College, Cambridge. Elected M.P. in 1906 he was unpaid private secretary to Asquith until his appointment as under-secretary for India in 1900. In 1914 he became financial secretary to the Treasury, and in 1915 privy councillor and chancellor of the duchy of Lancaster. On the formation of the coalition he became financial secretary to the Treasury once more, and from the summer of 1916 minister of munitions until the end of Asquith's premiership. Secretary of state for India in 1917 he collaborated in the M. Chelmsford report, but in 1922 was obliged to resign for publishing a dispatch from the India Gov. without cabinet authority. Losing his seat in the 1922 election he went into the city.

Montagu, Elizabeth (*née* Robinson) (1720-1800), Eng. authoress and social leader, *b.* at York, married in 1742 Edward M., grandson of the first earl of Sandwich. She was one of the best-known and most popular of the 'blue-stocking' coterie, and entertained largely at Sandeford, and at M. House, London. Among her writings was an *Essay on the Writings and Genius of Shakespeare* (1783), being a spirited reply to Voltaire. She was a voluminous correspondent and her letters were collected and pub. (1809-13) by her nephew, Matthew M. There is a biography by Mrs. E. J. Climençon (1906).

Montagu, Lady Mary Wortley (1689-1762), Eng. authoress, *b.* at Thoresby in Nottinghamshire, was a daughter of Evelyn Pierrepont, first duke of Kingston. In 1712 she married Edward Wortley M., who four years later was sent as ambas. to the Porte. Lady Mary accompanied her husband to the E., and there learned something of the practice of inoculation for smallpox, which on her return in 1718 she introduced into this country. She lived in London for the next twenty years. Pope's quarrel with her is historic. Lady Mary circulated verses animadverting upon the obscurity of Pope's birth and declaring his physical deformity to be a divinely appointed emblem of his crooked mind. Pope, in beautifully cadenced couplets, declared that Lady Mary's lovers contracted a disreputable disease. Later he added such details as that her husband was a miser and the happy pair's board so frugal that a second half-pint of wine was reserved for some exceptionally blessed occasion - the rumour that their only son had been drowned. In his study of Lady Mary (1949) Lewis Gibbs paints a very different portrait of Mr. M.: no cuckold but a man of infinite patience,

forbearance, and common sense, willing to act as a foil and even as an anvil for his extravagant and unaccountable wife. The significance of their twenty years of separation is here examined with a realisation of the sadness underlying the life story of a brilliant and supremely self-confident woman. She went abroad in 1739, and remained away until the death of her husband in 1761, when she came again to England. Lady Mary's *Town Eclogues* were first pub. in 1716 under the title of *Court Poems*. Her *Letters* were pub. in 1763, and her *Works* were collected in 1803. As she overestimated her power in verse satire so did she overestimate the merit of her indeed admirable letters, judging them, simply because they had so acrid a wit and so high a polish, equal to those of Madame de Sévigné. Much of her familiar writing suggests her age at its moral worst, and hence in the main that reputation for personal depravity about which Mr. Gibbs in the above work displays a wholesome and well-argued scepticism. See Violet Stuart Wortley, *Magic in the Distance*, 1948, and L. Gibbs, *The Admirable Lady Mary*, 1949.

Montague, Charles Edward (1867-1928), Eng. author. Educated at City of London School and Oxford Univ. His novels are of considerable merit, and among his other writings *Dramatic Values* (1911) contains excellent comments on the tendencies of nineteenth-century drama. Pub. works: *A Hind Let Loose* (1910); *Disenchantment* (1922); *The Morning's War* (1923); *Fiery Particles* (1923); *Rough Justice* (1926); and *Right off the Map* (1927). Some of these are based on his experiences in the First World War on active service. M. was a governor of the Manchester Univ. and a director of the *Manchester Guardian*. See O. Elton, *C. E. Montague*, 1929.

Montague, George (1751-1815), Eng. writer on natural hist., b. at Lackham, Wiltshire. He entered the army and served in the war with the Amer. colonies. He was one of the earliest members of the Linnæan Society, for which he wrote papers on the birds and shells of S. England. He had a splendid collection of birds and other animals, which was purchased by the Brit. Museum. He pub. an *Ornithological Dictionary of British Birds* (1802) and *Testaceæ Britannica* (1803) on Brit. shells.

Montague, tn. in Franklin co., Massachusetts, U.S.A., 72 m. W.N.W. of Boston. Pop. 1100.

Montagues (Monteschi), see CAPULETS AND MONTAGUS.

Montaigne, Michel Eyquem, Seigneur de (1533-92), Fr. writer, b. at the château of St. Michel de M., near Bordeaux, in Périgord. His father, after serving in the army, became mayor of Bordeaux; his mother was Antoinette de Lopez (or Loupes), of a Jewish family, which had emigrated from Spain. Some of his nearest relations were Protestants, while he himself, three-fourths pagan though he was, lived and died in the Catholic faith; and this mixture of creeds in his blood is probably responsible for his wide spirit of

toleration. At the age of six he entered the Collège de Guéenne, Bordeaux, the head of which was the scholar, André de Govoa, and where one of his 'familiar tutors' was George Buchanan, 'that famous Scottish poet,' and another was Marc-Antoine Muret. These masters wrote Lat. plays for the scholars, and M. tells us that he took part in them, but he does not hide the fact that he was lazy and read merely as his fancy prompted. From 1546 to 1554 his career is not certainly estab., but it is generally assumed that he was a law student at Bordeaux or Toulouse. At twenty-one he became a member of the Cour des Aides at Périgord, and three years later a councillor of Parlement at Bordeaux. Etienne de la Boétie was his fellow member there, and M.'s account of his 'unspotted' friendship with him is one of the classics of friendship. At thirty-three he married Francoise de la Chassaigne, daughter of a councillor of the Bordeaux Parlement, whom apparently he had not married 'for love,' but who served him with loving care. In 1568, on the death of his father, he became head of the family. Life, however, in the law courts was very tedious for him, and in 1570 he resigned his post and retired to his château de M., where he lived with his books for the remainder of his life. He had already (1569) pub. his trans. of the *Theologia naturalis* of Raymond de Sébondé (a fifteenth-century prof. of Toulouse, and in the same year had also ed. the works of his deceased friend, La Boétie. In 1572 he began to write his essays, and pub. the first two books in 1580. In the latter year he travelled in Switzerland, S. Germany, Italy, and the Tyrol, and on his return was elected mayor of Bordeaux, and though at first he declined the dignity he gave way on receiving a letter from Henry III. commanding him to accept. Generally speaking, he seems to have fulfilled his duties with much tact, in spite of a somewhat hasty departure when the plague broke out with renewed vigour. The fifth ed. of his *Essais*, to which a third book was added, appeared in 1588. In that year he had gone to Paris to arrange for pub. and soon after became acquainted with Mlle de Gournay. He died of quinsy and was buried first at M., and later in the chapel of the Feuillants at Bordeaux. At his death he left to his wife and Mlle de Gournay the task of issuing a definitive ed. of his *Essais*, which appeared in 1595.

Few books have exercised a greater and more enduring influence on the literature and thought of the world than M.'s *Essais*, which were much read by Bacon and by Shakespeare, who made numerous borrowings from them. M. had great influence also upon Pascal, and upon Sainte-Beuve, who called him the wisest Frenchman who ever lived. M. appeals to readers of all classes; though upon the young and sanguine he has a depressing effect, for his criticism is analytic, sceptical, and inconclusive; there is a continual weighing of evidence, and nothing certain emerges save his uncertainty.

The titles of the essays frequently afford no indication whatever of their contents, and are but suggestions to prompt ideas. He talks in a disconnected way on innumerable topics, often completely losing sight of his original theme, yet always with a clear object in view. The essays seem unduly egoistic, but this was M.'s method of arriving at general rules of conduct. In the search after self-knowledge he lays bare his own moral and psychological outlook, caring as little for the exposure of his own weaknesses as for the revelation of those things upon which he prided himself. Hence we know M. more intimately than we know any other writer, not even excepting Pepys. The foundation and

MICHEL DE MONTAIGNE

essence of his ideas are contained in the ironical *Apologia de Raymond Sebondé*, being an eloquent diatribe against the value of human reason so far as metaphysic and science are concerned. M. had no sympathy with innovation. He was born in a disillusioned age, when the splendid dawn of the Renaissance had faded into the light of common day. Thus the scepticism of age succeeded the enthusiasm of youth, and M. was its typical representative and indeed he takes himself as a representative of 'la moyenne humanité.' Nature, while remaining our guide, must be submitted to discipline; for the human mind is a 'dangerous vagabond,' in whose footsteps misfortune is sure to follow if it is not held in check and prevented from forming personal opinions dangerous to tradition. With M. indeed begins the reaction of the seventeenth century as represented by the *opinions générales*, i.e. by authority, and for the same reason, and because he hated all innovations, he condemned the reformation as an arrogant revolution. All his attention is given to points of practical

morals, in the constant discussion of which he ranges himself on the side of antiquity as opposed to medievalism. In this connection his views on education are of great interest. M. recommends the learning of foreign languages, but deprecates the wasting of so much time on Lat. and Gk., and, further, he thinks that the master should not confine himself to books. Corporal punishment is mercilessly attacked. But the defects of M.'s system of education are that it gives no scope to individual effort, and that athletics are neglected, while, generally, his theories lead to the development of social and worldly qualities. The chief Eng. trans. are by John Florio, 1603; C. Cotton (revised by W. Hazlitt), 1845 (new ed., 1923); G. B. Ives, 1926; and trans. of the *Journals* by W. Waters (1903-4) and E. Trechmann, 1929; latest ed. by J. J. M. Stewart, 1931. See A. Gruen, *Vie publique de Michel Montaigne*, 1855; R. W. Emerson, *Representative Men*, 1882; J. Fels, *Shakespeare and Montaigne*, 1884; M. E. Lowndes, *Michel de Montaigne*, 1898; E. Dowden, *Montaigne*, 1905; Edith Sichel, *Michel de Montaigne*, 1911; J. See also (*Eurres*, ed. by Armaingaud, 1626, and ed. by Plattard, 1931).

Montalban, tn. of Carabobo, Venezuela, 28 m. W.S.W. of Valencia. Pop. 8500.

Montalembert, Charles Forbes de Tryon Comte de (1810-70). Fr. historian, b. in London, the son of a Fr. émigré and his Eng. wife. In 1830 he joined Lamennais on the staff of the *Avenir*, accompanying him to Rome and to Munich. He submitted to the pope in 1835 his *Histoire de Ste Elisabeth d'Hongrie*, and pub. it in 1836, the first-fruits of his medieval studies, which was followed by *Du rationalisme et du catholicisme* in 1839. Failing as a moderate opponent of the empire to secure re-election to the Legislative Assembly in 1837, he devoted himself entirely to literature. He was elected to the Academy in 1852. His great work was *Les Moines d'occident depuis St. Benoît jusqu'à St. Bernard* (1860-77. Eng. trans., 1861-79). He also pub. *L'Avenir politique d'Angleterre* (1856); *Mémoire de l'abbé Lavoirdaire* (1863); and *Le Pape et la Pologne* (1861). See lives by Mrs. Oliphant, 1872; É. de Meaux, 1897; Père Lecannet, 1895-1901; and P. de Lallemand, 1927.

Montalvan, Juan Perez de, see PEREZ. Montana, N.W. state of the U.S.A., bounded on the N. by Canada, E. by N. and S. Dakota, and S. by Wyoming and Idaho, the latter also bounding it on the W. It is the third in size of the Amer. states, with a total area of 147,100 sq. in. There are Indian settlements, with a total Indian pop. of 16,800. The E. part consists of rolling plains rising from an elevation of 1800 to 4000 ft. at the base of the Rocky Mts. in the W., where Mt. Douglas (11,300 ft.) is the highest peak. In the N. is Glacier National Park. The Missouri rises in Yellowstone

Park to the S. of the state line; the Yellowstone, Madison, Bitterroot, Milk, Sun, Marias, Teton, and others drain the greater part of the state, while the Missoula and Kootenay drain the N.W. corner. In the riv. valleys and where irrigation has been extensively introduced the soil is very productive, and wheat and other cereals, flax-seed, potatoes, hay, sugar-beet, and fruit are grown. Sheep, cattle, and horses are reared in large numbers, and there are wide areas of forest. Of the immense potential water power, only about a third has been developed. The great industry of the state is mining, the total value of the mineral products amounting in 1948 to \$75,816,000. Coal, copper, manganese, zinc, petroleum, gold, silver, and sapphires

E.N.A.

A MONTANA INDIAN

are found. Other industries include smelting and flour-milling. The cap. is Helena 15,000. Butte (37,000) and Great Falls (30,000) are the largest tns. Other tns.: Billings (23,000); Missoula (19,000); Anaconda (11,000). M. was organised as a ter. in 1864, and admitted to the Union in 1889. It has a senate of fifty-six members, and a house of representatives of ninety; it sends two senators and two representatives to Congress. Pop. (1940) 559,500 (increase of 4 per cent over that of 1930). See *Montana*, issued by the Dept. of Agriculture, Labour, and Industry; *Montana's Production, 1930-46*, by the Bureau of Business Research, Montana State Univ.; and J. K. Howard, *Montana: High, Wide, and Handsome*, 1943.

Montanism, heretical movement of the second century. Montanus, its leader, was a native of M. sia, and the movement took its rise at a tn. of Phrygia. Montanus conceived that he had a mission to bring the Church back to a state of strictness and purity, but his great claim was to be the Paraclete promised by Jesus to his disciples. He taught that revelations

to man still continued, and these were frequently delivered by himself and by his female companions, Prisca and Maximilla. He proclaimed that the end of the world was at hand, and that then Christ would reappear at the tn. of Pepuza in Syria. M. was strict and most ascetic. No forgiveness was possible after mortal sin: the sacraments were therefore unnecessary; marriage was discouraged as an inferior state. At first the sect spread rapidly and made its most famous convert in Africa, where Tertullian joined its ranks. It was condemned unhesitatingly in sev. local councils, and finally in the Council of Constantinople (381). It died out in the W. about the fourth century, and did not survive much longer in the E. Ritschl's investigations supersede the older works of Tillemont, Wernsdorf, and others, and were pub. in 1811 with the title *Der Montanismus und die christliche Kirche des 2ten Jahrhunderts*. The later works, of which the best known and most exhaustive is G. Bonwetsch's *Geschichte des Montanismus* (1881), all follow the lines laid down by A. Ritschl. See also C. Adam, *Kirchenbegriff Tertullians*, 1907; A. Holland, *Deur heretiques*, 1935; and works on Christian dogma.

Montargis, tn. in the dept. of Loiret, France, at the junction of three canals connecting the Seine and the Loire, 40 m. E.N.E. of Orleans. It is a railway junction and an important trade centre. A bronze monument commemorates the combat between M.'s dog and Macaire, the murderer of M., in 1371. Pop. 12,000.

Montauban, see COUSIN-MONTAUBAN.

Montauban, cap. of the dept. of Tarn-et-Garonne, France, overlooking the Tarn R., 31 m. N. of Toulouse. It has a Renaissance cathedral completed in 1739. It has manufs. of cloth, woollens, sugar, and metal-ware, and a large trade in horses, grain, oil, wine, and leather. The tn. was founded by Count Alphonse of Toulouse in 1141, and was an episcopal see from 1317 to 1560. It became a Huguenot stronghold and was constantly besieged. At the fall of La Rochelle M. submitted, but its fortifications were destroyed in 1629. Pop. 28,700.

Montbéliard, tn. in the dept. of Doubs, France, at the confluence of the Allaine and the Lisaine, 48 m. E.N.E. of Besançon. The castle dates from the fifteenth century. There is a statue to Cuvier, the naturalist, b. here in 1769. The chief manufs. are watches and textiles. Pop. 10,500.

Mont Blanc, see BLANC, MONT.

Montbretia, genus of S. African plants (order Iridaceae), now incorporated in the genus *Tritonia*. The flowers are of great variety of yellow and red tints, and are borne on long graceful spikes. April is the best month for planting. M. may also be grown in pots, in a mixture of sandy loam and leaf-mould.

Montrbrison, tn. in the dept. of Loire, France, 20 m. N.W. of St. Etienne. It has mineral springs. Pop. 7800.

Montcalm, Louis Joseph, Marquis de (1712-59), Fr. soldier, b. at Candiac, near Nîmes. In 1727 he entered the army, be-

coming a captain at the age of eighteen. He served in Italy and Germany, being wounded at Piacenza (1746). In 1756 he was placed in command of the Fr. troops in Canada, captured Fort Ontario and Fort William Henry from the Eng. (1757), and repulsed Gen. Abercrombie's attack at Ticonderoga (1758). Lack of reinforcements and provisions forced him to retire to Quebec, where he was besieged in 1759 by Wolfe, both falling mortally wounded in the battle on the Heights of Abraham. In 1827 a monument to the joint honour of Wolfe and M. was erected in Quebec. See F. Parkman, *Montcalm and Wolfe*, 1884; Falgaufolle, *Montcalm devant la postérité*, 1886; and H. R. Casgrain, *Wolfe and Montcalm*, 1906.

Montceau-les-Mines, tn. in the dept. of Saône-et-Loire, France, on the Canal du Centre, 25 m. W.S.W. of Chalon-sur-Saône. It is the centre of a coal-mining dist., and has iron foundries and machine shops. Pop. 26,800.

Mont Cenis, see CENIS, MONT.

Montclair, tn. of Essex co., New Jersey, U.S.A., 5 m. N.N.W. of Newark, is a favourite residential quarter. Pop. 39,800.

Mont de l'Enclus, see KLUISBERG.

Mont-de-Marsan, tn. of France, cap. of the dept. of Landes, at the junction of the Midon and Douze, 81 m. S. of Bordeaux. Pop. 14,000; cent. 124,000.

Mont-de-Piété (lt. *Monte di Pietà*), estab. where money is lent to the poor at a moderate rate of interest, was founded, to combat the evils of usury, about the middle of the fifteenth century at Orvieto (1463) and Perugia (1467). The first estab. in Paris was opened in 1777, suppressed during the revolution, but later restored as a national undertaking with the right to charge 9 per cent on all loans to pay working expenses; any surplus gain goes to public charities. While the estab. at Paris is the largest in the world there are also similar centres of municipal pawnbroking in many European countries. In England the system appeared for a time during the eighteenth century, being abandoned as a non-practical idea after some seventy years. See also PAWN-BROKER.

Montdidier, tn. in the dept. of Somme, France, on the R. Don, 21 m. S.E. of Amiens. It suffered damage in the Second World War. Pop. 4300.

Montebello, vil. in the prov. of, and 10 m. S.W. of the city of, Vicenza, Italy. The Austrians were defeated here in 1796 by Gen. Bonaparte, and in 1805 by the Its. under Prince Eugene de Beauharnais. Pop. 5400.

Montebello Casteggio, vil. in the prov. of, and 14 m. S.S.W. of the city of, Pavia, Lombardy, Italy. The scene of two defeats of the Austrians by the Fr. in 1800 under Gen. Lannes, and in 1859 by the Fr. and Piedmontese. Pop. 3800.

Montebelluna, com. in the prov. of, and 13 m. N.W. of the city of, Treviso, Italy. Pop. 10,000.

Monte Carlo, tn. in the principality of Monaco, and 9 m. E. of Nice, overlooking the Mediterranean Sea. It is a popular winter and sea-bathing resort, but is

chiefly known for its gaming estab. The concessionnaire (a joint-stock company) pays an ann. grant of £50,000, rising in 1937 to £100,000. The first gaming estab. was opened by two Frenchmen named Langlois and Aubert, and there were other adventurers before François Blanc came on the scene, but none of them flourished. M. Blanc, however, having through the secretary of the gov. of Monaco purchased the Casino and the right to gamble for a sum approaching £70,000, organised the Casino into a commercial success. A railway was opened in 1868, a good steam-boat service instituted, and better hotel accommodation provided. In 1881, after the death of Blanc, the cap. of his company (the *Cercle des Etrangers*) was doubled from 15,000,000 francs to 30,000,000, divided into 60,000 shares of 500 francs each. Pop. c. 10,600. See MONACO.

Monte Cassino Monastery, see CASSINO.

Montecatini, two watering-places in Italy: (1) in the prov. of Pisa, 7 m. W.S.W. of Volterra; has copper mines. Pop. (com.) 5600. (2) in the prov. of Lucca, 30 m. W.N.W. of Florence. Pop. 9000.

Montecchi, see CAPULETS AND MONTAGUES.

Monte Cinto (8890 ft.), highest point in Corsica (*q.v.*).

Monte Cristo, small rocky islet off the W. coast of Italy, 28 m. S. of Elba. It is 2110 ft. in height, and has been a penal settlement since 1874. See A. Dumas, *The Count of Monte Cristo*, 1850.

Montecuculi, Raimondo, Count (1609-1680), Austrian general, b. at Modena. In 1625 he entered the Austrian Army as a volunteer, serving through the Thirty Years war. In 1657 he fought against the Swedes, and in 1660-64 against the Turks who had invaded Transylvania. In 1672, when Austria supported Holland against France, M. was in command of the imperial army and opposed Turenne in the campaign on the banks of the Rhine (1672-73). The Emperor Leopold made him a prince of the empire, and he was made duke of Mell. See his *Memoires* (1703).

Montefiascone, tn. in the prov. of Rome, Italy, 9 m. N.W. of Viterbo. It occupies the site of the Etruscan Fanum Voltumne, and is famous for its muscatel wine. Pop. 11,900.

Montefiore, Sir Moses Hayim (1784-1885), Jewish philanthropist, b. at Leghorn, Italy. He became a member of the London Stock Exchange, and made a large fortune. In 1818 he became president of the Sp. and Portuguese community, and made strenuous endeavours to remove the civil disabilities of the Jews in England. He was high sheriff of Kent, and in 1837 was admitted a sheriff of London. See L. Loewe (ed.), *Diaries of Sir Moses and Lady Montefiore*, 1890.

Montegnée, tn. in Belgium, 3 m. W. of the city of Liège. It has coal-mines. Pop. 10,600.

Montego Bay, tn. on the N. coast of Jamaica, and the second tn. of the is., 113 m. from Kingston, by rail. It is

attractive and historically interesting. It was a large Indian vil. when Columbus visited it (1494). There are traces of Arawak life in the sea caves. Lard was an export in the time of the Sp. occupation—whence its name, from *mantecca* (hog's butter). St. James's Church was built 1775-82. In the bay is a cluster of coral atolls, known as the Bogue Islets. Pop. 6600.

Montégut, Jean Baptiste Joseph Émile (1825-95), fr. critic and author, b. at Limoges. In 1857 he was made editor of the *Revue des deux mondes*. In 1862 he joined the *Moniteur universel*. He wrote *L'Angleterre et ses colonies Australes* (1879); *Essais sur la littérature anglaise* (1883); *Écrivains modernes de l'Angleterre* (1885-1892), and trans. the works of Shakespeare (1892). Macaulay, and Emerson.

Monteith, see MENTEITH.

Monteleone, tn. in the prov. of, and 26 m. S.W. of the tn. of, Cantanzaro, Calabria, Italy. The tn. was wrecked by an earthquake in 1905. Pop. 10,100.

Montélimar (Rom. *Aqusum*), tn. in the dept. of Drôme, France. 27 m. S.S.W. of Valence. It has manufs. of silk, cotton, bricks, and tiles. Pop. 13,600.

Montelius, Gustaf Oscar Augustin (1843-1921), Swedish archaeologist, b. at Stockholm. He was connected with the Hist. Museum at Stockholm in 1863, and in 1888 became a prof. and director there. Some of his books are *The Civilisation of Sweden in Heathen Times* (1888, Eng. trans.); *Ancient Dwellings in Europe* (1895); *The Prehistoric Age in Sweden* (1895); *Primitive Civilisation in Italy* (1895-1910); *The Bronze Age in Egypt* (Eng. trans.); *The Bronze Age in North Germany and Scandinavia* (1900); and *The Bronze Age in Sweden* (1900).

Montemayor, Jorge de (1520-61), Sp. poet, b. at Montemor-o-Velho, near Coimbra, Portugal. His fame rests on his unfinished pastoral romance, *Diana enamorada* (1558; Eng. trans. 1598, by Bartholomew Young). An ed. of his works appeared in 1886. See H. Rennert, *The Spanish Pastor*, 1912; also life by G. Schopenherr, 1886.

Montenegro (Black Mt.), called by the natives Tzernagora and by the Turks Karadagh, all three names expressive of the peculiar features of the country, is a small country, now a federative unit of Yugoslavia, situated between Herzegovina and Albania, and separated from the Adriatic by the narrow strip of land known as the circle of Cattaro, in Dalmatia. It contains about 3630 sq. m., and is everywhere mountainous, the mts. being in most cases clothed with dark forests of fir, ash, beech, oak, ilex, willow, and poplar. Mt. Dormitor, in the N., is 9146 ft., and Kutsh Kom, in the E., 9300 ft. above sea level. Agriculture is prosecuted to the utmost extent the country will admit of, but in a primitive manner, which the gov. is now attempting to modernise. There are vineyards, tobacco is cultivated, and the mulberry for silk-worms. The Sumach (*q.v.*), one of the most valuable of the natural trees, is not uncommon. Few oxen are reared, but

sheep, goats, and swine abound. The new cap. is Titograd (formerly Podgorica). The Montenegrins or Tzernagorzes are Slavs of the Serbian race, and number about 360,000. They are knit together in clans and families and have many feuds amongst themselves. Their chief occupations at home are agriculture and fishing. Their language is a very pure dialect of the Slavic. They belong to the Orthodox Gk. Church.

History.—M. belonged in the Middle Ages to the great Serbian kingdom, but after the battle of Kossovo (1389) the Montenegrins maintained their independence, though compelled to relinquish the level tracts about Scutari, with their chief fortress of Zabliak, and confine themselves to their mts. (1485). In 1516 their last secular prince resigned his office and transferred the gov. to the *vladika*. The country was conquered by the Turks again in 1714, but on their withdrawal it resumed its independence. In 1796 the prince-bishop, Pietro I., defeated the pasha of Scutari, who had invaded M. In 1851 the last prince-bishop died, and his successor, Danilo I., separated the religious from the secular supremacy, retaining the latter under the title of Gospodar. The Turks, under Omer Pasha, again invaded the country; but the intervention of the great powers compelled a treaty, Feb. 15, 1853. Until 1918 the country was a constitutional monarchy with Nicholas I. as king. In 1912, in concert with Serbia, Bulgaria, and Greece, M. declared war on Turkey, their operations being principally conducted in N.W. Albania. In 1913 the Montenegrins captured Scutari, but were compelled by the European powers to abandon it. In Jan. 1916 the Austrians took Mt. Lovitch (q.v.), the key of the kingdom, and entered Cetinje. King Nicholas fled from the country to Italy, leaving his second son with the Austrians. One of his sons, supported by the Royalist party, declared himself king, but abdicated after a short period. The 'pact of Corfu' included M. in the Serbo-Croat-Slovene state, which in 1929 became Yugoslavia. See also BALKAN WAR; TURKEY; YUGOSLAVIA. See F. Stevenson, *A History of Montenegro*, 1913; P. Edmonds, *To the Land of the Eagle*, 1927; and A. Steinltzer, *Dalmatian*, 1930.

Montenotte: 1. Vil. in the prov. and 26 m. W. of the city of Genoa, Italy, was the scene of Napoleon's first victory over the Austrians in 1796. Pop. 3500. 2. Tn. in the prov. of, and 109 m. W.S.W. of, the tn. of Algiers, N. Africa; iron, lead, copper, and silver are found in the neighbourhood. Pop. 4000.

Montepeloso, see IUSINA.

Montepulciano, tn. in the prov. and 28 m. S.E. of the city of Siena, Italy, at an altitude of 2070 ft. It is famous for its wines. Pop. (com.) 17,500.

Montereau, tn. in the dept. of Seine-et-Marne, France, at the confluence of the Seine and the Yonne, 12 m. S.E. of Fontainebleau; it has manufs. of porcelain, pottery, bricks, and cement. Pop. 10,000.

Monterey, city of California, U.S.A., on

M. Bay, 90 m. S.S.E. of San Francisco. It is a favourite winter resort of the Pacific coast. There is good fishing, especially for salmon, and the city has sardine canneries and large oil tanks, about 60,000 tons of oil being shipped annually. Stock-raising is also a prominent industry, and sand-lime brick is manufactured. Pop. 10,000.

Monte Rosa, see ROSA, MONTK.

Monterrey, city of Mexico, cap. of the state of Nuevo Leon, on the San Juan. at the head of a large and beautiful valley. Formerly merely a pass city, offering an easier route through the Sierra Madre than elsewhere, it is to-day one of Mexico's leading industrial centres. In 1880 it had no more than 30,000 inhab.; its first period of rapid growth came with the construction in 1888 of the railroad from the Texas border at Laredo to M., built with the objective of using the pass to Saltillo as the route to the highlands and to Mexico city. In recent years M.'s further rapid growth has been the result of the construction of the Pan-Amer. highway from Laredo through M. Inland from Tampico this highway passes through country formerly inhabited only by scattered tribes of Indians, who lived on wild game from the forests. To-day a large tourist industry has developed from America with air-conditioned hotels and tourist camps on the route, and M., now so easily accessible to the N. Amer. public, is being transformed in the process. Social anthropologists look upon this southward penetration of N. Amer. culture traits as a social phenomenon worthy of careful study. In M. about three-quarters of the iron and steel of Mexico is produced, the iron ore coming from the Durango deposits. Production is about 150,000 tons annually. There are also woollen mills, brass foundries, saw mills, flour mills, breweries, and a carriage and wagon factory. M. is the see of the bishop of Linares, and has a large cathedral and an episcopal palace. The tn. was founded in 1560, and chartered as a city in 1596. In 1846 it was besieged and taken by Gen. Taylor at the head of the Amer. forces. In 1909 about one-fourth of the city was swept away by a flood. Pop. 125,000.

Monte Sant Angelo, tn. in the prov. and 27 m. N.E. of the city of Foggia, Italy. The church of St. Michael is much visited by pilgrims. Pop. 23,000.

Montespan, Françoise Athenais de Rochechouart, Marquise de (1641-1707), favourite of Louis XIV., b. at Tonnay-Charente, was the daughter of the duc de Mortemart. In 1663 she married Louis, marquis of M. Having become maid of honour to the queen, in 1668 she attracted the notice of Louis XIV., who made her his mistress. She was both beautiful and witty, and remained for many years the favourite of the king, to whom she bore seven children. She was, however, supplanted by Mme de Maintenon in 1691, and left Versailles and retired from the world in 1700, after which she resorted to magic. Her *Mémoires* (1829) have been trans. into Eng. (1895). See F. Funck-Brentano, *Le*

Drame des poisons, 1900; V. Sardou, *L'Affaire des poisons* (dramas); and studies by H. Williams, 1903, and H. Carré, 1939.

Montesquieu, Charles de Secondat, Baron de la Brède (1689-1755), Fr. philosophical historian, b. in the château of La Brède, near Bordeaux. In 1714 he was appointed councillor of the Parlement of Bordeaux, and two years later on the death of his uncle, Jean Baptiste de Secondat, he succeeded to his title and fortune as well as to his judicial office as president of the Parlement of Bordeaux. His early studies were directed to natural science, and in 1721 he pub. *Discours sur les causes de la transparence des corps* and *Observations sur l'histoire naturelle*, but there was nothing especially noteworthy in this side of his work. But in the same

MONTESQUIEU

year appeared his *Lettres persanes*, a subtle satire on contemporary Fr. institutions and manners, written in the guise of a correspondence between two Persian noblemen travelling through Europe. This book achieved an immediate and resounding success, and indeed definitely encouraged him to continue a literary career. In the wide social and political satire and reflections on gov. and jurisprudence in this work we can already see the beginnings of *L'Esprit des lois*. In 1728 he pub. anonymously a poem (though like Buffon he looked upon prose as the ideal vehicle of thought), entitled *Le Temple de Gnide*, and was admitted to the academy three years later. After travelling for three years in foreign countries in order to gain the knowledge of the constitutions and conditions of the prin. civilised countries, which would be necessary for the ambitious work on jurisprudence which he already contemplated, he wrote *Considérations sur les causes de la grandeur des Romains et de leur décadence* (1734), a most able study of anet. Rome. For the conception of this work M. was indebted to J. Bossuet's *Discours sur*

l'histoire universelle (1844), in the course of which are enumerated the causes of the greatness of auct. Rome, love of liberty and fatherland, loyalty to leaders and the state, and so forth, and the causes of her decadence, particularly distant wars, an over-expanded empire and the corruption that ensues on ease and luxury. The work is important, not so much for its ingenious theories or explanations as for the wide and philosophic view of hist., the broad generalisations, which reflect the originality and significance of M.'s method. In 1748 appeared *L'Esprit des lois* in thirty-one books. This work, which took twenty years in compilation, and is one of the most important works of the eighteenth century judged from its influence on jurisprudence, is in effect the sum of M.'s observations and reflections, with the deductions he had drawn from the social and political phenomena of many states. It is to be observed that M. here uses the word *loi* not in the narrow technical sense, save in the last six books, which are purely legal hist., but as connoting 'the necessary relations existing between different things resulting from the nature of the things themselves.' The work is stupendous in range, but lacking in uniformity of plan, and in fact M. had no definite design for the whole, but included in the thirty-one books all the thoughts, deductions, and reflections accumulated over many years without regard for systematic arrangement or even logical sequence. M.'s admiration for the free Eng. constitution, which is to be inferred from book xi. of his work, had much influence on the earlier course of the Fr. Revolution, as well as having its effect on his discussion of the various types of gov. and of liberty in relation to gov. The standard ed. of his works is that of E. Laboulaye (7 vols.), 1875-79. See lives by L. Vian, 1879; A. Sorel, 1887; Sir C. P. Ilbert, 1904; J. Dedieu, 1913; and G. Lanson, 1932. See also A. Charaut, *L'Esprit de Montesquieu*, 1885; E. Fagnat, *La Politique comparée de Montesquieu, Rousseau et Voltaire*, 1902; C. Ouden, *Le Spinozisme de Montesquieu*, 1911; B. Kingsley Martin, *French Liberal Thought in the Eighteenth Century*, 1929; and N. Duconseil, *Marhiavel et Montesquieu*, 1943.

Montesquieu, Comte Robert de (1855-1921), Fr. writer and one of the most discussed figures in modern Fr. literature, b. in Paris. M. was proud of his family, which he claimed went back to the Merovingian kings; and it was certainly true that his genealogy included many great Fr. soldiers and statesmen, including the immortal d'Artagnan, who served as model for the famous character by Dumas. Although M. wrote many books of criticism, he devoted himself mainly to poetry, full of artifices and preciosities. The very titles proclaim this: *Les Chauves-Souris* (1893); *Les Hortensias bleus* (1896); *Perles rouges* (1899); and *Les Poons* (1900). He will probably be celebrated in after times because J. K. Huysmans took him as a model for his sinister character of des Essintes in *A Rebours*, and Marcel Proust is also supposed to have used him

in part as the model for one of the figures in his famous novel, *Recherche du temps perdu*.

Montessori, Maria (b. 1870), It. educationist and doctor, b. at Ancona, she was the first woman to qualify as a medical doctor at the univ. of Rome, where, in 1904, she became a prof., teaching anthropology. She held the chair of hygiene for eleven years at the Magisters Femminile of Rome, and in 1913 was made a member of the Academy of Science in Chicago. Dr. M., a leading feminist, has spoken against child labour and the exploitation of children's work.

Dr. M. took special interest in nervous diseases of children, making a study of

Montessori Centre

MARIA MONTESSORI

them at the Bicêtre and the Salpêtrière, in Paris. She was one of the first to take up experimental psychology, at the end of the nineteenth century, and attributes her real preparation to the writings of two Fr. doctors, Itard and Séguin. Dr. M. considered these the first two genuine contributions to scientific pedagogy. She became directress of the Scuola Ottocentrica (mind-straightening school) at Rome, for feeble-minded children and achieved such startling results that the so-called 'idiots' were able to compete with normal children of their own age. She then began to suspect that if her scientific method was applied to normal children it would bring about a radical reform of education. Her first experiment in this direction took place in 1906. It was attended with such success that she gave up her medical practice and her two chairs at the univ., and directed her future field of research to the education of normal children. Her 'children's houses,' built in proportion to the size of the children themselves, and designed to correspond to their psychological needs, appeared in

all parts of the world. The M. system (see under EDUCATION) rapidly became world famous, and a series of international courses for training M. directresses began in Rome in 1913 and 1914, were transferred to the U.S.A. and Spain during the First World War, and have continued ever since, either yearly or biennially, in different countries of Europe, particularly in Holland. Thirteen of these were held in London in the inter-war years, and another in 1946. During the Second World War Dr. M. resided in India, holding courses in Madras, Karachi, Ceylon, and Poona. Her teachings there have found special favour among all castes, the students working harmoniously together. Her pubs. include *The Method of Scientific Pedagogy as applied to Infant Education in the Children's Houses* (trans. into fourteen languages), which appeared in Eng. entitled *The Montessori Method* (1912); *Pedagogical Anthropology* (1913); *The Advanced Montessori Method*, vols. I. and II. (1918); *The Secret of Childhood* (1936); *Education for a New World* (1946, 1948); and *To Educate the Human Potential* (1948). Permanent institutions for the training of M. teachers, either directly or indirectly, associated with Dr. M.: The M. Training College, Cranleigh, Surrey; The Child Education Foundation, 535 E. 84th Street, New York; Arundale M. Centre, Adyar, Madras; The Municipality of Amsterdam; The M. Centre, 68 St. Mark's Road, London, W.10. There are M. societies in London (68 St. Mark's Road); in Edinburgh (63 Merchiston Crescent); in Holland (Amsterdam, Olympiaplein 59); in Italy (Via Nicotera 29, Rome); and in France (22 Rue Eugene Flachat, Paris). See Mario M. Montessori, *Dr. Montessori and her Work*, c. 1935.

Monteverdi, or Monteverde, Claudio (1567-1643), It. composer, b. in Cremona, and studied under Ingenucci, the duke of Mantua's *maestro di capella*, whom he succeeded in that post in 1603. His name is of great importance in the hist. of music and, especially, of opera. He is considered by many historians to be the originator of the orchestra, and of what was at that time called the 'new music.' Others regard him as being rather the last and chief exponent of the old tradition than the first of the new, because in his opera *Orfeo* (composed 1608) the prin. part is played not by strings or wind, but by plucked instruments (lutes and the like), destined, excepting the harp, to disappear from the orchestra. Whichever view be taken M. remains a musical genius and an original composer. In his madrigals, church music, and opera he laid the foundation of modern music by breaking away from the old polyphony by his freer use of extended melody. He was the first composer to use unprepared discords or dissonances, as in his madrigals, the beauty of which they murred, but he afterwards used them in music of a very different kind, as exemplified in his first opera *Ariana*, produced in 1607, with entire success. His second opera, *Orfeo*, was even more successful, and it remains an important opera also from its being

based on the principle that the only law to which the dramatic composer need conform is that of suiting the music to the demands of the scene. M. was invited to Venice in 1613 as *maestro di capella* of St. Mark's, and here he remained for thirty years. At Venice he wrote much sacred music, most of which is lost (there are extant some Vespers and Masses). In 1630 appeared another grand opera, *Proserpina rapita*; *L'Adone* was produced in 1639; in 1641 *Il Ritorno d'Ulisse* and *Le Nozze di Enea*; and in 1642 *Poppea* (or *The Coronation of Poppaea*). Though some of these were composed in old age, they show no decline, and in the *Ulysses* are passages in which may be traced the germ of comic opera. M. was ordained priest in 1633, but this seems to have in no way affected his musical activities. See lives by H. Prunieres (Eng. trans.), 1926, and G. F. Malipiero, 1930; also H. F. Redlich, *Das Problem des Stilwandels im Monteverdis Madrigalwerk*, 1931, and 'Monteverdi's Religious Music' in *Music and Letters*, 1946.

Monte Vergine (Italy), see AVELLINO.

Montevideo, or Banda Oriental: 1. Cap. of the republic of Uruguay, in S. America, is situated on the N. shore of the estuary of the Rio de la Plata (which is here 60 m. wide), and 132 m. E. by S. from Buenos Aires. It is one of the great cities of the continent. It stands on a small peninsula, and is surrounded by a wall and fortifications. The houses are mostly of one storey, with flat roofs, which are often used as gardens. The public buildings worthy of notice are the cathedral, the univ., and the tn. hall. M. has large Sp. and It. colonies, and a small Brit. community. There is also a Brit. hospital and a King Edward VII. sanatorium. The climate is healthy and the tn. clean and prosperous looking; but, as there are no rivers near the tn., water is scarce, and it is only obtainable from wells, or by collecting rain-water in cisterns. There are sev. plazas or open spaces, and a public park. The bay or harbour, which is about 3½ m. long by 2 m. broad, presents excellent facilities for building wharfs, docks, etc., is sheltered from all but the S.W. gales, and averages 16 or 17 ft. in depth. The trade of M. is extensive, the exports consisting of live-stock, the main wealth of the republic. Cattle are sent to the Argentine, and frozen meat to other parts of the world. Wool, hides, horns, wheat, flour, corn, hay, barley, tobacco, fruit, hair, tallow, salt, and preserved beef, bones, etc., are also exported. The chief trade is with Great Britain. M. is the anchorage during the winter months of various whaling flotillas, particularly of those S. Atlantic whaling fleets which belong to Scandinavia and Great Britain. It is also a resort city of considerable popularity, largely patronised by Argentines, and easily reached from Buenos Aires by an overnight boat trip or by aeroplane. The hotels and casinos of M. are famous, and being owned by the state they bring in a good income to the Uruguayan treasury. M. has direct communication by steamship with all the prin.

ports of the world. All Uruguayan railways, which are mostly in the hands of Brit. companies, converge on M. There is a wireless station at Cerritos, near M. The city was founded by the Spaniards in 1726; it became free in 1814, and in 1828 was made the cap. of the republic. Pop. 770,000. 2. Dept. of Uruguay, comprising the small area around the city of M. The greater part of the country's wine, of which 60,000,000 litres per annum are produced, comes from this dept. Area 256 sq. m. Pop. 541,042.

Monte Viso, see VISO, MONTE.

Montezuma I. (c. 1390-1464), emperor of anct. Mexico, succeeding his brother in

made a journey to Italy for the purpose of consulting the MSS. in the It. libraries. In this pursuit he passed three years, and upon his return in 1702 pub. an account of his journey and researches in his *Diarium italicum*. The greatest and best-known work of this eminent scholar is *L'Antiquité expliquée et représentée en figures* (Paris, 5 vols. fol.), to which, in 1724, was added a supplement in 5 vols. See E. de Broglie, *Montfaucon et les Bernardiens*, 1891.

Montferrat, Duchy of, ter. between Piedmont, Milan, and Genoa, originally independent, but now forming part of the republic of Italy. It had an area of 1300

THE MEETING OF CORTEZ AND MONTEZUMA II. IN 1519

A modern painting by H. W. Smith.

1436. He extended the Mexican conquest, rebuilt Tenochtitlan, the chief Aztec city, erecting houses of lime and stone on the site of the modern Mexico, and developed the ceremonial of the tribal religion.

Montezuma II. (1466-1520), emperor of Mexico, succeeding his uncle in 1502. He was a great warrior and legislator, but his arrogance alienated the people, and when Cortez landed at Vera Cruz in 1519 and attempted to march on Tenochtitlan, he was well received by the inhab. and made M. his prisoner. M. was restored to his throne as a vassal of Spain, but his subjects revolted and he was killed while attempting to address them.

Montfaucon, Bernard de (1655-1741), Fr. scholar, b. at the château de Soulagne, Aude, the son of Timoleon de M., Lord of Roquetaillade and Conillac. He was at first a soldier, and served in Germany under Marshal Turcane, but in 1675 he entered the learned Benedictine congregation of St. Maur. His ed. of Athanasius in Gk. and Lat. (3 vols. fol.) estab. his reputation as a profound scholar. He

sq. m., and its cap. was Casale. A portion of the duchy fell to the dukes of Savoy in 1631, and the remainder in 1703.

Montfleury, Antoine Jacob (1640-85), Fr. dramatist, b. in Paris. He was called to the Bar in 1660, but made his reputation as a dramatist the same year by his comedy entitled *Mariage de Rien*. He wrote numerous dramatic works which are characterised by their originality. Some of them are *Les Hésites raisonnables* (1661); *Le Mari sans femme* (1663); *Thrasibule* (1663); *L'Impromptu de l'hostel de Condé* (1663); *L'Escole des jaloux* (1664); *L'Escole des filles* (1666); *Crispin gentilhomme* (1677); *La Dame médecin* (1678); and *La Femme juge et partie* (1669), a comedy in five acts, his masterpiece.

Montfort, name of an anct. Fr. family, which is taken from the castle of M. or M. l'Amaury, near Paris. It was founded by Wm., the son of Amaury, count of Hainault, who married the heiress of M. about 952. Some members of the family are *Simon IV. de M.* (c. 1180-1218), who took a prominent part in the crusade against the Albigenes; *Amaury de M.*

(1192-1241), who was made constable of France in 1230; *Guy de M.* (d. 1228), brother of Simon IV., whom he accompanied on his military exploits; *Folande* (d. 1322), who married Arthur II. of Brittany.

Montfort, Simon de, Earl of Leicester (c. 1206-65), b. in France. He offered his services to Henry III. of England, who was so pleased with the young Fr. noble that he gave him the title of earl of Leicester. He married Elinor, sister to King Henry III. and the youthful widow of Wm. Marshal the younger, earl of Pembroke. After this marriage, which was viewed with disfavour by the king, de M. became a steadfast advocate of the Eng. charter and of the liberties of the people. His character, like Cromwell's, included a strong religious vein, and, also like Cromwell, he could see little security for liberty except in his own virtual dictatorship. In 1257 the king's debts were so great and the rapacity of his foreign relations so unbearable that the people were in a state of insurrection. The barons assembled and, under the direction of de M., held the celebrated parliament at Oxford. They passed statutes to enforce the provisions of Magna Carta. The king swore to observe them, but sent forthwith to the pope praying to be absolved from his oath. The Bull of absolution arrived. Henry set his barons at defiance, and the war began with the battle of Northampton. At Lewes the royal forces were signally discomfited, and the king was taken captive. The conditions exacted from the king were that he should observe Magna Carta and the charter of the Forests, be moderate in his expenses and grants until his old debts were paid off, and that Englishmen only should be chosen councillors. The queen (Elinor of Provence), who was in France, now occupied herself in collecting a large army. To deliberate upon the measures to be adopted at this great crisis, writs were issued to the sheriffs, in 1265, by de M., directing them to return two knights for each co. and two citizens or burgesses for every city and bor., and from this time may be dated the recognition of the Commons as an estate of the realm in Parliament. A second war broke out, and this time the popular cause was weakened by defection and treachery. Prince Edward (afterwards Edward I.) encountered the barons at Evesham with a greatly superior army; de M. was defeated and killed. He was denied a grave by the royalists, his head being sent to Wigmore Castle and his mutilated limbs to different tns. See lives by C. Bémont, 1804 (Eng. trans. 1930); G. W. Prothero, 1877; M. Creighton, 1895; T. S. Bateman, 1923; and B. C. Boulter, 1939. See also F. M. Powicke, *Henry III. and the Lord Edward*, 1948.

Montgolfier, Joseph Michael (1740-1810), inventor of air balloons, was b. at Vidalan-le-Annoual, near Lyons, France. In conjunction with his brother, Jacques Étienne, he made his first experiment with a hot-air balloon in 1783. He was also the inventor of a hydraulic machine

called the water-rain. See also AERO-NAUTICS; BALLOONS.

Montgomerie, Alexander (c. 1556-1610), Scottish poet, b. in Ayrshire, and the brother of Robert M. (d. 1609). He held office in the Scottish court in 1577 and became poet laureate. His chief poem is *The Cherrie and the Slae* (first ed. 1597), written in a fourteen-line stanza (of which M. was the greatest master, if not the inventor), which contains many beautiful passages. Other works are *The Flyting betwixt Montgomery and Polwart* (first ed. 1621) and; *The Mindes Melodie* (1605), a version of fifteen of the Psalms, Simeon's song, and the 'Gloria Patri.'

Montgomerie, Archibald William, see EGLINTON AND WINTON, EARL OF.

Montgomery, Gabriel, Comte de (c. 1530-1574), Fr. knight and officer in the Scottish Lifeguard of the king of France. At a tournament given by Henry II. in honour of his daughter's marriage with Philip of Spain, M., at the king's command, entered the lists unwillingly with him and accidentally killed him. M., although blameless, left France, and soon after embraced Protestantism in England. On the commencement of the religious wars in 1562, he returned to France and defended Rouen. In the third religious war M. escaped from the massacre of St. Bartholomew and fled to England. Next year he returned to Normandy, but being compelled to surrender the castle of Douvront, he was carried to Paris and beheaded.

Montgomery, James (1771-1851), Scottish poet and hymn-writer, b. at Irvine, in Ayrshire. He took up journalism, editing the *Sheffield Iris*. In 1806 he produced his *Wanderer of Switzerland*, founded upon the Fr. conquest of Switzerland, and in 1810 pub. another vol. of verse entitled *The West Indies*, in which he appeals for the abolition of the slave trade. These were followed by *The World before the Flood* (1812); *Greenland* (1819), a poem founded on the Moravian missions to Greenland; *Songs of Zion* (1822); and *The Pelecan Island* (1826), a poem written in imitation of Shelley, which is generally considered his best work. He also wrote *Lectures on Poetry and General Literature* (1833), and many hymns, upon which his reputation now mainly rests. Some of these are *Songs of Praise the Angels sang; For ever with the Lord; and Go to Dark Gethsemane*. See W. Odem, *The Sheffield Poets*, 1929.

Montgomery, Robert (1807-55), Eng. poetaster, b. in Bath. In 1828 he pub. *The Omnipresence of the Deity, Death, A Vision of Death, A Vision of Hell*, and in 1829 *Satan*, which was scathingly reviewed in an article by Macaulay. This classic castigation, which has perpetuated the memory of its victim from the oblivion it would have earned, appeared in the *Edinburgh Review*, April 1830. With an unfortunate facility in florid verbiage, combined with muddled metaphor, M. had no genuinely poetic gift. He went to Lincoln College, Oxford, in 1830, was ordained in 1835, and devoted himself zealously to his duties as curate at

Whittington in Shropshire. In 1836 he came to London, and then went to St. Jude's Chapel, Glasgow, in 1838, and back to London again in 1843 to the Percy Street Chapel, St. Pancras. At all these places he drew very large audiences, though his style of preaching is said to have resembled that of his poetical effusions. He was, however, generous and did much to promote charitable causes.

Montgomery-Massingberd, Field-Marshal Sir Archibald Armar (1871-1947), Eng. soldier, b. at Kennington. He was educated at Charterhouse and the Royal Military Academy, Woolwich. Decorated and mentioned in dispatches in the S. African war, in the First World War he became chief-of-staff to Rawlinson's Fourth Army, and took a major part in planning the attack of Aug. 8, 1918, from which followed the breaking of the Hindenburg line. From 1920 to 1922 he was deputy chief of the general staff in India, and in 1928 became commander-in-chief, Southern Command. In 1930 he became adjutant-general, and from 1933 to 1936 chief of the Imperial General Staff, being promoted to field marshal in 1935.

Montgomery of Alamein, Sir Bernard Law, Viscount (b. 1887). Brit. soldier, son of Rt. Rev. H. H. Montgomery, K.C.M.G. Entering the army in 1908, he became lieutenant-colonel in 1931, and colonel in 1934. He served in the First World War, 1914-18, being mentioned in dispatches. He commanded 1st Battalion Royal Warwickshire Regiment, 1931-34; was G.S.O.-1, Staff College, Quetta, 1934-37; commander of 9th Infantry Brigade, Portsmouth, 1937-38. He commanded the 3rd Div., 1938-39, participating with it in the Dunkirk evacuation; corps commander, 1940-41, in Aug. 1942, with the rank of lieutenant-general he succeeded Gen. Ritchie as commander of the Brit. Eighth Army under Gen. Sir Harold Alexander, commander-in-chief, Middle E. Under his command the Eighth Army won one of the most brilliant victories in the hist. of the Brit. Army, when, between Oct. 23 and Nov. 7, the Brit. forces at El Alamein, after repelling all the assaults of Marshal Rommel's mixed Axis forces, turned to the offensive and completely routed the Ger. marshal. M. was knighted in Nov. 1942. In the winter of 1943, after a brilliant pursuit of Rommel's army across Libya and Tripolitania, he entered Tripoli and thereby completed the conquest of all Italy's African empire. In March 1943 he again defeated Rommel's reinforced army at the battle of the El Mareth line and followed this with another defeat at Akarit and the capture of the Tunisian ports of Gabes, Sfax, and Sousse. In the summer of 1944 he led the allied armies in the great victory of the battle of Normandy and led the 21st Army Group to the Rhine and across that riv. to the Elbe. After the war he was appointed chief of the Imperial General Staff. In 1948 he became chairman of the commanders-in-chief of the W. Alliance, formed for the defence of W. Europe. A soldier possessing extreme technical

capability, coupled with clear insight into the nature, though not all the details, of modern war. The N. African campaign (see AFRICA, NORTH, SECOND WORLD WAR CAMPAIGNS IN), which first revealed his three characteristics, tactical skill, confident resolution, and the intuitive power to use opportunity, showed also how spiritual and intellectual resources could be used to restore and maintain indispensable morale. It was his outstanding campaign, but the battle of Normandy (see WESTERN FRONT IN SECOND WORLD WAR) was the greater. The battle plan

Press Portrait Bureau
FIELD-MARSHAL MONTGOMERY

here was his; the holding, offensive-exhaustion battle in the E., combined with a powerful thrust and pursuit in the W. through Brittany, and its relentless execution, secured him a great victory. Whether his own sequel to it, equally relentless pursuit to the Rhine and across, was really feasible is a disputed point; it was possibly more feasible than it looked, but it depended on things outside a commander's control, and the Arnhem conception at least failed because of them. On Africa and Normandy M.'s fame securely rests. To brilliant competence M. brought also the personal touch; to the army he commanded M. was a hero, to more than the army he is already a legend. See his *From Normandy to the Baltic* (1947); *From El Alamein to the River Sangro* (1948); and *Forward from Victory* (1948). See also A. Moorehead, *Montgomery*, 1946, and Sir F. de Guin-gaud, *Operation Victory*, 1947.

Montgomery: 1. Municipal and parl. bor. of Wales, cap. of the co. of the same

name, is placed at the foot of a high and well-wooded eminence, about 1½ m. from the Severn and 168 m. N.W. by N. of London. The ant. castle of M., of which some ruins still remain, was founded by Baldwin, a follower of William the Conqueror. Pop. 900. 2. A dist. and tn. of the W. Punjab, Pakistan, in the Multan div. The dist. has an area of 4754 sq. m., and is situated between the Ravi and the Sutlej. The tn. lies 90 m. S.W. of Lahore, and has cotton and silk manufs. Pop. of dist., c. 800,000; of tn., c. 15,000. 3. State cap. of Alabama, U.S.A., and seat of M. co. It is situated on the Alabama R. at the head of navigation for larger vessels. It is one of the prin. cotton centres of the U.S.A. There are manufs. of fertilisers, syrups, and cotton goods. Its chief buildings are the Capitol and the city hall. It was the seat of the Confederate Gov. in the first part of 1861. Pop.: co. 114,400; tn. 78,000.

Montgomeryshire, inland co. of N. Wales, between Shropshire on the E. and the Welsh cos., Merioneth and Cardigan, on the W. Area 925 sq. m. The surface is almost wholly mountainous (Plynlimon, 2469 ft.), a large portion consisting of bleak elevated moorlands, but toward the Eng. border there are sev. warm, fertile, and well-wooded valleys. The Severn, the Vyrnwy (Liverpool's main water supply), and the Dovey are the prin. rvs. The co. belongs almost entirely to the basin of the Severn. The mineral wealth of M. is not great, but copper, lead, and zinc are procured, and millstones, slates, and limestone are quarried. Cattle and sheep, and the pure breed of Welsh ponies called 'Merlins,' are reared. The Welsh flannel manuf. is extensively carried on in the co. The cap. is Montgomery. Other tns. are Welshpool, Llanidloes, Llanfyllin, Newtown, and Machynlleth. The co. sends one member to the House of Commons. Pop. 46,000.

Month (interval of time) is the time which elapses between one new moon and the next. This interval is not constant owing to movements of the moon's orbit relative to the earth. Its mean length is 29·5305887 days. There are five classes of M. 'The sidereal M.,' or the time of the circuit of the stars, averages 27·3216614 days; the 'anomalistic M.,' or the time of revolution from perigee to perigee, averages 27·554599 days; the 'tropical M.,' or the time of passing from any point of the ecliptic to the same again, averages 27·32158 days. The average 'nodical M.,' or interval from a node to a similar node, is 27·2122222 days; the 'common or synodic M.' is the interval 29·5305887 days noticed above.

Montherlant, Henri de (b. 1900), Fr. novelist. A Catholic by inheritance, he early asserted that the evangelical spirit lacked virility. Having served in the First World War he returned to celebrate the glories of athletics and the prowess of the human body. His books on the Olympic games, as practised since the First World War, had for object to inspire Fr. youth to cultivate outdoor sports. Much of his best work is partly auto-

biographical. *La Relève du matin* (1920) is a story of college days. *Le Songe* (1922), one of the best Fr. stories of the war, is largely his own story. *Les Bestiaires* (1928) is a Proust-like book filled with the colour and thrill of bull-fighting—M. was himself an amateur bull-fighter. His style is at times inspired by Barrès, Claudel, and d'Annunzio. M. has never quite achieved success in a work of art as such except in *Les Bestiaires*. He tells the truth, brazenly and recklessly, regarding sensations as the only truth.

Monthly Nutation, see under **NUTATION**.
Montholon, Charles Tristan, Comte de (1783–1853), Fr. general and diplomatist, b. at Paris. He first entered the navy, but later joined the army and served in many campaigns. In 1809 Napoleon made M. chamberlain; he employed him at Wartzburg, 1811–12, and in 1815 M. accompanied Napoleon to St. Helena, and remained with him till his death. With Gen. Gourgaud he pub. *Mémoires pour servir à l'histoire de France sous Napoléon, écrits à St. Hélène sous la dictée* (1822–25). M. was Louis Napoleon's chief-of-staff in his attempt at Boulogne (1840), and was sentenced to twenty years' imprisonment at Ham, but released in 1847. He pub. in England *Récits de la captivité de Napoléon* (1847).

Monthyon, see **MONTYON**.

Montier-en-Der, tn. of the arron. of Wassy, dept. of Haute-Marne, France. Nearly half the tn. was destroyed or badly damaged in the Second World War. Pop. 1700.

Montignies-sur-Sambre, tn. in the prov. of Hainaut, Belgium, 2 m. S.E. of Charleroi on the R. Sambre. It has coal-mines, blast furnaces, foundries, plating mills, and quarries of marble and sandstone. Pop. 23,000.

Montigny-en-Gohelle, com. of the Pas-de-Calais dept., France, in the Béthune arron. Pop. 7707.

Montigny-lès-Metz, com. in dept. of Moselle, France, 1½ m. S.W. of Metz, on the Moselle; it has railway workshops. Pop. 13,000.

Montilla, tn. of Spain in the prov. of Cordova, and 20 m. S.S.E. of the city of that name. Manufs. of coarse linen and earthenware are carried on. The famous wine, Amontillado, is produced in the vicinity. Pop. 16,800.

Montivilliers, tn. in the dept. of Seine-Inférieure, France, 7 m. N.E. of Le Havre. Pop. 6900.

Monti, Vincenzo (1754–1829), It. poet, b. at Alfonsine, near Ferrara. At the beginning of his career he was secretary to Luigi Braschi, and at that time was a violent enemy of the Fr., but in later life he became a Republican, next a panegyrist of Napoleon, and lastly a eulogist of the emperor of Austria. He was prof. of eloquence at Pavia during the Fr. republic, and during the empire historiographer for Italy at Milan. His *Bassmilliani* (1793), written on the murder of Hugo Basserville, the Fr. ambas. at Rome, is a wonderful imitation of Dante, and gained him a high reputation. His other chief works were *Il Burdo della Selva Nera*

(1806), a eulogy of Napoleon; *Cantica* (1806), a political poem; a trans. of Homer's *Iliad* (1807); and *Proposta di alcune correzioni ed aggiunte al vocabolario della Crusca* (1817-26), an attack on the pedantry of the Cruscan dictionary. He also wrote the tragedies of *Aristodemo* (1786); *Galeotti Manfredi* (1787); and *Caio Gracco* (1800). His collected works were pub. in Milan (1939-42). See studies by Cantu, 1879; Viechi, 1885-87; Tumbini (3rd ed.), 1894; K. Bevilacqua, 1928; and A. Pompeati, 1928.

Montlhéry, tn. in the dept. of Seine-et-Oise, France, 17 m. S.S.E. of Paris. There are ruins of an auct. château. Pop. 2609.

Montluc, Blaise de Lasséran (1502-77), marshal of France, b. at St. Genmès, Gers, of an illustrious Guienne family, and one of the bravest, if cruellest, soldiers of all time. As a captain of infantry, fought under Brissac against the Its., and narrowly missed ending the war by a *coup de main*. He performed brilliant exploits at the head of his arquebusers at Cériseles (1544), and again at San Damian, Bèze, and Costemiglia. He became lieutenant-general of the gov. of Guienne (1564), and executed Protestants 'with a ferocious gaiety.' His last military act was the siege of La Rochelle (1573), after which he devoted himself to compiling his *Commentaires* (printed 1592) of memoirs of his military life. These are said to have been described by Henry IV. as the 'soldier's Bible.' Some writers have presented M. in a rather different light, as a faithful and brave soldier, no fanatical Catholic, but (as he says in his memoirs) one whose religion, as well as his body, was 'au service du roi.' It is said that scars covered almost his entire body, and that finally a gun-shot tore away half of his face, compelling him to wear a mask. Directness of speech, a whole-hearted desire to help others to acquire honour and reputation, and rough soldierly humour illumine his *Commentaires* with much of the 'romance' of war. See ed. of his *Commentaires* pub. in 5 vols., 1864-72.

Montluçon, tn. in the dept. of Allier, France, picturesquely situated on the slope of a hill on the r. b. of the Cher, at the S. extremity of the Canal de Berri, 40 m. W.S.W. of Moulins. It manufs. mirrors, glass, chemicals, and sewing-machines, and trades in corn, wine, and fruits. Pop. 47,000.

Montmarie, N. arron. of Paris, within its fortifications. It is a Bohemian resort of Parisians and visitors. It stands on rising ground, which is surmounted by the Sacré-Cœur basilica.

Montmédy, tn. and second-class fortress in the dept. of Meuse, France. It lies 31 m. S.E. of Sedan, on the R. Chiers. It is defended by extensive outworks, and has a barracks, military hospital, and prison, and manufs. hosiery and leather. Pop. 2000.

Montmorency, Anne Pierre Adrien, first Duc de (1493-1567), marshal and constable of France, b. at Chantilly, belonged to one of the oldest and greatest of the noble families of France. He received, it is said, the name of Anne from his god-

mother, Anne of Brittany. He distinguished himself in the wars between Francis I. and the Emperor Charles V., and was taken prisoner along with his sovereign in the battle of Pavia (1525). He afterwards became the leader of the Fr. Gov., and was made constable in 1538; he was suddenly banished from court in 1541, but returned on the accession of Henry II., and was again head of affairs. In 1557 he commanded at the battle of St. Quentin, in which he was taken prisoner. During the minority of Charles IX. M., with the duke of Guise and the Marshal St. André, composed the famous triumvirate which resisted Catherine de' Medici. In 1562 and 1567 he commanded the royal army against the Huguenots, and in both wars gained victories over them, but was fatally wounded at St. Denis, 1567. See F. Decrue, *Anne de Montmorency*, 1885-89.

Montmorency, Henri, Duc de (1595-1632), son of Duke Henry I. and grandson of Anne, constable of France. He took part in the religious wars (1621-30), took R6 and Oléron in 1625, and defeated the Piedmontese in 1630. He was made marshal the same year, but being provoked into rebellion by Richelieu, he joined the party of Gaston, duke of Orléans, and placed himself at the head of the insurgent army. He was, however, defeated by Marshal Schomberg at Castelnaudary in 1632, and, being severely wounded, fell into the hands of the enemy and was beheaded as a traitor at Toulouse.

Montmorency: 1. Riv. of Quebec, Canada, rising in Snow Lake and entering the St. Lawrence, 6 m. N.E. of Quebec. The falls at its mouth are 150 ft. wide and 265 ft. high, and supply electric power to Quebec. 2. Com. in the dept. of Seine-et-Oise, France, 9 m. N. of Paris. The Forest of M. is a favourite resort of the Parisians. It has manufs. of cheap lace and grows famous cherries. Pop. 11,200.

Montone, Braccio di, see BRACCIO.

Montoro, tn. of Spain, in the prov. of Cordova, built on a rocky ridge around which winds the Guadalquivir, 26 m. E.N.E. of Cordova. The heights in the vicinity are clothed with olive plantations, and oil is largely exported from this quarter, as well as cattle and timber. Pop. 21,200.

Montorsoli, Fra Giovanni Angelo da (c. 1507-63), It. sculptor, b. at Montorsoli, near Florence. He studied under Andrea Ferrucci at Fiesole, and worked for Michelangelo at San Lorenzo, Florence. About 1527 he became a monk, and in 1530 was invited to Rome by Pope Clement VII., who employed him to restore some statues. Some of his works are the tomb of the poet Sannazzaro, at Naples; the statue of Andrea Doria, at Genoa; the fountain in the piazza and the façade of the cathedral at Messina; and various statues in the church of the Servites at Bologna. See F. Brinckmann, *Barockskulptur*, 1919.

Montparnasse, S. quarter of Paris, noted for its graveyard and as an artist's colony.

Mont Pelée, see under MARTINIQUE.

Montpelier, city, cap. of Vermont, U.S.A., co. seat of Washington co., on

the Winooski R. The State Capitol is one of the most magnificent buildings in the U.S.A. In the vicinity are large granite quarries. Pop. 8000.

Montpellier, cap. of the dept. of Hérault, France, is situated on an eminence on the r. b. of the Lez, 30 m. S.W. of Nîmes, and 17 m. N.W. of Cette, the port of this tn. It is irregularly built, with narrow, steep, but generally clean streets, and the houses are mostly well built. It has a cathedral, with no pretensions to beauty or interest; a univ.; an exchange, with a fine Corinthian colonnade; a court-house; a medical school, etc. The botanic garden of M., the earliest collection of the sort in France, was estab. in the reign of Henri IV. There are, among other establs., cotton and woollen factories, dye-works, paper mills, distilleries, breweries, sugar-houses, and chemical works for the making of alum, Prussian blue, etc. The prin. articles of export, besides the produce of the manufs., are wine, oil, fruits, wool, and other rural produce. Towards the end of the eighteenth century M. was first raised into the position of an important tn., governed by hereditary lords under the bishops of Maguelonne. At the Reformation a great number of the inhab. became zealous Huguenots. Pop. 93,000.

Montpensier, Anna Marie Louise d'Orléans, Duchess de (1627-93), known as 'La Grande Mademoiselle,' b. at Paris. She was the daughter of Gaston, brother of Louis XIII. She was an ambitious woman, but much of her energy was wasted in seeking a husband. She aimed at marriage with Louis XIV., but was defeated in this by Cardinal Mazarin (q.v.). This annoyed her, and during the wars of the Fronde (q.v.) she accompanied the army with Condé against the court. She contrived a secret marriage with Lauzun, but he was imprisoned soon after. Her memoirs (publ. 1729) cover the period 1630-88. See Duc de la Force, *La Vie amoureuse de la grande Mademoiselle*, 1927.

Montreal, metropolis of the dominion of Canada, holds a commanding position relative both to ocean and to riv. navigation. Situated on the l. b. of the St. Lawrence R., 1000 m. inland from the Atlantic, it is the second largest E. coast port on the N. Amer. continent, being exceeded only by New York. The city is built on M. Is., a triangular-shaped is. 32 m. long by 7 to 9 m. wide, at the confluence of the St. Lawrence and Ottawa Rs. M. proper has an area of 60 sq. m. Its built-up areas spread out in all directions from the lower slopes of beautiful Mount Royal, from which the city takes its name. Mount Royal, visible for many miles by air, land, and riv. routes, presents a pleasing spectacle to visitors approaching the city. M.'s beginnings go back to 1535 when Jacques Cartier, sailing up to the mighty St. Lawrence, came upon a large fortified Indian vil., Hochelaga. Seventy-six years later, in 1611, Champlain estab. a trading post on the is., and in 1642 Paul de Chomedey, Sieur de Maisonneuve, founded Ville Marie, subsequently renamed M. The place

remained under Fr. rule until 1763, when Canada became a Brit. possession under the treaty of Paris. It was formerly the federal seat of government, but in 1847 this was removed to Quebec, and later to Ottawa. The Ottawa R., which joins the St. Lawrence both above and below the city, drains an area of about 80,000 sq. m. M., being the highest point to which the St. Lawrence is navigable for sea-going vessels, drawing 18 ft. of water, it may be considered in addition to its pre-eminence as an ocean port as the chief port of the Great Lakes and St. Lawrence R. system.

Canadian Government

MONTREAL

St. James's Street showing the Royal Bank building.

The pop. of M. (1948) was 1,122,295, with a further pop. of 231,736 in the surrounding suburbs. About 66 per cent of the inhab. are of Fr. origin, some 20 per cent are of Brit. origin, the balance being made up of important groupings of other nationalities, thus making M. one of the most cosmopolitan cities in N. America. It is a bilingual city: Fr. and Eng. M. is the largest city in Canada, the furthest inland ocean port in the world, and one of the greatest centres of electrical power resources in the W. hemisphere. From its beginnings as a Fr. colonial settlement, M. has been the cradle of Canadian financial, transportation, and industrial development. Canada's prin. banking and investment institutions are located here. It is the headquarters of the Canadian Pacific Railways and of the Canadian National Railways, and the world headquarters of the International Civil Aviation Organisation. As such, it is the terminal for Amer. Canadian and

Overseas air routes. The Canadian Pacific Railways have a total mileage of 17,169, while the Canadian National Railways have a mileage of 23,691. Ocean, lake, and riv. transportation also converge at M. The harbour of M., situated on the St. Lawrence R., is reached by ocean shipping through a dredged channel having a minimum depth of 32 ft., now being completed to 35 ft. It is served by both Canadian railways, connected to the harbour front by 60 m. of terminal railway operated by the National Harbours Board. The harbour is open to navigation from about the middle of April to the beginning of December of each year. Main piers, wharves, and jetties provide 105 berths, totalling about 10 m. of berthing accommodation. There are twenty-six transit sheds, with an average floor area of over 2,063,000 sq. ft., also four grain elevators, with a total storage capacity of over 15,000,000 bushels; 3½ m. of grain conveyor galleries; a cold storage warehouse, with a capacity of 4,628,000 cu. ft. A 75-ton capacity floating crane and ten locomotive cranes are available. During the 1948 port season shipping was as follows: there were 4049 arrivals, with a total net registered tonnage of 5,823,270 tons. The value of merchandise exported through the port (1947) amounted to \$536,361,814, while imports totalled \$450,313,797. In 1946 there were 4074 industrial establs., employing 197,413 employees. The gross value of production amounted to \$1,400,935,768. The leading industries by gross value of products are as follows: women's clothing, \$114,927,598; railway rolling stock, \$83,018,858; men's clothing, \$67,749,062; slaughtering and meat packing, \$59,532,900; electrical apparatus and supplies, \$52,176,376; tobacco, cigars, cigarettes, \$51,071,227; boots and shoes, \$33,828,882; breweries, \$28,652,517; fur goods, \$25,159,379; paints and varnishes, \$20,664,127; biscuits and confectionery, \$20,335,637; medicines and pharmaceuticals, \$20,123,701; printing and publishing, \$19,164,747. It is estimated that there is available in the prov. of Quebec, of which M. is the chief industrial centre, a potential 13,064,000 electrical h.p., of which 5,750,000 h.p. has already been developed, or more than half of the total for all of Canada. M. is also the transportation centre of the dominion. In the city there are 430 m. of tramway track and bus routes comprising ninety-two regular circuits. Some 1550 transit vehicles carry approximately 1,100,000 passengers per day.

The civic gov. of M. differs from that of most Amer. and Canadian cities. In some ways it resembles the local govts. of the larger United Kingdom cities and in other respects it is similar to that of continental cities. For electoral purposes the city is divided into eleven dists., each of which sends six members to the city hall. Three of these are elected by property owners and three by the electors at large. In addition thirteen public bodies appoint thirty-three representatives to the city council. The total membership of the council is, therefore,

ninety-nine councillors, plus the mayor of the city, who is elected by majority vote of the electors at large. The day-by-day administration of the city is entrusted to an executive committee, the seven members of which comprise the mayor of the city and two delegates from each of the three categories of civic groups mentioned above. The actual executive administration rests upon eleven civic depts.: law, health, public works, city clerk's office or secretariat, finance, city planning, welfare, assessors, purchases and stores, police, and fire. These depts. are in turn co-ordinated by the central figure of the city's permanent civil service, namely the director of depts.

Noted for its many beautiful public buildings, some of the more imposing are Notre Dame Church (Rom. Catholic), Christ Church Cathedral (Church of England), St. James Cathedral (Rom. Catholic), Church of St. Andrew and St. Paul (Presbyterian), Sun Life building, Royal Bank, Bell Telephone, Civic Library, and M. Art Association. McGill Univ. (founded 1811) and the Univ. of M. (founded 1878) are located in the city as are a number of other educational institutions. St. Joseph's Oratory, internationally famed shrine, which annually attracts thousands of visitors, is located in M. An is.-city, there are numerous bridges connecting it to the mainland. Victoria bridge, completed in 1859, marked one of the great engineering achievements of the nineteenth century. Originally a tubular bridge, its total length of 9184 ft. has been replaced by one of cantilever design. Jacques Cartier bridge, completed in 1930, of cantilever design, is 8670 ft. in length, constructed in three sections, the central span of which rests on St. Helen's Is. It was on this is., a legend says, that Chevalier de Lévis burned his flags so as not to surrender them to the Brit. in 1760. M. still retains much of its old-world atmosphere. After Paris it is the second largest fr.-speaking city in the world. See H. Beaupré, *La Vieille Montréal*, 1884; A. Leblond de Brumath, *Histoire populaire de Montréal*, 1890; S. Lencock, *Montréal: Seaport and City*, 1942; V. Morin, *The Historical Records of Old Montréal*, 1944; W. P. Percival, *The Lure of Montréal*, 1945; and M. Gibbon, *Old Montréal*, 1948.

Montreuil, or Montreuil-sous-Bois, tn. in the dept. of Seine, France, 1½ m. E. of Paris. It is famous for its peach orchards, and has gypsum quarries and manufs. of porcelain, paints, and chemicals. Pop. 69,800.

Montreuil-sur-Mer, tn. in the dept. of Pas-de-Calais, France, 24 m. S.E. of Boulogne, with which it is connected by rail. It is founded on a seventh-century monastery built by St. Sulpice. The church of St. Sulpice was founded in 1200 and rebuilt in the nineteenth century. The château of Beauréal was occupied as the Brit. G.H.Q. from 1916 to 1919. Pop. 2800.

Montreux, par. at the E. end of Lake Geneva, canton of Vaud, Switzerland, which includes the vils. of Clarens,

Vernex, Territet, Gllon, Veytaux, and others. It is a favourite winter resort. Near Veytaux is the castle of Chillon. Pop. 12,000.

Montrose, James Graham, fifth Earl and first Marquess of (1612-50), was educated at the univ. of St. Andrews. After three years' travel on the Continent he had an interview, in 1636, with Charles I., who, however, gave him but a cool reception. Actuated by this contemptuous treatment by the king, but more by his discontent with the political supremacy of the bishops and his desire to give a greater independence to his countrymen, he joined the national movement, assisted at the signing of the covenant (1638), three times occupied Aberdeen for the Covenanters, and finally overthrew Viscount Aboyne, Charles's lieutenant in the

JAMES GRAHAM, MARQUESS OF MONTROSE

N., at the bridge of Dee (1639). M. now came a second time into personal contact with the king and hence, according to the Presbyterians, arose his great apostasy. M. definitely joined the king in 1641, and was imprisoned the same year for six months in consequence of a supposed conspiracy against Argyll. In 1644, with the rank of lieutenant-general and the title of marquess, he defeated the covenanting forces at Tippermuir and Aberdeen, and in the following year won four other pitched battles at Inverlochy, Auldearn, Alford, and Kilsyth. His subsequent attempt to raise the royalist standard in the Lowlands was an utter failure, and in 1645 he suffered a crushing defeat at Philiphaugh; next year he was a refugee in Norway. The responsibility for this sudden and disastrous reversal of fortune rests in part on the ill-fated M. himself. He had been blind to the fact that, while Highland troops might perform unheard-of deeds of daring to defend their clanish honour, they were incapable of disinterested combination to further a national cause, and he had, moreover, been powerless to restrain the wanton carnage which had been the regrettable sequence to all

his victories. M. was in the Low Countries when he heard of the king's execution. He swooned at the news, and swore a great oath to avenge the martyr's death. In 1650 he landed in Caithness with a mere remnant of the little army he had collected, for he suffered shipwreck on the way, and was easily vanquished by Strachan's horsemen at Invercarron. The same year he was hanged in the Grassmarket, Edinburgh. Thus ended 'a life of meteoric splendour.' The title of earl of M. dates from 1505, when Wm., Lord Graham, a title dating from 1445, was made earl of M. John, third earl, was regent of Scotland and chancellor, 1603-8. James, the fourth marquess, and a supporter of the union of 1707, was made a duke in that year. See *Lives by Lady Violet Greville, 1886*, and *M. Morris, 1892*. See also M. Napier, *Montrose and the Covenanters, 1838*; G. Wishart, *James, 1st Marquis of Montrose, 1903*; and H. Pryce, *The Great Marquis of Montrose, 1912*.

Montrose, royal burgh and seaport of Angus (Forfarshire), Scotland, 42 m. S.S.W. of Aberdeen. It stands at the mouth of the S. Esk, where it forms the M. basin. The tn. received its charter from David I., and became a royal burgh in 1352. It is rich in historic memories. Industries include timber and flax spinning. Pop. 11,000.

Mont St. Jean, vil. of Belgium, in the prov. of S. Brabant, 11 m. S.E. of Brussels, and just E. of the scene of Waterloo.
